The third paragraph of the resolution states "That the Hoover Institution on War, Revolution, and Peace is an independent Institution within the frame of Stanford University. Its relation to the University is that the President of the University will propose all appointments, promotions, and the budget of the Institution directly to the Board of Trustees. There will be no reference to any faculty committees between the President and the Trustees." It is also clearly stated in a later paragraph of the same resolution that the Director of the Hoover Institution is responsible, through the President of the University, to the Board of Trustees of Stanford University.

The 1959 document also states that "The members of the staff of the Hoover Institution must be free to publish statements or books of the results of their research work in which they give their 'interpretation' or opinion. If the writer of this type of publication wishes to state that he is a member of the Hoover Institution, the publication must carry a declaration that the Institution does not assume responsibility for statements in the publication."

The 1959 agreement was reaffirmed by the trustees in 1962 as a condition of Mr. Hoover's donating his archives to the Hoover Institution, in 1971 when the name of the Institution's board was changed from the Advisory Board to the Board of Overseers, in 1975 when funds were provided by Congress for the construction of a federal memorial to the late President Hoover, and again in 1978 when the William H. Volker fund was donated to the Hoover Institution.

A report of the activities of the Hoover Institution prepared by the Institution's Board of Overseers is sent each year to the Stanford Board of Trustees for its consideration. This report is the formal communication with the Trustees of the activities of the Hoover Institution during the year.

Appoinments

The petitioners have stated that "most fellows hired by Hoover do not need University approval." Actually, the appointment process for various categories of scholars is as follows.

For senior fellows who receive continuity appointments but not academic tenure, the president creates an ad hoc committee to review the nomination by the director (which is made after a nationwide search) before submitting it to the trustees.

In the case of senior research fellows who receive term appointments of five years or less, the director gives the president advance notice of his intention to recommend a particular person and provides background information.

In the case of certain senior library personnel, such as the associate director for library operations, curators and the archivist, search committees composed of Institution staff as well as representatives of University faculty and administration are used. The latter representatives are selected by the director in consultation with and with the concurrence of the president. The director recommends one candidate to the President who reviews the candidate before submitting the recommendation to the Board of Trustees.

Junior members of the scholarly staff as well as other staff members are selected in accordance with procedures similar to those used by the rest of the University.

Hoover Institution Finances

The total budget of the Hoover Institution for the academic year 1982-83 is $8.4 million. Of this total, University funds account for $2.65 million, or 31.6 percent. These funds are devoted to the Library and Archives, where they are used to purchase books, periodicals, and additions to the archival collections, to pay the salaries and staff benefits of the library and archives staff, and to cover the other expenses of the Library and Archives.

These include, for example, the costs borne by the Institution for its membership in and use of the national automated library cataloging system known as RLIN, which makes the collections accessible to scholars throughout the nation. University funds account for slightly less than 80 percent of direct library and archival costs; the balance is covered by expendable gifts to the Hoover Institution and income from the Institution's endowment.

Over 90 percent of the University funds go directly to the library; the rest is applied toward the general administrative expenses of the Institution, where they cover about one-third of the total administrative costs. The remaining two-thirds of the cost is paid from Hoover In-

continued on next page

Hoover/ continued from page 8

stitution funds.

Two points about this allocation are pertinent. First, the Hoover Institution provides a larger share of its administrative costs from its own funds than any other comparable unit in the University. Second, the proportion that University funds bear to the total administrative budget of the Institution equals the share that the expenses of the Library and Archives bear to the Institution's total budget. Thus all of the University support of the Hoover Institution's budget is applied to the Library and Archives.

Income from the Institution's endowment will provide about $2.0 million for 1982-83. It must be emphasized that these are restricted funds which cannot be used for any purpose at Stanford other than to support the Hoover Institution. They result from the raising of funds for that purpose by the Director of the Hoover Institution and its staff over the past 20 years and are held by Stanford for the support of Hoover Institution programs. In no sense, therefore, can the support from the endowment be counted as part of the University's support of the Institution.

Almost the entire balance of the budget is accounted for by expendable gifts made to the Institution on an annual basis, or on the basis of multi-year pledges. These gifts are made by a large variety of donors, including individuals, corporations, corporate foundations, and private foundations.

In the category of annual and multi-year gifts of this kind, the pattern of donors for the Institution differs in some respects from that for Stanford. The share of foundations in annual gifts (about 70 percent) to the Institution is greater than that share in donations to Stanford, while gifts by living individuals are smaller.

The share of industry and business in annual gifts to Stanford as a whole is about twice the share from that source to the Hoover Institution. Bequests typically play a larger role for Stanford than for the Hoover Institution.

Since the Institution's budget is small relative to Stanford's, there are fluctuations in the shares from various categories of donors from year to year. The Institution would have no objection to disclosing its list of donors if Stanford were to change its policy against the disclosure of the names of donors, which presently prevents all individual units at Stanford from such disclosure.

Finally, approximately four percent of the Hoover Institution budget is derived from the sale of books published by the Hoover Institution Press and microfilms, and less than one percent from government grants.

The Library and Archives account for approximately 36 percent of the total 1982-83 budget. Research in both domestic and international studies accounts for about 49 percent of the budget. The remaining expenditures are divided approximately equally between administrative expenses and publications costs.

Comments on the Hoover Institution from the so-called 'Inner Core'

Once again the Hoover Institution and its scholars are being attacked on spurious grounds while the real reasons for what can only be termed an indecent assault are hidden behind appeals to value-free research and calls to end Hoover's partisanship.

The reasons for the current attacks on Hoover appear to be the same ones that motivated earlier attacks, that is, greed, envy, and political partisanship. Liberal-Left faculty and students are intolerant of views that run counter to theirs and are unwilling to allow conservative view to be espoused in any significant or dynamic way.

Ideological one-sidedness has been present among some faculty at Stanford since at least the 1960s. Now that some campus activists perceive that there are scholars at Hoover who have political influence with the Reagan administration, they have launched a mini-war against us.

Since Prof. Manley's memorandum to the Political Science Department sparked this new controversy and is the basis for faculty and student petitions, let's discuss his major points seriatim.

It is Manley's (and the faculty and student petitioners') belief that Hoover by its ties to a great university "shares in the prestige of the University and so enhances its mission." The second part of this statement is patently untrue—Hoover as an institution has no mission; its many scholars have many missions; not included among them, however, is the mission to be politically partisan.

The first part of the statement is certainly true, but it is equally true if the order is reversed: the University shares in the prestige of the Hoover Institution.

By any criterion, Hoover in its fields of interest (20th-century international and domestic studies) and in its library and archives is at the very least equal to University departments and libraries that do similar work.

International studies at Stanford have been centered at the Hoover Institution since 1919. Its library and archives are a national resource. Certainly Hoover's research library is unique, transcends the Stanford University Library system, and is nationally ranked in the top three in all its collecting fields (East European and Soviet Union, East Asian, Western Europe, Africa, Middle East, and Latin America). The University gains because of Hoover's national and international reputation as a documentation center with the major international studies program in the western United States.

Hoover's publications and fellowship programs (such as the National Fellows Program), its conferences and lectures, are equally outstanding and lend luster to Stanford. No university department or departments in its fields of interest (area studies, international studies, domestic studies, political science, history, economics, sociology, international relations) produce as much as Hoover does.

The International Studies Program of the Hoover Institution currently supports 199 projects (14 on Africa, 26 on East Asia, 58 on Eastern Europe and the Soviet Union, 32 on Latin America, 27 on the Middle East, 31 on the U.S., 11 on Western Europe). Scholars associated with this program come from the leading institutions in the U.S. and are among the leaders in their fields. Their works are published not only by the Hoover Press but by such university presses as Harvard, Cambridge, Oxford, Princeton, and Stanford.

Let's compare one University and one Hoover program. The University's Africanists certainly include some outstanding scholars; so do Hoover's. Hoover's African Program, by virtue of its resident staff and fellowship program, has in the past 20 years outproduced (90 books to date) the University's Africanists by about four volumes to one (only three or four of the 90 volumes can be considered policy-oriented research). The scholars associated with Hoover's African Program are overwhelmingly Left-Liberal. But while Hoover scholars have always invited those they disagree with to contribute to their volumes, reciprocal courtesy is seldom afforded them.

The charges against us force us to praise ourselves when others should be doing that. Likewise the attacks on the political affiliations of Hoover scholars require us to use labels such as our opponents use. There should be no necessity on a university campus dedicated to free inquiry to have to call people left, liberal, or conservative.

In area studies and international studies, Hoover equals or outranks the University faculty. Time and again in the past, Hoover has had to lead the University into new fields of study.

Hoover was first to develop formal studies programs at Stanford on Eastern Europe and the Soviet Union, the Middle East, and Latin America. To this day the University has no Middle East program; Hoover has had one since the 1950s. This program has published 25 books and currently is funding 27 projects.

Hoover, no matter what its detractors contend, is a prestigious national institution associated with Stanford and attracts students and scholars from around the world. Furthermore, the presence of Hoover's great research facilities induced some of Stanford's major scholars to take up appointments at Stanford. Mention should be made of at least one, former president Richard Lyman, who was Hoover's honorary curator of the British Labor Collection. Others are cited in Berger's letter.

The University gains further prestige from Hoover's Domestic program (DSP). Four Nobel Laureates are fellows of the DSP. Virtually all of the Stanford joint or courtesy appointments are in domestic studies. Obviously they have perceived it to be in their interests to associate themselves with Hoover. And they lend as well as receive prestige by such an association.

Hoover senior scholars in the DSP are recognized as leaders in their fields. Their many conferences on domestic issues have brought the country's ablest scholars to Stanford. Scholars associated with Hoover in both the International and the Domestic Studies Programs include five Nobel Laureates—and between them—32 members of the American Academy of Arts and Sciences, the American Association of Sciences, the National Academy of Sciences, and the National Academy of Education. As, with Stanford faculty, we have our share of Guggenheim and NEH fellowships and awards from the Ford and Rockefeller foundations.

Hoover as a Two-Tiered Organization

The Manley memo (and the petitions) make much of an imagined two-tier, two-class system at Hoover, claiming that the Stanford scholars who add greatly to Hoover's prestige are in one tier and the Hoover regular research staff are in another and lower tier—lower, that is, in reputation, legitimacy, and influence.

This two-tier system, the petitioners believe, was cleverly developed by Glenn Campbell "to upgrade the Institution's reputation by improving its quality and adding luster to its masthead." While it is true that the many Stanford scholars associated with Hoover do enhance our reputation, it is not true that there are no equally able and famous people on Hoover's regular staff.

One has only to look at their rewards, honors, fellowships, and publications to determine that Hoover's curator-scholars, for example, are the foremost experts in the United States not only as documentalists but also as bibliographers and scholars. Hoover's senior economists and political scientists are also recognized as among the leaders of the U.S. intellectual world.

The benefits of the Hoover-Stanford association then are mutual. The chairman of the Sociology Department, Joseph Berger, writing in the *Stanford Daily* of April 26, 1983, explains what the Hoover connection did for his department—it enabled Sociology to achieve a national preeminence in social science by allowing that department to attract and to keep four outstanding people.

The Hoover appointments allow the University "to keep them in the face of competing alternatives" and "is dependent, to an important degree, on the resources for scholarship. . . made possible by their Hoover Institution appointments." What are these resources?

Freedom to do less teaching and more research, office space, secretarial help, research assistance, access to word processors and computers, to mention only the material benefits. Prof. Berger knows of no "political litmus test" for these four appointments. Nor do we know of any political tests or loyalty oaths to any party required of any Hoover scholars.

This takes us to the question of whether or not there is a Hoover plot to develop a two-tier organization to enhance our reputation and to overcome our so-called lackluster regular staff. Alas, the two-tier plan exists only in Manley's head; it has never been in Glenn Campbell's head. He simply does not believe he needs to augment his research staff with Stanford's eminent scholars. He believes the regular staff he recruited is at least equal to Stanford's faculty.

The push for joint or courtesy appointments never came from Campbell; he did not initiate negotiations for any of these appointments. The initiative either came from the faculty themselves or from Hoover scholars who wished to have faculty colleagues join them at Hoover. So there is no plot.

As for Hoover creating a "two-class professoriate" at Stanford—"those who receive research funds and the benefits from Hoover, and those who do not"—the answer is that a two-class professoriate is endemic at all universities, not just at Stanford.

Some professors publish more and are paid more. Some law professors have outside sources of income and some do not, some scientists and engineers consult and some do not. There is no moral obligation in life to see to it that everyone benefits equally regardless of ability and drive. Some Stanford professors make more than others, but Prof. Carnoy does not censor the University for this.

Ironically, Hoover does represent most shades of political opinion, and we have greater diversity in this respect than most social science departments at prestige universities. According to the research on academe by Lipset and Ladd, the social science faculties of American universities are overwhelmingly Liberal-Left and members of the Democratic Party. Hoover thus appears conservative only when compared with Stanford faculty in certain areas.

In any case, whereas social science and humanities both at Stanford and elsewhere are overwhelmingly dominated by registered Democrats, Hoover senior staff has a near balance: 11 Democrats, 10 Republicans, and three Independents. And if you were to tally the political beliefs of all scholars associated with the Hoover Institution—that is, not only the resident scholars but also those on grants or fellowships from the Institution or commissioned to write books or chapters in books for it, you would discover that at this so-called conservative, partisan center there is, in reality, a wide variety of views.

Take, for example, the distribution of perspectives in the cooperative study of Marxism published for Hoover by the Stanford University Press in 1965. Of the 35 active participants, no more than five could be considered "right-wingers." The liberal and even the socialist contingent was far larger and unquestionably dominated the proceedings. Among the Socialist contributors were Carl Landauer, Lewis Feuer, Sidney Hook, Max Schachtman, Max Nomad, Hans Gerth, and Daniel Bell. (See the *New York Review of Books*, October 28, 1965.)

Or take another example, the five-volume series *Colonialism in Africa*, published by Cambridge University Press. Of the 55 contributors the Liberal-Left corps outnumbered the Conservatives five to one. In *African Socialism*, another Hoover volume published by the Stanford Press, we can find no known conservatives but many Socialists and one Soviet Communist scholar!

So where is our partisanship, slanted research, or

continued on next page

Hoover/ continued from page 9

conservative bias being shown? As the examples above demonstrate, Hoover invites those of different political persuasion to contribute to its publications.

The record then is clear: Hoover has balance and is open, tolerant, and free of partisanship. Furthermore, Hoover scholars are at least as divided on political issues as their colleagues in the University. We have a better balance of political affiliation than any of Stanford's social science and humanities departments, which Lipset and Ladd show to be almost all liberal-left Democrats.

Rather than being political partisans, some Hooverites are outspoken critics of some of this administration's policies, as they were of those of previous administrations. And this fact is made abundantly clear to White House aides when they visit.

Our critics charge us with being a conservative think tank that has provided the Reagan administration with much of the research base behind its policies. Although the Reagan administration has taken some of our permanent staff, it has not always taken our advice.

Appointees included Martin Anderson, assistant to the president for policy development (Level II), Darrell Trent, deputy secretary of transportation (Level II), Richard F. Staar, ambassador to the mutual and balanced force reduction negotiations (Level II), Philip C. Habib, special envoy of the president to the Middle East (Level II), Annelise Anderson, associate director of the office of management and budget (Level IV), and John F. Cogan, assistant secretary of labor for policy (Level IV).

Furthermore, many scholars invited to Washington did not go, preferring to remain at Stanford and be free to criticize. Hoover staff members were approached but did not accept high level appointments at the following ranks: one level I, one level II, one level III, and two level IV. These positions included the directorship of the Arms Control and Disarmament Agency, secretaryship and assistant secretaryship of Education, membership on the Council of Economic Advisers, and assistant to the president for deregulation.

We have been criticized for reporting about the people who have moved from Stanford to Washington and about our influence in the White House. We have every reason to be proud that so many of our staff have been called upon to serve the nation in so many responsible positions.

When Stanford sent people to Washington during Carter's years, much boasting was heard. The March 1977 Stanford *Observer* proudly reported the event under the headline of "Top Jobs" and "Stanford in Washington. Faculty Division," with pictures of Barbara Babcock, associate professor of law, appointed to an executive level IV position as head of the civil division of the Department of Justice, and Donald Kennedy, endowed professor in human biology, appointed to an executive level V position as commissioner of the U.S. Food and Drug Administration. (The highest presidential appointment is level I.)

The *Observer* noted that other faculty members would be on leave to serve in President Carter's administration, including Professor of Psychology Richard Atkinson, appointed to the only really top government post, a level II position, as director of the National Science Foundation; Professor of Law Thomas Ehrlich as president of the Legal Services Corporation; and Professor of Psychiatry David Hamburg as president of the Institute of Medicine, National Academy of Sciences.

Many Stanford faculty have served in the federal government under both Democratic and Republican administrations. We do not recall any criticism of improper "partisan" behavior having been made prior to the current charges.

Berkeley and Harvard sent more people to Washington during Kennedy's time in the White House. Again much was made of these appointments in the press of those universities. The list of faculty and alumni was so extensive, it took up almost two pages in a February 1961 *Harvard Alumni Bulletin* under the heading "Crimson Cabinet." Law School Dean Griswold is alleged to have complained that Mr. Kennedy had taken more than 10 percent of his faculty of 40. James Reston quipped that there would soon be "nothing left at Harvard but Radcliffe."

Appointed faculty at these institutions did not charge partisanship then. A Harvard witticism has it that you cannot get a quorum in the Faculty Senate when a Democrat is elected president, and you cannot get one on the Board of Overseers when a Republican becomes president. Surely the petitioners are not against public service, or are they opposed only if it is done for a conservative, Republican president?

Hoover is not technically a think tank like Rand or Brookings. At Hoover there is no coordination or direction of work of the individual scholars. We have seldom done contract research for government, and we have undertaken no research for any branch of the Reagan administration. As individuals we do engage in public policy, public-choice research at Hoover, but this is not our exclusive interest.

Our critics make much of the fact that Hoover engages "in an impressive variety of policy-relevant research" as if this were unscholarly and objectionable. We would indeed be remiss if we did not study crucial issues of the day, such as the draft, social security, health care, welfare, and Soviet expansion and militarism.

As a dynamic, scholarly institution, we fail to understand why we should not do so or why we should be censured for writing hundreds of articles and op-ed pieces each year on vital issues of concern to citizens. These were not written just to influence a Republican president.

Are Profs. Manley, Carnoy, and Rebholz protesting our fecundity or our concern for policy matters? Are they denying us our right to express our views? Certainly faculty members at Stanford and elsewhere do not hesitate to criticize or comment on Reagan's presidency.

One has only to look at Hoover's list of publications to realize that we are not only concerned with public-choice questions of the present. Many of our works are historical analyses and deal with people and events before 1980!

Does the Domestic Studies Program at Hoover Constitute a Perversion of Hoover's Original Charter?

Early on the Hoover Institution had researched domestic issues but then stopped until such work was revived in the 1960s and expanded in the 1970s. Why should this be a perversion of its original charter? Mr. Hoover did not exclude such work.

Surely the Institution has a right to expand its programs. Should we have limited our work just to the causes of war because that was Mr. Hoover's original purpose in founding the Hoover War Library? Common sense refutes the charge. Furthermore, the Domestic Studies Program was carefully worked out with University authorities and had their approval. Dr. Martin Anderson proposed a domestic studies program at the Hoover Institution to concentrate on studies on domestic change. He reassured the Board that this work would complement and not supersede or replace the existing international studies program. (See the Hoover Board of Overseers' Report to Stanford University's Board of Trustees, January 1971, and the annual reports thereafter.)

At the 1972 meeting of the Hoover Board of Overseers, the minutes record that President "Lyman pointed out that the Hoover Institution already had a considerable domestic research presence in Anderson, Freeman, Possony, and Rita Campbell. The new program, then, would noi represent any drastic shift."

The fact is that there has been full University awareness of and support for a Domestic Studies Program at Hoover since the beginning. Furthermore, Dr. Lyman had only praise for and welcomed this new program provided funds were available.

As former Vice-President for Public Affairs Robert Rosenzweig noted in the May 6 *Daily*, it is ironic that petition initiators charge Hoover with being a partisan political institution while maintaining that the issues raised do not concern the policies of individual members of the institution.

Further we understand the names of faculty members supporting the petition will not be disclosed. This appears to Hoover scholars to be unfair and certainly unacademic. It smacks of McCarthyism.

The political charges against Hoover are a charade, an example of faculty partisanship and of double standards. The record of political partisanship of activist faculty and students is overwhelmingly in support of so-called liberal causes.

There is no comparison between this kind of faculty activism as expressed in sit-in demonstrations, parades, riots, breaking up of meetings, intimidation, support of Marxists, Maoists, Trotskyites, and anything Hoover scholars have done to promote the Republican Party, the Reagan administration, or the cause of conservatism.

In any case, what is the right proportion of particular views in each department or institute of the University? Should the University ensure that all views are represented in all departments? Why should the Hoover Institution alone be singled out for this kind of an investigation? Surely, social science and humanities departments are more monolithic than Hoover. Should we investigate whether there are too many Marxists and not enough conservatives in some University departments?

We think the petitioners have no case; we trust the Senate will not recommend that a committee of the Board of Trustees be appointed to investigate Hoover. Such an investigation in our view is unnecessary and offensive to our scholars. The last Senate investigation of Hoover produced a report that was so full of misjudgments that although the Senate received it, it did not act upon the report's recommendations.

Kennedy comments on Hoover petition

STATEMENT ON THE HOOVER INSTITUTION PETITION
President Donald Kennedy
May 17, 1983

The Senate of the Academic Council now has on its agenda for May 26th, a discussion of some of the issues raised by petitioners. I do not think it would be appropriate for me to preempt the terms of that discussion; but I do venture to hope that it will be forward-looking and productive, and concentrate upon how the Hoover Institution and Stanford can improve upon a relationship that has been increasingly valuable to both.

The important issues, it seems to me, have to do with governance and appointments, and not with who has what kind of politics. Consideration of the latter not only is an improper criterion for appointment or evaluation under our principles of academic freedom; it can also turn a discussion into one that is unnecessarily strident on both sides.

In the course of the present debate, both sides have referred to the University's budgetary relations with Hoover, and to the appointment process. It may be helpful for me to review the present status of each, so that our future deliberations can concentrate on more substantive matters.

During the present fiscal year, the Hoover Institution will receive a total of about $2.7 million in University general funds. Ninety percent of this budget line is for the support of the Hoover Library and Archives, which are part of the network of University Libraries. Petitioners assert that "this figure represents a 64 percent increase since 1979-80 at a time of severe University funding cutbacks." The intention, apparently, is to suggest that Hoover is receiving especially favorable budgetary treatment.

Actually, the increase is 55 percent, not 64 percent. It compares with an increase of 62 percent in Stanford's overall operating budget over the same period: this rate of growth reflects the degree to which *all* budgets have been subject to inflationary increase. The Hoover increase thus has some economic significance, but no political significance whatever.

By a 12-year old agreement, Hoover Senior Fellows—the only category of Hoover appointees on continuing appointment—are subject to the approval of the President.

They have been reviewed in the following way. The President has asked the University's liaison officer with Hoover—the Vice-President for Public Affairs—to constitute an informal consultative group of knowledgeable Stanford faculty members in the same discipline as the prospective appointee.

After studying the documentation submitted by the director of the Hoover Institution, this group advises the Vice-President on the suitability of the nomination, who reports the result to the President.

A relatively small number of appointees has been processed in this way over the past decade, since many senior fellows were simultaneously appointed to the Stanford faculty and accordingly received regular tenure reviews. No appointments subject to the above process have been rejected in the past dozen years, though some have been returned for additional information.

These clarifications may contribute in a small way to an improvement in the quality of the discussion on which we have embarked. The relationship between Stanford and the Hoover Institution is an important one, and its future matters more than its present or its past. I hope that consideraiton of that relationship can concentrate upon the more serious issues, and can be based upon the information that is accurate and pertinent.

Company stories help employees resolve conflict —Martin

Those "unique" company stories about employees who brave fire and flood to get the product to the customer are not unique, nor is the recounting of these stories just idle talk around the office water cooler.

So says Stanford Business School Prof. Joanne Martin, principal investigator in a study of "The Uniqueness Paradox in Organizational Stories." Stories of heroic feats of achievement or sacrifice are intended as statements about the company culture—predictions about what the firm will or won't do in certain situations, or its expectations about how employees should behave, says Martin.

She is an associate professor of organizational behavior at the School.

Martin and a three-member student research team have examined the commonality among organizational stories and why some stories proliferate and others do not. The student researchers, all doctoral students, are Mary Jo Hatch and Sim Sitkin of the Business School, and Martha Feldman of Stanford's political science department.

Organizational stories, like fairy tales, legends, and religious myths, are expressions of a culture that convey claims to uniqueness, says Martin. The paradox, she says, is that "a culture's claim to uniqueness is expressed through cultural manifestations that are not in fact unique."

Organization tales

In the study, the researchers examine seven types of organizational stories that carry a claim to uniqueness, yet occur in virtually identical form in a wide variety of organizations. The stories include some Martin collected from academic literature on organizations and from published institutional histories as well as stories she and her researchers personally gathered.

The seven story themes are: 1) Rule-breaking, in which a low-level employee challenges the head of the company for breaking a company rule; 2) Is the big boss human?; 3) Can the little person rise to the top?; 4) Will I get fired?; 5) Will the organization help me when I have to move?; 6) How will the boss react to mistakes?; 7) How will the organization deal with obstacles?

In one example of the rule-breaking story, a young security supervisor dares to challenge Thomas Watson Jr., the intimidating former chairman of the board of the IBM Corp., for not wearing the proper identification badge in a high security area of the company. In the story, Watson, when challenged, follows the regulations and puts on the correct identification. The IBM story, says Martin, enables employees to complete the sentence: "What we are proud about around here is. . . ." For high-status employees, the moral is "Even Watson obeys the rules, so you certainly should." For lower-status employees the message is, "Uphold the rules, no matter who is disobeying," says Martin.

Martin says she found remarkably similar versions of the rule-breaking story in a variety of organizations and that in each case the story had the same two characters: a high-ranking figure in the organization and a low-status employee who is either very young or new to the firm.

"These attributes of the two protagonists amplify the status differences between them," says Martin. "The inequality in power sets up a tension: Will the high-status person pull rank and be angry at the attempt to enforce the rules?"

Martin analyzes the content of organizational stories with the aid of script theory, a way of stripping a story of all but its barest essentials, and ending up with a set of characters and a causally-connected sequence of events. She is then able to determine whether a given tale is or is not an example of a common story type.

Of the seven story types, the most common is the obstacle story, in which employees respond to natural disasters, technical problems, or errors of other employees with effort beyond what is required in their formal job descriptions in order to get the job done. Examples include insurance agents who buy snow shoes and hike through blizzards to reach their clients, scientists who work night and day to solve an untractable problem, or a team of employees who overcome great odds to solve an elusive quality control problem.

Martin makes a distinction between what she calls "positive" and "negative" organizational stories. In the positive stories, employees, who are usually mentioned by name, exert considerable control over events; obstacles are overcome, bringing unanticipated success to the organization, or at least a return to the status quo. In the negative stories, the starring employees are not mentioned by name, do not exert unusual courage or effort, but simply do their jobs.

Martin cites as an example of the negative story the tale of a large bureaucracy in which an employee receives a form requesting him to mail someone a report. He complies with the request, unlike five employees before him, who each received the request but delegated the task to someone else. The hero thereby overcomes an obstacle by doing his job, while other employees are portrayed as poor performers.

Why do some organizational stories survive and others die by the wayside? Those that survive do so because they help resolve tensions between the individual employee and the organization, help explain past actions of employees or the organization, and allow employees to identify with or distance themselves from the organization.

Seven types

Like anthropological myths, organizational stories bridge conflict between the goals of the individual and the goals of the organization by offering a clear-cut resolution or by expressing discomfort at doing so, Martin says. "Employees may value equality, security, and control, while organizations may demand the right to threaten these values in order to survive," she says.

Common story types present a self-enhancing explanation for organizational events, she says. "People and organizations often seek retrospective explanations. This is not merely dispassionate inquiry. Reputations and self-esteem are on the line. Not surprisingly, individuals and organizations often see themselves as the cause of success, while blaming failure on forces beyond their control."

Martin says the positive organizational stories enable employees to identify themselves with the organization while the negative stories allow them to distance themselves. "In the positive versions, the starring employees have the same desirable control over outcomes as the rest of the organization—a control which is not characteristic of forces in the environment, such as other organizations," she says.

Martin characterizes the message of positive story types as: "My organization and most, if not all, of its employees are good, sane, just, and competent. To the extent that difficulties are not surmounted, this is the fault of forces outside our control."

The message of negative stories, she says, is: "Some employees in my organization with whom I identify, are good, sane, just, and competent. My organization, however, is bad, insane, unjust, and incompetent. To the extent that successes occur, they happen because of the efforts of these admirable employees, because of assistance from forces outside the organization, and despite the actions of the rest of the organization. When failure occurs, the organization itself is to blame.

Martin says: "It is difficult for most people to abandon the assumptions that decision-making processes are rational and that events are under one's personal control. It may be that in organizational cultures the claim to institutional uniqueness is as fundamental as assumptions about rationality and internal control. In our society these assumptions are comforting. It is possible, however, to imagine societies where they would not be."

—Herb Blanchett

It is difficult for most people to abandon the assumptions that decision-making processes are rational and that events are under one's personal control.

—Joanne Martin

Wessells backs higher tenure standard

continued from page 1

policies to keep their percentage between 50 and 60 percent." Among 13 major private universities, the tenured faculty ratio is about 70 percent.

The School of Humanities and Sciences has a professoriate of 470, whose average age is 48.

Changes in expectation for tenure, a tightened job market elsewhere, and the growth of what Stanford Law Dean John Hart Ely calls "tenure law" have greatly increased faculty grievances, Wessells said.

"The intrusion of non-University attorneys into the University's tenure processes will have extremely deletrious consequences if we ignore what I believe is a strong thrust in a number of grievance papers.

"This is an explicit failure in them to recognize that the process of evaluations at departmental, school, and higher levels of review are basically subjective judgment processes. They are not processes involving simple algebraic summation of pluses and minuses in the form of referee letters, statements by Stanford colleagues or student evaluations.

"Instead the essence. . . involves careful weighing of all such evidence, examining precisely what is said, why, and by whom—reading between the lines, if you will, in some instances—and then arriving at a balanced, reasoned and wise judgment. . . .

"Grievance documents written by various attorneys would turn us away from those long-established practices and toward a system of rigid objectivity in which professional *judgment* would have little role to play—10 letters in favor, four against, yes on tenure.

"Such procedures would seriously damage the quality of the faculties of great research universities. Like it or not, we simply cannot define precisely a single set of criteria every syllable of which may serve as the launch pad for a grievance. . . .

"We must literally take the offensive in improving our system or the courts will ultimately try to do so for us.

"We must define our criteria for tenure, describe our time-tested procedures, apply them with utter equity and fairness, and insist that it is the University professoriate—not the aggrieved assistant professor, the attorneys or the courts—that determines the rules of the game."

Symposium heralds molecular clues to disease

"Only in the last decade has learning become something we can study on a cellular level."

—Eric Kandel

Genes that can trigger cancer, the biology of learning and memory, and cell receptors that help the body fight heart disease all played a part in what Stanford Medical School Dean Dominick Purpura called an "academic festival" held at the medical center last Friday.

Six scientific sleuths from around the country, prominent in the search for molecular answers to questions of health and disease, profiled their research for an overflow crowd in Fairchild Auditorium in a day-long symposium entitled "Perspectives in Molecular and Genetic Medicine."

Just as the invention of the microscope opened a window on a world too small for the naked eye, the new biochemical tools of geneticists are permitting scientists to go several steps further and explore the interactions of molecules in both healthy and diseased tissue. Researchers in a variety of fields are now snipping molecular strands of genetic material into component parts, and recombining them in ways that offer a new, deeper level of understanding.

"We are, to a large part, what we are because of what we've learned. But only in the last decade has learning become something that we can study on a cellular level," said Dr. Eric Kandel, a neuroscientist from Columbia University whose work with Dr. James Schwartz has revealed fundamental mechanisms of learning in sea slugs.

The celebration of recent advances in genetics, biochemistry and medicine was prompted, Purpura

Genetic tools are being used to get an inside look at arteriosclerosis—an often fatal clogging of the arteries.

—Michael Brown

Remarkable research findings on origins of cancer. . .

A series of remarkable research findings in the past four years are clearly illuminating the route to understanding the precise biochemical and genetic events that surround man's most dreadful disease—Cancer!

These discoveries were an unanticipated growth of studies of a group of simple viruses that cause tumors in animals. In spite of having very little genetic material—some as few as two or three genes—the viruses are powerful inducers of cancer, according to Dr. J. Michael Bishop, a microbiologist at the University of California in San Francisco.

Bishop's research is in the opening phases of what is, in a very real sense, a biological revolution. It was to look at the status of that revolution that scientists from all over the country gathered at Stanford for a day-long conference on Friday in the Medical School's Fairchild Auditorium.

Bishop's work not only illustrated the progress made in understanding basic aspects of the cancer problem, but also the impact of recombinant DNA technology on these developments, which the public does not seem to have yet fully grasped.

With this powerful new tool researchers can for the first time begin to literally dissect the genetic material of tumor viruses and identify the single viral genes responsible for malignant transformation.

The University of California, Stanford, and Harvard are among the several institutions whose laboratories are taking a leading role in this field. To date some 17 different transforming genes have been found among viruses. Each of these genes, inserted into a host cell's genetic material by a virus, can subvert or alter the cell's biochemical machinery making division its primary function.

How some of these genes work is known. They produce enzymes that subtly alter some cellular functions, at least one of which triggers uncontrolled cell growth.

This observation has led to another significant—and surprising—discovery. Uninfected cells display the same enzymatic activity, though at much lower levels. That is, a gene or genes producing similar enzymes must be a normal component of cells. The question: is there any similarity between these and viral genes?

Just a few years ago, this question would have defied experimental answers, the scientists agreed. With recombinant DNA techniques, however, the experiments are now possible and quite straightforward. Briefly, the viral transformed genes themselves are used as probes to detect similar or identical genes in cellular DNA.

DNA, the genetic chemical, is composed of two slender strands made up of subunits called nucleotides. It is the sequence in which different nucleotides are strung together that makes each gene functionally separate and unique.

The two DNA strands are held together by weak bonds between certain pairs of nucleotides. In a gene, typically some thousands of nucleotides in length, the two chains are exactly complementary; each nucleotide binds to one opposite it and the two strands are held together tightly by the combined strength of thousands of weak bonds. Moreover, if the strands are separated by heat or chemical treatment, which breaks these bonds, and then allowed to reform, the complimentary strands will come together again in precisely the right way.

This exact nucleotide pairing is the basis of the so-called DNA hybridization technique, an elegant way scientists use to compare viral and cellular genes. Thus, while single DNA strands from the same or identical copies of the genes will reform tight double strands, single strands from dissimilar genes will not. In this case, there's not enough sequence "homology" to hold the strands together.

In the test, radioactive single strands from the viral transforming genes are washed over a surface bearing fragments of cellular DNA. If, during this process, the viral strands encounter highly homologous cellular jequences, radioactive viral-cellular hybrid molecules are formed and retained. These are easily detected and their presence demonstrates that a cellular gene very similar to the viral gene was present.

Using this technique researchers have found that each of the known viral transforming genes has a counterpart in animal cells. In fact, it is now clear that the cellular genes came first. Cancer virus may have evolved from non-tumor virus which picked up these genes during the course of infection.

When recombinant DNA techniques were applied to a group of simple viruses that cause tumors in birds, an answer was quick to appear: just one gene was sufficient to transform a healthy cell to a cancerous one. Moreover, the protein product of the transforming gene of one of these, the Rous Sarcoma Virus in chicken, was identified by Bishop and his colleagues at UCSF as being responsible for causing the tumor.

The gene—named *src*, after sarcoma—takes advantage of the production machinery in the cell to make many copies of the offending protein. As always, this finding raised important new questions: Do all tumor viruses transform that way? Are there other ways by which cells can become malignant?

At least partial answers to these questions have come rapidly from laboratories throughout the world. They confirmed the original findings, but also they have showed that other tumor viruses did not transform cells into cancer that way. Clearly, scientists now think, alternate mechanisms of transformation of normal cells into cancer must exist.

In fact, studies already suggest how cancers may arise in the absence of viruses. Apparently, normal genes have the potential to transform normal cells into cancer. Mutation-causing chemicals or radiation can alter the usual genetic control mechanisms, allowing these genes to function when they should not.

There are clues that potential "cancer" genes, like the cancer genes in mice and fowl, do in fact exist in man. Studies have begun looking for such genes and scientists may learn much more about the origin of human cancer.

—Spyros Andreopoulos

Medical Alumni Symposium to tackle creativity and early experience

Two Nobel laureates and an internationally-acclaimed pianist will highlight Stanford's Medical Alumni Symposium scheduled for the morning of June 4 at Sherman Fairchild Auditorium.

Drs. David Hubel, John Franklin Enders University Professor at Harvard Medical School, and Joshua Lederberg, president of Rockefeller University, will join artist Lorin Hollander to explore "Creativity and Early Experience," with members of the Stanford Medical Alumni Association, and medical school faculty and students.

Hubel, a neurobiology professor at Harvard, received the Nobel Prize in Medicine or Physiology in 1981 for his work with two colleagues on the visual information-processing system.

Lederberg, former head of Stanford's genetics department, received the Nobel Prize in Medicine or Physiology in 1958 for his work on the organization of genetic material in bacteria.

Hollander began his career as a concert pianist with a Carnegie Hall debut at age 11. In addition to performances, he holds artist-in-residence programs at universities throughout the country, which include lectures and workshops that examine the psychological mechanisms of the creative process, the phenomena of stagefright and the neurotic distortions of creativity. He has served on national and international artistic and scientific organizations as well.

Specifically, Hubel will discuss "How Plastic is the Newborn Brain?"; Lederberg will talk about "The Biography of a Scientific Discovery;" and Hollander will discuss "Music, the Creative Process, and the Path of Enlightenment."

Participants in the morning program can earn up to three hours of Category I credit in the California Medical Association's Certificate in Continuing Medical Education Program. Certificates of attendance will be available.

The alumni association's annual meeting is scheduled to follow the morning program. Keynote speaker Dr. David Rogers, president of The Robert Wood Johnson Foundation, will speak on "Keeping Book on American Medical Care: How Are We Doing?"

The afternoon will end with a cocktail reception at the Stanford Faculty Club, hosted by Dean Dominick Purpura. Reunion dinners for the classes of 1933, 1938, 1943, 1948, 1953, 1958, 1968, 1973, and 1978 are scheduled for the evening.

For information and registration, contact the Stanford Medical Alumni Association, 750 Welch Road, Suite 300, 497-6389, by May 26.

Pre-meds need more than sciences

It takes more than a knowledge of science to make it in medicine, and the time to get that other knowledge is before entering medical school, Stanford University Medical School faculty and community physicians told undergraduates during a panel discussion last week at Sherman Fairchild Auditorium.

"There's a strong misconception that there's only one path to success in medical school," said Dr. Bruce Parker, associate professor of clincal radiology. "It's not that important to major in a specific field, such as science. It is important, however, to choose a field and put some real effort into pursuing it in a scholarly, intellectual way."

"That you'll understand the biological sciences is a given," added Dean Dominick Purpura. "But it's the human values, the ethics, and the concepts dealing with the essence and meaning of life that you need also. Medicine is simply an extension of humanity."

The panel, entitled "Reflections on Medicine: Education, Lifestyle, and Diversity," was the kick-off for the Majors Event the following day (last Tuesday). Booths—staffed by faculty, graduate students, and alumni—set up in the University's Inner Quad gave Stanford undergraduates the chance to learn about all majors.

The medical panel participants discussed the pros and cons of choosing medicine as a career as well. "Medicine is one of the most flexible professions," said Dr. Harvey Weinstein, clinical assistant professor of psychiatry. "There are multiple career pathways, such as administration, teaching, or clinical practice. You can arrange your life according to your priorities, and get as involved in medicine as you'd like. You can't do that with a lot of other professions."

"Medicine is a big commitment, however," cautioned Dr. Roger Peeks, who is in private practice. "It's important to know what you're getting into. Once you start your medical education and training, it's like a snowball effect. It's hard to stop if you decide you don't like it."

"There is nothing more intellectually stimulating and fun than medicine," concluded Dr. Tom Fiene, who also is in private practice. "Every day you deal with a great variety of people. You have to be able to relate to them on more than just a scientific level. Once you're in medical school you won't have time to learn this. The time to learn about different things, and to establish your values, is now, as undergraduates."

—Shirley Kraus

Gonda (left), for whom the top SUH employee service award is named, congratulates Bill Ferguson, this year's winner.

Hospital employees gathered for 25th annual service awards banquet

President Donald Kennedy noted the "remarkable length of service record of Hospital employees," and surprised award winners accepted recognition plaques, as almost 400 employees and their guests gathered for the hospital's 25th annual employee service awards banquet last week.

The top award went to Bill Ferguson, associate project manager in the Operations and Maintenance Department, a 24-year hospital employee. He was presented the Thomas A. Gonda Award for dedicated and exemplary service.

Special awards also went to Laurie Gunderson, clinical nurse coordinator on the North Intensive Care Unit; Armanda Holland, dietitian assistant; Carol Oakes, assistant director of care review/risk management; William Schueler, senior orthopedic technician, Nursing Services; and Marilyn Tucker, Systems Development supervisor.

Dan Robinson, acting director of Personnel and master of ceremonies for the event, noted that the first employee awards banquet was held in 1958 in the old Palo Alto-Stanford Hospital, now Hoover Pavilion. Nineteen employees attended that event in the hospital cafeteria, he said.

This year, more than 350 employees observing five, 10, 15, 20, 25 and 30 years of service to the hospital received award pins.

Three employees were recognized with a standing ovation for achieving 30 years of service: Elizabeth Griffith of telecommunications; Lovie Lewis, laundry and linen; and Helen Rantz, housestaff administration.

Eighty-four employees and 48 retirees who worked 20 to 40 years at the hospital were invited as honored guests.

The Gonda Award recognizes the former hospital director and medical director who has been associated with SUH for 29 years.

Bill Ferguson, eighth recipient of the annual award, was introduced as a "doer, a teacher, a leader. . .with a track record for accomplishing the impossible yesterday" in construction, remodeling, renovation and maintenance projects.

Laurie Gunderson was described in award nomination letters as earning the highest respect from her peers and physicians, "a dynamic leader, a true professional, and above all a caring person."

Armanda Holland, who recently received the Outstanding Employee Award of the dietetics department, was praised for her dedication. She also volunteers in the Hoover gift shop during her days off.

Carol Oakes, hospital employee since 1963, teaches infection control practices for health professionals and patients. She has received the "Woman of the Year" Award of the Palo Alto Chapter of the American Business Women's Association, and was a national finalist as Business Woman of the Year.

William Schueler was recognized for his services in the orthopedic-neurosurgical speciality area, his day-to-day contributions in instruction and in-service programs, managing budgets, supplies and equipment.

Marilyn Tucker, with more than 20 years of service, not only played a key role in the recent patient accounting conversion project, but also has been involved with solving information needs and systems problems for many hospital departments.

—Barbara Battino

Hematology clinic forms weekly patient support group

How would you feel if your doctor told you you had leukemia? Or hemophilia? Whom would you talk to? How many of your friends and relatives understand what problems such diseases present?

These are just some of the reasons that a new patient support group has been formed at the Medical Center for patients treated in the hematology clinic with relatively rare diseases such as leukemia, multiple myeloma, polycythemia, or hemophilia.

The group enables patients with the same types of medical problems to share the feelings, frustrations, coping strategies and other concerns peculiar to this type of health problem. The support group meets each Wednesday from 10:30 a.m. until noon.

The group is run by Dr. John Ruark, a resident in psychiatry, and Phyllis Burton, R.N., B.S.N., a staff nurse in the hematology clinic. Also frequently present are Juanita Smith, M.S.W., and Kathleen O'Brien, M.S.W., both from the department of social services.

Patients are welcome to bring family members or friends to the support group, which meets in TF-122c of the Psychiatry Building at the medical center. Other health care staff are also encouraged to attend at any time. For further information, call the clinic at 497-6961.

Group therapy helps women to cope after breast loss

To heal her scars is the goal of a mastectomy patient on the road to recovery.

Often overlooked, however, is the fact that these scars are more than skin-deep. The emotional recovery of a woman who's undergone a mastectomy is frequently harder to reach—and longer in coming—than her physical recovery.

"Women who've had mastectomies as long as 20 years ago still experience the same emotional stresses as those new to the situation," said Regina Kriss, Ph.D., project director of postmastectomy group therapy in the department of psychiatry at Stanford. "It's clear that, contrary to what many women have traditionally been told, time alone will not help."

It was largely these considerations that led Kriss, a family therapist, to undertake a study of the role of therapy in helping women deal with their psychological reactions to breast loss.

Specifically, Kriss collaborated with Dr. Helena Kraemer, associate professor of psychiatry, to research the effects of group therapy on the sexual adjustment and self-image problems of post-mastectomy women.

A panel of postmastectomy women, joining Kriss in a public lecture at the Medical Center last week, confirmed that the group setting had been particularly helpful. It provided the chance for each woman to hear her own emotions expressed and validated by others, and as one woman said, "to feel that she was probably not the worst off."

Sixty-two women entered Kriss' study groups, which began in 1979. Compared to women who had not had mastectomies, these women were less self-accepting, less sexually active, more dependent, and more self-sacrificing, she said. Both married and single women had experienced profound changes in their sexual interactions.

Kriss and participants in her postmastectomy study brainstormed to plan the May 12 presentation on emotional recovery after breast loss. The women pictured are, from left: Corrine Goldstick, Kriss, Bev Jorgensen, and Maria Mather.

Film shows emotional turmoil

As demonstrated in "No Less a Woman," a dramatized documentary film made by Kriss and Marvin Silverman, professor of education at San Francisco State University, married women often found their husbands withdrawn and cold, unable to offer comfort or to express their own sorrow and fear; many single women, terrified of rejection, shrank away from establishing any relationships with men.

Kriss, who has herself had two mastectomies, explained, "Breasts are a symbol of femininity, of desirability. Without them, it seems that everything you can offer a man is gone. It isn't vanity—it's the loss of an essential part of your core of existence as a woman."

Says one woman in the film, "I feel like a fraud. On the outside I look fine, but I'm not a real woman on the inside. I can't stand even looking at myself in the mirror; how can I show anyone else?"

Kriss said that because of these feelings, and possibly also because of the anger they feel about what's happened to them, some postmastectomy women end up feeling asexual. Ironically, at the same time, they may feel a greater need for sex and a sexual relationship than ever before.

"Some women find it harder to make a sexual adjustment toward their husbands than toward other men, since with their husbands there's more a sense of sadness about their loss," said Kriss.

But one man in the audience commented, "Being a WWII veteran myself I've seen many people have to cope with physical mutilation. Twenty years ago it would have been harder I think, but now I just know I'd rather have my wife here than not. So I can look at those pictures of mastectomy scars, though it's hard, and I can tell my wife here in public that I hope to God it never happens to her, but it won't make a damn difference to me if it does."

Because the issue is so complicated, Kriss soon realized in her research that she had to include men. So she held separate and then couples group sessions. She also did this with the women's daughters, most of whom were frightened, realizing they were at higher risk for cancer.

"In both cases, I found that everyone was protecting everyone and not telling how they felt. Through the groups they were all able to open up more." She added, "This is a time for close communication within a family, and all family members, even sons, are affected."

(In the next step of her studies, Kriss plans a pilot study on family work through groups of mothers and daughters, in collaboration with Dr. Alice Lee, a psychiatrist in private practice and a clinical instructor in the department of psychiatry.)

During the study, the importance of early therapeutic intervention after mastectomy became increasingly obvious, said Kriss. Few doctors realize the trauma of the surgery, she said, or prepare their patients for its psychologic impact.

Awareness must grow

"Doctors don't know because their patients don't tell them. To be 'good' patients, women after mastectomy deny perfectly normal feelings. They have to take the responsibility for communicating their problems, and doctors have to listen."

One woman in the audience added, "If any doctor says, 'Never mind that, just trust me,' run away so fast that you can't see straight."

Kriss attested that the medical community is now becoming more aware and attuned to the special problems of mastectomy patients. In Hoover Pavilion at SUH, she said, women and their husbands are interviewed carefully on attitudes towards breasts and the possibility of breast loss.

One exercise of her therapy groups was for the women to go home and really look at their scars. At another session, the women decided to compare their scars. "That was so therapeutic," said one. "You could say to yourself, 'hey, it doesn't look so bad when you look at someone else.' "

Emotional recovery after mastectomy, said Kriss, is tied intrinsically to the medical experience of surgery followed by chemotherapy or radiation. "The whole thing is so traumatic because of its suddenness," she said. "One day you're OK, the next you're not. You're not prepared for it, it's not gradual like the aging process or the progression of chronic disease."

The question women later ask is, "My cancer's now cured, but what next? When do I start to feel like me again?"

Some women opt for reconstructive surgery as part of the recovery process or to make them more comfortable in their active, outdoor lifestyles. For others, going "under the knife" again is too frightening, or unnecessary.

But even those who've had successful reconstruction say it doesn't change the fear, or the knowledge that they've had cancer. It doesn't erase anything.

Neither does group therapy solve all the problems. But the most important thing every mastectomy patient must do, said Kriss, is admit to herself if she needs help coping and seek out a group that can help.

—Lisa Ames

This week features nutrition computer series by docs

A series of minicomputer programs providing new perspectives on nutrition will be available for use by Medical Center health care professionals May 18, 19, and 20, said Jane Woeckener, assistant director of dietetics.

Three programs, all written by physicians, will be offered, each 15 to 20 minutes in length. The topics addressed are "Protein-Calorie Malnutrition—A Preventable Complication of Hospitalization;" "Protein Malnutrition—Clinical Expression and Assessment;" and "Nutrition Intervention—Techniques for the Prevention of Protein-Calorie Malnutrition."

This educational program uses the Apple microcomputer and has been exhibited at national conventions for such groups as the American College of Surgeons, the American Academy of Family Practice, the American College of Gastroenterology, and the American Society of Clinical Oncology.

The computers will be in the P.A.T.S. lounge as follows:

- Wednesday, May 18, from 9 a.m. to 5 p.m.
- Thursday, May 19, from 7 a.m. to 4 p.m.
- Friday, May 20, from 7 a.m. to 4 p.m.

The program is sponsored by Abbott Laboratories, and a representative will be available to assist in operating the computers.

For further information, call Dietetics at 497-6904 between 8:30 a.m. and 4:30 p.m.

Symposium. . .

continued from page 12

said, by the university's recent commitment to a "Center for Molecular Genetics," an interdisciplinary program planned for development at Stanford within the next several years.

"It is critical to be far-sighted," President Donald Kennedy later told a gathering of alumni, "if we are to lead phase two of the wave of breakthroughs in biochemical research in the same way that we have led phase one."

"Phase two" of the revolution will involve further exploration of basic science, Purpura said, coupled with applications of that knowledge in ameliorating disease.

A century-old search for a genetic basis for cancer may have found its first fruits in the recent discovery of "oncogenes," genes found in certain animal tumors, and thought also to exist in some human cancer cells, that by their very presence convert a healthy cell to a cancerous one.

"Tumor viruses have revealed to us a set of genes whose activities may lie at the heart of every cancer, no matter what its cause," said Dr. J. Michael Bishop, a microbiologist from the University of California, San Francisco. "We view these genes as the keyboard on which many

Courtesy Stanford University Press

The common sea slug yields clues to the biochemistry of memory and learning.

different carcinogens can play, whether they be chemicals, X-rays, the ravages of aging, even viruses themselves. An enemy has been found—it is part of us—and we have begun to understand its lines of attack."

Bishop uses viruses as experimental tools "to ferret out the universal processes that may cause a cell to run amok" (*see commentary by Spyros Andreopoulos, page 12*). Dr. Michael Brown, a geneticist at the University of Texas Health Science Center at Dallas, spoke of using similar genetic tools to get an inside look at arteriosclerosis—an often fatal clogging of the arteries.

"Mike Bishop mentioned that one out of four people in the United States die from cancer. Twice as many die from hardening of the arteries," said Brown. "It's an insidious disease that begins in the teenage years, but usually causes no symptoms until middle age, when heart attacks and strokes begin to occur."

To understand why the disease starts and how it progresses, Brown and colleagues looked to the metabolism of cholesterol and found answers. Most cholesterol is made in the liver and travels through the blood in tiny protein packages called "low density lipoproteins," or LDLs. Receptors inside each cell retrieve the LDLs from the cell surface and carry them inside to be broken down in a several-step process.

About one in 500 people in the world have a genetic defect that makes those receptors faulty, Brown said, and permits too much cholesterol to build up in the bloodstream. "Hypercholesterolemia," an illness that leads to arteriosclerosis, is one of the most common genetic diseases in the world, he said. During the past eight years, Brown and his team have defined gene mutations that deform the LDL receptor in persons who have the disease, have located the receptor within the cell, and are now trying to clone the genes in an effort to better understand and find new ways to treat arteriosclerosis.

The new tools of molecular and genetic medicine have found a niche in the study of normal processes as well as in the research of disease. Kandel told the audience how his work with "aplysia," a variety of sea slug, is shedding light on the mechanisms of memory and learning.

"Some of us feel that the ultimate challenge facing biology is the neurobiology of mentation," Kandel said. "Can the complexity of behavior be explained by a simple grammar of biological rules?"

The sea slug has relatively few neurons that are large and much easier to study than the interlocking maze of cells that make up man's brain. The slug's behavioral repertoire is also quite simple, but the primitive behaviors, and ability to learn and remember, are probably governed by the same molecular mechanisms as the more complicated processes seen in higher organisms, Kandel said.

Even remembering the name of an acquaintence probably causes semi-permanent changes in the junctions between nerve cells in the brain, he suggests.

Channels in the membrane of nerve cells open and close to permit electrically charged molecules to flow back and forth at the bid of an electrical signal initiated in the brain. Changes in the number of channels that open determine how much neurotransmitter—the chemical messenger between nerve cells—will be released.

Kandel and his associates have studied the sea slug's "gill withdrawal reflex," the tiny creature's response to being disturbed. In calm tidepools, a sudden change in water pressure signals that a predator may be nearby, and prompts the gill withdrawal reflex as a first step towards escape.

But when repeated exposure to the same stimulus causes no ill effects, the sea slug grows accustomed, or "habituates" to the stimulus. Through experiments, Kandel has linked the habituation to a change in the number of specific ion channels open in the cell membrane. If the sea slug is then exposed to a new stimulus—such as a mild pinch—the configuration of open channels changes again, more transmitter is released, and the creature quickly withdraws his gill.

Neurobiologists see habituation and its sister phenomenon "sensitization" as building blocks of learning.

Other speakers at the symposium included Drs. Philip Leder, Harvard Medical School; Gerald Rubin, Carnegie Institution of Washington; and Leon Rosenberg, Yale University School of Medicine.

Dr. Paul Berg, Stanford's Nobel prize winning geneticist, called Friday's symposium a "treasure trove of scientific discovery." The conference will be held annually, Purpura said, to "memorialize life through the study of science" and to foster the translation of research advances in molecular and genetic medicine into revolutionary methods of disease diagnosis and treatment.

—Deborah Franklin

Construction Corner

Boswell Renovation Progress Report:

- **Balconies**—The external decks in the courtyard, which are designed to allow patient access and waiting space, have had concrete poured. Fireproofing of the structural steel will soon be completed. The temporary protective awning should be removed by mid-summer.
- **Radiation Therapy**—Fireproofing of the columns and concrete fill around the footings have been completed. The core drilling of concrete is proceeding in the ceiling above Radiobiology. The coring is for Phase II plumbing work. This requires close coordination between the department, facilities and the contractor to minimize the impact on the ground floor research functions. The contractor was scheduled to complete his work in Radiation Therapy by May 15.
- **Penthouse**—The mechanical room designed to house the new air conditioning system located on the roof of the west wing of the Boswell Building is proceeding with the erection of walls, roof panels, and electrical equipment. The latter was delivered from the street level up to the penthouse via helicopter early Saturday morning.
- **First Floor South**—Demolition is nearly completed with the exception of the entry doors from the external deck. These will be cut soon.
- **Furniture**—Consultants are nearing the completion of their report as to the needs of the new areas to allow a furniture budget to be identified.
- **Third Floor**—Preliminary programming has been completed for anticipated usage of the third floor. Currently, there is not funding for this project; however, the design will allow for identification of plumbing and electrical needs that may be incorporated in the construction activities occurring on the floors below.

SUMC South Parking Lots, Revised Work Schedule:

As previously announced, most of the expansion work on the southeast and southwest parking lots will be accomplished on Saturdays and Sundays. However, the scope of the project will require work on some Fridays, thereby resulting in a loss of some parking on those days.

The work will ultimately result in an increase of parking availability, so everyone's cooperation and indulgence in this inconvenience is requested. A revised work schedule, available from Safety/Security Services, indicates when the various parking lots will be affected by Friday closures. Lot entrances will be blocked off and signed to indicate closures.

Chilled Water Line:

The Medical Center chilled water line now under construction will, in part, follow the alignment of Blake Wilbur Drive. If the new Children's Hospital "footprint," yet unknown, should encroach upon Blake Wilbur, it may force the relocation of this service line. However, the line is required now and there is no sure alignment that would avoid Children's with certainty; therefore, work is proceeding.

Volunteer services coordinator named

Sharon Beckham has been named coordinator of volunteer services at SUH, announced Jeanne Kennedy, director of community relations.

Beckham has been coordinator of volunteer services at the University of California at San Francisco (UCSF) since 1977. She will assume her new position at Stanford July 5.

Beckham's main function, said Kennedy, will be to develop programs that recruit, retain and reward volunteers. She will report to the director of community relations and work closely with the Medical Center Auxiliary and other ongoing volunteer activities of the hospital. Direct supervision of the volunteers will remain with the departments to which they are assigned.

At UCSF, Beckham was administrative support manager with responsibility for the business management and development of the volunteer services program.

Prior to that position she was coordinator of volunteer services at UC Irvine. She also was director of volunteer services at Cedars-Sinai Medical Center in Los Angeles, and has served as a consultant to organizations in the design of volunteer systems.

Beckham is president of the Northern California Association of Directors of Volunteer Services, and teaches volunteer management courses at UCSF and Dominican College. She is a graduate of Tulane University.

FPP employee awards banquet

Invitations have been mailed to all Clinics and Faculty Practice Program (F.P.P.) employees for the third annual F.P.P. employee awards banquet, to be held Friday evening, May 20, at the Stanford Faculty Club.

Awards will be presented to those employees who have five, 10, 15, 20, 25 and 30 years of service at the Medical Center. A total of 29 awards will be given, including one 30-year award to Sylvia Hupman, a licensed vocational nurse in the eye clinic.

Social hour for the event will begin 6:30 p.m., with dinner to follow at 7:30. Speakers will include Medical School Dean Dominick Purpura and Donald Tower, executive director of the F.P.P. and the Stanford University Clinics.

For further information about the banquet, call 497-6323.

Intern's death under investigation

Thirty-year-old Lorraine Johnsrud, an intern in medicine at Stanford University Hospital, was found dead in her Menlo Park apartment by police May 6.

The cause of her death is under investigation by the San Mateo County Coroners Office.

Colleagues at SUH notified Menlo Park police when Johnsrud failed to report to work that morning. Police entered her apartment at 10:13 a.m. and found her body.

Johnsrud had received a Ph.D. in molecular biology from Harvard, and an M.D. from Washington University prior to coming to SUH.

"She was an excellent physician," said Dr. Mark Perlroth, head of the department of medicine's housestaff program.

Colleagues said she had been severely depressed in recent months following the death of her father, and had been receiving professional help.

Johnsrud is survived by her mother, sister, and brother. Funeral services were held in Minnesota on May 10.

...News Notes...

Ruth Allen, *chairwoman of volunteers of the SUH Auxiliary, was honored last month in recognition of outstanding volunteers in the county, by the Junior League and the Volunteer Center of Santa Clara County.*

Allen was chosen from 93 county volunteers nominated for the award. A member of the Auxiliary for 13 years, she has given over 1,000 hours of volunteer service to SUH patients.

"Ruth really cares about having things work right for patients," said Jeanne Kennedy, director of community relations, who works closely with the Auxiliary.

* * * *

Two junior Auxiliary members were awarded scholarships at the Junior Volunteer Awards and Recognition Picnic, held April 30 in the Garden Patio.

Holly Reichert *and* **Blanka Pecen,** *both graduating high school students, were each given a $500 college scholarship, said Phyllis Alper, first vice president of the Auxiliary.*

Reichert, a Palo Alto High School senior, has volunteered more than 200 hours at the gift shop and flower desk. She plans to attend the American University in London for the summer, and then return in the fall to Menlo College.

Pecen has contributed over 85 hours in the pediatric playroom. A junior at Los Altos High School, she is graduating after only three years and will attend UC Riverside. She hopes to participate in a program in biomedical science that will allow her to complete her undergraduate and medical school studies in seven years.

* * * *

The joint office of SUMC Public Events and the Medical Alumni Association has moved. The new location is 750 Welch Road, Suite 300. They can still be reached at 497-6389 or 497-5064, respectively.

* * * *

Three staff members in hospital personnel have new telephone numbers.

Dan Robinson, *acting director of personnel management, said he and secretary Gail Escobar can be reached at 497-6527.* **Frank Montalvo,** *manager of wage and salary administration, can now be phoned at 497-6630.*

All are still located in E009 of the hospital.

* * * *

Stanford Medical Center Day at Marriott's Great America will be Sunday, May 22. The park will be open from 10 a.m. to 8 p.m., and specially-priced tickets are $6.95, with children under three admitted free. The price includes a full day's admission with unlimited use of all rides and shows.

Tickets may be purchased May 16 to 20, 11 a.m. to 3 p.m. in the cashier's office, C110 of the hospital; or 2 to 4 p.m., in the Hoover Nursing Administration office, N149; or May 19 and 20, 6 to 8 a.m. in E009, hospital personnel.

* * * *

Dr. Marvin Karasek, *professor of dermatology, was elected vice president of the Society for Investigative Dermatology at the group's meeting in late April in Washington, D.C.*

* * * *

Three personnel appointments have been made in SUH Safety and Security Services, said Hilary Ryniewicz, director of that department.

Ed Avila *has been promoted to safety and security supervisor.*

Paul Watkins *has been hired as the night shift senior safety/security officer.*

And **John Lyons** *has been hired as the evening senior safety/security officer.*

* * * *

A program to acquaint new employees to the Medical School is scheduled for **May 25.** *This is the second "new employee welcome" sponsored by the Dean's Office, and is planned to be offered three times annually.*

The intention of the new employee welcome is to provide medical school and clinic employees with some knowledge of the history, organizational structure, and services available to Medical Center employees.

Invitations were recently sent to employees who began their status with the medical school from January through April. Employees should also still attend the Stanford University New Employee Orientation.

* * * *

A new Stanford University Medical Center **Facts** *booklet for 1983 is now available. Filled with statistics, graphs, telephone numbers, important names and information regarding the medical school, hospital and clinics, copies of the publication can be obtained by writing or phoning: Publications, Office of Medical Development, 780 Welch Road, Suite 106, Palo Alto, CA 94304; (415) 497-7603.*

Medical Center Calendar

WEDNESDAY, MAY 18

Div. of Hematology noon conference: "The Spleen in Myeloproliferative Syndrome"—Dr. Theodore Cohen. Noon, L201.

Dept. of Medicine Research seminar: "Fluid and Solute Transport Across Pulmonary Alveolar Epithelium"—Dr. Edward Crandall (UCLA). 4 p.m., M110.

SUH Auxiliary Volunteer Orientation. 9:45 a.m., W001. For further information, call the Auxiliary office at 497-6636.

Hematology Support Group: Meeting for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family and significant others welcome. 10:30 a.m. till noon, TF-122c. For further information, call 497-6961. *(See related article in this issue.)*

THURSDAY, MAY 19

Registration deadline: for Nursing Educational Services workshop, to be held June 2, "Burnout: Treatment and Prevention," from 8:30 a.m. till 4 p.m., 701 Welch Road, suite 327. Course will focus on defining burnout, assessing individual levels, developing standardized and individualized care plans to counteract the problem, and identifying helpful responses to others' burnout. For further information or to register, call Carole Kidder at 497-6366.

Dept. of Pharmacology seminar: "Tyrosine Protein Kinases"—Dr. Edwin Krebs (Univ. of Washington). 4:15 p.m., Pharmacology library R358.

Dept. of Medicine grand rounds: "Myasthenia Gravis"—Drs. Bruce Adornato and Joseph Lacy. 8:30 a.m., Fairchild Auditorium.

Div. of Otolaryngology/Head and Neck Surgery lecture: "Management of the Paralyzed Face"—Dr. Mansfield Smith. 6 p.m., R117.

Dept. of Biochemistry seminar: "Introns/Exons and the Evolution of Genes"—Dr. Walter Gilbert (Harvard). 4 p.m., Braun Auditorium, S. G. Mudd Chemistry Building.

FRIDAY, MAY 20

Dept. of Clinical Social Work workshop: "Adaptation to Hemodialysis"—Elizabeth Garifalos, L.C.S.W., Dr. Alan Ringold, and Pam Simmons, R.N. 10 a.m. till noon, Hoover Pavilion Nursing Cottage, 1st floor. For further information, call 497-5091.

Pediatric grand rounds: "Contraception in Teenagers"—Dr. Iris Litt. Case presentation by Dr. Mary vander Velde, intern in pediatrics. 8 a.m., M106.

Heart Health Fair at the Stanford Shopping Center: sponsored by the cardiac patient teaching committee of Nursing Services. 11 a.m. till 7 p.m.

Registration deadline: for Nursing Educational Services "Selected Concepts in Surgical Nursing" conference to be held June 3 from 8 a.m. till 4:30 p.m., 900 Welch Road, room 15. For further information, call Carole Kidder at 497-6366.

Dept. of Gynecology and Obstetrics grand rounds: "The Evaluation and Treatment of Breast Lumps"—Dr. Hewlett Lee (Palo Alto Medical Foundation). 8 a.m., A336.

Div. of Family Medicine Friday noon lecture series on Women and Health: "Sex Role Development"—Julie Olsen Edwards (Cabrillo College). Noon, M114.

Div. of Child Psychiatry grand rounds: "Time and Trauma"—Dr. Lenore Terr (UCSF). 11 a.m. till 12:15 p.m., Faber Auditorium, CHAS.

SATURDAY, MAY 21

Dept. of Emergency Services Pre-Hospital Care Program: Sports Medicine for R.N.s, M.D.s, and allied health professionals. Goal is to teach development of personal exercise programs and identification and emergency management of sports-related injuries seen in various medical practices. 8:30 a.m. till 5 p.m., Fairchild Auditorium. Will also be offered June 4 at Letterman Army Medical Center in San Francisco. For further information, call 497-6017.

SUNDAY, MAY 22

SUMC Day at Marriott's Great America. Park to be open 10 a.m. to 8 p.m., and specially-priced tickets are $6.95, with kids under three admitted free. Tickets may be purchased May 16 to 20. See related "news note" for details.

MONDAY, MAY 23

Registration deadline: for Nursing Educational Services conference "Pediatric Critical Care Course: Level I," to be held June 6 and 7, 900 Welch Road, room 15. For further information, call Carole Kidder at 497-6366.

Dept. of Medical Microbiology seminar: "Retinal Pigments in Halobacteria as Light Energy and Signal Transducers"—Dr. Walther Stoeckenius (UCSF). 1:15 p.m., M114.

TUESDAY, MAY 24

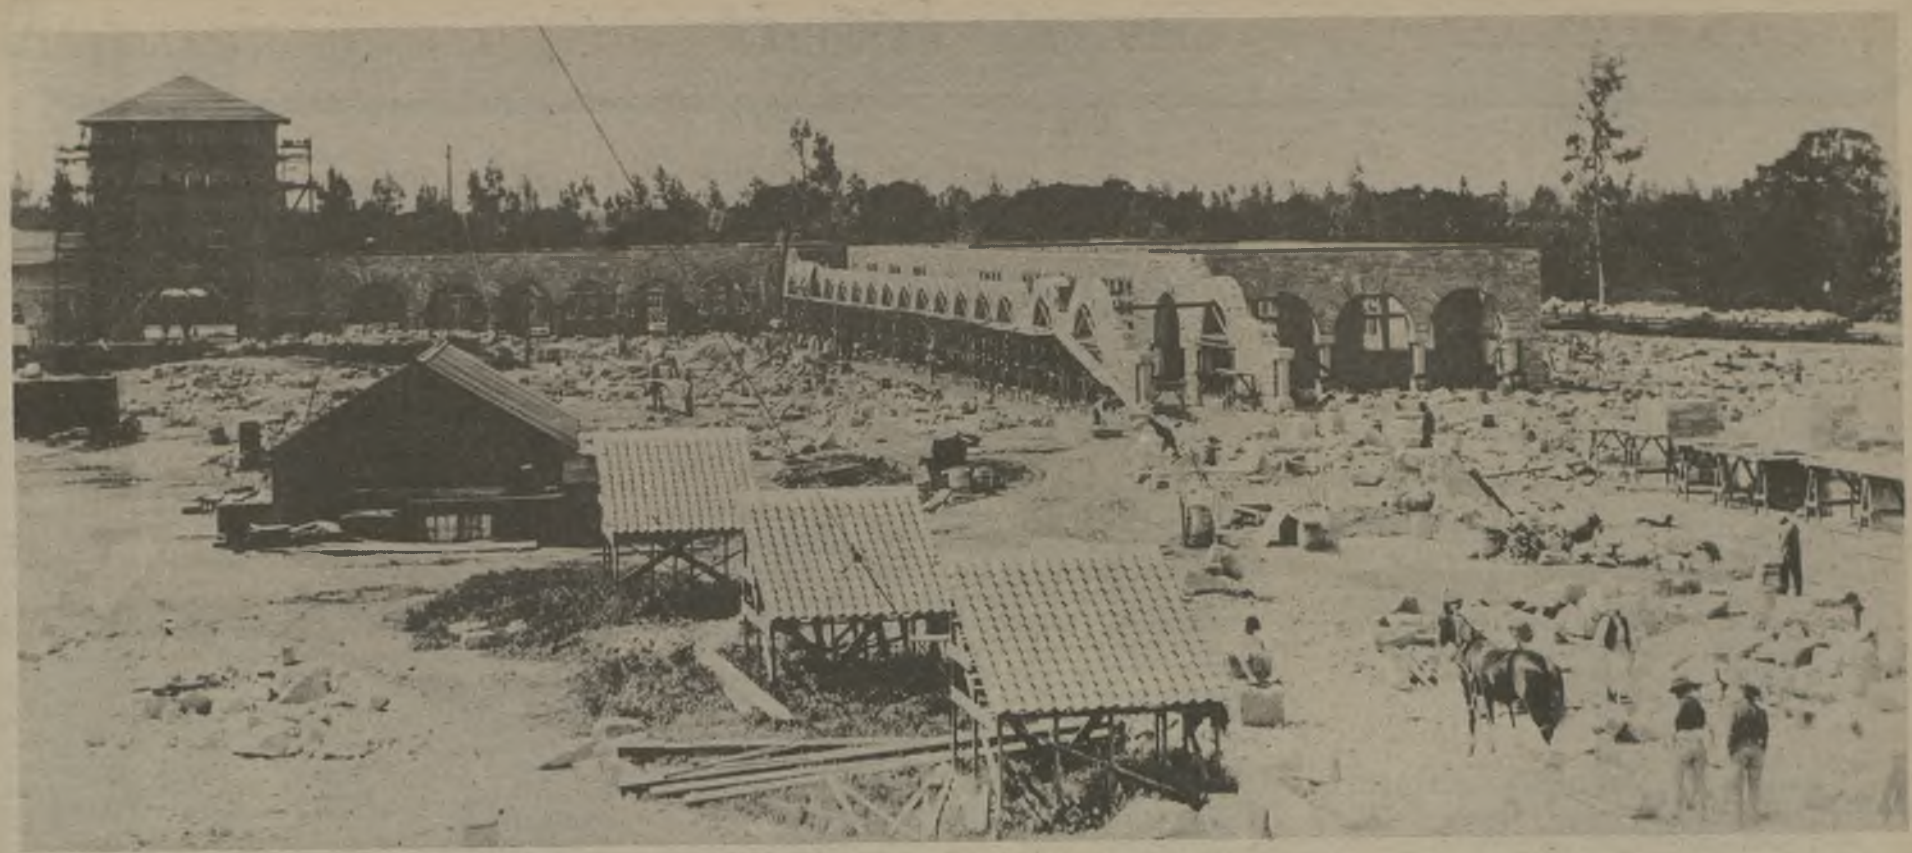
Dept. of Dermatology special lecture: "A New Look at the Older Antibiotics"—Dr. Jay Sanford (Uniformed Services University of the Health Sciences, Bethesda, Md.) 10 a.m., Dermatology Library R136.

Dept. of Dermatology special lecture: "Yellow Rain"—Dr. Jay Sanford (USUHS, Bethesda, Md.) 4:30 p.m., M114.

Dept. of Psychiatry and Behavioral Sciences lecture: "Amphetamine: Effects on Neurochemical and Behavioral Circadian Rhythms"—Dr. Anna Wirz-Justice (Univ. of Basel, Switzerland). Noon, Pharmacology Library R358.

WEDNESDAY, MAY 25

Nursing grand rounds: "Career Development: New Directions for Job Joy." Guest speakers will describe various strategies for job expansion including lateral transfers, administrative opportunities, clinical nursing specialist research and combining nursing with other careers (such as medical law). 3:30 till 5 p.m., M104. For further information, call Karen Kawauchi days at 497-6923, or Kit Laird nights at 497-6377.



Div. of Hematology Wednesday noon conference: "Pediatric presentation"—Dr. Bertil Glader. Noon, L201.

Dept. of Structural Biology seminar: "Three Crystal Structures for Citrate Synthase: Catalytic Activity Requires Large-Scale Conformational Changes"—Dr. James Remington (Univ. of Oregon at Eugene). Noon, Fairchild Building D102.

Div. of Orthopedic Surgery grand rounds: "Anatomy—Foot and Ankle"—Dr. Gary Watson, 7:30 a.m.; and "Cement Fixation"—Dr. Steven Woolson, 8:30 a.m., M114.

Dept. of Neurology grand rounds: "The Synthetic Street Heroin Story: A New Model for Parkinson's Disease"—Dr. William Langston (Santa Clara Valley Medical Center). 5 p.m., C364.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

The arcade, which is the distinguishing feature of the quandrangle, was the work of master craftsmen who carefully shaped and placed the great blocks of sandstone.

From stock farm to University: How the campus evolved

Do not say that you have nothing to live for. . . Live for humanity."

These words, which Senator Leland Stanford heard his son tell him in a dream the first night after the youth's death, provided the impetus for the founding of Stanford University—a fitting memorial to a young man approaching college age.

The Stanford family's country residence, the Palo Alto Stock Farm, was the natural location for such a university; Leland, Jr. had always considered it "Home."

Monday, May 23, marks the opening of an exhibit in the gallery of the West Wing of Green Library detailing the evolution of this memorial—from stock farm to university—through the planning and construction of the Stanford Quadrangle. It was compiled by Barbara Begley from resources in the University Archives.

The design of the University was a collaborative effort between Senator Leland Stanford, landscape architect Frederick Law Olmsted, and the architectural firm of Shepley, Rutan, and Coolidge (formerly H. H. Richardson's Boston office).

The Senator took an active part in the design from the beginning and adamantly clung to his ideas of architectural planning, much to the dismay of the professional designers.

The earliest conflict concerned the siting of the University. Olmsted, most famous today for his design of New York's Central Park, favored a site in the foothills, which would have required an asymmetrical design of the type Olmsted was most comfortable with.

Stanford insisted upon locating the school on the plain, ostensibly so that no topographic features would interfere with the addition of future buildings.

The exhibit, by way of introduction, displays photographs of the virtually barren plain which was the site of Senator Stanford's highly successful trotting horse farm. Also highlighted is Frederick Law Olmsted, including several of his working architectural drawings and his correspondence with his client.

The cornerstone was hurriedly laid on the 14th of May, 1887, on what would have been Leland Jr.'s 19th birthday.

The plan was still undergoing major revisions at this time. While a consensus had been reached very early in the planning that the architectural style be "distinctively Californian" (alternatively "Spanish," "Moorish," or "Mission"), the designers and the Senator had not yet agreed on the form or orientation of the quadrangles. Construction continued for nearly two years.

Stone was brought up from the Goodrich Quarry near San Jose on Stanford's Southern Pacific line, necessitating a new short spur to the construction site. Piled in the area known today as the Oval, the sandstone was shaped to specified dimensions by stonecutters, then carted by wheelbarrow to the construction site and laid into place. As the walls increased in height, ramps and cranes were used to hoist the stones.

The arcade, which is the distinguishing feature of the quadrangle, was created of meticulously laid voussoir arches. After building a wooden framework for the arch, the stones were set into place and the frame removed. All stages of the construction are well documented in photographs—from stonecutting, wheelbarrows, and ramps to the carving of the frieze in Memorial Arch.

Because the Memorial Arch was destroyed in the earthquake of 1906 and not rebuilt, many people are not familiar with its more interesting features. One of the many fascinating items in the exhibit is an architectural blueprint of the Arch, showing the stairs inside both sides leading to the observation level near the top which had windows through which people could view the town of Palo Alto down Palm Drive.

Memorial Church was also severely damaged in the earthquake and not entirely rebuilt. Parenthetically, the mosaic adorning the facade of the Church was not an element of the original design, but rather the thought of Mrs. Stanford following her husband's death in 1893. Several of the artist's drawings for the mosaics on the facade are on display. While the Church had not been completed at the time of the University's opening in 1891, the site was marked by more elaborate arches.

Senator Stanford and Frederick Law Olmsted also differed on the matter of landscaping. Olmsted was vehemently opposed to the use of "New England scenery"—New England trees and grass, which would require extensive watering. He preferred low-growing vines as ground covering and indigenous flora, and suggested that the quadrangle be paved.

The concept of circular plantings in the quad seems to have evolved at an early stage, although there was disagreement over their diameter, the height of the "pavers" enclosing them, and the eventual height of the proposed plants to be included.

The surface was originally paved completely with asphalt. Within a few years, this had become badly cracked, and before the earthquake the major axes were paved with concrete and the remainder covered with gravel. (It was resurfaced in 1915 and has been neglected since.)

A series of photographs illustrate the changes from a completely barren state through early planning when the palm trees were a mere eight feet tall, and show the wide variations in surfacing prior to the earthquake.

Throughout the planning and construction phases there was a great deal of public attention drawn to the University. One case of the exhibit is devoted to the media coverage of the campus design during this period, including interesting examples from periodicals such as the San Francisco *Examiner* and *Harper's Weekly Magazine* showing how the media portrayed the plan (quite often completely incorrect in their assumptions).

The final case displays photographs of the completed quad in the period before the earthquake.

The plan of Stanford, particularly the concept of enclosed and interconnecting quadrangles, was a significant innovation in campus planning. The unified and powerful design of the quads resulting from the collaborative effort of several great minds continues today as the nucleus of the University.

Anna-Marie King

Senate report

TO MEMBERS OF THE ACADEMIC COUNCIL
FIFTEENTH SENATE REPORT NO. 12

Summary of actions taken by the Senate
May 12, 1983

At its meeting of May 12, 1983, the Senate took the following actions:

1. On the recommendation of the Steering Committee, the Senate, by unanimous voice vote, requested the Committee on Committees to draft a charge appropriate for an *ad hoc* Committee on Senate Representation. The *ad hoc* committee should recommend the most appropriate Senate size, proportional representation, and reapportionment procedures, given the current size and compositon of the Academic Council. The committee should report to the Sixteenth Senate no later than November 10, 1983.

2. On the recommendation of the Committee on Academic Appraisal and Achievement, the Senate, by unanimous voice vote, approved the C-AAA Proposals for Student Evaluation of Teaching, as amended. The Proposals, in final form, appear at the end of this report.

MINUTES OF THE FIFTEENTH SENATE OF THE ACADEMIC COUNCIL
May 12, 1983

A meeting of the Fifteenth Senate of the Academic Council was held on Thursday, May 12, 1983, beginning at 3:18 p.m. in Room 180 of the School of Law with A.L. Fetter, chair, presiding. Present were 36 representatives, 9 *ex officio* members, and a number of invited guests.

Approval of Minutes

The minutes of the meeting held on 4/14/83 (SenD#2501) were approved as submitted.

Report of the Steering Committee

In the report from the Steering Committee, A.L. Fetter, chair, called attention to the change in forthcoming agenda items for the remaining meetings of the Fifteenth Senate. Two reports from C-US will not be ready to present to the Fifteenth Senate in time for it to take action before the end of the academic year. These include the review of the Overseas Studies Program and the report on residential education. Both of these reports are now expected to be early agenda items for the Sixteenth Senate in the autumn quarter. The report on the review of the Freshman/Sophomore Seminar Programs does not demand Senate action, and will be included as a report item in the 1982-83 Annual Report of C-US which is to be presented to the Sixteenth Senate in the fall.

He called attention to the Hoover/Stanford petition included for information in the recent Senate mailing, and explained that the Steering Committee had decided against scheduling it for discussion at the May 12th Senate meeting because of important prior agenda commitments, and because the Steering Committee had rightly been criticized earlier in the year for scheduling new business too late in a Senate meeting for adequate discussion. The petition will therefore be an agenda item for the Senate meeting of 5/26/83. That meeting will also hear a brief report on alternatives to TIAA-CREF.

The final Senate meeting of the year will consider two reports from the Committee on Research: one a proposed change in copyright policy, and the other the preliminary report on weapons-related research at Stanford.

The final item reported from the Steering Committee was a motion to establish an *ad hoc* Committee on Senate Representation:

> It is moved and seconded by the Steering Committee that the Fifteenth Senate of the Academic Council ask its Committee on Committees to draft a charge appropriate for an *ad hoc* Committee on Senate Representation. The *ad hoc* committee should recommend the most appropriate Senate size, proportional representation, and reapportionment procedures, given the current size and composition of the Academic Council. The committee should report to the Sixteenth Senate no later than November 10, 1983.

It is expected that a draft of the charge to this committee would be presented to the Fifteenth Senate at one of its two remaining meetings. The Committee on Committees of the Sixteenth Senate would then be expected to appoint the members of this committee by mid-June of this year.

Senate hears reports from Wessells, Provost

Dean Wessells suggested that such a committee might also look at the way the Steering Committee has been selected in the past. Traditional procedures make possible the election of a Steering Committee which contains representatives of only one school (e.g., the members of Steering Committee XVI are all from Humanities and Sciences) and this does a disservice to the Senate with respect to representation. A. Fetter confirmed that this question, and others raised in a survey of the legislative history of apportionment and reapportionment, would be transmitted to the Committee on Committees for consideration before completion of the draft charge.

The motion, put to a vote, passed unanimously.

Report of the President

President Kennedy reported first on an interesting new phenomenon on the national scene in undergraduate admissions: a significant departure by many high quality institutions from the nationally carefully constructed system of following a need-based policy of financial aid. This results in a "bidding" for academically talented students to win them away from institutions where financial aid is awarded on the basis of need. He expressed the hope that Stanford could resist this trend, which be believes to be pernicious.

He then remarked that he had been asked to comment on the Hoover/Stanford issue, but declined to do so since it is scheduled for debate at the next Senate meeting. He did not mean to preempt that discussion, which he hoped would be forward—looking and constructive. He does plan to comment at that meeting on the facts concerning the part of the Hoover budget that derives from general funds, and on the arrangements regarding presidential review of continuing appointments at the Hoover Institution. These issues are germane to the inquiry and there is a need to clarify some misapprehensions on these matters.

A. Siegman asked a question in advance of the Hoover petition discussion as a courtesy to permit the collection of necessary information or the determination of who might be best able to respond: There are a number of requirements which apply to sponsored research in the University (participation of students, identification of sponsors, etc.). To what extent do those same policies apply to restricted funds which are given through the University to Hoover or directly to Hoover?

Vice-Provost Lieberman indicated that policies on identification of sponsors apply uniformly across the board, to Hoover as well as to the University at large. The question of student participation is more interesting because whether or not students are involved in Hoover-sponsored research is not now known to him. He will check into it.

President Kennedy pointed out that, while the criterion for student participation in sponsored projects is one of the criteria applied in general; there is no requirement that every individual project must have a student attached to it. Some off-campus sponsored projects, for example, do not.

A. Siegman commented that he had in mind also the extent to which sponsored project requirements apply to any research activities paid for by outsiders at Hoover, whether they are technically listed as sponsored projects or not.

President Kennedy responded that there is an important definitional distinction between sponsored projects and those carried out by a department, for example, under the terms of a restricted gift. To the latter, sponsored research regulations don't apply at all. Such a gift does not involve a proposal, an award that pays idirect costs, and a prescribed reporting schedule. A gift may be described as applicable to a specific area of research but contain no such 2quid pro quo1 arrangements.

C. Degler inquired whether the administration could provide information on the relationship between Harvard and the Kennedy School of Public Policy, and Princeton and the Woodrow Wilson graduate school by the May 26th meeting.

President Kennedy agreed that such information as could be gathered would be forthcoming from the administration by the next meeting, but pointed out that more germane models might be found among institutions which were affiliated with universities but were themselves not degree-granting. The two examples cited are composed of regular university faculties and themselves constitute regular schools or departments of the institution with which they are affiliated. The administration will try to prepare some comparative information for the 5/26/83 meeting.

G. Gillespie asked for a list of other research groups at Stanford which do not grant degrees. Vice-Provost Lieberman referred him to page 626ff. of the current *Courses and Degrees Bulletin*.

Report of the Provost

Provost Hastorf began his report by noting that Professors R. Davis (biochemistry) and D. Purpura (neurobiology and Dean of the School of Medicine) are newly-elected members of the National Academy of Sciences. Professors O. Bjorkman (biology and, by courtesy, the Carnegie Institution), B. Efron (statistics) and T. Hansch (physics) were elected members of the American Academy of Arts and Sciences. Professor J. Gibbons (electrical engineering) was a recent recipient of the Texas Instrument Founders Prize.

The provost also announced that academic and administrative computing will now be separated, with the appointment of a new member of the provostial staff to assume responsibility for academic and research computing and planning (including network planning) and for LOTS. The provost hopes to announce that appointment before the end of the academic year. He is now consulting with deans and other faculty and with a committee, on micro processors chaired by G. Lieberman. That committee includes W. Kays, J. Hennessy, P. Suppes, J. Ullman, J. Moore, and R. Gorin. The Center for Information Technology will continue to operate its present equipment and to deal with administrative computing; E.E. Shaw will continue to direct that Center.

Report from the Dean of Humanities and Sciences

The report on the School of Humanities and Sciences delivered by Dean N. Wessells is published in its entirely elsewhere in this issue of *Campus Report*. His remarks had three major focuses: undergraduate education, the Humanities and Sciences faculty, and issue of faculty grievances.

In focusing on a promised new activism in undergraduate education, he called attention to the team of associate deans sharing responsibility for that endeavor: W. Chase, D. Kennedy, and C. Lougee. One of Dean Lougee's most important accomplishments to date has been the establishment of the new Humanities and Sciences Advisory Committee on the Curriculum, which parallels the school Advisory Committee on Appointments and Promotions. The school intends to assume a leadership role in undergraduate education, including departmental curricular reviews, the encouragement of advanced intensive work by juniors and seniors, grading policy and practice, experimentation with the academic calendar, the promotion of liberal education, and the expansion of the undergraduate writing experience. Attention will also be given to the graduate curricula and to degree requirements.

The extradepartmental programs transferred to H & S last fall have been operating well. Reviews of several have been completed, and decisions based on the recommendations of the faculty review committees will be made soon with the advice of C-US. The remainder of the extradepartmental programs are scheduled to be reviewed next year. This will afford an opportunity for looking at the total picture and considering what the optimal program of extradepartmental education at Stanford ought to be. This new review committee has already been planned in consultation with the Committee on Committees, the Steering Committee, the President's Undergraduate Cabinet and the school's Advisory Committee on Curriculum. It will contain strong representation from the faculties of H & S, Engineering and Earth Sciences and also from the student body. The School of Humanities and Sciences is committed to maintaining and improving innovative education for undergraduates.

Dean Wessells' second focus was the school's most important resource: its faculty. He discussed the growth of the tenured proportion of the school's faculty over the past decade and compared the school's tenuring percentage to the average across similar institutions. Stanford is about 10

continued on next page

Senate report...

continued from page 18

percent more heavily tenured than the average. Major funding for junior faculty development is the highest priority funding project in the school.

He detailed a number of notable appointments made this year in the humanities, and singled out a series of senior appointments in Linguistics, Computer Science, Philosophy, and Cognitive Sciences as a model of how effective leadership can best make use of scarce billets in tight times.

He discussed in some detail the relationship of the assistant and associate professor ranks both with regard to the time needed prior to the tenure decision and the serviceability of the rank of associate professor with tenure. A lengthening of the period prior to tenure is widely preferred within the school, and the diversity of criteria and interpretation of the tenured associated professorship makes the usefulness of that rank questionable. These issues will be discussed next year in Humanities and Sciences and will be brought before the Senate for discussion if a strong consensus for change develops within the school.

His last focus was on the problem of the filing of faculty grievances on the basis of denial of tenure. Ninety percent of these in recent years have occurred in the Humanities and Sciences and an increasing number of them are filed by lawyers on the basis of accusations never made a decade ago. Dean Wessells attributes these grievances to altered expectations about tenure at Stanford and at other institutions after leaving Stanford, and to misconceptions about the criteria now being used in tenure decisions. Standards of promotion at Stanford in the 1980s must be extraordinarily high. Earlier criteria are no longer adequate. The primary criterion must be demonstrable excellence as a research scholar. High quality teaching is critically important, but top quality teaching is inseparable from first-rank scholarship.

It is essential that tenure criteria be clearly defined and fairly administered, that procedures be adequately specified, and that the right of the professoriate to determine the rules be maintained. We must also provide a better system of junior faculty career development, with strong support from administrators and senior colleagues. This includes frank and adequate feedback on deficient performance all along the line.

The alternative to this acceptance of responsibility and control of the present grievance problem will be the loss of the tenure line billet system for junior faculty—a system from which Stanford has benefited greatly.

At the conclusion of Dean Wessells' report, J. Merryman observed that lawyers do not exist without clients and that the important point is to ensure that the academic process is invariably due process.

R. White remarked that a lifetime professorial career inevitably is 80 percent post-tenure. Lowering the tenure non-tenure ratio necessitates taking one of three actions: 1) lengthening the time prior to tenure; 2) eliminating the tenure—line assistant professorship; or 3) finding some way to eliminate older faculty.

Dean Wessells commented that no decisions had been made about what policies should be adopted. The problem is clearly serious enough to warrant study, however, probably not just within Humanities and Sciences but also in the University at large. He pointed out that in the years from 1962 to 1979, the promotions to tenure in H & S ran about 38 percent of those initially appointed as assistant professor, a far higher rate than that of any similar university except Duke.

President Kennedy pointed out that a system which has a low promotion rate has an automatic incentive to search less carefully for assistant professors. Hence, low promotion rate is an outcome of a behavior that it itself generates. Dean Wessells agreed that such schools cannot attract as high quality assistant professors as Stanford can. That's another reason we must keep and improve that very important aspect of our system.

B. Roth commented that some of the legally-initiated grievance cases may stem from a perceived unfairness in our grievance procedure, in which grievances are heard by the same people who were responsible for the original decision. If neutral hearing officers were invoked in our grievance procedures, that might cut down on the number of grievances field with recourse to legal aid.

He also challenged once again the belief that the change in the retirement law will have an adverse effect upon faculties and that increased aging among the faculty is a serious problem.

Dean Wessells responded that, like it or not, nerve cells die as a function of age and that, on the average, an older faculty is a less vigorous faculty. The gap in age between our freshman (born after Kennedy was killed) and many of our faculty is one important reason why we have to have a large and vigorous junior faculty.

C-AAA Report on Course Evaluation and Teaching Improvement

S. Matisoff, chair of the Committee on Academic Appraisal and Achievement, presented the C-AAA Report on the Stanford Program of Course Evaluation and Teaching Improvement, which had been published in the 4/27/83 issue of *Campus Report*. She pointed out that the review mandated by the Senate took three years to complete. Two important aspects of the report are C-AAA's reaffirmation of a Senate-mandated system of student evaluations of teaching, and the report's emphasis on an integrated system of evaluation of teaching which uses course evaluations by students as one of a number of components.

She expressed the gratitude of the parent committee for the exceptional work of its Subcommittee on the Evaluation and Improvement of Teaching (SC-AAA-EIT), chaired by W. Lohnes. That subcommittee's report to C-AAA was published in the *Campus Report* of 4/27/83. Although the recommendations of the two reports are not identical, the proposals presented for Senate action by C-AAA are entirely in accord with the subcommittee's findings, and the C-AAA Proposals have been endorsed by SC-AAA-EIT as well as by the parent committee. A further report, prepared by N. Gage and subcommitted as an appendix to the C-AAA report, was also published in *Campus Report*, on 5/11/83.

From the background of these three reports, C-AAA presented a set of 10 proposals concerning student evaluation of teaching to the Senate for approval. Together, the proposals represent a modification of the course evaluation system currently in effect. The course evaluation form has been revised to make it simpler, and to have the uses to which it will be put, as well as the method of administration, printed on the form itself. (A second part of the form, to be used in the preparation of the ASSU Guide, will be designed by ASSU at a later date.)

Matisoff expressed the committee's hope that, if adopted, the changes would be implemented as soon as feasible and no later than autumn quarter 1984. The system should be reviewed again after another four years, once it is put in effect.

In the discussion following the C-AAA report, the proposals were lauded for simplifying the standard evaluation form, encouraging more open-ended student feedback, including the evaluation of team-taught courses and teaching assistants, clarifying the uses to which the evaluations will be put, separating the various functionsof the evaluations, and stipulating that the evaluation should be completed in class time.

There was consensus that no one evaluation form would fill all needs, however, and several criticisms were made of the form proposed. These included oversimplification, insufficient "anchoring" for judgments on the rating scale, the deletion of data on medians for comparison with a norm, the lack of mid-quarter applications, failure to include the final or the completion of a project, and the inadequacy of the allotted minimal 10 minutes for completing the form if mini-essay student responses are desired. Matisoff and W. Durham, vice-chair of C-AAA, responded in each case with the committee's reasons for settling on the proposal given as the best compromise, given the total problem.

It was also pointed out by several that alternative methods can be used for mid-quarter reviews of how a course is going, and that these must be highly specific evaluations of aspects which can be effectively changed on short notice.

N. Gage commented that this compromise evaluation form does not optimally serve teaching improvement needs. Research shows that mid-quarter evaluations can improve teaching if they are augmented by consultation with those who can help the teacher implement the suggestion for improvement. Matisoff reminded the Senate of the availability of the Stanford Center for Teaching and Learning for this purpose (see *Campus Report*, 4/27/83, p. 23).

It was suggested that the ASSU Course Guide should evolve as a more subjective, critical complement to the evaluation form represented in the C-AAA proposal. No draft of the ASSU portion has been yet provided, but Matisoff indicated that ASSU feedback and collaboration went into the form proposed by C-AAA.

It was also made clear that the mandate for course evaluation applies University-wide, regardless of the form employed in the various schools.

In a strong statement against the use of median figures and norm-referenced evaluations, N. Gage pointed out that using norms in interpreting these evaluations is like grading on a curve: a good rating becomes not good when the normative value is somewhere between good and very good or higher. These ratings are determined by many factors besides the excellence of the teaching. They are conditioned by the size and nature of the class, the kind of student, the discipline, whether the course is elective or required, etc. Comparisons across disciplines or even departments can often be spurious. This is why C-AAA is discouraging norm-referenced evaluation. They cause false impressions.

E. Webb asked for clarification on the contrast between the present and proposed systems on courses to be excluded from the mandated review. The present system provides that those courses must be reviewed but the reviews need not be made public; the proposal exempts them from review and leaves the evaluation of such courses to the option of the instructor. This perception of the difference was confirmed by S. Matisoff.

Since a number of other questions had been raised earlier about the wording of particular portions of the form (e.g. the ambiguous term "learning experience"), at this point, M. Bratman proposed a friendly amendment, the wording of which was slightly modified in an amendment later proposed by S. Dornbusch and accepted by Bratman. As amended itself, the amendment read as follows (to be added as a second sentence to the fifth proposal:

> C-AAA will have the authority to make minor changes in the questions, or other minor adjustments in implementation, while this system is in effect.
> The friendly amendments were accepted by consensus.

The motion to approve the amended C-AAA Proposals for Student Evaluation of Teaching was then put to a vote. It passed unanimously. The Proposals are presented below in their final amended form.

The meeting adjourned at 5:12 p.m.

Clara N. Bush
Academic Secretary

C-AAA PROPOSALS FOR STUDENT EVALUATION OF TEACHING (as adopted by the Senate, 5/12/83)

1. There shall continue to be Senate-mandated student evaluation of teaching in all courses in the pool of courses defined below.
2. All courses are subject to mandatory evaluation each time they are offered except those of the following type:
   a. Courses of an individual/independent study nature (e.g., independent study courses, special research projects, thesis enrollments, etc.);
   b. Courses considered practica (e.g., studio art and music practice courses);
   c. Laboratory courses (i.e., those which carry separate course numbers and units of credit);
   d. Physical Education activity courses;
   e. Courses taught by first-year instructors;
   f. Courses of an experimental nature;
   g. Courses with enrollments of 7 or fewer.
3. There shall continue to be a standard form for this purpose;
4. This standard form, the University Dual Form, shall consist of two parts:
   A. The first part shall serve the purposes of improvement of teaching and administrative review. In contrast to the standard form prsently in use, it will
      1. be simpler;
      2. have the uses to which it will be put printed clearly on the form itself;
      3. have the method of administration printed clearly on the form itself;
   B. The second part of the form will be designed by the ASSU, or other authorized student organization, to provide it with information to assist students in course selection.
5. The first part of the University Dual Form shall consist of the questions shown as Appendix I. C-AAA will have the authority to make minor changes in the questions, or other minor adjustments in implementation, while this system is in effect.
6. Student answers to the multiple-response section of the first part of the standard form will be tabulated and reported only as frequency distributions.
7. Where the University Dual Form is undesirable, a School, Department, or Program may devise its own substitute for purposes of satisfying the Senate mandate, provided that the part of the form to be used for administrative review in the evaluation of teaching is acceptable to the relevant Dean (in consultation with the Provost and Advisory Board).
8. The first part of the standard form, or its approved substitute, is to be used in all courses in the described pool. Faculty use of the second part is strongly encouraged.
9. Ordinarily, the University Dual Form will be administered in class at the end of the quarter, usually during Dead Week. The timing of administration of substitute forms is a matter to be settled between the School, Department, or Program and the relevant Dean.
10. The data gathered from the first part or its substitute is not intended for public release, but is to be released only to the faculty member, department chairman, and other appropriate administrative officials for the purpose of confidential administrative review. The right to release this material for any other than confidential administrative purposes resides solely with the faculty member.

Wessells says research should be prime tenure criterion

Following is a report from Humanities and Sciences Dean Norman K. Wessells to the Faculty Senate, May 12, 1983.

It is a pleasure and honor for me to talk with the Senate about some opportunities and concerns for Humanities and Sciences.

First let me address the issue of undergraduate education. When I accepted the deanship I assured Provost Hastorf that there would be a new activism in undergraduate education in the Humanities and Sciences dean's office. Associate Deans Kennedy and Chace were chosen in part with that in mind, since they are such remarkable teachers and educators.

With our new responsibilities inherited from the former Office of the Dean of Undergraduate Studies, I have had the great good fortune to add Carolyn Lougee to our team. One of Dean Lougee's most important accomplishments to date is establishment of the Humanities and Sciences Advisory Committee on Curriculum. That group is composed of some of the School's and University's most distinguished faculty persons.

Traditionally, our office has played a modest, behind-the-scenes role in curricular matters, a subject left largely to departments, programs, and occasionally the Senate. That has changed. So far the new committee has discussed: 1) the question of mandating periodic curricular reviews by our departments; 2) new ways to encourage more intensive and advanced work among our juniors and seniors; 3) grading policy and practice; 4) ways to encourage experimentation with the academic calendar—that in response to the Senate's mandate; and several other topics.

In general, the committee will begin its work by concentrating on ways to promote liberal education for undergraduates in a research university. In future years, we intend to place issues about graduate curricula and degree requirements on the committee's agenda. Because the committee is close to the budget allocation machinery of Humanities and Sciences, I envision that it can have strong beneficial effect upon the quality of undergraduate and graduate education here.

For instance, our goals of expanding the undergraduate writing experience and of providing a special, enriched educational program for some of our most independent and intellectually ambitious juniors and seniors will be aided greatly by the committee's deliberations.

The transfer to our office of responsibility for the extradepartmental programs took place last autumn. I am happy to report that all of those programs have continued to operate well this year. The regularly scheduled reviews of some have been completed, and decisions on the recommendations of the faculty review committees will be made soon, with the advice of C-US.

Self-examination, evaluation

Next year affords us a superb opportunity for self-examination and educational innovation. The remainder of the extradepartmental credit-granting programs are scheduled for review. This includes SWOPSI, SCIRE, Undergraduate Specials, URO, and ARLO.

In considering how to plan those reviews, we were mindful of Representative Kenneth Arrow's remarks about small Ph.D. graduate programs—each by itself is always approved, but we never really look at the whole collection and ask basic questions about what we are doing.

Dean Lougee and I plan, therefore, to ask the single special review committee not merely to review the operation of these five programs, but also to examine the question of what the optimal extradepartmental educational program at this University should encompass; and, once defined, how we get there.

We have already discussed the composition of this committee and its charge with the Committee on Committees, the Senate Steering Committee, the Committee on Undergraduate Studies, the President's Undergraduate Cabinet, and the School's Advisory Committee on Curriculum.

Within a few weeks, we will name this committee, with strong representation of the facilities of Humanities and Sciences, Engineering, and Earth Sciences, and of the student body. In accepting responsibility for the extradepartmental programs (EDPs) last year, I assured Dean Katchadourian and Provost Hastorf that the Humanities and Sciences dean's office is committed to maintaining and improving non-departmental educational opportunities for our undergraduates.

We have the opportunity, indeed the obligation, to profit from the designs of the late 1960s and early 1970s, as we conceive and implement exciting new opportunities for Stanford's undergraduates of the 1980s.

Second, permit me to turn to issues of our School's most important resource, its faculty.

In 1949-50, the year Humanities and Sciences was organized, 62 percent of our 214-person faculty was tenured. By 1964, the 15th year of Humanities and Sciences' existence, the percentage of our professorial faculty with tenure was 68 percent. Today Humanities and Sciences is 79 percent tenured. That figure will rise further over these next years, due to the new retirement laws.

Unless we take new steps to resist the trend, by the 1990s Humanities and Sciences will have only about 75 assistant professors among its 28 departments. For comparison, Yale now has 55 percent tenured faculty and has adopted policies to keep their percentage between 50 and 60 percent. Also, for comparison, the average of 13 major private universities is about 70 percent tenured.

The other side of this coin is, of course, mean faculty age—as President Kennedy summarized in October, that is rising at a distressing rate; the mean for Humanities and Sciences is now nearly 48 years of age.

As far as I can discern, Stanford and Duke Universities stand in the extreme in having let themselves become so heavily tenured. Members of the visiting committee to Humanities and Sciences, the Humanities and Sciences Council, have expressed great concern about our situation, and along with my colleagues in the dean's office, feel that something must be done to guarantee continuing presence in our departments, laboratories, and classrooms of significant numbers of developing young scholars.

Junior faculty fellows

Major funding for a Junior Faculty Fellows program is the highest single development package for our School—our aim is to bring young persons here on two-year appointments, give them only modest teaching responsibilities, and provide them every opportunity to develop as scholars. We owe it to our undergraduates, to our graduate students, and to the professions to make the junior faculty.

This year University budget difficulties forced us to defer some faculty appointments we would otherwise have liked to make. Nevertheless, we have proceeded with our long range faculty planning process and have had an excellent year at making new appointments and in retaining a number of our faculty who had received exceptional outside offers.

In the Humanities, due to the efforts of William Chace and Chairperson Joaquim Coelho, a spectacular young chairholder from Princeton, Alban Forcione, will join Spanish and Portuguese. In fact, in order to retain their star, my counterpart at Princeton offered a second chair to this broad-based young scholar.

Also in the Humanities, one of our proudest faculty acquisitions will be to Stanford's already famous group in Computer Music led by John Chowning. The appointee is John Pierce, distinguished past director of the Bell Laboratories and more recently of Cal Tech. Pierce is described by one referee as follows: "... it would be no exaggeration to say that Pierce is universally regarded as the number one living engineer in the entire world." Music and Humanities and Sciences are happy to do this small bit to help improve Engineering at Stanford!

Finally in Humanities, under John Freccero's leadership, searches are underway that will bring two preeminent senior scholars to our Comparative Literature Program, and will help to make that program a gemstone in the Humanities at Stanford. I am sad to report that we came very close but did not succeed in adding a superb young professor from Yale to Comparative Literature and the Feminist Studies Program. Our efforts at faculty recruitment for Feminist Studies continue; Dean Lougee and I are currently planning procedures for a search at the senior level in certain social science disciplines.

A new steeple of excellence—in Fred Terman's parlance—is about to appear at Stanford due to the imagination and leadership of Linguistics Chairperson Elizabeth Traugott and Dean David Kennedy.

Three senior appointments have been made in the area of Formal Linguistics. Senior persons from MIT, Texas, and Wisconsin will join our Departments of Linguistics and Philosophy. Together with faculty already here, they will constitute an interface of Linguistics, Computer Science, Philosophy, and Cognitive Science.

This kind of package appointment involving several senior persons working in one area should serve as a model, I believe, if we are to use our precious faculty billets most beneficially during tight times.

Associate professor rank

Next permit me to address two linked issues about the assistant and associate professor ranks. First, young scholars in some fields require longer times than average to get their scholarship programs established so that a sufficient volume of published work is available to permit the assessment of quality and potential that is the basis for tenure judgment. This may involve, for them, the acquisition of special skills; it commonly involves publishing books instead of journal articles.

In discussion with Humanities and Sciences chairpersons Appointments and Promotions Committee (A and P) members, and Policy Committee members last year there was broad, though not unanimous, support for lengthening the assistant professorship term. In fact, significant numbers of chairpersons felt that a term longer than seven years might be desirable.

This year, when we discovered that the change to the seven-year assistant professorship was feasible under existing regulations, we chose that time, with three- and four-year appointments being adopted. A number of departments would prefer the four and three combination. I do not believe that the seven-year policy will lead to a lowering of standards for promotion to tenure—and I shall address the issue of our standards in a moment.

A second, related issue is that of our rank of tenured associate professor. The extraordinary diversity in professional disciplines among our 28 departments in the School is associated with very different attitudes toward that rank and the promotion from associate to full professor.

I suspect that as much personal pain, misunderstanding, and resentment are associated with this issue as any other in faculty life. Yale has finally come to grips with one aspect of this problem by adopting a policy of automatic promotion to professor at the end of seven years as tenured associate professor.

Whereas past deans of Humanities and Sciences have endeavored to ensure equity in the criteria for promotion to full professor at five, six, or more years, there can be no doubt that there remain substantial differences in expectation among colleagues, both tenured and non-tenured, about the meaning and criteria for promotion.

I believe most departmental faculties have agonized over this dilemma: promote now, say, in the ninth or eleventh year, in the hope that a pat on the back will be what is needed to pep up a flagging performance; *or*, don't promote now, the title of Professor is too important a distinction.

Deep reservations expressed

The basic question is, however, whether the tenured associate professorship is a useful rank. I have conversed with many senior colleagues in the School about that question and find a significant number who have deep reservations about the system we have inherited.

Many would prefer what some of our Eastern colleagues have lived successfully with for years, a single tenured rank, Professor. A new arrangement for us might be, then, a non-tenured associate professorship of, say, four or five years in length that would follow a single assistant professor term of, say, four years.

You now see the linkage in discussion of both assistant and associate professor appointments. I believe we would gain two desirable ends by such changes; the prolongation of the period prior to the tenure decision, and the disappearance of a rank that may not now be serving us well.

Obviously, this kind of proposal is faculty business, Senate business, indeed Trustee business, since it would require alteration in basic faculty structure. I shall be discussing it with our new Policy A and P Committees in the fall, so that the issues are likely to be studied in detail in our School next year. Since the Humanities and Sciences faculty is the largest at Stanford I hope that the Senate will be willing to discuss these issues if we develop a strong consensus for a new appointment schedule.

Next, permit to turn to what I view as a grave problem that is taking a larger and larger proportion of time of chairpersons, deans, and the Provost. The problem is *grievances*.

Grievances now occur in many cases in which persons fail to gain tenure. About 90 percent of faculty grievances at Stanford in recent years have come from Humanities and Sciences. I wish I could say that the problems they present are ones to be resolved exclusively in our School. I fear, however, that since we include 470 of the professorial faculty, the solutions we design will inevitably have impact upon other Schools. Let me describe the situation in some detail.

Grievances are being filed on the basis of combinations of accusations never seen a decade ago. Some grievances are written by attorneys as wide nets designed to catch the fish of some administrative slip-up or deficiency, occuring at any one moment during the six assistant professorship years.

Such grievance documents can be monographic in size, and demand immense time, intense concentration, and prolonged consultation with University counsel in order that chairpersons, deans, or grievance officers may do justice to the grievant and to the University.

Law School Dean John Hart Ely remarked to me recently that a new subspecialty in law has appeared—it is called "tenure law." That occurance bodes ill for the professoriate and the universities, and leads me, wistfully, to recall that wonderful scene in Henry VI, Part 2, when Jack Cade and his henchmen pipedream for the new world—Dick the Butcher exclaimed "... let's kill all the lawyers!" Being a university, we should be humane and discriminating on that one.

Why the greater proportion of grievances? First, I sense that an alteration has occurred about the expectation for

continued on next page

Wessells. . .

continued on page 20

tenure at Stanford, and about professional expectations beyond Stanford.

Time was, during the 1960s and early '70s, when most junior faculty could spend profitable years here but then move on to rewarding academic employment elsewhere. More recently, however, the job market for six- or seven-year assistant professors in most Humanities and Sciences disciplines has dried up. Many of the School's assistant professors do not have the options available to junior persons in medicine, law, business, engineering, and earth sciences. "Up or out," too often is followed by "out and down."

Against that background we have a simple but strong reality: a solid record of published scholarship and of teaching is now not enough to guarantee tenure at Stanford.

It is not yet clearly recognized that the standards for promotion in the 1980s and '90s are and must be extraordinarily high here. Yet being denied tenure at Stanford is not a statement that the individual is an unworthy scholar and teacher.

Indeed, since virtually all persons initially appointed to our assistant professor ranks do have substantial talents, some people of real quality will be denied permanent membership on our faculty. This is not because they are deficient on the national scale, but because they do not meet the extraordinarily high standards we must set for ourselves.

One of the causes of the current unrealistic expectation on tenure has resulted, I believe, from the inadvertent chiseling in stone of then-Dean Albert Hastorf's criteria for tenure: "... truly superior in either scholarship or teaching, and at least very good in the other."

Those criteria are no longer adequate for the Stanford of the 1980s and '90s. We are now among the elite research universities of the world: no person should be granted tenure here who is not demonstrably *excellent* as a research scholar.

That, in sum, should be recognized as our primary criterion for tenure. We must continue to emphasize that high-quality teaching is critically important but we should embrace the concept that first-class university-type teaching is sustained by, and is directly dependent on, continuing scholarship of the first rank. The two are inseparable.

Senior faculty, chairpersons, and deans of this University must articulate clearly our tenure standard, explain how it applies in the various disciplines, and ensure that no junior faculty member remains unaware of what is required to attain tenure here.

Let me return to the painful issue of grievances. The intrusion of non-University attorneys into the University's tenure processes will have extremely deleterious consequences if we ignore what I believe is a strong thrust present in a number of grievance papers.

This is an explicit failure in them to recognize that the process of evaluations at departmental, school, and higher levels of review are basically *subjective judgment processes*. They are not processes involving simple algebraic summation of pluses and minuses in the form of referee letters, statements by Stanford colleagues, or student teaching evaluations.

Instead, the essence of the process involves careful weighing of all such evidence, examining precisely what is said, why, and by whom—reading between the lines, if you will, in some instances—and then arriving at a balanced, reasoned, and wise judgment.

At the level of supra-departmental reviews, the Humanities and Sciences Advisory Committee on Appointments and Promotions or the University Advisory Board, groups of our most distinguished and seasoned faculty persons, are brought together literally to judge the judges. Those committee members carefully assess why the chemists or philosophers or economists believe some young person warrants the distinction of a tenured appointment here. And sometimes, of course, they disagree.

Grievance documents written by various attorneys would turn us away from those long-established practices and toward a system of rigid objectivity in which professional *judgment* would have little role to play—10 letters in favor, four against, yes on tenure. Such procedures would seriously damage the quality of the faculties of great research universities. Like it or not, we simply cannot define precisely a single set of criteria every syllable of which may serve as the launch-pad for a grievance.

Courts might intervene

So, where can we go from here? First, we must literally take the offensive in improving our system or the courts will ultimately try to do so for us.

We must define our criteria for tenure, describe our time-tested procedures, apply them with utter equity and fairness, and insist that it is the University professoriate, not the aggrieved assistant professor, the attorneys, or the courts, that determines the rules of the game.

Second, if we are to preserve our independent system, then we must develop a better form of Faculty Career Development. By that, I mean a program for all junior faculty that will include such components as minimal committee work, maximal aid in developing teaching skills, a sympathetic ear when leaves for scholarly and research purposes are requested, aid in finding research funds, and effective guidance by senior professional colleagues. Perhaps each assistant professor should be formally or informally linked to one or two senior colleagues who can act as confidants and advisers about all phases of professional career development.

Faculty Career Development must include something we owe to every junior faculty person: more complete and frank assessment each year and at the time of reappointment. Over the years, I suspect that it has been the rule, not the exception, for department chairpersons and senior colleagues to avoid saying difficult, perhaps discouraging, things to their junior colleagues.

One result of failing to give adequate feedback on deficiencies in performance is the awful "surprise" of being denied tenure. On occasion reservations held by senior faculty, deans, provosts, or the advisory board have not been passed on to the junior faculty person. The times no longer permit that behavior.

We must develop a new trustworthiness of communication so that occasional sober perspectives on reappointment papers at the departmental, decanal, provostial, or Advisory Board levels can be included in the appraisal given to the assistant professor.

Part of this new frankness must be the acceptance that criticisms can be expressed without later being the basis for accusations of bias or prejudice against the individual offering the advice.

It is ironic indeed that in some cases, chairpersons have given frank criticism and guidance at the three-year review, and then, when tenure was denied at six years, those chairpersons have been accused of bias by the unsuccessful candidate. That catch-22 is not acceptable, and can be avoided if the giving of frank appraisal to *all* junior faculty becomes a recognized duty of chairpersons and senior faculty colleagues.

But let me return to the most important part of Faculty Career Development: the positive aspects intended to give every assistant professor the opportunity to develop as scholars and teachers to her or his fullest potential. This aspect of Faculty Career Development must become a way of life in every department.

In closing, let me emphasize that I regard the junior faculty of our School as one of Stanford's great assets. Young scholars such as Mary Pratt, Patricia Jones, Corey Goodman, Ann Peck, Jay Fleigelman, and Brigette Cazelles—all promoted from within last year and this—are by any standards a spectacular group.

We must ensure a continuing flow of such marvelous young people to the faculty. We must do so despite the unfortunate effects of new retirement laws and our very high standards for tenure.

Stanford has benefited greatly from having a tenure-line billet system for junior faculty; such a system has meant there has been a real possibility of promotion to tenure. But the warning signals are clear: *if* we cannot bring the grievance problem under control, *if* we cannot streamline the grievance procedures in significant ways without abrogating faculty rights, *if* we do not do a much better job at Faculty Career Development, then I see only one alternative: a non-tenure line junior faculty.

Under that system, no tenured position would necessarily be on the horizon; most of the kinds of grievances we see would be eliminated, but so too would much of junior faculty morale and identification with the institution.

Sober dwelling on that bleak outlook should be sufficient goad to us all to work with vigor and enthusiasm at improving what we have. I would hope that our colleagues in other schools will join us in the Humanities and Sciences in designing and implementing policy and practice in these important areas.

Humanities Center appoints 11 new fellows from Stanford, other universities

The Stanford Humanities Center has selected six Internal Fellows and five External Fellows for the academic year 1983-84.

The Internal Fellows from Stanford are: N. Gregson Davis, associate professor of classics; Carl Degler, professor of history; John Felstiner, associate professor of English; Thomas C. Grey, professor of law; Diane W. Middlebrook, associate professor of English; and Richard M. Morse, professor of history.

Each will also teach one course at the University during their year's residency.

The External Fellows are: Joseph Frank, professor of comparative literature at Princeton, and William Reddy, assistant professor of history at Duke, will be Marta Sutton Weeks Fellows.

John McNees, instructor of philosophy at the University of Houston, will be the William Rice Kimball Fellow.

Gonzalo Munevar, associate professor of philosophy at the University of Nebraska at Omaha, and Gail L. Mortimer, associate professor of English at the University of Texas at El Paso, will be the Ethel Wattis Kimball Fellows.

Five new Graduate Fellows have been selected: James M. Carolan, comparative literature; Thomas M. Lutz, modern thought and literature; Martha G. Newman, history; Mark Pentecost, English; and Antje-Christiane Petersen-Weiner, German studies.

Continuing Graduate Fellows are Maria M. Makela, art; Maurice P. Rehm, drama; Maidi Rosenblatt, anthropology; Nancy Ruttenburg, comparative literature; and Kenneth W. Warren, English.

According to Prof. Ian Watt, director of the Humanities Center, "The number of fellows represents a considerable increase above the current year. This partly reflects the generous donations of the Mellon Foundation and the Kimball family to support visiting junior fellows."

Watt also notes that five of the nine fellows at the Center this year have completed books during their tenure. Wanda M. Corn, associate professor of art at Stanford, has completed *Grant Wood: The Regionalist Vision*. Lilian R. Furst, professor of comparative literature at the University of Texas at Dallas, has completed *Fictions of Romantic Irony*.

Herbert S. Lindenberger, professor of English and comparative literature at Stanford, has finished a book on opera, tentatively titled, *The Extravagant Art: A Poetics of Opera*.

David E. Wellbery, Stanford assistant professor of German, has completed the revisions of his book *Lessing's 'Laocoon': Semiotics and Aesthetics in the Age of Reason*.

John J. Winkler, assistant professor of classics at Stanford, has finished his book *Auctor and Actor—Narratology and Religious Conversion in Apuleius' The Golden Ass, Concerning Metamorphoses*.

Hoover...

continued from page 1

The petitioners claim "the existence of a partisan research and policy organization. . . raises serious questions concerning the academic independence, integrity and reputation of the University."

Hoover Institution spokesmen have denied charges of partisanship. More than a dozen faculty have signed a counter-petition warning that such an inquiry could threaten academic freedom.

Kennedy expressed hope the Faculty Senate debate scheduled for May 26 will be "forward looking and constructive" and "concentrate on how the Hoover Institution and Stanford can improve upon a relationship that has been increasingly valuable to both."

Commenting on recent faculty and student petitions opposing unclassified, weapons-related research proposed at the Stanford Synchrotron Radiation Laboratory, Kennedy repeated his earlier comments to the Academic Council that "to open the door to prohibitions based on prospective end use would do more harm than good.

"Today's benign restriction might become tomorrow's suffocation. Once you begin to make value judgments about the possible outcomes of scientific work, there is no place to stop.

"We place our faith in the ultimate net benefit of free inquiry."

Kennedy added: "My own judgment is that the faculty will not decide to change that research policy, although it is theirs to change. I have told my colleagues that I do not propose to ask that they change it." Widespread applause followed.

Victor Fuchs takes a comprehensive look at *How We Live*

Male dominance likely to decline economist says

The following are excerpts from a new book by Prof. Victor Fuchs of the Stanford Economics Department. How We Live: An Economic Perspective on Americans From Birth to Death, Harvard University Press, 1983.
Reprinted with permission.

Since World War II, the family has faded in importance as the major institution in American life.

At every stage of life, there is evidence of this change:

* The birth rate has been below replacement level for a decade;

* The proportion of all births delivered by unmarried women has risen to 18 percent from 5 percent in the past 20 years;

* Among women age 25-29, the proportion never married has grown to 21 percent from 11 percent in the past decade;

* The number of unmarried couples living together has tripled in the past decade;

* The proportion of married women with children under age six in the work force has risen to 45 percent from 12 percent over the past three decades;

* Two out of five marriages now end in divorce;

* Almost 25 percent of all children now live in no-parent or one-parent households;

* About 40 percent of all children will live in one-parent households before reaching age 18;

* The proportion of adults living alone has nearly tripled, to 11 percent from 4 percent, in the past three decades.

Individuals rely less on their families today than in the past for the production of goods and services and as a source of financial and psychological support.

Documenting the scope and reasons for these social, economic, and demographic changes may help us better understand how these changes influence our personal lives and suggest constructive ways in which we, as a society, can better cope with the future.

Fertility rate falls

Over the long term the general fertility rate (the number of births per thousand women ages 15-44) has moved sharply downward. Between 1800 and 1910 the rate fell by more than half, and between 1910 and 1980 it again fell by half.

Most economists believe that this long-term downward trend, which has its counterpart in all economically developed countries, can be explained by three types of changes: a decrease in the benefits to parents from having children, an increase in the costs of having children, and a decrease in the costs of avoiding having children—that is, the costs of birth control.

The benefits of children are many and varied. For most parents children are a source of pride and delight, a link with the future, an object and a source of love and affection. In agricultural societies children are often valued for their contribution to production; in that sense the demand for them is analogous to the demand for farm machinery. Moreover, in societies that lack banks, insurance companies, and other financial institutions, investment in children is a principal method of providing for the future.

Industrialization substantially reduced the economic benefits of children. Economic development shifted the locus of work from the farm to the city and raised the age at which children began work, thus making them less valuable to parents as a source of production and income.

Growing opportunities for accumulating savings in banks, securities, and annuities virtually eliminated the need for children as a method of saving. And the expanding role of government in providing retirement benefits, health insurance, unemployment insurance, and other social programs diminished the importance of having *one's own* children as a source of insurance later in life, even though society as a whole depends upon future generations to pay the retirement benefits of the preceding ones.

While the economic benefits of children have been decreasing, the costs of raising them have been increasing.

Traditionally, one of the largest costs of child-rearing has been the time spent by the mother. A good measure of the alternative cost of this time is what the mother could earn if she held a paying job. Thus, the long-term rise in women's earnings has increased the "price" of children, and at any given time the price is higher for better-educated

Victor Fuchs

women because they have higher potential earnings. Better-educated women tend to have fewer children, and, if husband's schooling is held constant, the negative effect of wife's education on fertility is even more pronounced.

Unmarried mothers increase

Although teenage fertility fell considerably over the past two decades, the U.S. rate of 52 per thousand is still double that of most countries of Western Europe, five times that of the Netherlands and Switzerland, and more than 15 *times* as high as teenage fertility in Japan.

The relatively high U.S. rate is mostly the result of the growing fertility of *unmarried* teenagers. The number of babies born to unmarried women ages 15-19 jumped from 87,000 in 1960 to 240,000 in 1978, while births to married teenagers fell from 507,000 to 316,000, thus tripling the illegitimacy ratio in less than two decades.

Why are there so many babies born to unmarried teenagers? The oft-heard answer that these births are the *unintended* consequences of increased sexual activity among teenagers is unsatisfactory. Sexual activity has undoubtedly increased, but there is good reason to believe that many, possibly more than half, of these babies are wanted by their mothers at the time of conception. They are not "accidents."

This is true even though the large majority of *pregnancies* of unmarried women are unwanted, because most unwanted pregnancies are terminated by abortion.

A sharp decline in the willingness of unwed mothers to offer their babies for adoption provides additional evidence that these births are wanted. This is particularly true of whites, for whom the ratio of adoptions to births out of wedlock fell rapidly between 1960 and the mid-1970s.

Most of these births are to young women from low-income families who have little education and poor employment opportunities. For young women in such circumstances motherhood often appears to offer an opportunity to leave the parental home, to improve one's status, and to develop a more satisfying life.

The only difference between the present and the past is that in the U.S. this formerly had to be accomplished within the bond of matrimony. Without the sanction of church or state there was great social stigma for mother and child, and no reasonable prospect of financial support.

Recently, the social stigma has been greatly reduced, and government has come forward as a source of support. AFDC payments, food stamps, day care centers, Medicaid, and other subsidized programs make it possible for unwed mothers to establish a separate household and raise their children, albeit at a low level of living. Some are completely supported by transfer payments while others use government programs to supplement low earnings. A small proportion of the babies are born to young women with relatively good jobs who have opted for a life without a husband for themselves or a father for their children.

Mothers in the labor force

Why has the labor force participation of married mothers grown so *rapidly* and so *steadily*? Popular discussion frequently attributes this growth to changes in attitudes that were stimulated by the feminist movement, but Betty Friedan's *The Feminine Mystique* was published in 1963, long after the surge of married mothers into the labor force was under way. Moreover, there is no evidence of any sudden acceleration in response to this movement. Similarly, widespread public expression of feminism *followed* rather than preceded the rise in the age of marriage and the fall in the birth rate. Divorce is the one variable whose change coincided with the burgeoning feminist movement, rising rapidly between 1965 and 1975.

Feminist writings and discussion, valid as they may be in their own terms, will probably not be viewed by future historians as a basic cause of social change but primarily as a rationale and a rhetoric for changes that were already occurring for other reasons.

Within the economics profession the explanation that commands the widest consensus is that *higher wages* have attracted more married mothers into the labor force.

The rapid expansion of jobs in the service sector has also contributed to the rise in female labor force participation. The service industries (retail trade, financial services, education, health, personal services, public administration) have traditionally offered much greater employment opportunities for women than have mining, manufacturing, construction, and other branches of the industrial sector.

Service sector employment has provided nearly all of the additional job opportunities in the U.S. economy since the end of World War II. Between 1947 and 1980 U.S. employment expanded by 39 million; the service sector provided 33 million of these additional jobs.

Better control of fertility makes a career in the labor market more promising to women, not only because of a reduction in the *number* of children but also because women now have better control over the *timing* of births.

The increase in the *probability* of divorce contributes to the rise in female labor force participation because women recognize that complete commitment to home and husband can leave them in a perilous economic position if the marriage should dissolve.

Alimony and child support payments are often inadequate, and are not paid at all in a large proportion of cases. An old song says that "diamonds are a girl's best friend," but today the ability to earn a good wage is likely to prove a more reliable asset.

The future of marriage

What about the future of marriage? Does the increase in living alone, unmarried cohabitation, and divorce signal the demise of this ancient institution? Probably not, but the character and the basis of marriage are changing, and not for the first time.

In most preindustrial societies the marital union was part of a more elaborate and more-extended network of family and clan relationships. These relationships served to enhance production, to distribute risk, and in general to contribute to the economic and social welfare of the larger group. The interests and preferences of the individual bride and groom were usually subordinated to those larger concerns. Decisions about the timing of marriage, choice of mate, living arrangements for the married couple, and the like were typically not left to them, but were the responsibility and prerogative of their elders. These decisions were frequently made only after consultation with others who would be affected by the union.

With the coming of the Industrial Revolution, the growth of markets, an increase in formal education, greater mobility, and increases in private and public insurance programs, marriages became less the concern of the extended family and more that of the individual man and woman. The basis for marriage shifted primarily to that of a partnership entered into for affection, intimacy, children, and the benefits of the division of labor. Women typically specialized in home production, including child care, cooking, and cleaning, while men specialized in work in the market.

In this partnership the husband usually contributed more goods and services than the wife, except when there were small children at home, in which case the longer hours worked by the mother tended to offset the differential in explicit or implicit wage per hour.

The earnings potential of men was higher than that of women for two principal reasons. First, the fact that women usually bore several children and were at risk of additional pregnancies sharply reduced their opportunity to successfully pursue a remunerative career. Second, physical strength was an asset in most jobs prior to the development of modern production techniques and the growth of the service industries. Although the economic power of the husband was usually greater than that of the wife, their consumption of goods and services was usually equal. Such marriages, therefore, were typically hierarchical rather than egalitarian in social and power relationships.

The inequality in economic power resulted in deference of the wife toward the husband, a double standard with respect to sexual behavior, and other gender inequalities. Most women accepted these hierarchical marriages because the alternative seemed worse.

continued on next page

Family fades, economy, government rise

continued from page 22

Perpetuation of such inequality is morally indefensible. Fortunately, another transition in the nature of work and marriage is under way. Better control over fertility and longer life expectancy imply that women can consider spending many more years in the labor market. The rise of a service economy implies that differences in size and strength no longer confer an advantage to men in most occupations. The hospital, the classroom, and the shopping center have replaced the coal mine, the steel mill, and the assembly line as the major work sites of modern society. "Industrial man" has been succeeded by "postindustrial person."

These economic and demographic changes will reduce economic inequality, there will be less specialization, and male dominance is likely to diminish. Even Lady Diana Spencer, the bride of the future king of England, did not promise to "obey" when they were married in 1981.

There is, however, one large obstacle remaining in the path of economic equality for women: their demand for and concern about children. If, as current behavior suggests, this demand and concern are not as great among men as among women, two outcomes are possible. On the one hand, concern for children may prevent some women from committing themselves as wholeheartedly as men to paid careers, and an earnings gap will remain. On the other hand, full commitment to careers by women may result in further decline in fertility and less parental attention to children. Solution of this dilemma will require imaginative and courageous action in both the private and public sectors.

Many women (and some men) desire complete gender equality at *work* and at *home*. To date, these expectations and desires have not for the most part been realized.

If we want more and better day care for children, we must be prepared to say how we will meet its cost. The problem is not solved by simply saying that "business firms" or "the government" should pay for day care either through direct provision of services, subsidies, or "tax incentives."

Surely, we have learned by now that there is no magic wand that can divert resources to day care without taking them away from something else. If business firms provide day care (and it may be good business for them to do so), the cost of that care must come primarily out of the wages or other fringe benefits of employees, or be added to the price of the goods and services they produce. If government bears the cost (and there may be good reasons why it should), this must result in higher taxes or in lower expenditures for other services.

The fading family

The family has faded relative to the market and the government for several reasons. First, economic growth has increased the advantage of both large-scale and specialized production units. As Adam Smith so acutely noted more than 200 years ago, productivity rises with division of labor, and division of labor is limited by the size of the market.

As markets have expanded, the processing of food, the making of clothing, the education of children, and the production of many other goods and services have moved from the home to specialized institutions. Technological change involving economies of scale frequently contributes to this shift; some elements of modern hospital care, for instance, could not possibly be delivered within the home.

The declining importance of home production of most goods and services, far from strengthening the family, seems to be leading to further reductions in its most intimate, most central functions. It is not at all unusual today for men and women to purchase child care services from institutions or other individuals, seek advice about education, health, and careers from professionals, depend on the workplace for emotional support and assistance with smoking and drinking problems, and delegate care of dying relatives to hospital and nursing home personnel.

Not only has the market taken over many activities formerly carried out in the family, but government has also been assuming many family functions such as providing social insurance for widows and orphans, the sick, and the elderly. Occasionally, universal government insurance is more efficient than private insurance because it overcomes the problem of adverse selection.

The main reason for the proliferation of government programs, however, is the pressure for income *redistribution*. Almost all government "insurance" programs, from Aid to Families with Dependent Children to Social Security retirement benefits, contain significant elements of redistribution. When the family was the dominant social and economic institution in society, it redistributed resources among its own members, but there was great inequality among families.

The more affluent and complex a society becomes, the more it depends on the willing, cooperative, conscientious efforts of the people who work in that society and the more difficult it is to obtain satisfactory effort through the use of force.

The declining importance of home production of most goods and services, far from strengthening the family, seems to be leading to further reductions in its most intimate, central functions.

—Victor Fuchs

When the main task of society consisted of hauling large blocks of stone from a quarry to a pyramid, it was a relatively simple matter to rope hundreds of slaves together and use a whip and the threat of starvation to secure compliance. In feudal societies the predominantly agricultural workers were kept in line by force, by taking advantage of their limited mobility and their need for protection, and by preaching to them the promise of Heaven and the threat of Hell.

But when a nation's workers are airplane mechanics, teachers, and operating-room nurses, for example, such techniques will not succeed. The complexity and interdependence of a modern economy make it highly vulnerable to disruption by disaffected workers. Furthermore, a regime based on force and terror is incompatible with the widespread education, free flow of information, and geographic and social mobility necessary for a highly productive economy.

In advanced industrialized societies the problem of getting everyone to "go along" is compounded by the waning power of religion, nationalism, and other traditional control structures. Calls to serve God and country do not meet with as enthusiastic a response as they once did, whether that service is military or some onerous and not particularly rewarding civilian task.

Modern governments use egalitarian social welfare legislation to induce mass participation and cooperation in the tasks of society. Paradoxically, this same legislation also can create negative incentives for work and investment.

For example, subsidization of food and medical care is in part an attempt to placate the poor and bring them into the mainstream of society. These attempts succeed, at least to some extent. But subsidiess that are available only to individuals and families with income below specified levels tend to discourage work and saving because greater income would result in a loss of benefits.

The expansion of government at the expense of the family is exacerbated when, as is often the case, public assistance is provided only if individuals use *nonfamily* sources for the subsidized services. Nursery schools, hospital care, and nursing homes provide examples of the way in which government policy biases choices in the direction of obtaining services outside the home, even though some of them could be provided within the family.

Government agencies undoubtedly find it more difficult to monitor the use of financial aid in a family than in an institution, but some of the biases embedded in present programs of subsidized care could be eliminated. For instance, subsidies for home care of chronically ill elderly could result in reduced expenditures for hospitals and nursing homes.

The same pressures for equality that result in redistributive social welfare legislation also lead to weaker hierarchical relations within the family—as well as in the church, the workplace, the school, and other institutions.

We have only to contrast present with past relations between priests and parisoners, employers and employees, or teachers and pupils to realize that the weakening of parental authority over children or of husbands' authority over wives is part of a larger phenomenon.

As Stanford historian Carl Degler has stated, "The great values for which the family stands are at odds not only with those of the women's movement, but also with those of today's world. Democracy, individualism, and meritocracy, the values most closely identified with the last two centuries of Western history, are conspicuous by their absence from the family."

As Norman Macrae so aptly noted in *America's Third Century*, "It is pointless to say... that society must therefore return to being ruled by the old conventions, religious restrictions, craven obedience to the convenience of the boss at work. Individuals will not accept these restrictions now that they see that wealth and the birth control pill and transport technology make them no longer necessary."

If we value the contribution that the family can make to individuals and society, we have no choice but to try to reconstitute it on a more democratic, egalitarian basis while enhancing its role as a vital, viable institution for socialization. Maintenance of an adequate level of investment in children by both the private and public sectors will play a central role in meeting that challenge.

The Inter-Group Conflicts

The long-term trend toward lower fertility has radically altered the age distribution of the population—a change that has important social and economic implications, especially for the elderly.

The upward trend in the relative numbers of elderly, from 4.6 percent of the population in 1930 to 11.3 percent in 1980, has resulted primarily from changes in fertility and only secondarily from the lengthening of life expectancy.

Poor health, mandatory retirement, and age discrimination may affect the employment status of individual older workers, but they do not explain why four out of five older men were not at work in 1980. The major reasons are the growth of real income, the relative increase in the number of elderly, the retirement incentives built into the Social Security and tax systems, and institutional changes such as the decline of self-employment.

The drastic decline in the labor force participation of older men during the last 30 years would already have had a large effect on the ratio of workers to retirees if not for two offsetting trends: the rapid growth in female labor force participation, and the large influx of young workers into the labor force in the 1970s as a result of the baby boom of the 1950s. These trends will not continue.

The labor force participation rate of women is likely to remain high and will probably even increase, but there is no possibility of its continuing to increase at as fast a rate during the next 30 years as it did in the past 30.

Furthermore, the number of young people entering the labor force will surely decline because of the fall in the birth rate in the 1960s and 1970s. Thus, unless retirement patterns change, the ratio of workers to retirees will decrease substantially, and further improvement in life expectancy will intensify the decrease.

A cynic once observed that "rich or poor, it's good to have money." From that perspective, today's older Americans are much better off than their predecessors. They have more income and more wealth (adjusted for inflation) than any previous generation of elderly.

The cleavage between the elderly and other groups is one of the sharpest to emerge in recent years, as the population 65 and over grows in numbers and political power.

Although they constitute only 16 percent of the voting-age population, the political influence of the elderly is great because they can focus single-mindedly on a few issues of special relevance to them. Children, by contrast, have no political power themselves, and other age groups are not likely to devote political efforts exclusively to benefiting children.

Age is not the only basis for intergroup conflict. The interests of women and those of men are far from identicial, primarily because women have a stronger desire for children and care more about their welfare. Thus, there are many public policies such as those subsidizing child care or promoting part-time employment that could favor women at the expense of men.

If our society is to achieve "liberty and justice for all," traditional male *dominance* must end.. Great care is needed, however, to distinguish this objective from the elimination of male *presence* within the family. The challenge to individuals and to public policy is to promote equality between men and women without "throwing out the father with the bath water."

Some diversity of interests among age, sex, and marital status groups is inevitable, but the growing tendency to try to resolve differences through government poses a great danger to our nation. A society that tries to settle all the detailed questions of life through the ballot box and the courts should not be surprised to find itself fragmented, polarized, and unstable.

When large principles are at stake, there is no alternative to the political process; but for day-to-day adjustments regarding who does what and who gets what, both market processes and intrafamily decision making are usually smoother and less divisive.

Public policy priorities

There are many areas of American life that would benefit from changes in public policy. Based on the criteria of number of people affected, economic impact, and availability of workable solutions, highest priority should be given to *reform of the Social Security retirement system*.

This system affects nearly every American; over $100 billion in retirement benefits are paid annually. It is basically a good program and should be continued, but several changes are currently needed in order to correct injustices, increase economic efficiency, and restore the

continued on next page

Balance of institutions best for future

continued from page 23

system's financial integrity. In the fall of 1982 a Presidential Commission investigated the problems of Social Security, and many remedies were proposed.

In my judgment, the following modifications would provide the greatest improvement with the least disruption:

First, slowly and gradually raise the age of eligibility.

Second, make the program universal so that it covers every man and woman.

Third, make the individual's benefit (above a minimum level) proportional to the taxes paid.

Fourth, define a minimum benefit available to all elderly as a matter of right; if the earned benefit does not at least equal the minimum benefit, the difference should be made up from general revenue.

These changes would improve the balance between revenues and expenditures without raising taxes or reducing benefits to current retirees. It would result in fairer treatment of women, and it would lead to a larger work force and a bigger gross national product. Most important, if these moderate changes are not made now, we will face a crisis that may destroy the system as the baby boom cohorts of the 1950s approach retirement age.

A second area requiring priority attention is health. *Reform of health insurance*, and concomitant changes in the organization of medical care, are needed because the cost of health care is increasing at a more rapid rate than the nation can sustain in the long run.

Expenditures by private and public health insurance plans now exceed spending for national defense, and the present system of paying for care is incapable of stemming further increases. Most hospitals are reimbursed according to their costs and physicians according to their fees; thus, expenditures soar because neither the insured patient nor the hospital nor the physician has any incentive to hold them in check.

The best solution to this problem would be to develop comprehensive health plans that deliver care for a fixed amount per person or per family per year—that is, "capitation" reimbursement. In each area of the country there should be several such plans competing on the basis of quality and cost, and the government should subsidize participation in these plans by the poor and the near-poor.

Short of this comprehensive approach, and as a partial solution to our present difficulties, several steps should be taken.

First, Medicare and Medicaid beneficiaries should be offered a voucher option that would enable them to join existing comprehensive capitation plans as an alternative to the fee-for-service, cost-reimbursement system.

Second, a ceiling should be established on the amount of employer-paid health insurance that employees can receive *tax-free*; this ceiling should be generous enough to include all present plans, but should help deter future increases.

Third, all employees should be given a choice of health insurance plans, with the same contribution by the employer regardless of the plan selected, provided it meets federally established minimum standards.

Despite its fading importance, the family is still the biggest barrier to equality in postindustrial society.

—Victor Fuchs

Fourth, if an employee chooses a plan that costs less than the employer's contribution, the employee should receive from the employer a tax-free rebate equal to the amount saved.

The objective of these reforms is not necessarily to keep health care expenditures from increasing in the future but to ensure that these expenditures are the result of rational choices by physicians and patients who have considered the costs as well as the benefits of alternative courses of action.

The third area for priority attention, *increased investment in children*, involves more complex issues and solutions are less certain. Nevertheless, I favor expansion of subsidies for children, subsidies that would be available to all families regardless of marital status, work status of the mother, or income.

Subsidies to low-income families, however, should be proportionately greater than to high-income ones. These subsidies would help reduce the widespread inequality of opportunity that still stands as a formidable barrier to efficiency and justice in our society. Efficiency suffers because many infants, children, and adolescents do not receive enough investment in human capital to realize their full potential as workers and citizens. Justice suffers because inequality of opportunity contributes to inequality of achievement.

Subsidies for child care provided at home or in the market would alleviate some of these problems. These subsidies would also help women in their efforts to achieve equality with men.

Depending upon how they are structured, child subsidies could also contribute to a pronatalist policy, if further declines in fertility make such a policy necessary.

There are many different ways to provide subsidies for children, and considerable study is desirable before launching any major programs. The needs of children, however, must be kept in the forefront of public discussion because the political power of other groups, such as the elderly, is so much greater than that of children.

If more attention were paid to children, there would be fewer crises in adolescence, but the problems of this stage—unwed motherhood, poor work skills and attitudes, crime, suicide—will not disappear.

We should, therefore, *experiment with alternatives to conventional schools* for men and women ages 16-24. Many young people might benefit from an opportunity to leave their homes and schools to participate in residential programs that encompass work, training, and counseling. These experimental programs should appeal to advantaged as well as disadvantaged youth by providing an opportunity to perform a significant nonmilitary service for the nation through the conservation and enhancement of natural and human resources.

Youth who successfully complete such a program should be entitled to scholarships and other benefits similar to those given the veterans of World War II. These benefits would serve as an inducement to join the program and as a subsidy for further investment in human capital.

The best way to reduce unwed motherhood and unemployment among teenagers is to increase their skills and earning power, but *elimination of the minimum wage* would also improve their opportunities to work and make progress in life.

At present we make it illegal for many young people to obtain valuable work experience by setting a minimum wage that is higher than their net value to employers.

This policy bears particularly heavily on young black teenagers who, in many cases, must overcome other disadvantages such as growing up in low-income one-parent homes, attendance at trouble-ridden schools, and racial prejudice. The full benefits from the elimination of the minimum wage would take time to accrue, and many other policies are needed to improve the prospects for black youth. The minimum wage, however, needlessly makes their lives more difficult by imposing an artificial barrier to employment.

Final recommendations

In the future the government should pay more attention to preserving *efficiency* when designing redistributive programs. In general, a negative income tax or cash grants should be used rather than grants that are tied to the purchase of particular goods or services.

The worst policies of all are those that attempt income redistribution by regulating particular markets through wage controls, rent controls, energy subsidies, and the like.

This kind of interference introduces needless injustices and inefficiencies. Injustices arise because some of the people who benefit from the regulations are not the ones whom the policy is supposed to help—wealthy tenants in rent-controlled housing, for example.

Inefficiencies arise because regulations are expensive to administer and because people change their behavior in order to take advantage of controlled prices, rents, and so forth. For instance, when the government holds the price of gasoline below its true cost, consumers use too much of it and producers supply too little.

Most important of all, we must recognize the need for *balance*, both in the goals that we set and in the institutions that we nourish in order to pursue these goals. If we value efficiency *and* justice, freedom *and* security, the economic perspective tells us that we will often have to give up some of one goal in order to ensure the partial achievement of others.

Both theory and history indicate that the best way to seek multiple goals is through a balance of institutions—market, government, family, and others. No single institution is superior for all goals; each functions best when complemented by the others. Moreover, diversification, be it of institutions, genes, or security holdings, is the wisest strategy for stability and survival in the face of an uncertain future.

We must recognize the potential conflict between the family and the expansion of redistributive government. Despite its fading importance, the family is still the biggest barrier to equality in postindustrial society.

Inheritances can be taxed, but as long as mothers and fathers pass on to their offspring their genetic endowment, their knowledge, and their special heritage and values, attempts to achieve complete equality will be frustrated.

At some point in the future we will have to ask whether the last increment of equality is worth the loss of so valuable an institution as the family—one that can stand as a refuge from impersonal markets and authoritarian government.

The message for public policy is clear. Let the market do what only it can do well: allocate human, natural, and man-made resources to producers, and distribute goods and services to consumers.

Let government do what only it can do well: maintain a legal and financial framework conducive to the smooth functioning of competitive markets, redistribute income to ensure a more just society, and use taxes and subsidies to eliminate differences between private and social costs and benefits.

Let families and religious, philanthropic, and cultural institutions do what only they can do well: socialize the young, honor the old, transmit values, give texture and meaning to life, teach love, and inculcate faith in the possibility of human improvement.

The message for individuals is also clear. There is no magic path that can carry us to every goal. If we are wise, we will determine what we most deeply value and will realistically balance aspirations against resources. In short, we must choose, and the choices we make will help determine how we live. The wisdom of those choices will determine how well we live.

Serra House moved last Tuesday (May 10) beginning in the wee hours of the morning—8 a.m. found it near the intersection of Escondido Road and Alvarado Row.

Freelen...

continued from page 1

great ironies of advocacy is that it has such a bad name. But the one quality which you have to have consistently is honesty.

"If you don't provide accurate information or withhold it, then you have used up your good will. Once you have shaded the truth or lied, you don't have access. . .any more."

During 1978-79, he was chairman of the board of trustees for the Council for Advancement and Support of Education (CASE), a national service organization for college fund-raising, publications, and related matters.

A native of Rutland, Vt., Freelen received his bachelor's degree in political science at Stanford in 1957 and his MBA here two years later. He returned to the University in 1961 as associate general secretary and director of the Stanford Annual Fund.

He was named associate dean of students in 1969, director of student services in 1970, and director of government relations in 1972. He was promoted to associate vice-president for public affairs in 1978 and served as acting vice-president during 1980-81 while Rosenzweig was working on a major AAU project.

Vice Provost Gerald Lieberman headed a consultative committee for Kennedy on the search for the new vice-president. Freelen is the third appointment at this level in 1983. Prof. Henry Riggs, industrial engineering, a 1957 classmate of Freelen, was named vice-president for development and John Schwartz, university counsel, was promoted to vice-president.

Freelen lives in Watsonville with his wife, Sally, and their two children.

Kennedy blasts merit-based scholarships

The new national trend toward merit-based scholarships is "quite pernicious," Stanford President Donald Kennedy said Thursday, May 12.

The trend is "quite a significant departure" by "quite good quality schools" from the "quite carefully constructed system of need-based" financial aid, he noted.

"I don't know how heavily laden this bandwagon is going to get," Kennedy told the Faculty Senate. "But if it continues to grow rapidly for another two or three years, it may "prove hard for a great many places to resist it—though not, I sincerely trust, for us."

Stanford is one of the few institutions nationally which follows a "need-blind" admissions policy. It meets the calculated financial need of all those admitted as freshmen through a combination of student self-help, loans, jobs, grants, and scholarships. About 70 percent now receive aid.

In the 1970s, President Richard W. Lyman of Stanford was among the leaders in a national effort which urged the National Collegiate Athletic Association to have athletic scholarships based solely on need. Their effort failed by two votes.

Board of Trustees report

Board of Trustees approves faculty appointments, promotions

On May 10, 1983, the Board of Trustees approved the following actions, effective September 1, 1983, unless indicated otherwise:

PROMOTIONS

Nancy D. Cartwright, professor of philosophy; Eve V. Clark, professor of linguistics; Ralph Cohen, associate professor of mathematics; C. Norman Coleman, associate professor of radiology and medicine; Dieter R. Enzmann, associate professor of radiology, 6/1/83; Ronald J. Gilson, professor of law, 7/1/83; Peter B. Gregory, professor of medicine (clinical) and, by courtesy, of family, community, and preventive medicine (clinical); Richard T. Hoppe, associate professor of radiology; Patricia P. Jones, associate professor of biological sciences; James V. Jucker, professor of industrial engineering and engineering management; Helmut Krawinkler, professor of civil engineering; Drew V. Nelson, associate professor of mechanical engineering; Nel Noddings, associate professor of education; James Plummer, professor of electrical engineering; Orrin W. Robinson III, professor of German studies.

REAPPOINTMENTS:

Arthur N. Applebee, associate professor of education; M. Beatriz Arias, assistant professor of education; Kristina Branch, assistant professor of art; Hector Cavallari, assistant professor of Spanish and Portuguese; Dean R. Chapman, professor of aeronautics and astronautics and mechanical engineering: (research); William H. Durham, assistant professor of anthropology; John K. Hoover Tower project approved

The Board of Trustees took the following actions at its meeting on May 10, 1983:

1) Approved actions already taken by the Office of the Vice-Provost and Dean of Graduate Studies and Research to enter into contracts and grants for research for the month of February, 1983, totaling $9,516,673 and for the month of March, 1983, totaling $12,404,986. The monthly average of such awards for the twelve-month period ending March 31, 1983, was $14,879,174 compared with $12,536,981 for the corresponding period the year before.

2) Accepted gifts received during the month of March, 1983, totaling $9,373,103 and during the month of April, 1983, totaling $5,798,886.

3) Amended its By-Laws to provide for the creation of the office of Vice-President and General Counsel.

4) Appointed Bruce Hinchliffe as Stanford's representative to the Newhouse Foundation.

5) Authorized an investment of $1,000,000 in CH Transition Fund.

6) Accepted a report of action taken between meetings to invest $400,000 in the convertible notes of SB Investors, Inc.

7) Accepted a report of action taken between meetings to offer to purchase the Leasehold interest at 3381 Miranda Avenue.

8) Heard the semi-annual report by portfolio managers from Capital Guardian Trust Company.

9) Approved the project and design for improvements in the facilities for tennis.

10) Approved the project to improve fire safety at Hoover Tower with a total budget of $807,000.

11) Approved the concept of constructing the Samuel J. and Ileen B. Campbell Wing of the Braun Music Center.

12) Authorized the transfer of $1,017,661 in the Medical School Equipment Annuity Fund from funds functioning as endowment to expendable funds.

13) Approved the design for the Electronics Building Annex at the Stanford Linear Accelerator Center (SLAC).

14) Heard the Annual Report on Debt.

15) Heard a report on a change in the interest rates charged on funds loaned to students.

16) Established the Edward F. and Irene Thiele Pimley Professorship in Neurology and the Neurological Sciences.

17) Heard a report on the proposed Center for Molecular and Genetic Medicine at the School of Medicine.

18) Conversed informally with students selected for prestigious scholarships.

19) Heard a report from J. Myron Atkin, Dean of the School of Education, on "Collaboration with High Schools: Stanford's School Study."

20) Discussed the "Facilities Plan and Capital Funding Forecast, 1983-86."

□ **Academic yr, '83-'84:** Visit. scholar, wife; nonsmokers, need med-sized hse on campus. Poss. EXCHANGE for hse in Bethesda, Md. 10 min. to NIH. Call Gurley, 857-0169.

□ **June to Aug. (flex):** 4 to 6 wks. Mature 17-yr-old French male seeks active fam. life. Exchange later (Paris & Normandy coast) or will pay. Enjoys sports, music, cooking; plans wilderness trips. Call Chiltons, 497-4289 (day), 854-5432 (eve).

□ **June 22 to July 23:** Swedish prof, wife, 16-yr-old daughter seek 2-3Br furn hse or apt. Call 948-8058.

□ **June or July thru Aug. '83:** Reliable student seeks home to hsesit/caretake. Will care for garden, yd, pets. Local refs avail. Call Kyle Koehler, 324-1471 (early a.m. or eves.)

□ **Beg. Nov. '83 for 1-2 yrs:** Visit. Australian M.D., wife & 2 children (5 & 2) seek 3 or 4BR furn hse on or nr campus. Refs. avail. Call B. Barnett, 497-5913 (day).

□ **Sept. '83 to Aug. '84:** Visit. French M.D. & wife seek 1BR furn. apt. on or nr campus. Local refs avail. Call B. Barnett, 497-5913 (day).

□ **Sept. '83 to Jan. '84:** Female librarian seeks hse or apt. Call D. Kemp, 321-3204 or write: 1812 Willow Rd., Apt. 406, Palo Alto, Ca. 94304.

□ **July, Aug., Sept. '83 (flex):** Retired cpl. seeks apt. or small hse. Nonsmokers, no entertaining, very neat. Local refs. Call Fuchs, 326-7639 (day), 858-1527 (eve).

□ **July 1, '83 to Dec. 31, '83:** Seeking 3BR furn. hse in Palo Alto/Stanf. area for visit. prof, wife & 2 children. Call Susan Richardson or Michelle Renaldo, 497-2218 (day).

□ **Aug. '83 to July '84:** Visit. prof, wishes to rent hse in good schl nghbrhd for above period (flex). Call COLLECT (416) 651-0228 or write Marshall Walker, 24 Turner Rd., Toronto, M6G 3H6, Ontario, Canada.

□ **Beg. June 15 for min. 1 yr:** M.D. & wife, no children, no pets, seek 2 or 3BR unfurn. hse in Palo Alto area. Refs. avail. To $1000/mo. Call (313) 996-1800 or write Stuart Flynn, M.D., 1810 Virnankay, Ann Arbor, MI 48103.

□ **Sept. 25 to Mar. 25, '84 (flex):** Visit Canadian physician & wife, no children, seek 1-2BR furn apt, sm hse, or hsesit position. Prefer within 10 min. to Stanf. Med. Ctr. Refs. avail. Call (403) 432-3912 (day), (403) 439-5135 (eve).

□ **Sept. '83 to May '84 (flex):** Visit. prof, sabbatical at Stanf., & spouse with dog seek 2BR furn hse in Palo Alto, Menlo Pk area. Nonsmokers. Call COLLECT (413) 367-2286 (eve).

□ **Aug/Sept. '83 thru July '84:** Humanities Ctr Fellow & spouse visit. from Duke U. seek 1-2BR fully furn hse or apt. in Palo Alto or Stanf. area. Refs. avail. Call COLLECT (919) 544-3116 late aft., early eve.

□ **Beg. June '83 for 6 mos:** Faculty cpl from Albert Einstein Coll. of Med, NYC, seek rental nr Stanf.

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Stanford—Utah State team launch electronic tether in space

Researchers from Stanford and Utah State University launched a sounding rocket at 1 a.m. Saturday, May 14, from the White Sands Missile Range, N.M., to test the effects of a beam of electrons on the surrounding ionosphere.

The rocket, a Nike Black Brant V, a two-stage, solid-fuel rocket, will fly for about nine minutes and reach an altitude of approximately 250 kilometers (155 miles).

Roger Williamson, senior research associate at the Stanford Electronics Laboratory, said the experiment, called CHARGE (Cooperative High Altitude Rocket Gun Experiment) is the first use of an electrodynamic tether in space. (The word "gun" refers to an electron gun, not a weapon.)

The rocket will also carry sophisticated, state-of-the-art electronics, including a microprocessor, to monitor and analyze the data.

At about 90 kilometers (55 miles) the top half of the rocket is to separate from the bottom half containing the rocket motor. The payload will stop spinning, and will orient itself so it is traveling sideways, perpendicular to the magnetic field and to its direction of travel.

Two portions of the sounding rocket then separate into a "mother" and "daughter" section. Most of the instrumentation is in the mother section, which is connected to the daughter by a long wire.

An electron gun fires from the mother, and instruments on both sections measure the beams as the two fly apart.

"We are particularly interested in looking at what we call plasma waves that are generated by the electron gun beam pulsing," Williamson said. "These are radio waves of various frequencies, as well as some special types of waves that only propagate when you have ionized gas around, like we do in the ionosphere."

The mother section takes photographs of the beam, measures the light, the voltages, and the energy of the electrons which come back to the sounding rocket.

The electrons fired off must be replaced on the rocket to neutralize it. "We are very much interested in how that occurs in space," Williamson said, particularly with large space stations and space telescopes planned in the future.

Williamson said that the insulated wire between the two sections will provide the first reference point in space for measuring voltages. When the wire is stretched fully it will be about the length of four football fields.

He said the microprocessor will be measuring the beam at a rate of 10 million times a second. The devices will collect 160 million bits of information per second.

The system then will "dump" the data to earth by radio from the electronic memory on board.

Williamson said that several things make the experiment unique. First, this is an active experiment; most in the past have been passive. Second, CHARGE uses nature as the laboratory, which means the scientists will be dealing with densities, pressures, and energies different from what can be recreated in laboratories. This will enable engineers to better understand the operation of the space shuttles and large space stations.

Other Stanford researchers are providing a group station to monitor the very low frequency transmissions produced by the electron gun and the tether.

John Raitt is the main scientist on the project from Utah State, where the experiment was built. The photography devices were provided by Los Alamos National Laboratory, and several Japanese scientists from the Institute for Space and Aeronautical Science in Tokyo provided much of the instrumentation. Other scientists from the University of Michigan and NASA's Goddard Space Flight Center will participate in the experiment.

Funding comes from NASA.

Housing. . .

continued from page 26

during sabbatical. Our hse avail. for rent or EXCHANGE. Call Dr. Philip Silverman, (212) 430-3124 (day), (914) 723-3103 (eve), or write: 2 Shady Lane, Scarsdale, NY 10583.

□ **Sept. '83 to Aug. 31, '84:** Visit. Prof., wife, 3 children seek to rent 3-4BR furn hse on or nr campus. Up to $1500/mo. No pets, nonsmokers. Call 497-3480 (day), 856-0534 (eves, wknds).

□ **Beg. Oct. 1, '83:** Visit. Eng. MD seeks 3BR hse or apt for 1-2 yrs. Wife, children (2½ & 6 mos). Nonsmokers. Prefer furn. nr. campus. Will pay to $1000/mo. Call UK 272-502114 or write 54, Westacre Close, Westbury-on-Tryon, Bristol, UK, Dr. Gaston.

□ **Aug. '83 to July '84 and Sept. '83 to Aug. '84:** 2 Stanf. Humanities Ctr Fellows seek quiet, furn. 1BR apts, pref. nr. campus. Call Sue Asch, 497-3054 (day).

□ **Aug. '83 to Aug. '84:** Visit. scholar from New Mex., spouse & children 12 & 14, seek 3BR hse on or nr campus. Call W. Harrison, 497-4224.

□ **Beg. late Sept. '83:** Studious male grad student, nonsmoker, seeks furn. rm. in hse on campus or College Terr. Ktchn unnecess. Local refs. Call Gabriel, 328-5932 (eve).

□ **July 1 for 1-4 mos:** Reliable Stanf. staff seeks HOUSESIT for summer—flex. Returning from EAST. Nonsmoking, childless cpl will give xclnt care to plants, pets, hse. Call COLLECT (617) 469-2040 or write David Mark, MD, 20 Walnut Hill Rd., Chestnut Hill, MA 02167.

□ **June 14 to July 12:** Careful tenant, English woman prof, staying longer than planned, seeks apt or hse on/nr campus. Call H. Himmelweit, 321-2052 (day) or 856-9696.

□ **Summer:** Visiting grandparents desire to HOUSESIT. Avail. any part of summer. Call Paulette, 493-4598.

□ **Aug. '83 to July '84:** Visit. scholar from Penn State seeks furn. 3BR hse. Prefer Palo Alto or Sunnyvale Sch. Dist. Nonsmokers, no pets. Will care for plants, pets, gardn. Call (814) 234-8110 (eve). Prof. Mathews, (814) 865-8859 (day).

□ **NOW:** As soon as poss: 2-3BR unfurn hse or duplex, commute dist. to Stanf. Will pay to $800-900/mo. For new Stanf. fac., husb, & child. Call Elissa, 497-4977 & lv. message.

□ **Beg. July 1:** For min. 1 yr. M.D. assoc. w/Stanf. Med Ctr seeks to lease hse or condo w/3BR in or so. of Palo Alto area. No children, no pets, not cost limited. Call (619) 450-1133 or write John Connolly, 8652-1 Villa La Jolla Dr., La Jolla, CA 92037.

□ **NOW to Sept. 1 or longer:** Stanf. staff w/Univ & local refs wants caretake or HOUSESIT in Palo Alto area. Will give excl care to your hse, business, yd, pets. Call Donna, 497-3967 (day).

□ **Beg. Aug. (flex) for academic yr:** Visit. scholar, wife, 1 child, seek furn. hse. or apt. nr campus. Nonsmokers, clean living, home-owners. Will care for plants & pets. Local refs. Call COLLECT (314) 875-2858 (eve).

Scientists seek Sakharov release

Eight internationally prominent physicists and arms control experts Monday, May 16, urged the Soviet Union to allow Andrei Sakharov to emigrate to the West.

They strongly discounted Soviet claims the famed physicist still has crucial state secrets stemming from his past work in weapons programs.

"Based on our experience and our understanding that Sakharov has had no involvement in Soviet weapons programs for more than 15 years, we can neither understand nor accept the validity of the Soviet statement," they declared.

Signers included Luis W. Alvarez, of UC-Berkeley; Hans A. Bethe, of Cornell; Richard W. Garwin, of IBM's Thomas Watson Research Center; Jerome Weisner, of MIT; Herbert York, of UC-San Diego; and Sidney Drell and William J. Perry, both of Stanford, and Marvin Goldberger, president of Cal Tech.

"Soviet authorities have recently said that Andrei Sakharov cannot be permitted to leave the Soviet Union for the West because of his knowledge of crucial state secrets based on his past work in their weapons programs.

"Each of the undersigned scientists has had a long and extensive involvement with U.S. defense technology and problems. Based on our experience and our understanding that Sakharov has had no involvement in Soviet weapons programs for more than 15 years, we can neither understand nor accept the validity of the Soviet statement.

"We urge that our great colleague Andrei Sakharov be allowed to emigrate and come to the West, where we are eager to welcome him."

Personnel update

Tuition grant applications due

Faculty and staff parents whose children qualify for the University's Tuition Grant Program are asked to submit applications during June for the school year beginning next fall.

Applications for those children who will be attending UC-Berkeley must be completed before June 15.

Staff members with five or more years of continuous, full-time (100%) service with the University are eligible to apply for Stanford's tuition grants for their children who will be attending accredited colleges and universities.

Additional information and applications are available from Chris Rodger in the Office of Benefits and Records, Old Pavilion, or by calling 497-1778 between 9 a.m. and 4:30 p.m.

Applications are available also at the Benefits Office at SLAC. Employees located at SLAC should return their completed applications to the SLAC Benefits Office.

Dental plan rates increase June 1

Dental plan rates will increase effective June 1, reports Jeannie K. A. Thomas, manager of benefits and records.

Faculty and staff members who are not currently required to contribute to the cost of the dental premiums because of their appointment or the terms of a collective bargaining agreement will not be affected by the rate increase. However, if employment status is such that a deduction is currentiy made from an employee's pay for dental insurance, the deduction will increase on the May 22 paycheck. The May 22 deduction covers the month of June.

If you have any questions or wish to make changes in your dental plan participation, please call the Office of Benefits and Records at 497-1776 or 1777. SLAC employees should call the SLAC Benefits Office at 2357.

Below are the rates effective June 1:

For	50-74% Time Your Monthly Contribution	Leave Without Salary Your Monthly Contribution
You	$ 5.62	$11.25
You plus one dependent	$10.29	$20.58
You plus two or more dependents	$16.76	$33.52

Carpools

Riders needed for vanpool M-F. Leave Newark 7 a.m.; Leave Stanford 4:45 p.m. Call Mark, 7-4342.

Need ride: San Jose (No. Capitol) to Stanford (ERL) and back, 8:30 and 5, M-F. Call Maria at (408) 280-2568 (day) or (408) 926-5328 (night).

Accidents and injuries

Accidents and Injuries Occurring During Week of May 9-13

Cause of Accident	Number	Number of Days Off
Animal/insect contact	2	(0, 0)
Cut by sharp object	1	0
Pinched, squeezed, crushed	1	0
Fall from height (incl. stairs)	1	1

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

43520-PM (JCC:2094) ADMIN ASST II: Supv personnel activities; interpret Univ policy; maintain records & control research grant expenditures; prep annual operating budget; monitor & control expenses; prep monthly statements & forecasts for division accts; assess & recommend div'l space & eqpt allocations; represent Clinic Chief in negotiations w/ other clinics; prep & monitor annual IMC budget & prov financial forecasts; QUALIFICATIONS: prev exp in budgetary mgmt & personnel supvn; excel interviewing skills; diplomatic & resourceful in interpersonal relationships; ability to assign prior; and show initiative in developing creative solutions to problems required; computer literacy desired; contact: Anne Gaddy, Med Ctr S-169 (497-5821).; C05; $1670-2086.

21692-JB (JCC:2160) ACCOUNTANT II: responsible to provide acctg serv & acctg info to Operations & Maintenance Personnel as directed by the F/M Analyst; position is of a cost acctg nature; prov cost useful for income & expense measurements; analyzing variance between income & expense; devel costs approp for mgmt decisions; aid in controlling operations; specifically prep journels, analyze accts, work w/ mgrs to research & reconcile balances, monitor acctg data for customer service; must be able to access info on HP3000 data base; QUALIFICATIONS: BA or BS in Acctg or Business or equivl practical exp; familiarity w/ complex acctg system, computer applications in acctg fields & principles of cost acctg & fund acctg; must be able to meet deadlines & work under pressure to meet deadline from multiple sources; must be well organized & have strong interpersonal skills & communications for dealing w/ a wide variety of people.; C06; $1854-2312.

40382-JB (JCC:2262) FIN/MGMT ANALYST II: Develop budget control mechanisms; review monthly expenditures vs budgets; revise budgets periodically; report monthly to DOE & periodically to other sponsors; prep annual 5-yr budget plan submittals; prep annual Univ budget; interact w/ sponsors, SLAC & Campus budget & acctg offices; interact w/ SSRL Directorate & staff on budget matters; QAULIFICATIONS: 3-5 yrs Acctg & financial mgmt exp, preferably w/ emphasis on Dept of Energy funding; hands-on exp w/ computer-based acctg & financial mgmt sys desirable.; C07; $2113-2724.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, May 24, in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

27147-LL (JCC:5588) LIFE SCI RES ASST I: Exp in drug analyses using gas-liquid chromatography, high performance liquid-chromatography & radioimmunoassay techniques; familiar w/ all aspects of these techniques incl a thorough understanding of theory involved in performing these analytical techs; exp w/ instrument maintenance desirable; QUALIFICATIONS: knowl of scientific theory assoc w/ completion of a Bachelor of Sci degree & sufficient lab exp to allow the indiv to function independently in the lab.; C05; $1670-2086.

26639-AW (JCC:5108/5116) SCIENTIFIC PROGRAMMER II/III: Act as a genl consultant/analyst for users of the software & services of CIT; act as an instructor for CIT classes; write & review documentation for CIT users; help plan, implement, test, & evaluate user software, incl some programming; give users consulting advice & other tech assistance on a broad range of applications incl utilities, langs (PL/I, FORTRAN), text processing (SCRIPT, WYLBUR), statistical packages (SAS,SPSS), & database tools (SPIRES); phone/-mail consulting; QUALIFICATIONS: BA Degree or equiv edu/exp; approx 3-5 yrs computing exp w/ text editing & formatting using WYLBUR & SCRIPT, data base/info retrieval (w/SPIRES), graphics & statistical programs; 3 yrs customer serv exp in tech writing/teaching; excel written/verbal commu skills w/solid command of English lang; exp in design & development of user applications; excel planning/organization ability; level III require in-depth exp w/ an understanding of a broad range of programming langs & applications.; C06/C07; $1854-2312/2113-2724.

Nonexempt

11059-PM (JCC:2554) SECRETARY II: Academic Affairs Sec sets up & maintains all undergrad & grad student academic files, grad admission files, grad award files, & alumni files; handling corresp, transcripts, study lists, gradeslips, supplementary grad report cards & all petitions & applications; produce copy for Courses & Degrees; typ qrterly Time Schedules; maintain & distribute up-to-date rosters of students & advisors, & Preliminary Class Lists, End Quarter Reports, etc; serv as receptionist in Dept Offc; answering phones; sorting mail; QUALIFICATIONS: typ 50; substantial exp in genl offc work; familiarity w/ Stanford forms & procedures helpful; some exp w/ computer text-editing highly desirable; ability to set constantly changing work prior required, using high level judgment & discretion; ability to interact effectively w/ diverse group of faculty, staff, students & the public; send appl/resume to Betty Kaplan, Dept of Communication, Bldg. 120.; B11; $1246-1310.

27054-PM (JCC:2554) SECRETARY II: Sec'l Assistance to Sr. Fellows, Sr. Res Fellows, and/or Visiting Scholars participating in Domestic Studies Program of Hoover Institution; typing manuscripts, articles, & corresp (making extensive use of word-processing eqpt); covering phones on call-director eqpt; this support will be coordinated by sec to the dir of the Domestic Studies Program; QUALIFICATIONS: typ 65; excel typing skills; prev exp on word-processing eqpt preferred; ability & willingness to learn required; judgment & tact in fielding varied requests; ability to establish work prior; send appl/resume to Mrs. Audie Carlson, Hoover Institution or call 497-2585.; B11; $1246-1310.

32122-PM (JCC:2562) SECRETARY III: Sec to Dir of Residency Program & Postgrad Edu Program & Pediatric Subsection faculty in Div of Diagnostic Radiology; developing letters & brochures to be sent to applicants; screening applications & routing to proper faculty for review; setting up interview schedules; prep mat'l pertaining to course mat'l & mail; make arrangements for mtgs; answer phones, corresp, travel, monitoring accts, manuscripts, etc; prov sec'l serv for Chief Resident relating to schedule & programs of residents, etc; QUALIFICATIONS: typ 65-70; excel organizational skills & ability to work w/out supvn; good command of English lang & excel typing skills; familiarity w/ Stanford policies & forms very helpful; dictaphone & word processor desirable; send appl/resume to Sally Healey, S078 Med Ctr.; B14; $1440-1514.

43577-PM (JCC:2596) SECY II-SPEC: Prov full sec'l serv to Faculty in Endocrinology Div of Dept of Med; type corresp & manuscripts fr long hand & transcription, incl careful proofreading of final drafts; use Xerox word processor; answer phones; set up & maintain filing sys for clerical & scientific mat'l; open & sort mail; make travel arrangements & prep expense reports; prep purchase reqs for lab & offc supplies; QUALIFICATIONS: typ 65 fast & accurately; knowl of or ability to learn Xerox 860 word processor; well organized; good interpersonal skill; knowl of scientific & med terminology desirable; good written & oral commu skills; send appl/resume to Mary Driscoll, Med Ctr S005.; B12; $1310-1373.

31436-PM (JCC:2672) MED SERV ASST III: 8:30-5pm; performs all clerical duties nec to properly register patients into Faculty Practice Program; interview patients for financial & insurance info; receives & documents patient cash payments; works under dir of Clinic Chief & Nurse Mgr in Neurosurgery Clinic to accomplish clerical functions of patient care provided in ambulatory setting; duties incl patient appt setting, req lab & radiology exams as well as heavy telephone commu w/ patients, physicians & other depts; QUALIFICATIONS: 1 yr exp in a med setting; able to work in a fast pace, high pressure environ; able to interact w/ public; bilingual ability desirable; contact: Vicki Stewart, A367 Boswell, 497-6323.; B11; $1246-1310.

31435-PM (JCC:2672) MED SERV ASST III: 50%; performs all clerical duties nec to properly register patients into Faculty Practice Program; interview patients for financial & insurance info; receives & documents patient cash payments; works under direction of Nurse Mgr or Clerica Supvr in Surgery Clinic to accomplish clerical functions of the patient care provided in ambulatory setting; QUALIFICATIONS: typ 35-40; 1 yr exp in a med setting; able to work in a fast pace, pressure environ; able to interact w/ the public; bilingual ability desirable; contact: Vicki Stewart, A367 Boswell Bldg., 497-6232.; B11: $623-655

32504-BP (JCC:2454) OFFICE ASST II: Support dept professionals & sec—data processing, proofreading & editing; typ responses to routine corresp; screen phone calls; open & sort mail; filing; photocopying; run errands; serv as bkup on word processor; QUALIFICATIONS: typ 60; excel grammatical & spelling skills; evidence of flexibility & reliability; good organizational skills; ability to interact w/ diverse group of people; prev word processing exp helpful, but will train; prev offc exp desired; send appl/resume to Sally Hines, 105 Encina Hall.; B09; $1130-1189.

31168-PM (JCC:1747) LIBRARY SPEC I: 75%; 10-5pm; performs duties in Gov't Documents Dept; checks out, renews, discharges documents; maintains circulation records according to dept. guidelines; processes monthly & quarterly overdues & mails notifications; serv as dept resource person regarding circulation activities & genl info questions; enforces dept circulation procedures & regulations & SUL policies as well; checks patron ID for circulation of documents; assts in interviewing, hiring, & training student assistants & evaluates performance; schedules staff hrs at circulation desk; QUALIFICATIONS: typ 40; prev public serv exp; good organizational & clerical skills; reliability & punctuality; familiarity w/ WYLBUR or other word processing sys desirable; prev lib exp desirable; contact: Bob Johnson, Green Lib, Room 223 (497-3152).; B10; $892-935.

31167-PM (JCC:2462) OFFICE ASST III: Performs duties in Privileges Division of Access Services Dept; answer patrons' questions & makes approp directional/info'l referrals; interviews patrons to determine privileges needs; issues lib cards; accepts payments; takes appi for UC Berkeley/Stanford Coop Program cards; respon for opening/-closing procedures as assigned; organizes & maintains complex records, files, & statistical records; maintains sections of Privileges Manual; prov clerical assistance to Div Head; QUALIFICATIONS: typ 45; demonstrated clerical & organizational skills; prev public serv exp; ability to learn & interpret a large number of complex policies on lib privileges & fees; good commu skills; prev cash register exp desirable; knowl of standard offc machines & prev exp w/ automated lib offc processes desirable; contact: Bob Johnson, Green Lib, Room 223 (497-3152).; B11; $1246-1310.

31433-PM (JCC:2696) MED SERV ASST IV: 8:30-5pm; respon for coordinating & supervising clerical functions that support patient care in Eye Clinic; performs & supv others in performing charge procedures, ordering lab tests, making patient appts, telephone commu, preparing med records & registration process; QUALIFICATIONS: typ 40; must have demonstrat supervisory ability; 2 yrs exp in a med setting; able to work in a high pressure situation; must have excel verbal & writing commu skills; contact: Vicki Stewart, A367 Boswell Bldg., 497-6323.; B14; $1440-1514.

31431-PM (JCC:2696) MED SERV ASST IV: 8:30-5:00; respon for coordinating & supervising the clerical functions that support patient care in ENT Clinic; performs & supv others in performing charge procedures, ordering lab tests, making patient appts, telephone commu, preparing med records & registration process; QUALIFICATIONS: 2 yrs exp in a med setting; demonstrated leadership ability; able to work in a high pressure situation; excel verbal & writing commu skills; contact: Vicki Stewart, A367 Boswell Bldg., 497-6323.; B14; $1440-1514.

31635-TC (JCC:6810) SOC SCI RES ASST I: 9-5:30 occasional wkend & evening hrs; coord screening & recruitment of potential subjs for sleep & neurobehavioral studies involving premature infants; conduct sleep observations of infants on and off waterbeds; perform data reduction & analysis by hand & w/ computers; prep manuscripts & grant applications; the ongoing research is done at Intensive Care Nurseries of Stanford Hospital & Kaiser-Permanente Med Ctr in Santa Clara; QUALIFICATIONS: typ 40+; BA or equiv exp; interest in developmental problems desirable; interest in developing computer & word-processing skills; well-organized; strong atten to details; commu effectively w/ a broad range of people; require a car to travel to Kaiser Hospital.; B12; $1310-1373.

Bargaining Unit

29759-DS (JCC:7654) CUSTODIAN: TMS Unit; 8-4:30; works under direct supvn; performs daily cleaning, mopping, waxing, vacuuming, cleaning restrooms, etc; washes walls & woodwork by hand or using industrial eqpt; 1 spot cleans, shampoos, waxes, & oils furniture; QUALIFICATIONS: knowl of cleaning & waxing methods & mat'ls used in industrial cleaning; knowl of related safety procedures; ability to lift moderately heavy items, 25-75 lbs; ability to withstand extensive walking, pushing, pulling, stooping, & squatting.; A13; $ 6.68.

SLAC

94690-JM (JCC:8880) ELECTRONIC ENGINEER:
94691-JM (JCC:8880) ELECTRONIC ENGINEER: Hardware & software sys design of computer control & monitoring sys for linear accelerator; sys integration & field testing; design, develop't & testing of analog & digital circuits; design, planning, documentation of sys & training of field personnel; QUALIFICATIONS: BSEE (MSEE preferred) in electronics or computer sci or equiv; extensive exp in computer control sys; analog & digital design, particle accelerator control sys exp desirable; knowl of FORTRAN essential; assembly lang, Camac & multibus exp desirable; good oral & written commu skills; ability to effectively supv efforts of others.; C99; $2600-3800. APPLY AT SLAC

94695-JM (JCC:8880) ELECTRONIC ENGINEER: Design, construct, test, maintain & document radiation & electrical interlock sys for the accelerator, research area & storage ring facilities; supv electrical installers, electricians, mechanics & draftpersons; develop safety procedures, schedules, cost estimates & procurement; QUALIFICATIONS: BSEE or equiv; must have comprehensive knowl of fail-safe redundant circuit design w/ clear understanding of falure mode implications; familiar w/ National & Calif. codes & safety regulations; exp in lge accelerator environ desir; familiar w/solid state & electromechanical logic circuits; C99; $2200-3000; APPLY AT SLAC (854-3300 ext. 2353)

94644-JM (JCC:2462) OFFICE ASST III: Prepare & type travel expense reports applying approp policies, procedures & authorizations; typ reqs, advances, invoice & other forms; maintain files; asst w/ travel arrangements, quarterly reports, annual analyses & spec projs; serv as reference source on travel policies for personnel, visitors and/or guests; QUALIFICATIONS: accurate typing 50-65 wpm; good spelling & figure aptitude; knowl of 10-key calculator, intelligent typewriter (or willingness to learn); good understanding of filing tech; ability to work under pressure w/ frequent interruptions; ability to be tactful, discrete & exercise good judgment.; B11; $1246-1310. APPLY AT SLAC

91355-JM (JCC:5124) SCIENTIFIC PROGRAMMER IV:
91354-JM (JCC:5124) SCIENTIFIC PROGRAMMER IV: Specify, write, debug & support real-time FORTRAN applications programs for SLC control sys; programs incl control & monitoring of complex accelerator apparatus such as radio frequency klystrons, megawatt power supplies, beam monitoring instrumentation, etc; work w/ engrs, technicians & operations personnel performing on-line testing; QUALIFICATIONS: MSEE, MSCS, Ph.D. or equiv; thorough knowl of CAMAC sys & VAX VMS operating sys highly desirable; ability to independently & effectively commu w/ others.; C08; $2464-3848. APPLY AT SLAC

95572-JM (JCC:5284) COMPUTER OPR TRNEE: TMS Unit; rotating shift; 15 mon training program; operate peripheral units such as tape drives, disk drives, card readers, printers; monitor & report eqpt malfunctions & output errors; fulfill admin reporting requirements; QUALIFICATIONS: high school or equiv; some exp in computer facility working in dispatch, disk, tape area; must know how to clean eqpt, change printer ribbons/paper; good reading, oral & arithmetic skills.; A00; $1300. APPLY AT SLAC

95355-JM (JCC:6680) S&E TECH MECH: TMS Unit; monitor target status & record vital data in log book; fill, transport, connect, operate & service liquid hydrogen & nitrogen dewars; asst in construction, testing, installation & alignment of apparatus used w/ hydrogen targets; maintain eqpt; QUALIFICATIONS: requires basic training in engrg & scientific principles, math & related subjs equiv to technical, trade or vocational school; couple yrs of practical work exp; working knowl such as maintenance, troubleshooting, test, repair & modification of tech eqpt; proficient in use of standard hand tools, wrenches, drills, saws, etc; exp w/ vacuum sys, leak detectors & cryogenics desirable; able to qualify for gov't driver's license; ability to handle heavy eqpt.; A28; $ 1647. APPLY AT SLAC

94958-JM (JCC:6714) ACCELERATOR SYS OPR TR: TMS Unit; rotating shift; genl operation of complex research sys to establish, tune & maintain particle beams for physics experiments; correction & preventative maintenance of related eqpt; QUALIFICATIONS: AA degree in electronics or equiv; related exp desirable; aptitude for learning computer programming, operation & particle accelerator beam dynamics; ability to function in high stress environment.; A00; $1811. APPLY AT SLAC

91526-JM (JCC:6774) ELEC PROTOTYPE FAB: TMS Unit; perform work such as chassis & modular devices metal fabrication, electronic assembly, genl wiring, wirewrapping & breadboard circuits; use electrical, electronic & machine tooles; QUALIFICATIONS: ability to read schematic & logic diagrams, related component polarity & symbology; ability to originate wire lists fr prints, demonstrate proficiency in chassis layout, fabrication & wiring; basic math skills required to work w/ fractions, decimals & metric dimensions; basic knowl of printed circuit board design desirable; basic fundamentals of electronics theory mandatory w/ several yrs or related practical exp; practical & soldering test will be given.; A28; $1647. APPLY AT SLAC

Public meeting set May 27 on renovation of Inner Quad

A meeting to solicit public opinion about design of the upcoming Inner Quadrangle renovation will be held from noon to 2 p.m. Friday, May 27, in room 2 in the History Corner basement.

Part of the open planning process preceding the actual design phase, the session will feature a presentation by Anthony M. Guzzardo, the San Francisco landscape architect retained by the University as project designer. Guzzardo will present results of his preliminary site analysis, including surveys of existing conditions in the courtyard, behavioral and use characteristics of the area, and historical research.

Interested persons then will have an opportunity to address Guzzardo and the project's advisory committee on any aspect of the Inner Quad renovation, according to project manager Max Mazenko.

Other meetings are being scheduled with departments that surround the Inner Quad.

Mazenko said the meetings are being held "because of the special nature of the Inner Quad courtyard as the historical heart of the campus and because of the anticipated high level of community interest.

"Because the courtyard is the original campus 'commons space,' community input is regarded as vital to the planning and design process and development of a renovation plan which will be accepted by the community as a whole."

Specific design recommendations are expected from Guzzardo next autumn. Presentations of the design alternatives to the community and the Inner Quad neighbors are tentatively set for October.

Both oral and written statements are solicited for the May 27 meeting, Mazenko said.

The renovation project will include new paving and ground surfaces, landscaping and irrigation, lighting, and additional seating, using $1 million in anonymous gifts donated for that purpose.

When designing the University Frederick Law Olmsted recommended that the Inner Quad courtyard be paved with artificial paver blocks resembling granite. Instead, it was paved with bitumen, a forerunner of asphalt, and later covered with gravel. The rough surface has been a source of aggravation to many for nearly a century.

Olmsted also wanted seat-height edges around the eight planting circles. A Planning Office report last January advocated making the courtyard more of a "people space" where people could "stop, ponder, pause, sit, chat, and relax."

The Project Management Office, which will oversee the renovation, has appointed a resource advisory committee. Members are:

Pete Allen, University editor emeritus, representing the Stanford Historical Society; Dick Bennett, director of administration, Office of Development; Andy Doty, director of community relations, Public Affairs; Douglas Kessler, student; Paul Turner, assoc. professor of art, author of books and articles about the University's planning and architecture; Michael Wade, student; and Phil Williams, director of planning.

Staff members may audit selected classes at night in summer quarter

Summer quarter provides the opportunity for Stanford staff members to audit a number of evening classes free of charge through the Staff Summer Auditing Program.

In general, auditing is a passive function, but active participation in the class is possible at the instructor's invitation and may even be required in some classes. Auditors earn no academic credit and no records are maintained for them.

The following classes are open to staff auditors this summer. All daytime classes and evening classes with formats which are inappropriate for auditing are excluded.

* Engineering 205. International Telecommunication Agreements, W 7-9 p.m.
* English 138/238A. Impressionist Novel: James to Hawkes, MW 7-9 p.m.
* History 168. American History in Film: WWII to Present, T 7-10 p.m., TH 7-9 p.m.
* Psychology 117S. The Disabling Society: Social Psychology of Physical Differences and Disabilities, T 7:30-9:30 p.m., TH 7:30-8:45 p.m.
* Sociology 113. The Family in Transition, W 7-10 p.m.
* Statistics 60. Introduction to Statistical Methods, TTH 7-9:15 p.m.
* Undergrad Special 34. History of Jazz, W 7-9 p.m.

These are all eight-week classes; summer quarter runs from June 20 to August 13. Detailed course descriptions appear in the Summer Session *Bulletin* which may be obtained at the Special Registration window in the Old Union or by calling the Summer Session Office (7-3109).

Staff wishing to audit should complete the application form in the *Bulletin* for *graduate students and persons over 25* and indicate the course number(s) on the tentative study list. Completed applications should be sent to Katie Adler, Summer Session Office, Building 1. The deadline for application is June 3. Applications will be considered on a first come, first served basis, and applicants will be notified of instructor approval and space available by June 15.

All questions regarding the Staff Summer Auditing Program should be directed to the Summer Session Office.

Blood Bank adjoins Mem Chu Sunday

Blood is like a parachute—if it's not there when you need it, chances are you'll never need it again.

The Stanford University Blood Bank will have a blood drive 12:15-3 p.m. Sunday, May 22, in Room 61A of the Inner Quad (next to Memorial Church).

Sign-ups will be taken after Sunday services or call the Blood Bank, 497-7831, or Memorial Church, 497-1762, for an appointment. Walk-ins will be welcome too.

Ph.D. oral exams

THURSDAY, MAY 19

Toshimasa Oyama, materials science and engineering, "Processing and Properties of Ultrahigh Carbon Steels," 2:30 p.m., 550A Peterson Bldg. **Sarahelen Thompson**, food research, "Price Performance in Thin Markets," 9:30 a.m., 214 Food Research Institute.

FRIDAY, MAY 20

Hisham Z. Massoud, electrical engineering, "Thermal Oxidation of Silicon in Dry Oxygen: Growth Kinetics and Change Characterization in the Thin Regime," 10 a.m., Applied Elec. Labs. AEL 109. **Stephan G. Regulinski**, engineering-economic systems, "R&D Portfolio Selection," 2:15 p.m., Terman 329.

MONDAY, MAY 23

Rajeev Batra, business, " 'Low Involvement' Message Reception—Processes and Advertising Implications," 2:15 p.m., 243 Graduate School of Business. **Richard J. Gerrig**, psychology, "Lexical Innovations and Theories of Comprehension," 3 p.m., 358 Jordan Hall. **Doug Morgan**, electrical engineering, 4:15 p.m., Mc 127. **David Oyibo Ogbe**, petroleum engineering, "Pulse Testing in the Presence of Wellbore Storage and Skin Effects," 2:15 p.m., Mitchell 350.

TUESDAY, MAY 24

Emilio Antunez, petroleum engineering, "Single Well Tracer Test Studies," 2:15 p.m., Mitchell 350. **Pieter G. Buning**, aeronautics and astronautics, "Computation of Inviscid Transonic Flow Using Flux Vector Splitting in Generalized Coordinates," 4:15 p.m., Materials Science, Room 550A, Durand 450. **Helen Cunningham**, psychology, "Children's Motor Programming and Spatial Representation Skills," 3 p.m., 358 Jordan Hall. **Yoshihiro Iwasaki**, food research, "International Transmission of Inflation to the Developing Countries: An Application of the Scandinavian Model," 2:15 p.m., Room 214 Food Research Institute. **Thao N. Nguyen**, electrical engineering, "Physics and Modeling of Short-Channel Effects in Surface—and Buried-Channel MOSFETs," 1:15 p.m., AEL 109. **Eugene Sidney Schweig III**, geology, "Neogene Tectonics and Paleogeography of the Southwest Great Basin, California," 1:15 p.m., 61G, Bldg. 60. **John L. Shefelbine**, education and psychology, "Learning Word Meanings from Text Context," 2:15 p.m., e114 Education Bldg. (Cubberley). **Ruth J. Williams**, mathematics, "Brownian Motion in a Wedge with Oblique Reflection at the Boundary," 1:45 p.m., 383N (Mathematics Bldg.). **You-Wen Yau**, applied physics, "Generation and Applications of Finely Focused Low Energy Electron Beams," 2 p.m., McCullough Building, Room 240.

WEDNESDAY, MAY 25

Les Atlas, electrical engineering and speech and hearing sciences, "Speech Processor Design Considerations for an Auditory Prosthesis," 4 p.m., AEL 109. **Charles Lincoln Ballard**, economics, "Evaluation of the Consumption Tax with Dynamic General Equilibrium Models," 3 p.m., Bldg. 20-21B. **Marjorie Ellen Foddy**, mathematics, "An Analytic Solution for the Stationary Distribution of Reflected Brownian Motion with Drift Confined to a Quadrant by Oblique Reflection," 2:15 p.m., Math Bldg., Room 383N. **Susan Holloway**, education and psychology, "Mothers' Attributions Regarding Math: Formation and Consequences for Children's Motivation," 2:15 p.m., e114 Education Bldg. (Cubberley). **William Newton Suter**, education, "An Experimental Investigation of Correlational Bias in Students' Ratings of Teaching Effectiveness," 9:30 a.m., e114 Education Bldg. (Cubberley).

THURSDAY, MAY 26

Pamela Clark Brown, engineering-economic systems, "Design of Incentive-Compatible Procurement Contracts that Allow Risk-Sharing," 9:30 a.m., Terman 329. **David Charles Dobson**, geology, 2:15 p.m., Room 326 (Department of Geology). **Kristina M. Johnson**, electrical engineering, "A Study of Reciprocity Law Failure in Multiple Exposure Holography, with Applications to the Display of Medical Data," 4:15 p.m., McCullough Room 134. **George J. Mergos**, food research, "Prices, Technology, and Derived Demand for Grains: An Econometric Model of Feed Substitution Responses," 11 a.m., 214 Food Research Institute. **Christine E. Miller**, mechanical engineering, "Static Point-Load Measurements of Basilar Membrane Compliance," 4:15 p.m., Skilling Auditorium. **Bizhan G. Moslehi**, mechanical engineering, "Electromechanics and Electrical Breakdown of Particulate Layers," 9 a.m., HTGL Conference Room, Bldg. 520, Room G.

FRIDAY, MAY 27

Susan Bryan, English, "American Literature (1840-1940)," 2:15 p.m., Bldg. 1, Room 2-B. **Robert Bunge**, history, 3 p.m., Bolivar House. **John Lawrence Dunec**, aeronautics and astronautics, "Development and Perturbation Analysis of Model Stochastic Equations for Global Circulation," 2:15 p.m., Room 450 Durand. **Ellen Palmer Francik**, psychology, "Referential Choice and Narrative Structure," 9 a.m., 358 Jordan Hall (Bldg. 420). **Bruce A. Harvey**, English, "19th Century British Literature," 2:15 p.m., Bldg. 40, Room 41-F. **Kyttack Hong**, economics, "Monetary Policies in Semi-Industrial Countries: Theory and Evidence from Korea and Taiwan," 2:15 p.m., 414 Encina Hall. **William H. Magruder**, biological sciences, "Fertilization, Reproduction, and Life History of the Red Alga *Callithamnion neglectum*," 2:15 p.m., Terman 105. **Brian Daniel Mariani**, biological sciences, "Expression and Replication of the Dihydrofolate Reductase Gene in the Cell Cycle," 2:15 p.m. T-175 Herrin Labs. **Steven Arthur Newton**, applied physics, "Optical Fiber Delay Line Signal Processing," 2:15 p.m., Applied Physics 200. **Gail Adrianne Perez**, English, "Renaissance Literature (1509-1640)," 2:15 p.m., Bldg. 70, 71E (Professor Ryan's Office). **Michael Gary Prisant**, chemistry, "Studies in the Reaction Dynamics of Beam-Gas Chemiluminescent Reactions," 2:15 p.m., Chemistry Gazebo. **Andrew Edmund Scharlach**, psychology, "Filial Responsibility of Women Toward Their Elderly Mothers," 3:15 p.m., 358 Bldg. 420. **Elaine Vaughan**, psychology, "Effects of Perceived Familiarity and Personal Relevance on the Assessment and Acceptability of Risk: Implications for the 'Expert' Decision Maker," 10 a.m., Bldg. 420, Room 371.

MFA student exhibit at Art Gallery

An exhibition of paintings, sculptures, and photographs by four students who have completed the requirements for the Master of Fine Arts degree at Stanford opened Tuesday, May 17, in the Stanford Art Gallery.

Daniel Phill, a graduate of Washington State University, shows abstract paintings that combine, according to the painter, "freely painted surfaces as well as areas treated with refinement and precision." Color plays an important role in animating Phill's abstract forms.

Steven Schloemer, who came to Stanford from the University of Iowa, shows large expressionist oil paintings. Themes are drawn largely from his experiences as a commercial fisherman in the waters off the Northern California coast. Many of the paintings refer to a type of abstracted figuration, often human in its connotations, though rarely specific in its associative meanings.

The sculptor in the group, Alec MacLeod, describes his work as conceptual, yet imbued with "ethical and personal themes in a simultaneously satirical and romantic manner." MacLeod received his bachelor's degree from Hampshire College in Amherst, Mass.

Tony Grant, the photographer, exhibits 35 photographs. He studied as an undergraduate at UCLA with Lee Friedlander and like Friedlander, is "interested in picturing people and peopled things."

The four artists have studied, respectively, with Frank Lobdell, Richard Randell, and Laura Volkerding of the Department of Art.

The MFA exhibition runs through Sunday, June 12. The Art Gallery, on the Stanford campus next to the Cummings Art Building, is open Tuesday through Friday from 10 a.m. to 5 p.m.; Saturday and Sunday, from 1 to 5 p.m. It is closed on Mondays. Admission is free.

Dramatists slate *Getting Out*

Pulitzer-prize-winning playwright Marsha Norman's first play, "Getting Out," will be presented at 8 p.m. Wednesday through Saturday, May 25-28, in the Nitery Theater on Stanford campus.

Directed by second-year drama doctoral student Johanna Dickey, the production is a presentation of the Drama Department's Graduate Directing Workshop.

Beginning at 7:30 p.m. each evening, free programs which serve as the "ticket" of admission will be distributed to the first 100 persons at the Nitery.

Norman won the Pulitzer this year for her play "Night, Mother," which is currently running on Broadway. It has been nominated for a Tony award. Her latest play, "Hold Up," is currently being performed in San Francisco by the American Conservatory Theatre.

"Getting Out" is a play about a woman who has spent most of her adolescence in prison. The action begins the day she is released. The play uses flashbacks and two actresses play the leading role.

Lisa Glass, playing Arlene in the present, must confront the "outside" world and come to grips with her uncertain and far from glowing future.

Her past is revealed as Arlie (Arlene's younger self), played by Terra Vandergaw, lives out her prison experience with all its graphic horror.

The process of "getting out" is the maturation of Arlene and the reconciliation of her two selves, as she becomes free of her past and is able to face the future.

'Beyond War' film series

"Beyond War," a series of three free films, will be shown at Stanford under the sponsorship of six faculty and staff members.

"Race to Oblivion," a new film by Physicians for Social Responsibility, will be shown at noon Wednesday, May 18, in Skilling 193.

"No Frames, No Boundaries" will be shown at noon Tuesday, May 24, in GSB 82 and at noon Wednesday, May 25, in Skilling 193.

"What About the Russians?" which includes interviews with SALT II negotiator Paul Warnke and Admiral Gene LaRocque will be shown at noon Tuesday, May 31, in GSB 82 and at noon Wednesday, June 1, in Skilling 193.

Sponsors of the series are Profs. Martin Hellman and Malcolm McWhorter and Dick Lagerstrom, Jerry Ostrander, Ed Scoles, and Gary Williams.

I-Center to show *Waiting for Fidel*

Cuba is in the spotlight this week in the Other Culture Film Series. "Waiting for Fidel" will be shown at 7:30 p.m. Thursday, May 19, at the International Center.

Viewers find themselves inside Cuba with a movie-making trio whose hope is that Fidel himself will star in their film. The filmmakers are former Newfoundland premier Joseph Smallwood, radio and television station owner Geoff Stirling, and NFB film director Michael Rubbo, a Stanford graduate.

What happens while this unusual film crew awaits its star shows a good deal of the new Cuba and also of the three Canadians who chose to film the island.

The film is free and open to the public. A 75 cent donation will be requested to help defray the costs of the series. Stay for fresh pastries and coffee at the I-Center's "Cafe" after the film.

Singers, Band set joint concert

The Stanford Music Department's Early Music Singers and Renaissance Wind Band will perform Franco-Flemish music of the Renaissance in a free joint concert at 8 p.m. Tuesday, May 24, in Memorial Church. The Singers are directed by William Mahrt; the Band by Herbert Myers.

Featured work on the program will be a Mass by Josquin DesPrez based on the "L'Homme arme" tune performed by the Early Music Singers. Josquin's work is a particularly famous one, in which the secular song warning against the "armed man" is placed in a different key for each movement.

The Renaissance Wind Band will play settings of courtly songs for various instruments and humorous tunes by German contemporaries of Josquin.

Kay Bedenbaugh

Kay Bedenbaugh piano recital set

The Music Department will present DMA candidate Kay Bedenbaugh in a free piano recital at 4 p.m. Sunday, May 29, in Tresidder Lounge. She studies with Adolph Baller.

Bedenbaugh will perform *Fifteen Hungarian Peasant Songs* by Bartok, *Sonata in F minor, "Appassionata"* by Beethoven, *Three Intermezzi, op. 117* by Brahms, Haydn's *Sonata in G Major*, and *Ballade in f minor, op. 52* by Chopin.

Bedenbaugh received a Bachelor of Music degree from Birmingham-Southern College in Alabama and a Master of Music degree from Juilliard, where she was a scholarship student of William Masselos.

She recently returned from London where she studied at the Royal Academy of Music on an International Rotary Fellowship. While in London, Bedenbaugh gave solo recitals at the Royal Albert Hall and Queen Elizabeth Hall, and was heard on Capital Radio.

Bing Fair this Sunday

Bing Nursery School will hold its eighth annual Bing Fair between 11 a.m. and 3 p.m. Sunday, May 22, at the School, 850 Escondido Road.

The event offers games and activities for children two to eight years old. The tots may enjoy puppet shows, clowns, helium balloons, face painting, and a wide selection of children's handicrafts.

There will be hot dogs, a creperie, and the traditional array of foreign foods prepared by Bing families.

Job Spring Jazz concert Saturday

Saturday, May 21, Student Arts at Stanford (STARTS) in conjunction with the Stanford Jazz Workshop will present the 3rd annual Joy Spring Jazz concert—an afternoon of free jazz entertainment on the front patio of Tresidder Union.

This year's concert features Stanford's own Adlai Alexander Band at noon, and Bay Bop at 1:15 p.m. The Mark Levine Quintet will perform at 3 p.m. Pianist, composer, and valve trombonist Levine recently released his first album, "Up Till Now," on Catalyst Records.

The music for this performance is funded in part by U.S. recording companies as arranged for by the Music Performance Trust Fund (MPTF) and the National Association of Jazz Educators (NAJE).

Lectures

Wisse on Sholom

Prof. Ruth Wisse, visiting professor of Jewish civilization from McGill University in Canada, will speak on "Sholom Aleichem at Stanford" at 4 p.m. Sunday, May 22, in Room 270 Tresidder Union.

Wisse, a professor of literature in the Department of Jewish Studies at McGill, is known as a foremost teacher of Yiddish literature. At Stanford she is teaching two courses—Humor, Realism, and Fantasy in Yiddish literature, and The Modern Jewish Short Story.

Wisse is the author of *The Schlemiel as a Modern Hero* and coeditor with Irving Howe of *The Best of Sholom Aleichem*. She also is a frequent contributor to *Commentary* magazine.

Her lecture is part of the visiting professorship sponsored by the Endowment Fund of the Jewish Community Federation.

Human rights talk

"Human Rights in the '80s" is the title of an address to be presented by Law Prof. John Barton at noon Tuesday, May 24, at Bechtel International Center.

Barton, a graduate of Stanford Law School, acquired his bachelor of science degree in philosophy and physics from Marquette University in 1958. He practiced law in Washington, D.C., before coming to Stanford's law faculty in 1969.

His principle subjects are arms control, contracts, international business transactions, and international human rights.

Barton's talk is the last in the regular Tuesday Luncheon/Lecture series at the International Center for this academic year.

Luncheon tickets are available at a cost of $2.50 one week before the event at the I-Center office on the second floor, or at the door as they last. Brown baggers are also welcome at no charge.

Research management

"Science and Engineering Research—Its Management" will be the topic for a panel discussion at 4:15 p.m., Thursday, May 26, in Room 420-041 (entrance in the basement of the Math Department).

Discussants will be June Anderson, manager of disk materials product engineering at IBM General Products Division; Ruth Havemeyer, director of research administration at Syntex; and Lynn Roylance, project manager at Hewlett-Packard Laboratories.

The event is sponsored by WISE—Stanford Women in Science and Engineering—the last of a spring quarter series designed to promote interdisciplinary discussion among women.

The formal presentations are followed by informal discussion over refreshments.

Hamlet's Doubles

Distinguished English critic Frank Kermode will speak on "Hamlet's Doubles" at 4:15 p.m., Thursday, May 26, in Annenberg Auditorium.

Kermode, a professor of English at Columbia University, is the former King Edward VII Professor of English at Cambridge University. His talk, which is open to all, is sponsored by the English Department, the Stanford Humanities Center, and University Events and Services.

Windham Hill: l to r Ira Stein, piano; Daniel Kennedy, percussion; Russel Walder, oboe

Windham Hill artists play for KZSU

Windham Hill recording artists Ira Stein, piano, and Russel Walder, oboe, will perform with their new percussionist Daniel Kennedy at 8 p.m. Wednesday, May 25, in Dinkelspiel Auditorium.

The concert is a benefit for Stanford student radio station KZSU.

The original duo, Stein and Walder, have had a successful debut album called "Elements." Kennedy's work on tabla and conga provides an energetic base to the lyrical sounds of those pieces.

Stein and Walder recently performed with George Winston and Will Ackerman at Davies Symphony Hall in San Francisco.

Tickets for the Stanford concert are $6 in advance (Tresidder Ticket Office and all BASS outlets) and $6.50 at the door.

Top student pianist plans concert

The Stanford Music Department presents pianist Alan Gampel in a free solo recital at 8 p.m. Saturday, May 28, in Dinkelspiel Auditorium.

Gampel, a sophomore, recently received the Peter Rosenthal award for the undergraduate student in the Music Department most gifted in piano.

After his performance of Rachmaninoff's *Piano Concerto No 2* in November, the *Peninsula Times-Tribune* wrote: "Standing ovations are not as common as they once were, but the audience rose spontaneously to applaud the brilliant performance of the concerto."

Gampel's May 28 recital will include Sonatas in C minor and E Major by Scarlatti, three Preludes from Book II by Debussy, *Sonata, op. 110* by Beethoven, and Schumann's *Carnaval*. Gampel studies piano with Adolph Baller.

In March, Gampel performed Tchaikovsky's *Piano Concerto No. 1* with the Fremont-Newark Philharmonic to outstanding reviews in *The Argus*: "Sunday afternoon's crowd. . .witnessed a spectacularly brilliant performance of this monumental work. The local audience is notoriously generous with its standing ovations, but this time, for Alan Gampel, the ultimate tribute was quite justified."

Gampel has won many awards and scholarships, among them first place in the Music Teacher's Association of California Piano Concerto and Solo Competitions and a Presidential Scholars Award.

Alan Gampel

Symposium on 'Resistance' honors Marcuse May 20-21

The African Studies Center at Stanford will host a free public symposium on "Resistance: Studies in African, Caribbean-Latin American and Afro-American History" Friday and Saturday, May 20-21.

The conference marks the 40th anniversary of the publication of *American Negro Slave Revolts*, a pioneering study by Herbert Aptheker, ethnic studies scholar at the University of Santa Clara.

Editor of *The Complete Published Writings of W.E.B. Du Bois*, Aptheker will be one of 11 scholars presenting papers for subsequent publication. The others are:

John H. Bracey, Jr. Afro-American studies, University of Massachusetts-Amherst, author of 10 books including *Black Nationalism in America*;

Michael Craton, history, University of Waterloo, Canada, author of *Testing the Chains*;

Elizabeth Fox-Genovese, history, SUNY-Binghamton, first secretary of the Coalition for Women in the Humanities and Social Sciences and coauthor of *The Fruits of Merchant Capital*;

Eugene D. Genovese, history, University of Rochester, author of *The Political Economy of Slavery From Rebellion to Revolution*, and *Roll, Jordan, Roll*, among others;

Vincent Harding, Iliff School of Theology, University of Colorado, coeditor of *The Slave Trade and Slavery* and author of *The Other American Revolution*;

Paul E. Lovejoy, history, York University, Canada, editor of *The Ideology of Slavery in Africa* and *Transformations in Slavery: A History of Slavery in Africa*;

Terence Ranger, history, University of Manchester, former president of the African Studies Association of the United Kingdom, and author of *Revolt in Southern Rhodesia, 1896-97* and *The African Voice in Southern Rhodesia, 1898-1930*;

Leslie B. Rout, Jr., history, Michigan State University, author of *The African Experience in Spanish America: 1502 to the Present*;

Herbert Shapiro, history, University of Cincinnati, author of a recent critique, "Eugene Genovese, Marxism, and the Study of Slavery;" and

Rosalyn M. Terborg-Penn, history, Morgan State University, cofounder of the Association of Black Women Historians and coeditor of *The Afro-American Woman: Struggles and Images*.

Directed by Gary Y. Okihiro of the University of Santa Clara and Joel Samoff of Stanford, the conference will meet in the Sherman Fairchild Center of the Medical Center May 20 and in Room 112 of the CERAS Building May 21.

Contributors in support of the program include the Ethnic Studies Program, University of Santa Clara; the UC-Stanford Joint Center for African Studies; and the International and Comparative Studies Program, UC-Santa Cruz. Additional funding comes from the California Humanities Council and the National Endowment for the Humanities.

For further information call the African Studies Center at (415) 497-0295.

Chamber Orchestra to play May 27

Stanford's Chamber Orchestra will present works by Haydn, Stravinsky, and Walton at 8 p.m. Friday, May 27, in Dinkelspiel Auditorium.

Doctoral candidate Eric Kujawsky will conduct Haydn's *Symphony No. 82 in C Major, "The Bear"*—one of Haydn's most popular symphonies.

Doctoral candidate Chris Christensen will conduct two 20th-century works: *Concerto in E-flat Major, "Dumbarton Oaks"* by Stravinsky and *Facade* by William Walton.

Robert Woods Bliss, owner of the Dumbarton Oaks estate in Washington, D.C., commissioned Stravinsky's concerto and sponsored its first performance there in 1938. Stravinsky studied and played music by Bach while composing the piece, and it shows the influence of Bach's third Brandenburg Concerto in particular.

Facade, as originally composed in 1923, was designed to accompany nonsense verse by Edith Sitwell, a good friend of Walton's. Walton subsequently revised it as both a ballet score and a work for full orchestra. The Stanford Chamber Orchestra will perform it as originally intended, with Jane Boothroyd reciting.

Conductor Christensen, son of Lew Christensen (codirector of the San Francisco Ballet), describes Walton's 21-movement work as a "jazzy novelty piece." He is dedicating this performance to the composer, who died last month.

Tickets for the May 27 concert are $4 general, $2 students and senior citizens.

Donna Ornitz to give flute concert

The Stanford Department of Music presents flutist Donna Ornitz in a free recital at 8 p.m. Wednesday, May 25, in Tresidder Lounge. She will be accompanied by pianists Ikuko Fukui and Akimichi Takemura.

Ornitz will perform Platti's *Sonata in G Major, Sonatine* by Dutilleux, *Fantaisie* by Gaubert, *Andante and Rondo for two flutes* by Doppler, and *Sonata in A Major* by Franck. Flutist Kathryn Barnard will join her for the Doppler duo.

Ornitz is a senior majoring in biology. She plans to go to medical school. A student of flute teacher Frances Blaisdell, Ornitz will probably attend a music school this summer. She is a member of Stanford's ski team and Band.

Donna Ornitz

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., May 18, to cover the week of Mon., May 30, through Sun., June 5. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

MONDAY, MAY 23

Center for East Asian Studies Bag Lunch: "Nominalization and Subordination in Classical Chinese," by Prof. Christolph Harbsmeier, University of Oslo. Noon. Asian Language Lounge.

Numerical Analysis Seminar: "The Probability of a Numerical Analysis Problem Being Difficult," with Jim Demmel from U.C. Berkeley. 4:15 p.m. Room 380C, Math Corner.

Slavic Dept. Lecture: "Tartu Semiotics School as a Social Institution," by Prof. Boris Gasparov. 4:15 p.m. Bldg. 200, Room 34.

Biological Science Seminar: "Regulation of Yeast Histone mRNA," by Dr. Lynna Hereford, Dana-Farber Cancer Institute, Boston, Mass. 4:15 p.m. Room T-175, Herrin Hall.

STARTS Presents Katherine Hepurn & Spencer Tracy in: "Adam's Rib," about a dual-career couple and female equality. 7 p.m. & 9 p.m. Tresidder Room 270. $2 students, faculty and staff, $3.

TUESDAY, MAY 24

Bechtel International Center Tuesday Luncheon/Lecture Series: "Human Rights and International Migrations," by John Barton, Stanford Law Professor. Noon. I-Center. $2.50 for hot lunch, brown-baggers welcome at no charge.

Learning About Racism Lunch Series: Workshop on Unlearning Racism. Bring a bag lunch or arrange to eat at Casa Zapata. Noon. Casa Zapata Dining Room.

Center for East Asian Studies Film: "Misunderstanding China," directed by Irv Drasnin, narrated by Charles Kuralt. An excellent historical presentation of how Americans have viewed China, illustrated through old film clips, comics, newsreels, etc. Noon. Room 241, Lou Henry Hoover Bldg.

Computer Science Colloquium: "How Fast Can a Single Instruction Counter Machine Execute?," by Tilak Agerwala, IBM T.J. Watson Research Center, Yorktown Heights, New York. 4:15 p.m. Skilling Aud.

Applied Mechanics Seminar: "Computation of Inviscid Transonic Flow Using Vector Splitting," with Pieter Buning, graduate student in Aeronautics & Astronautics. 4:15 p.m. Materials Science Room 550a.

Center for East Asian Studies Colloquium: Dr. Lin Ke, Institute of World Economics and Politics, Chinese Academy of Social Sciences will speak on Chinese and American economic issues. 4:15 p.m. Room 238, Lou Henry Hoover Bldg.

S.O.A.R: American Youth Hostel Slide Show. 7 p.m. Tresidder Union, Rm. 271.

Music Dept. Concert: Early Music Singers & Renaissance Wind Band. William Mahrt & Herbert Myers, directors Franco-Flemish music of the Renaissance. 8 p.m. Memorial Church. Free.

WEDNESDAY, MAY 25

Latin American Studies Lecture: "The Mexican Corporatist State and Public Policy Formation in Education," with Carlos Alberto Torres, Ph.D. candidate, SIDEC. Noon. Bolivar House.

CROW Lecture: "What Is Female Sexuality?" by Marilyn Safir, senior lecturer in psychology, Univ. of Haifa. Noon. Terman Aud.

Structural Biology Seminar: "Three Crystal Structures for Citrate Synthase: Catalytic Activity Requires Large-Scale Conformational Changes," by Dr. James Remington, Institute for Molecular Biology, University of Oregon. Noon. Fairchild Bldg., Room D102.

Chemical Engineering Colloquium: "Models of a Porous Solid Undergoing Reaction," by Prof. George R. Gavalas, Dept. of Chemical Engineering, Caltech. 4:15 p.m. Chemical Engineering Conference Room.

Music Dept. Concert: Donna Ornitz, flute. Works by Franck, Gaubert, Bach, Martinu. 8 p.m. Tresidder Lounge. free.

THURSDAY, MAY 26

Theology & Natural Science Lunch Series: "Certainty in Science & Theology," by Robert Hamerton-Kelly, Dean of Memorial Church, and Sidney Drell, Deputy Director of SLAC. Noon. Otero Dining Room, Wilbur Hall.

Stanford Women in Science & Engineering: "Science & Engineering Research: Its Management". June Anderson, Manager, IBM Research; Ruth Havemeyer, Director of Research Administration, Syntex; Lynn Roylance, Project Manager, Hewlett Packard Labs. 4:15 p.m. Building 420, Room 041 (Enter through Math Dept. basement).

Center for East Asian Studies: "The Problem of National Identity in Medieval Korea," by Prof. Michael Rogers, Dept. of Oriental Languages, U.C. Berkeley. 4:15 p.m. Room 238, Lou Henry Hoover Bldg.

Solid Mechanics Seminar: "Measurement of Basilar Membrane Compliance," with Christine E. Miller, graduate student in Applied Mechanics. 4:15 p.m. Skilling Aud.

Industrial Engineering Symposium: "Alternative Methods of Public Decisions," with Dr. Lee Merkhofer, SRI International. 4:15 p.m. Terman Aud.

Condensed Matter Physics Seminar: "Phase Diagrams of Spin Glasses," by M. Gabay, Ecole Normale Superieure, Paris, and University of California, Berkeley. 4:15 p.m. Applied Physics 200.

"Other Cultures" Film Series: "Faces of Man, Faces of France," and "Two French Families". A visit to five families, each in a different region and each with a distinct mode of living. The different regions shown are Brittany, Marseilles, the Alps, Loire Valley, and Paris. "Two French Families" looks at the life styles of a a traditional large farming family and a young urban couple with one child in Paris. 7:30. Bechtel International Center. 75 cent donation requested.

La Casa Italiana Panel Discussion: "Contemporary Italian Poetry," with Beverly Allen, Luigi Ballerini and Paul Vangelisti. 7:30 p.m. La Casa Italiana.

FRIDAY, MAY 27

Mathematics Dept. Lecture: "Some Free-Boundary Problems," with Erik Hansen, from Technical University, Lyngby, Denmark. 3:15 p.m. Room 380-C, Math. Bldg. 380.

Dept. Concert: Stanford Chamber Orchestra. Haydn-Symphony No. 82 in C Major, "The Bear";Stravinsky-Concerto in E-flat Major, "Dumbarton Oaks"; Walton-Facade, with poetry of Edith Sitwell. 8 p.m. Dinkelspiel Aud. $4/$2.

Stanford Society of the Archaelogical Institute of America: "New Excavations in the Fayum," by Wilfred Griggs of Brigham Young Univ. 8:15 p.m. Room 370.

STARTS/Coffee House: Elements: Russ Walder and Ira Stein. Windham Hill recording artists perform pieces from their celebrated debut album, "Elements". 9-12 p.m. Coffee House. Free.

SATURDAY, MAY 28

Applied Physics Colloquium: "New Systems for Imaging Below 500 A.," by Prof. C.F. Quate, Applied Physics & EE Depts., Stanford. 4:15 p.m. Applied Physics 200.

Music Dept. Concert: Alan Gampel. piano. Works by Scarlatti, Beethoven, Brahms, Schu Chopin. 8 p.m. Dinkelpiel Aud. Free.

SUNDAY, MAY 29

University Public Worship: Preacher: Wendy Smith, Assoc. Dean of the Chapel. 11 a.m. Memorial Church.

Music Dept. Concert: Kay Bedenbaugh, piano. Bartok-15 Hungarian Peasant Songs; Beethoven-Sonata op. 57 ,"Appassionata"; Ravel-Valse Nobles et Sentimentales; Brahms-Three Intermezzi, op. 117; Chopin- Ballade in F minor,op. 52. 4 p.m. Tresidder Lounge. Free.

ASSU Sunday Flicks: "An Officer and a Gentleman". 7 & 9:30 p.m. Memorial Aud. $1.50.

EXHIBITS

Early Lithography: 1803-1830. Museum, Miedel Room. April 12 - June 19.

Chicanos in California: Organization, Politics & People. An exhibition selected from the Chicano Manuscipt Collection, Dept. of Special Collections. 8 a.m.- 5 p.m. Louis Lurie Rotunda, Green Library. April 25 - June 30.

Stanford Senior Class Art Show. 7 a.m. to 11 p.m. Tresidder Coffee House and Upper Lobby. May 1 - June 15.

Lorraine Schreiber, watercolor paintings. I-Center. May 4 - May 30.

Master of Fine Arts Exhibition. Tues.-Fri.: 10 to 5 p.m.; Sat. & Sun. 1 to 5 p.m. Stanford Art Gallery (next to Cummings Art Bldg.). May 17 - June 14.

Works by Graduate Students in the M.F.A. Program at Stanford. Art Gallery. May 17 - June 12.

Electronic news goes on display at Tresidder

Tresidder Union has joined more than 80 university and college unions in the U.S. with the recent installation of an electronic message center in the first floor dining area.

The electronic display board transmits news, sports, and campus information (plus a few commercials)—and University departments and student organizations can have their own messages added at no cost.

The electronic message center is on-line with a central computer in Dallas, Texas, which transmits the eight-minute segments that run each day.

Ad segments for campus-wide events and services of general interest to the Stanford community will be reserved on a first-come, first-served basis.

Blank message forms are available at the Tresidder Information Desk—the forms must be turned in two weeks prior to the week in which the ad segment is to appear.

For more information on how to display a free ad segment for your organization or department, call 497-4311.

DeLauer says CIS provides model of U.S.

The U.S. plans to stay ahead of the Japanese with a new Defense Department supercomputer project, a key official said Thursday, May 19, at Stanford.

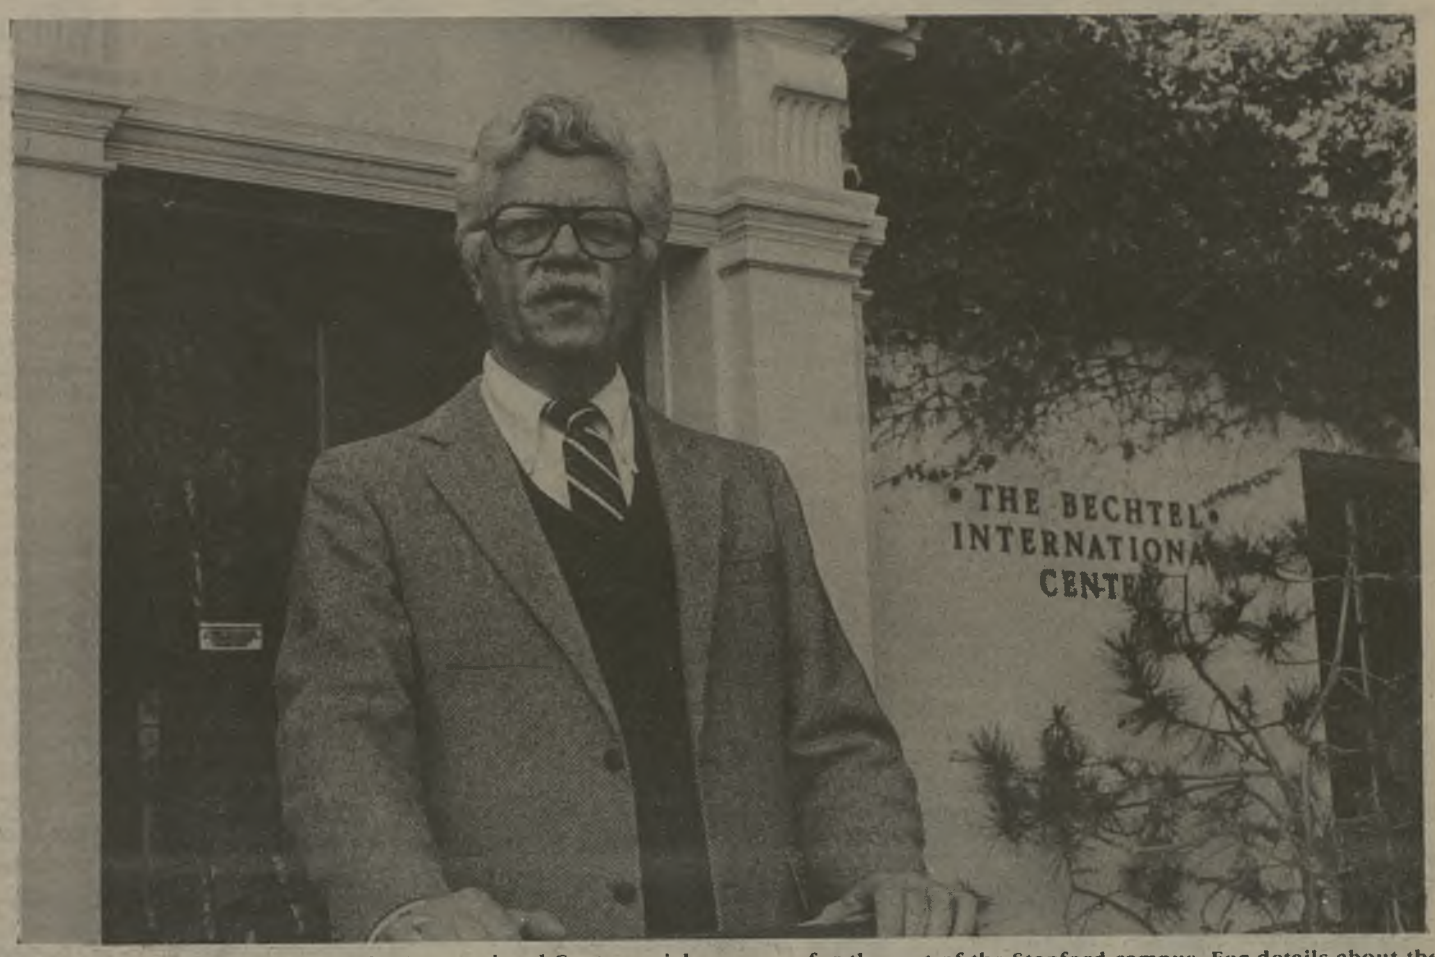
"I call it the 'N' generation computer. . . the Japanese plus one," said Richard DeLauer, undersecretary of defense for research and development.

"If they have six (generations), we'll have seven. It's going to be configured exactly the same way" as Stanford's new Center for Integrated Systems, a joint government-university-industry effort to maintain world leadership in electrical engineering, computer science, materials science, and related fields.

"The Defense Department can fund the leading edge, industry can fund the institution on a continuing basis, with a university that can supply the best minds and in such a way that we can rapidly introduce this into the general economy."

The "N" generation computer has military objectives, DeLauer said. "I want to make it clear our job is to spend taxpayers dollars for security. We want to spend it smart enough to flow out into the economy."

The supercomputer will have "three orders of magnitude over existing systems as far as speed is concerned," he added. "Right now it's in a five-year plan to match the Japanese dollar for dollar. I think we'll be able to do it if we're smart."



IBM plans to join the superconductor project, he added. "That's like having Catholic services at a synagogue—we're getting together. . . . Joshua Lederberg (Nobel Laureate formerly at Stanford) said we can't leave Rockefeller (University) out."

The whole "very exciting" venture "started with CIS" at Stanford, he said. DeLauer, then at TRW; Robert Noyce, of Intel; George Pake, of Xerox; and John Young, of Hewlett-Packard; were instrumental in getting 19 firms to provide $750,000 each for the CIS, which celebrated its formal groundbreaking Thursday.

DeLauer, a Stanford alum who cochairs a Defense Department-universities committee with Stanford President Donald Kennedy, said the

Director Lee Zeigler considers the International Center a rich resource for the rest of the Stanford campus. For details about the staff, the activities, and the volunteers, see page 10.

131 faculty sign counter-petition on Hoover

Working single-handedly, a conservative Stanford professor has obtained 131 faculty signatures on a petition opposing an investigation of alleged partisanship by the Hoover Institution as a "grave threat. . .to academic freedom."

Prof. Alphonse Juilland, French and Italian, says the widespread support "proves this is not a dispute between the Stanford faculty and the Hoover Institution, as has been presented in the news media. . . . The faculty does *not* want an investigation. "Stanford has about 1,100 faculty members.

The Faculty Senate Thursday, May 26, will discuss a petition signed by 84 faculty, including 76 whose names were made public, asking that the Board of Trustees "initiate an immediate and independent inquiry, including a public report, on the relationship between the Hoover Institution and Stanford University."

Juilland charged that Profs. John F. Manley, political science, and Ronald Rebholz, English, speak for "quite a meager fringe" of "ultra-liberals."

Contrary to Juilland's petition, Manley and Rebholz argue that "we are not proposing an inquiry into the political orientation of Hoover—that seems generally well established; rather we are proposing a debate over the proper relationship between Hoover as a political research institution and the University. . . .

"If Hoover and Stanford are joined ever more closely, and if Hoover engages in political activity, it appears that Stanford directly and indirectly aids a political cause."

If Manley and Rebholz had addressed governance issues exclusively Juilland said in an interview, "all the reaction they would have elicited from the community would have been a gigantic yawn.

"They needed to inject politics to hook public attention. In this they succeeded. But now they're stuck on a hook of their own creation."

continued on page 26

Rebholz, Manley disclose 76 Hoover petition signers

The names of 76 Stanford faculty among 84 who have urged their colleagues to discuss an independent inquiry by the Board of Trustees into the relationship between the University and the Hoover Institution have been made public by Profs. John F. Manley, political science, and Ronald Rebholz, English.

The issue will be debated by the Faculty Senate Thursday, May 26.

The petition states that "The existence of a partisan organization, whether liberal or conservative, within the University raises grave questions concerning the academic independence, integrity, and national reputation of the University."

And continuing:

"Whereas, the legitimacy and influence of the Hoover Institution and the causes for which it stands are immeasurably enhanced by sharing in the prestige of a great University; and

"Whereas, Stanford University provides approximately one-third (32 percent) of the Hoover Institution's annual budget, and this $2.7 million support comes at a time of severe cuts in the University's budget;

"Therefore, the undersigned members of the Academic Council request the Steering Committee of the Academic Senate to place on the agenda of the Senate the following resolution:

"The Academic Senate urges the Board of Trustees to initiate an immediate and independent inquiry including a public report, on the relationship between the Hoover Institution and Stanford University."

People

Dean's student service awards presented to 17—here's what they've done

Mary Haynes, senior in communication, for "leadership in the Black Student Mental Health Advisory Committee, the Black Media Institute, Black Recruitment and Orientation, the Black Student Union, and as a Theme Associate in Ugamaa and a Resident Assistant in Mirrielees. . . ."

Gary A. Allen Jr., graduate student in aero and astro, "for transforming the Stanford Student Branch of the American Institute of Aeronautics and Astronautics. . .into one of the most lively AIAA chapters in the country. . . ."

Megan Chestnut, senior in psychology, for her role as "Cowell nursing assistant, volunteer at the Peninsula Children's Center, swimming instructor at the Community Association for the Retarded, president of Pi Beta Phi sorority, student counselor for Miramonte Mental Health Organization, and dedicated Resident Assistant at Roble and Manzanita. . . "

Deborah Chen, senior in mechanical engineering, "for effectively applying her technical skills to social needs for solar energy, improved computer instruction in local schools, and mechanical devices to aid the locomotion of disabled children. . . ."

Chris Eberspacher, graduate in applied physics, "for his instrumental role in designing and teaching Applied Physics 010, a new undergraduate course in science and technology. . . ."

Forrest Ames, graduate student in mechanical engineering, "for his work in energy conservation, projected to save the University $300,000 annually through an improved chilled water pumping system. . . ."

Sharon Padilla, graduate in education, for her "valued talent as an organizer, group leader, and teacher of leadership skills; for her dedication to the development. . .of numerous high quality co-curricular programs such as El Centro, Chicano Orientation, and OSA Leadership Training. . . ."

Magdalena Rosales, graduate in education, for her role as "teacher, counselor, and leader in Casa Zapata, for her involvement in the problems of world hunger, for her travel to Central America and subsequent presentations of her observations of different approaches to national development. . . ."

Shelly Saunders, junior in economics and sociology, for her role as "leader, manager, group member, facilitator, communicator, coordinator; for the unusual level of dedication she brings to her job as Resident Assistant in Lagunita; and for her spirited devotion to the goal of celebrating ethnic and cultural diversity. . . ."

Ruth Williams, graduate in mathematics, "for her many quarters of hard work as a Teaching Fellow in the Mathematics Department, and especially for organizing the highly successful 1982-83 lecture series for Women in Science and Engineering. . . ."

Front row (left to right): Nancy Showen, senior in human biology; Carrie Griffin, senior in biological sciences; Nancy Kass, senior in human biology. Back row: Robin Cooper, senior in international relations; Jim Steyer, law student. "For effectively combining their many and different talents in service to the goals of the Rape Education Project, yielding a campus-wide voluntary program unique in its impact, energy, organization, and educational contributions to the campus community. . . . "

Dean's Student Service Awards were presented to 17 students, including a group of five who worked together on the Rape Education Project, Monday, May 16.

Recipients each received a bronze medallion and a personalized certificate.

The awards, given by the Dean of Student Affairs office, pay tribute to "outstanding service to Stanford and to its students."

Not pictured are Andy Beal, senior in economics, honored "For his leadership of the Inter-Fraternity Council. . . and for his efforts to remove real and imagined barriers between the fraternities and other student communities. . . . " and Doug Perkins, senior in biological sciences, honored for "his many achievements as captain of the wrestling team, and for time and affection freely given—to his teammates, to little kids on the nursery school playground, to youngsters at Sierra Camp, and to Stanford students new to the scene of college athletics. . . . "

The Raubitscheks: a classics couple with extended family of scholars in U.S.

Last year, all graduates in classics perservered, found suitable employment

BY DONALD STOKES

Isabelle and Antony Raubitschek

A white-haired couple work late every night in their Palo Alto home, piecing together a tale that is thousands of years old.

Antony and Isabelle Raubitschek are busy in separate studies, his on the ground floor, hers on the upper. Their research is in different but complementary parts of the story of ancient Greece.

Occasionally they cross-check with each other, when their research meshes. Then they bring alive together yet another piece of mankind's history that refuses to die. They reveal another aspect of the civilization which has been an inspiration to the west since long before the days of Christ.

There is an overflow from each of their studies, of papers and books, artifacts and drawings. Links with the ancient days are found in the oddest places; there are, for example, books on the laundry room.

Antony Raubitschek, emeritus professor in Stanford's Classics Department, is famous in the classical world for his study of inscriptions, the public and private notices carved by the Greeks. These have thrown new light on the customs, laws, habits, and philosophy of that remarkable race.

Isabelle Raubitschek is associate professor emerita in the Art Department at Stanford. She is known for her work in bringing alive the full meaning of classical art and literature.

The couple has been married for 41 years. Perhaps the most important thing about them has been their creation of an extended family of scholars, all over the nation, who are filling in more gaps in knowledge of the classical world.

The professional family consists of former students of the Raubitscheks who are now widely dispersed, each one pushing ahead on a particular piece of the great puzzles of the Grecian past.

It is a small but determined band, which faces economic worries and the temptation to concentrate on fields where salary prospects are brighter. Last year all the graduates of the Classics Department found suitable posts; that modest achievement is a measure both of the difficulties and the persistence of the classicists.

The extended family of the Raubitscheks was seen in force during March when more than 100 classical scholars came to Stanford from far and near to honor Antony Raubitschek's 70th birthday. Sir Ronald Syme and David Lewis came from Oxford, and every corner of the U.S. was represented by former students of the Raubitscheks, some going back several decades.

For two days members of the extended family renewed touch with each other and with the age that refuses to die.

"Much of the major scholarship work I have passed on to former students. They will carry on the work," says Antony Raubitschek. "Many of them are so very able.

"I have not written as many books as I might have, but each one of my friends at the meeting was a sort of wonderful book. Each was distinguished in a particular way. Such friends are more important than books, which get out of date so quickly."

Most members of the extended family act as if they are children of the Raubitscheks. "They are just as loving and just as demanding," laughs Mrs. Raubitschek.

"A great deal of Toni's time is spent answering their letters and phone calls, reading their manuscripts, trying to find jobs for them. Often he gives his own partially completed manuscripts to his students for their own projects."

At Christmas the flood of hundreds of cards chokes the mailbox of their big house in "old Professorville," Palo Alto.

The family is still growing. Some of the youngest members are seen each morning when Toni Raubitschek cycles to campus—he has never learned to drive a car. Invariably he is escorted by an informal honor guard of young students. There is a remarkable bonding of affection between the old man and the young people.

Raubitschek brings his students little presents—cookies, avocados from his garden. He handwrites, then duplicates a digest of each one of his lectures for presentation to his flock. The students respond with gifts of their own. At the end of his lectures they often stand to applaud him. There is an almost tangible emotion of love and caring in the air.

The story of the Raubitscheks began just as the warclouds of Nazism began to menace Europe.

In 1937 Isabelle Kelly was 23, a student at the American School in Athens, where she had come to work on her dissertation. While still an undergraduate at Barnard she had done graduate work at Columbia under William Bell Dinsmore, the great expert on classical architecture. She had previously gained a fellowship to the Sorbonne in Paris where she had studied Greek archaeology under Charles Picard.

Antony Raubitschek was a Viennese, aged 25, who had already established a reputation for his work on reconstruction of the statue bases on the Acropolis, where he had physically moved the stones back into their correct positions.

He was able to do that because in those days the Greek authorities were very cooperative with genuine researchers, and the Acropolis had not become the center of mass tourism it has today.

Isabelle heard the young man lecture at an open meeting of the Austrian School. He had dark curly hair, and his enthusiasm for his work was infectious. He on his part had heard about the Boston girl and had looked forward to meeting her. They shook hands formally during the reception after his address but were not able to pursue their acquaintance as she had to go on field research in Attica.

Although Raubitschek was supposed to attend his classes at the University of Vienna, actually he spent nearly all the school year in Greece, researching the dedications and working at the Acropolis. He returned to Vienna only to take the examinations at the end of term.

His one difficulty was in the course on pedagogy, for which he had enrolled as the usual insurance of a classicist against lack of employment.

When he showed up for the pedagogy examination the professor exclaimed, "I've never set eyes on you before!" On hearing the explanation he allowed Raubitschek, after a brisk period of reading, to take the examination. This he passed, as he did the others.

The Nazi war machine was poised ready to gobble up little Austria. Being of Jewish ancestry Raubitschek realized his peril, and decided to accept an offer to join the famed Institute for Advanced Study at Princeton, N.J.

Fate brought the two young people together again. Isabelle, then teaching in Brooklyn, came to the Institute to be interviewed for a job as assistant to the distinguished British paleographer E. A. Lowe.

She got the job and found a husband, for she met Raubitschek again on that first day.

They were married in 1941 and went to New Haven where he joined the faculty at Yale, and she finished her Ph.D. dissertation. During the first seven years of their marriage, they moved back and forth several times between Princeton and New Haven. They shifted homes 10 times and they had four children during that period.

When their youngest child entered kindergarten, Isabelle went back to teaching, at a private school in Princeton. She taught Latin and Greek there till 1963, when the Raubitscheks came to Stanford.

The scholastic collaboration of the Raubitscheks had begun during their second stay in New Haven. "This was during the war, the evenings were long, and we were sharing the house with another family," recalled Toni Raubitschek. "We worked together on two books. One was a translation of a Greek play, and the other was a whole volume of Cicero's works.

"We had been asked to edit old translations, which by the time they lose their copyright are rather stale. So we decided to make a new translation. We spent evening after evening on the task. I had the Latin text before me, with Isabelle dictating and discussing. The resulting book was brought out by the Classics Club."

continued on next page

Raubitscheks. . .

continued from page 3

Raubitschek was at the Princeton Institute during one of its highwater marks. Among the luminaries there were Albert Einstein and the celebrated mathematician Hans von Neumann. There was a School of Humanistic Studies, to which Raubitschek was attached.

There, Prof. Benjamin Meritt arranged to have paper impressions, called "squeezes" made of all the important inscriptions from Greece. (Meritt, now 84, came to Stanford from Texas for the celebration of Toni's 70th birthday.)

"We filled a whole room with 'squeezes,' " said Raubitschek. "We did an extraordinary amount of work with them, matching them and finding pieces that belonged together, restoring the texts."

Meanwhile, the young married couple continued their work at home which they would discuss with each other. Typically, she would study some ancient work of art and he would fill in for her the historical and political background.

Their work together gradually grew over the years. Her special expertise was in classical art, and she taught this at Stanford for many years. She also taught the survey course in ancient art.

She has for years been working on the large collection of Greek and Roman coins owned by the Stanford Museum, and is engaged in the long and intricate task of cataloguing. Most of the coins have been given to the Museum by former students and friends.

"We were each trained as classical archeologists," says Mrs. Raubitschek, "but my husband's aim was to be a Greek historian. While he examined the inscriptions, the primary evidence of Greek history, I would handle the archeological evidence."

The secret of her husband's fame, thinks Mrs. Raubitschek, is his rare capacity for absorbing the *mores* of each main period during the long span of Greek civilization.

"He has the facility to interpret sources in the light of the ways and thinking of the people of that particular time. This is essential. The outlook of Greeks separated by hundreds or even thousands of years from each other varied as much as it does among more recent civilizations. Think how differently we feel and act than, say, the Pilgrim Fathers.

"Very few historians are capable of entering the minds of people who lived long ago. They don't have the imagination to project themselves back two thousand years, and think in the way people did in a particular period.

"Toni is completely immersed in the various shades and changes of Greek history so that he can think, for example, like a Greek of the fifth century B.C."

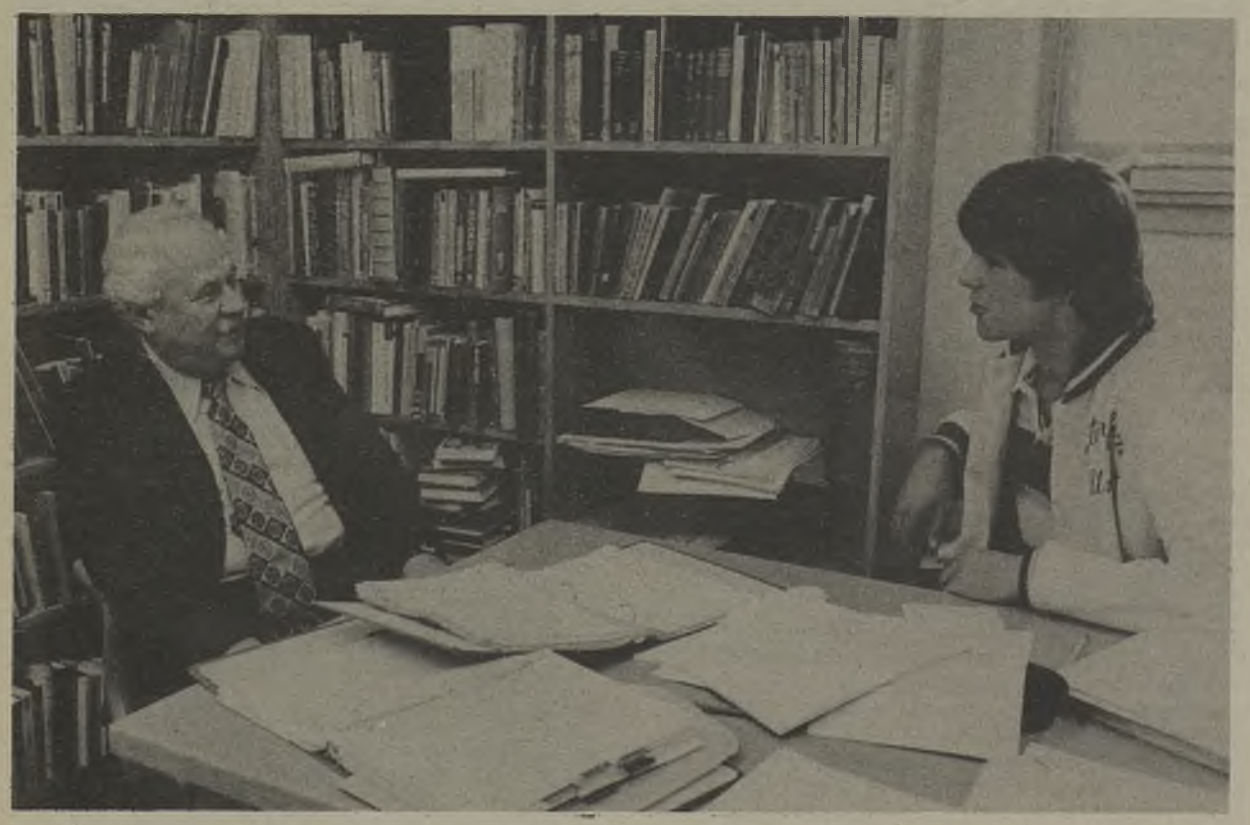
Asked whether she reads any of her husband's manuscripts in draft she laughed. "Sometimes, and occasionally I disagree, so perhaps it is not wise to read them. I do argue my own point of view on those occasions"—again her laugh—"but I am not sure I have ever influenced him!

"One of our standing arguments is about the sculpture on the Temple of Zeus at Olympia, where he is sure that Pausanias' account was correct. I am sure that it is impossible."

Among their joint works was a paper on vase painting. "I was lecturing in Milwaukee, where I had been told there was nothing to look at," said Toni Raubitschek.

"That was utterly stupid, because there is an awful lot there in its marvelous museum. I found an Attic vase that looked very unusual. I discussed it with the director, who kindly let me have photos of it.

"The longer my wife and I looked at it the more interested we became, because it included features from two distinct styles. Several years later we were invited to write a catalogue statement about it when the vase was exhibited at a Midwest collection."



One of the joint tasks they enjoyed most is on the Vase of Triptolemos, in the Stanford Museum. This is a krater (mixing bowl) which illustrates the Greek belief that Athens had given the world knowledge of the use of grain and of wine.

"Triptolemos was the Johnny Appleseed of ancient Greece. The goddess Demeter gave him the ears of corn, and a chariot to go and spread the word of how to use them," said Toni Raubitschek.

Each of the Raubitscheks contributed expertise to a study of the legend and the vase. The result was a distinguished paper *The Mission of Triptolemos*.

At this time Isabelle is working on the bronzes from the excavations at Isthmia. "I have been busy on these for some time," she said. "There are over 3,000 of them. It is a difficult problem because the area was destroyed by the Romans in 146 B.C. and repeatedly devastated in subsequent centuries.

"The area was bombed by the Nazis in World War II, because it is adjacent to the Corinth Canal, which they were trying to block. So there is no stratification. Some of the oldest relics are near the surface, and more recent material is well below."

Toni Raubitschek with student Ted Pappas: "If you do this (teaching) well, it takes up many hours."

One of their great regrets is that they have not been able to go to Greece as often as they would wish. They have each made trips of a few weeks, not often together, because of Isabelle's poor health in recent years. On several occasions Toni has gone carrying Isabelle's queries and problems, and he has spent as much time as he could seeking answers to her questions.

He draws beautifully, and he has done many of the illustrations for her volume on the Isthmian bronzes. He is also a skilled sculptor.

The Raubitscheks are distressed by the deterioration that is afflicting many of the irreplaceable relics of the past, especially in smoggy Athens. When they first went to Athens after the war and saw how it had been spoiled by unskilled people trying to "clean up" they were appalled.

"Many of the statue bases Toni had joined had been moved around so that they were in meaningless positions," said Isabelle. "Apparently the work had been done by people who were cleaners rather than archaeologists. Some of the pieces, to the untrained eye, were simply bits of stone. It needed an expert to tell them for what they were.

"Many of the pieces are now in the storeroom of the Acropolis. But it would take a couple of years for anybody to go in and put right the damage.

"There are all sorts of schemes, some quite wild, to stop the ravages caused by erosion, and chemicals in the air. In the end I think a more conservative approach will be adopted.

"Some of the treasures in Greece, and in Italy, have already been damaged irretrievably. The work of restoring the rest and protecting them is one that requires very painstaking individual work of the type that is very rare in the modern world."

She believes that in many cases it will be necessary to move many of the treasures that are now in the open, prey to all the destructive chemicals in the air, into indoor sanctuaries where the air content and humidity can be controlled.

She does not approve the ideas of Melina Mercouri, Greek Minister of Culture, who is asking for the return to Greece of such treasures as the Elgin Marbles in England. "When you consider what has happened to many of the relics that remained in Greece, it is clear that the treasures abroad were safer where they were protected."

During the last few years, Toni Raubitschek has devoted much of his time to teaching: "If you do this well it takes up many hours."

He shrugged in cheerful resignation, and the brown eyes sparkled: "As you get older there are so many calls on your time. There are letters of recommendation, the inquiries, the friends all over the world, other peoples' manuscripts to read."

The Raubitscheks take great pleasure in their four children and seven grandchildren. Their elder son, John, is a patent attorney for the U.S. government and lives in Washington with his wife and two children. Their elder daughter, Kleia, clinical director of obstetrics and gynecology at Toledo Hospital, is married to Kurt Luckner, a former student of Isabelle's at Stanford; they also have a son and daughter.

Marita, a developmental psychologist, lives in Minneapolis with her husband, Terry Hopmann, a Stanford Ph.D. in political science, and they have two children.

The youngest child, Andrew, was a resident physician at Stanford Medical Center and now works for Cetus Immune. He, his wife, and one-year-old son live with Toni and Isabelle in the latter's Palo Alto home.

Mrs. Raubitschek is something of a fatalist. "Things that look like chance really are not," she says. She believes that the pattern of lives unfolds in predestined ways.

She and her husband each came from medical families and each took some medical training, but each was drawn into the career that brought them together. Both have made a significant contribution to the education of two generations of students and to our general knowledge of antiquity.

Emigre musician finds 'You have to build a whole new world'

BY JULIA SOMMER

Emigration is like a divorce—it is a total disruption. We think of ourselves as autonomous, but actually we have countless links. . . to family, colleagues, friends, society. When you cut these links, it leaves a wound. You have to build a whole new world."

So says Stanford's newly appointed associate professor of music, Karol Berger, who left Poland in 1968 at the age of 20. As a musicology student at Warsaw University, Berger felt "suffocated in that kind of society. You have to get out because it is a jail—quite large and comfortable, but nevertheless a jail. I needed fresh air."

Asked what it was like living in Poland in the '60s, Berger gave this response: "If you want to understand how it feels to grow up in a communist state, you have to realize that it is a state ideologically committed to the construction of paradise on earth.

"There is just one little problem which makes this project unrealizable—namely, the existence of human beings—those recalcitrant creatures whose destiny is not to live in paradise, but on the ever-imperfect earth.

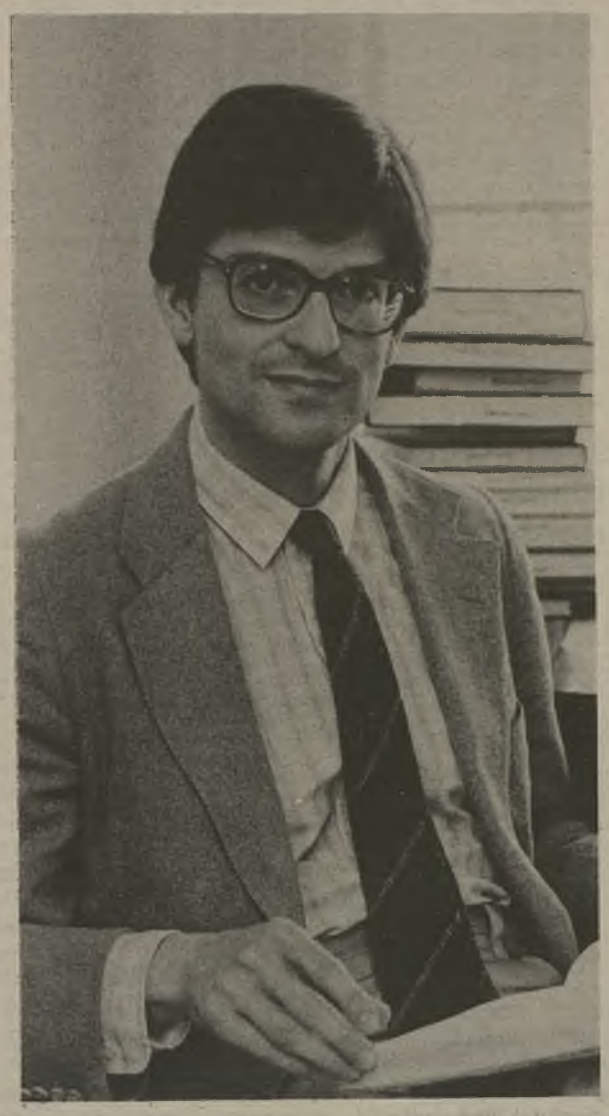
"This human reality is a thorn in the side of the 'scientific' ideology of the state which claims to have found the ultimate answers to all fundamental problems of humanity. Consequently, much of the state's effort is devoted to suppressing all evidence which contradicts the claims of the pseudo-science on which it wants to build its legitimacy.

"If there is one word that characterizes the texture of life under communism, it is lie—the incessant falsification of reality and language, and the enormous effort of the state to force everyone to repeat and participate in these distortions so that one becomes, willingly or not, an accomplice of the state."

Berger emphasizes that his Jewish background was not the reason he left. "I felt completely accepted by my schoolmates and Polish society. I left Poland because of its social and political system," he says. "The system offered absolutely no future for my generation. . .no room for personal growth, no field for maneuver. I saw no prospects for change.

"The range of options for my generation was extremely limited in comparison to more open societies because there were so many areas into which you simply could not go if you did not want to participate in the officially sanctioned lie.

"A legal career was closed to you because there was no independent judiciary, as was journalism because of the controlled press. Business was closed to you because the state had a monopoly on all economic activity.



"These enormous fields which suck in the majority of college graduates here were closed to us. This resulted in certain benefits for pure science and the arts because these were the only fields left for people who did not want to collaborate, but yearned for a genuine civil society.

"For instance, theater played an enormous part in the spiritual life of Warsaw. In a controlled society, art and music and theater can take over roles normally assumed by parliament and newspapers. Even so, the government made tremendous efforts to infiltrate these few areas left open to us as well.

"So, many of us left. It was a choice between internal and external emigration. Sometimes I think the better of us stayed in Poland. The decision to go abroad was, in a way, a defeat because that is what the authorities wanted. It's much easier to stay in power when there are no troublemakers around, and it used to be the intellectual community that produced the most active troublemakers.

"The emergence of Solidarity changed this. Now the authorities have to fear not only intellectuals, but the working class as well. It is not an accident that during the recent so-called state of war the internees were urged by the authorities to emigrate.

"We are back to where we started: communism would be perfection itself, if it weren't for the people. Or, as Brecht suggested after a workers' revolt in Berlin: 'Since the people cannot elect a new government, the government should elect itself a new people.'

Karol Berger

"If I had stayed in Poland, I would probably have worked at a research institute or become a private scholar supporting myself by translating—a common fate for those who choose internal emigration. I started writing music criticism and translating while a student to explore these fields. (Berger's translation of the book *Emotion and Meaning in Music* by Leonard Meyer from English to Polish was published in 1974.)

"Even academia entailed certain compromises with the political regime.

"I don't think the Polish government can last many more years because it is entirely unnatural and contrary to the aspirations of the Polish people, but it could last long enough to have spoiled my life there."

Berger's academic specialty is early music theory, mainly that of the Italian Renaissance since "from the 15th century on most innovative thought on music was happening in Italy.

"Italian music theorists thought music was worth writing and fighting about, even in the midst of monumental wars and plagues. You find scholars writing vituperous letters to each other about the most esoteric issues that would break off friendships for 20 years!

"There was an explosion of thought on music in the 16th century that coincided with the beginning of printing. What makes these texts particularly fascinating is that they allow you to observe the beginnings of the process which transformed the humble craft of music-making into the great art we know.

"More important, music of the distant past would be scarcely comprehensible to us if we did not know how it was originally heard and understood. In my work, I try to reconstruct these old ways of hearing and show how they differ from the more recent ones.

The way we hear and understand music is not immutable, but constantly changes.

—Karol Berger

"I also try to sell this idea—that the way we hear and understand music is not immutable, but constantly changes—to my students. Right now I teach a seminar on late 16th-century analysis, where we examine the way certain tonalities work in the music of the most influential master of that period, Orlando di Lasso, and compare this with the behavior of the same tonalities in later music."

Lasso is Berger's special interest among the composers of this period. He has written two papers on Lasso's music, and last fall participated in a conference on Lasso at his birthplace—Mons, Belgium.

Berger's Ph.D. dissertation, *Theories of Chromatic and Enharmonic Music in Late 16th-Century Italy*, was published by UMI Research Press in 1980.

Since receiving his doctorate from Yale in 1975, Berger has been writing and publishing a series of articles which examine early musical thought, some crossing the boundaries of traditional academic disciplines. In one, neo-Platonic views of the spiritual power of music form the point of departure for an interpretation of Shakespeare's *The Tempest*.

Another paper traces the way musicians of the Middle Ages and Renaissance imagined the whole universe of sounds (they imagined their sounds on the joints of the open left hand, while we imagine them on the keyboard) to the ancient art of memory (mnemotechnics).

Berger describes the direction of his research in this way:

"In music there is a triangle: one person writes the music, another performs it, and a third listens to it, although one person could do all three. Most of the effort in musicology has been directed at what composers do. The interest at Stanford is largely from the performance angle.

"I have been working for a long time on one of the most intractable problems which distorts our performances of Renaissance music—the problem of pitches which look entirely normal in notation, but which were accidentally inflected in performance.

"But my main interest is with the third point on the triangle, the least studied of all. I'm interested in music from the standpoint of its reception—the way people hear, react to, understand music. I read what people wrote about music in the past in order to reconstruct how they heard it."

Before coming to Stanford, Berger taught at Boston University for seven years, receiving tenure there last year.

"I find the give and take of the smaller classes here very pleasant, and I think the students learn more in small classes, but it's too early to make any further comparisons," he says.

"At any rate, graduate students in music are, for the most part, excellent everywhere these days. It takes real dedication to choose music over law or business."

Berger applied to Yale for graduate study in musicology while still a student in Poland, and was accepted with a scholarship.

"Relative to other emigrants, such as the Vietnamese, I had it very easy," Berger comments. "But when I got here, I found a totally alien society. I could have been from another planet. I found the free world extremely exotic.

"What struck me hardest was the transience of American society, what appeared to be a rootlessness, a lack of commitment to traditions and customs handed down from generation to

SCIRE announces Stanford Educational Administration Internships Program

SCIRE (The Student Center for Innovation in Research and Education) has announced a pilot opportunity for students, the Stanford Educational Administration Internships Program.

A variety of Stanford administrators have been contacted to participate in the program, which will offer undergraduates the opportunity to work in the administrative offices and study firsthand issues of undergraduate education and University administration such as decision making and policy formulation. "The internships will offer undergraduates the opportunity to gain experience in University administration and a unique perspective on how the University operates," says SCIRE staff codirector Judy Adams.

"Since 1976 SCIRE has worked closely with special fieldwork and departmental internship programs to coordinate fieldwork resources for students. Our *Clearinghouse Catalog* offers a broad range of community internships and research opportunities with Stanford faculty.

"It occurred to us that there are many untapped resources within the University for students to address management problems, policy-making, and the education goals of University administration. Why not enlist the help of University professionals in enhancing undergraduate education by setting up Stanford internships in their offices?

"We began contacting University offices in fall 1982, and are still in the process of developing positions. We collected syllabus materials from courses offered in the School of Education's Administration and Policy Analysis program, and from James Lyons, dean of student affairs.

"Although much remains to be done, we have decided to begin the program with three pilot internships: the Ombudsman's Office, the Affirmative Action Office, and the Community Outreach program of University Events and Services. These programs have the time to administer an intern and offer three different perspectives on the operation of the University. Each office will supervise the intern's work and provide an evaluation at the end of the internship.

"Interns may also be assigned faculty sponsors, and have a SCIRE support group/seminar which will provide a forum for discussion and an opportunity for the interns to meet with each other and compare their experiences. The internships will be accredited through SCIRE, although SCIRE will also facilitate departmental credit where appropriate.

"Students will be responsible for keeping a journal and writing a final paper on the experience. As such, the requirements will be the same as for our other SCIRE internships; what will be especially exciting is that students will be able to gain insight about the workings of their own University.

"In addition to adding new administrators to the program, SCIRE is also exploring with ASSU the possibility of offering academic credit to committee interns who meet SCIRE internship requirements."

Students can look at job descriptions and pick up application forms at the SCIRE office, 590A Old Union (or call 497-4504) for more information. The selections will take place spring quarter or early in the fall for internships to begin in fall 1983.

The deadline for fall quarter applications is October 6. Internships may be for one, two, or three quarters of that academic year. New positions will be announced as they are developed.

"Our Policy Board and the administrators sponsoring interns will evaluate the program as it develops," says Adams. "We hope students will be excited at the prospect of working in the University. We are excited about offering the opportunities."

Interested students should contact Adams at the SCIRE office.

CAHPERD elects Garcia as vice-pres

Robert A. Garcia, director of graduate programs in physical education and acting instructor of education in the Stanford School of Education, has been elected vice-president elect boys' and men's athletics for the California Association for Health, Physical Education, Recreation, and Dance.

CAHPERD is an active association of over 5,000 members who are committed to developing higher standards of professional growth, competency, and ethics in the fields of health, physical education, recreation, dance, and allied interest areas.

Anthony Chun, Royal Kopperud

Anthony L. Chun and Royal J. Kopperud have won $500 each in the Stanford undergraduate engineering writing and speech competitions, respectively.

Both winners of the W.B. Dickman prizes are seniors in chemical engineering.

Their selection was announced by David Lougee, director of the technical communications program in the School of Engineering.

French painter Gericault subject of Lorenz Eitner's new book

The first comprehensive study of the French painter Theodore Gericault's life in more than 100 years, a new book by Prof. Lorenz Eitner of the Art Department, has been published by Cornell University Press.

In *Gericault: His Life and Work* (376 pp., 9x11½, $75) Eitner traces the development of the artist's painting, taking a close look at the varied influences on his themes and style—his artistic training, his assessments of other artists, his trips to Italy and England, his political involvements, and his resourceful responses to the changing role of patronage.

Though Gericault was tormented by scandal, poor health, and bouts of insanity, and died at the age of 33, he produced paintings that prefigured the artistic revolutions of the 19th century.

Berger. . .

continued from page 5

generation, a lack of common cultural awareness. Only gradually did I realize that these first impressions were quite superficial, if not entirely incorrect."

While writing his dissertation at Yale, Berger worked for two years as assistant curator at the Archive of Historical Sound Recordings. Having never received a formal undergraduate degree in Poland, "I had an additional anxiety when I was writing my dissertation because I knew that if I didn't finish it, I wouldn't have any degree at all!"

Berger spent over two years in Shanghai, from age 13 to 15, when his father was stationed there as a consul. "This was a very happy time in my life because I didn't have to go to school. I spent those two years reading novels; in fact, all my literary education comes from this period. I also studied piano and English. It was a very fruitful time not to be subjected to formal requirements."

When he returned to high school in Warsaw, Berger also enrolled in a separate music school. He received diplomas from both.

The first foreign language taught in Polish schools is Russian, which you take from fourth or fifth grade until high school graduation. Since the hatred of Russia is universal, most Poles make it a point of honor not to learn the language, which is stupid. One knows very little about Russia in Poland.

"In high school you learn a second language—in my case, Latin. I continued to study English privately.

"In Poland there is a very strict separation of music performance and music scholarship. Only musicology is taught at the university; performers study at conservatories.

"Musicology in Poland is very respectable. I had good teachers. I'm very glad I had this experience. . .to benefit from education in two different countries with two different approaches to musicology. I maintain quite a close contact with some of my teachers in Poland and try to keep track of what is going on there.

"My first year in this country I fortunately had a teacher who required essays every week, which helped improve my English. This is something I now do with my own graduate students so they learn that writing is not so forbidding."

This quarter Berger is teaching, besides his graduate course on analysis of late 16th-century music, a course for non-major undergraduates: the operas of Mozart. "I want to teach courses of very different kinds. Music is potentially very attractive to non-majors, and this department should serve the general undergraduate community," Berger believes.

"Teaching the operas of Mozart is enormous fun. No other composer realized the dramatic potential of music so perfectly. Mozart not only embellishes his libretti with beautiful melodies, he makes your very nerves feel the movement of the dramatic action." Berger is preparing a paper on Mozart's tragic opera, *Idomeneo*.

Another interest of Berger's is the Polish composer Karol Szymanowski (1882-1937). He recently attended a conference on Szymanowski in Vienna, along with 30 other scholars. "Szymanoswki is very little known in this country, but he has a lot to offer. He is an interesting subject to a historian because he is not yet entirely classified by the music history bookkeeping system. He is not one of the very great, nor is he negligible.

"The view of the development of music in our century which dominates academic music history today was constructed largely by Schoenberg and his followers. In this view, music history consists of a progressive series of technical conquests made by one generation of avant-garde composers after another. There is no place in music history of this sort for composers like Szymanowski, Janacek, or Britten-Composers who were not interested in inventing new techniques and yet had something unique and important to say. When we study such composers, we are forced to reconsider the way in which we construct our recent past."

I think musicology concentrates too much on the past. It is not respectable for musicologists to study contemporary music.

Berger read a paper at the conference on Szymanowski's opera, *King Roger*—"a fascinating attempt to subvert the Wagnerian tradition from within, using the ideas of Nietzsche and Debussy as the weapons.

"I think musicology concentrates too much on the past. It is not respectable for musicologists to study contemporary music. When I was a graduate student, most of us went into Renaissance, fewer people studied medieval or Baroque music, but very few did anything else.

"It was not even terribly respectable to write a dissertation on music as recent as the 19th century!

"This has changed drastically in the past 10 years, with an explosion of 19th-century studies. I think the 20th century is next. We could pursue this profitably at Stanford. After all, we already have a world-class center for computer music here.

"We music historians are socially irresponsible if we don't promote what is truly valuable today; we should not leave it entirely to journalists and cultural impresarios.

"The 20th century is rich in opportunities for re-evaluations, changes in emphasis, but we have to know what is going on currently."

To practice what he preaches, Berger will offer a course on "Music Since 1945" next spring.

Margaret Doody views Aristotle as ancient Sherlock Holmes

BY MILLICENT DILLON

To Margaret Doody, visiting professor of English at Stanford, all scholarship is a form of detective work, the act of putting together clues.

So it's not at all surprising that she is the author of several detective stories, most notably *Aristotle Detective*. Doody is a professor of English at Princeton and an expert on 17th and 18th century English literature.

As its name implies, *Aristotle Detective* (Harper and Row) is a whodunit with Aristotle as the Sherlock Holmes figure—and a very logical and rational one he is, too.

"He's the classic detective," said Doody in a recent campus interview at the Stanford Humanities Center, where she is a visiting fellow. "He has that sense of humor, that detachment, that unshockability combined with curiosity as to why people do what they do."

She remembers clearly the moment when she got the idea of writing this mystery. "I was in Oxford, on a break from the University of Swansea. One night I was reading a translation of Aristotle's *Rhetoric* in preparation for talking to a graduate student about 17th century rhetoric.

"Then I crawled into bed with a detective story and the thought came to me that someone should write a book in which Aristotle was the Sherlock Holmes character. I thought about it for three weeks and realized that nobody was going to do it if I didn't. So I did.

"Of course there was an influence of the Dorothy Sayers' essay, which I had read many years before, on Aristotle and the *The Poetics*. In that, Sayers said he was really defining the detective story as a genre, though it hadn't been written yet.

"And above all, there was the influence of those visits to Greece I made when I was an undergraduate and graduate, 'the hiding places 10 years deep,' as Wordsworth says. Things come back that are important and you don't know that's what's going to happen."

Since she was not a Greek scholar, she had to do all her research in translation. But Doody knew where to find things and received a good deal of help from her classicist friends, most particularly John Gould, then head of the Classics Department at Swansea.

Doody has just finished another detective story with Aristotle as the chief character. Called *Aristotle and Poetic Justice*, the novel is set in Delphi.

"Part of the denouement takes place with the Delphic oracle. Aristotle and Stephanos (the Watson figure) travel and there's much more sex in it than there was in the first book. One scene takes place in a brothel. It's got comedy. It's got corpses turning up in odd places."

She's now doing research for a third story that focuses on Aristotle and medicine and the biological sciences. "I'm supposed to be reading part of that book at a conference on Aristotle and the biological sciences at Williams College, a serious conference, this July. I'm giving a reading in the evening as part of the entertainment.

"This new one will be partly set on the island of Kos, the hospital island, in fact Hippocrates' island.

"Aristotle wrote a great deal about biology, the parts of animals, the motion of animals, etc. Of course, his father was a doctor and he may have practiced medicine himself.

"He was a leader in biological sciences as well as in poetic criticism. People are going back to him now, as every few generations they do go back.

"People have at one time or another become enslaved to Aristotle, it's true. They've taken his sayings as simply ends and not as points of departure. But then other people have been very unfair to him. There's still a kind of Sunday newspaper school of criticism that classes Aristotle as everything rigid and bad.

"Of course, it's quite untrue. He's a great, great genius, with an extraordinarily flexible and entertaining mind, with a strong sense of order as well as a strong sense of questioning.

"It's amazing how off he was in some things—say, the organs of the body—and yet how nearly he really got other things, in particular he was close to the circulation of the blood."

Doing her research, Doody is spared questions of forensic medicine and ballistics that modern day detectives have to deal with—naturally, there was no fingerprinting, no bloodtyping, no autopsy, no revolver to be hidden or left at the scene of the crime.

But what makes it possible to write a detective story about the Greeks in the Fourth Century B.C. she says, is that they did have a legal system. "That's what you need: a legal system, a trial, evidence—a city of law.

"The Athenians had that. They had laws about murder. Fortunately I found just the right book, by a man called Douglas MacDowell, *Athenian Homicide Law*. It was just perfect, an answer to a prayer."

How do Doody's colleagues feel about her writing detective stories? "Some people don't approve at all, and others think it's great fun.

"In England it's taken more for granted that academics will write this kind of thing—there's a whole tradition. You can write hightone novels or lowtone novels and it's accepted as something you can do.

"But the American notion of being professional means that you don't deviate from your field.

"However, if you look around California you see that there are besides myself, Max Byrd at Davis, and E.F. Hutter at UCLA, who are also in 18th century English, and who also write detective fiction."

Doody's most recent project is a play based on Samuel Richardson's *Clarissa*, the longest novel in English, written in the 18th century. Richardson has been the subject of her scholarly study for many years. Her earliest published academic work was *A Natural Passion: A Study of the Novels of Samuel Richardson*.

"I thought for years of making *Clarissa* into a film. But then after I moved to Princeton and was teaching part-time at Columbia also, I met Florian Stuber who'd just finished his thesis on *Clarissa*. I found out he was thinking of turning it into a television serial.

"He had already started work on it with a friend in Hollywood, John Sgueglia, and then I joined up. And it has turned out that Florian and I have worked on the project and John has given us advice.

"We've written Episode One and the outline of the other twelve parts. So far we haven't been able to sell the television serial. We need someone with imagination to take it.

"However we had only just begun to look about us for something to do with what we had written when a young director, Bill Hegeman, asked if he could see it. And he offered it as his submission for a Director's Workshop at Circle Rep in Manhattan. He was chosen and it will be put on in the Workshop.

"Each piece being presented is an original work.

"So now we have 20 professional actors who will be in the presentation. In addition Diana Tramon is writing music for it.

"Of course, we had to rewrite it as a stage piece, not as something to be filmed."

Doody will be in New York for the presentation on May 26 and 27.

Commenting on the power of *Clarissa* as a literary work, Doody says, "In the deepest and least transient sense it's a feminist work. It's also a very powerful work about the relationship of human beings to society, to money, to power, about what happens to human beings under pressure, about the power of the irrational elements in all our characters and the irrational and destructive side of sexuality.

"It's the only tragedy the 18th century produced in literature.

Aristotle's a great, great genius, with a strong sense of order as well as a strong sense of questioning.
—Margaret Doody

"It's all about a fading aristocracy and its last bid for power. The only arena left for power for men of that class is in sex, as in *Don Giovanni*. Lovelace, the aristocrat, encounters Clarissa, a young woman from a new bourgeois family.

"Richards on himself, of low middle class working origin, portrays the bourgeois family very frighteningly.

"As for Clarissa she doesn't define herself as either bourgeois or aristocratic. She insists on trying to be herself. To my mind she is a spiritual genius.

"It's a very great work, an obsessive novel. You get inside it and it obsesses you.

"To Lovelace, possessing Clarissa sexually is an act of power. To him it means that he owns her. Clarissa's view, of course, is entirely different.

"I was brought up in classrooms where the men sort of giggled at rape. Now we don't. Women never do really.

"But to Richardson rape is a major issue. It signifies everything that is wrong not only between men and women but in power and in the relations of the powerful to the weaker, in the social structure, in an order of the community that allows and even encourages it—all the things in fact that we've been talking about recently.

"Lovelace ends up using force on Clarissa, as her own family in another way had used force upon her. It's a very violent world Richardson is writing about, along with all the new money and the elegance and the silks and satins.

"Richardson sees human beings as being violent at the heart under whatsoever veil of civilization. And the civilization itself is suspect.

"Clarissa at the end chooses to die in Covent Garden, which is a very low-life mixed area in London, instead of going into the country to die romantically.

"This is a book that has tremendous vitality. It deals with basic issues. It has wonderful characters, comedy and tragedy. It's very moving and very dramatic."

Letters to the editor

Fuchs 'stuck in familiar ruts of lockstep liberal academia,' Cohn contends

Editor, *Campus Report*:

The excerpts from (Prof. of Economics) Victor Fuchs' new book constitute a fascinating document of our times. The global breakdown of liberal (in the modern sense) economics such as Keynesianism, which has affected even the Democratic Party, is reflected here in some important admissions such as the fact that the minimum wage is often counter-productive.

He is realistic about the costs of supporting women in the labor force through extensive publically-funded childcare and accordingly sees a rapid descent in the rate at which women will be moving into jobs or professions.

But when it comes to truly long-range and deep perspectives on where we are going, Prof. Fuchs reveals himself to be stuck in the familiar ruts of lockstep-liberal academia in our time.

For example, he makes a fetish of the horizontal dimension of existence, in the particular form of egalitarianism. Of course, this direction of human reality is infinite in its claim on us, but there is the other infinite, of value, transcendence, deep personality, risk, vital *difference*, and (at least provisional) hierarchy, and so on, and we have somehow to balance this infinite with the other and muddle through in an enlightened way.

Fuchs does give some attention to the vertical dimension but rather grudgingly and certainly insufficiently. To him, the family is a *barrier* to equality since it perpetuates privileges in the genes and circumstances, so he rather welcomes its decline.

Well, in the first place, though it is true that the *extended* family has taken a beating (with some severe losses in the texture of culture which he doesn't mention), the nuclear family has bounced back strong an now constitutes 76 percent of all such arrangements in this country.

Secondly, when one thinks of what traditional and hierarchical families have contributed to culture, one wonders what he is crowing about. No more Freuds ("my golden Siegie" as his mama called him), Kennedys (old Joe beat the boys compulsively at everything), etc., etc.

Fuchs doesn't appreciate that it is precisely vertical *hierarchy*, starting, say, with the Oedipal crisis in which the sensitive boy is "crushed" in his rivalry with his father, according to Freud and Lacan, that is the motor of the boy's rising to powerful cultural fatherhood in his turn. Sure this vital process is risky and unjust (provisionally!) but what of any importance isn't in this world, at times? It is extremely interesting if you can take it. . . and you have to take it eventually anyway.

Bringing this steep and ambiguous, dialectical dimension into awareness as the best of modern thinkers have consistently done—it is the very hallmark of twentieth-century thought, starting with the Mallarmean revolution and passing through all the major figures of France—you get to realize, for example, that behind the cliche of male "domination" which to Fuchs is "morally indefensible" (and worth bringing down culture to cure) is a subtle irony.

Men have dominated mainly in the realm of Form, which is their particular turf, i.e., certain structures of civilization such as law and high symbolic achievement, abstraction, etc. This has to do with the basic differences arising from the fact that men are alienated *ab ovo* from the birth-core, from the center of human existence (a new book by Lillian Rubin has just rediscovered these old truths) and had to develop these compensatory *forms*.

Underneath, women have dominated in their own way of Being all along, clearly in the Old Testament at times, and folk wisdom has often alluded to this reversibility (who really wears the pants in the family, etc.). But economists and academics generally tend not to be in tune with imaginative folk wisdom, let alone visionary and whole-seeking thought.

And when you recall that just about all the violent crimes are still committed by men (and maybe worse-to-experience inner assaults are committed by women) and you look at our Congress and see, after all the hullabaloo, only 21 women out of 435, you wonder what the point of higher education—where everyone is ritually taught that men and women are essentially just the same or will be—is in 1983.

None of this is to deny the ambiguity of gender and the consequent complexity of the relation, including numerous "crossovers"; the point is rather to emphasize that there are *also* built-in differences which it is silly to ignore, such as when the Army wasted billions and pulled down our preparedness by training men and women together, oblivious of the 40 percent gap in upper-arm strength.

Fuchs' ideal aim is the redistribtuion of wealth. My own preference is for the higher health of mankind, implying a balance between the glories of superior art and achievement of all kinds on the one hand and maximum decency and opportunity on the other: Imperfect, to be sure, but lively and worth staying around for. Having witnessed the drab and dreary consequences of egalitarianism in Russia—has he been there?—one wonders why they want to keep going (alcohol seems to be the main support).

The answer is that human beings are tough and resilient, having come up the hard way from the original explosion and slime. And the "Adamic" way will never be easy for anyone, even in "laid-back" California where we have a high suicide rate, some strange new diseases and cancerous spiritual disorders along the lines of *1984*.

Having eliminated failure from the official picture at Stanford, we are now failing in a big way underneath. But the masterpieces of religious wisdom and of art are still on our consciences reminding us that, for all the original odds, life can do better than that.

Robert Greer Cohn
Professor of French

VA lab dog had advanced pneumonia, dehydration, fur in stomach: Giraud

Editor, *Campus Report*:

Some remarkable statements have come from the Medical Center lately—one being that "the search for knowledge is an instinctive trait unique to human beings." (That must be a scientific finding unique to our Medical School.)

There is a moving allusion to a relationship not clearly spelled out—"the relationship between humans and animals joined in research and teaching," which inevitably calls to mind a recent example thereof, specifically the case of the laboratory dog. . . .

Here is what happened:

On the evening of March 24, a third-year medical student, Peter Barran, working on a Stanford project in a Palo Alto VA Hospital lab, suddenly found himself confronted by the sight of a large, emaciated dog, collapsed on the threshold of his office. The dog, a white Samoyed, was lying in his own feces. His body was being shaken by a wracking cough. On his left rear leg the bare bone was exposed where an ulcerated wound had gone through skin and tissue. The other three legs were covered with deeply infected wounds. Barran peeled back a bit of scab and uncovered a bed of pus. In the right groin, a gaping six-inch incision that had penetrated skin, fascia, and muscle had opened and was oozing a yellowish fluid. The dog seemed in shock, and Barran judged he was near death. . . .

Barran, who later said he acted as he did out of a compassion for suffering that had made him enter his chosen profession in the first place, decided. . . (after a telephone conversation with Stanford and VA veterinarian Carolyn Reed) to take the animal to the only veterinary hospital open at that hour, the South Peninsula Emergency Clinic, where veterinarian Randy Hemphill was on duty.

Hemphill has said: "There is no doubt in my mind that this animal was suffering tremendously and had not been receiving proper medical or nutritional care." Like Barran, he judged the dog not likely to live out the night and decided to put him out of his misery with an injection of sodium pentobarbital.

The necropsy Hemphill subsequently performed revealed that the dog, in addition to what had already been apparent, was also suffering from advanced pneumonia, was badly dehydrated, that his intestines were empty and his own fur the sole contents of his stomach. Hemphill's findings were later confirmed by another necropsy performed, at the instigation of humane societies, by a veterinary pathologist at the Veterinary Medical Teaching Hosptial of UC-Davis. . . .

The dog had been obtained from a pound. It had been someone's pet and friend. Stanford and othe research institutions are fighting tooth and nail to defeat California SB 883, Senator Roberti's pound seizure bill, that would outlaw the use of pound animals in labs (a practice the National Institute of Health do not themselves support). The bill is now making its way through Senate committees, embattled all the way.

The VA's own committee cleared the VA of all wrong-doing in the case (May 11).

The three humane societies of the area, the Peninsula Humane Society, the Humane Society of Santa Clara Valley, and the Palo Alto Humane Society, are pressing for criminal prosecution of those responsible. . . .

Western Culture tracks solicited

Beginning in the fall quarter, 1984-85, there will be room in the Western Culture Program for a new track or tracks to take care of about 250 students. Proposals must be submitted to Marsh McCall, chairman, Western Culture Program Committee, by December 1, 1983.

Inquiries about the contents of such a proposal should be made, until June 15, to Laurie Davis in the Western Culture office (7-0944), and over the summer to Marsh McCall in the Department of Classics (7-2581).

Research staff sought

Protein crystallographer with Ph.D.

Research Associate or Senior Research Associate: A position is currently available at the Stanford Synchrotron Radiation Laboratory for a protein crystallographer with Ph.D. and several years research experience.

The candidate should be experienced in both electronics and software development and should have a strong crystallographic background. The successful candidate will take part in the further development and use of an area detector data acquistion development system that is being used in an experimental program to determine protein crystallographic phases using differences in the anomalous scattering at multiple X-ray wavelengths.

The candidate should be willing to interact with visiting research groups using 1) the area detector facility, 2) a rotation camera facility which will shortly be completed, and 3) a CAD-4 diffractometer system. There will be an opportunity for both personal and collaborative research in the field of crystallography.

The level of appointment and salary (from $25,000) will depend on experience. The initial appointment is for three years and may be renewed. Please send a CV, a list of publications and the names of three referees to Dr. Paul Phizackerley, at SSRL/SLAC Bin 69, P.O. Box 4349, Stanford University, Calif. 94305.

Application should be received before June 30, 1983.

Stanford is committed to equal opportunity through affirmative action in employment; we are especially eager to identify qualified minority and women applicants.

Intermediate energy physicist

Applications are invited for a **postdoctoral research associate** to participate in a program of experiments in intermediate energy physics. Current activity centers on the use of the Crystal Box detector for the study of rare muon and pion decays at the Los Alamos Meson Physics Facility.

The successful applicant should be prepared to reside at Los Alamos for appropriate periods of time. A willingness to participate in other projects involving -ray and X-ray detection at accelerator laboratories and in space is desirable. The position is tenable, intially, for three years with the possibility of further extension. Salary commensurate with experience.

Applications with curriculum vitae and the names and addresses of two academic referees should be sent to Prof. Robert Hofstadter, Department of Physics, Stanford University, Stanford, Calif., 94305, by August 31, 1983. Stanford is committed to equal opportunity through affirmative action in employment and we are especially eager to identify qualified minority and women applicants.

Tucci works with computers, would like to be a conductor

In high school I couldn't decide whether to major in computer sciences or music. I couldn't make up my mind at Stanford either, so I ended up majoring in both."

Christopher Tucci will receive both an MS in computer science and a BA in music this June after five years at Stanford. Last year he received his BS in mathematical sciences.

Now he's frantically trying to decide between job offers from GM, IBM, and Ford Aerospace while studying for finals and finishing a master's project. "I don't know what to do. I've been on long distance every night for a week trying to decide."

Besides his double major, Tucci has worked over 20 hours a week throughout school to support himself; started a 16-man singing group (The Stanford Fleet Street Singers); directed and helped write past Gaieties; RA'd at Wilbur Hall; and cofounded Stanford Children's Theater. He still manages six or seven hours sleep a night.

Tucci took 61 units freshman year, completing half his math-science major. He also played in the Band ("I had a lot of fun in Band, but it burned me out. . . it took too much of my time"), studied trumpet privately, performed with Alea II (the contemporary music ensemble), and wondered whether he should be a music major or not.

Sophomore year Tucci declared himself a music major, but stopped playing the trumpet. "I was experiencing sophomore slump," he recalls. "I dropped a lot of classes. I kept meaning to practice, but never managed to get my trumpet out of its case. I never thought I'd finish the music major; I just wanted to take as many music classes as I could."

That same year Tucci cofounded Stanford Children's Theater with two friends. They put on musicals *(Free To Be You and Me, Androcles and the Lion*, and original creations) at schools and hospitals in the area. Tucci was music director for two years.

Last year Tucci picked up his trumpet again, studying with Stanford trumpet teacher David Burkhart (principal with the Oakland Symphony). "I missed trumpet so much, and it was a great release of tension for me to play," he says. Tucci plays in the Symphonic Band, which gave its second annual Sousa concert May 21 under the direction of Art Barnes.

Both this year and last Tucci has received Music Guild scholarships to study with Burkhart. "Tucci is a very personable fellow," says Burkhart. "He's got the kind of personality, as well as talent, that make him a pleasure to teach."

Tucci is also a singer. "I started to sing when I was a senior in high school because I didn't want to play in the pit orchestra for the spring musical anymore. I figured the only way to get out of it was to try out for a part, and I got one of the leads (in *Carousel*). All the leads were given private voice lessons by the high school. Our spring musicals were a big deal in the Detroit area. We always sold out the seven performances and almost a third of the student body auditioned every year."

Last year Tucci studied voice privately with Vera Scammon, and last year and this has sung with the Early Music Singers under William Mahrt.

"I took two music courses from Prof. Mahrt and really enjoyed them. Then I directed the singers in *Everyman* my sophomore year, and I decided I wanted to sing more plain chants and Renaissance music."

Tucci especially enjoys conducting. Among his credits: *Guys and Dolls*, performed at Wilbur Hall May 5, 6, and 7; and *CopacaBranner* at Branner Hall in 1979.

Not to leave a musical stone unturned, Tucci is composing the music for a film by Cal Lai (compensation analyst in Stanford's Personnel Department and Resident Fellow at Okada House) under the auspices of De Anza's film department.

Tentatively entitled "Clog," the screenplay describes teenage life in Silicon Valley of the 1990s.

My short-term goal is to get a good job and do music on the side. I'm already $4,000 in debt.

—Christopher Tucci

Lai plans to distribute the film in February to cable networks, PBS, and film festivals.

Tucci's master's project in computer science brings his two majors together. He is concocting a program to solve counterpoint exercises that will hopefully interface with music Prof. Leland Smith's music typesetting program. (Counterpoint refers to two or more lines of music sounding simultaneously.)

This spring Tucci's commitments fairly boggle the mind. He is an RA at Okada House in Wilbur Hall (the Asian-American theme house), where he is responsible for organizing academic and social events and "just being there." He spends four or five hours a day on some musical activity, including two hours of trumpet practice. He works for the Computer Science Department typesetting books (he used to design typefaces for them), and teaches 20 students in a three-unit Undergraduate Special Program course on Tolkien. "And I'm supposed to be graduating!" he exclaims, with a note of panic in his voice.

Tucci has also worked at Stanford Hospital, starting up the pharmacy computers every morning at 6 a.m.; at the Faculty Club; and as a consultant for LOTS.

"My short-term goal is to get a good job and do music on the side," he says. "I'm already $14,000 in debt."

Tucci thinks that double-majoring in music is a great idea "if you want to work on music but not commit everything to it. I really enjoyed the small classes in the Music Department. No one is afraid to ask questions, and I always felt I had a handle on the material, unlike some of my technical courses."

One of Tucci's long-time dreams was realized last year when he, along with some close friends, formed the 16-man singing group, The Stanford Fleet Street Singers. They perform at study breaks every Wednesday night in the dorms and will give their spring concert May 26 in Toyon at 9 p.m. "We know about 35 songs, mostly our own arrangements of barbershop, '50s rock, crazy songs, and old Stanford songs. We want to be Stanford's newest tradition."

The Fleet Street Singers rehearse five hours a week, each section meeting separately for one hour. Having learned tap-dancing at Stanford, Tucci even does a soft-shoe routine with the group.

Tucci comes from Birmingham, a suburb of Detroit "where Jimmy Hoffa was kidnapped." His two sisters and one brother all attend the University of Michigan ("we're all on financial aid!") and his father teaches psychology at a local community college.

Last summer Tucci traveled throughout Italy, visiting relatives and friends of the family. His mother's family is from Abruzzo; his father's from Salerno.

Looking back over his five lively years at Stanford; Tucci recalls the courses and professors that made the biggest impact on his education: Medieval and Renaissance music (Mahrt), trumpet lessons (Burkhart), classical politics (Raubitschek) Dec-20 assembly language programming (Gorin), and statistical inference (Haley).

Looking ahead, he wonders if he is going into the right field. "I don't want to work with computers the rest of my life. I think I'd like to conduct an orchestra."—**Julia Sommer**

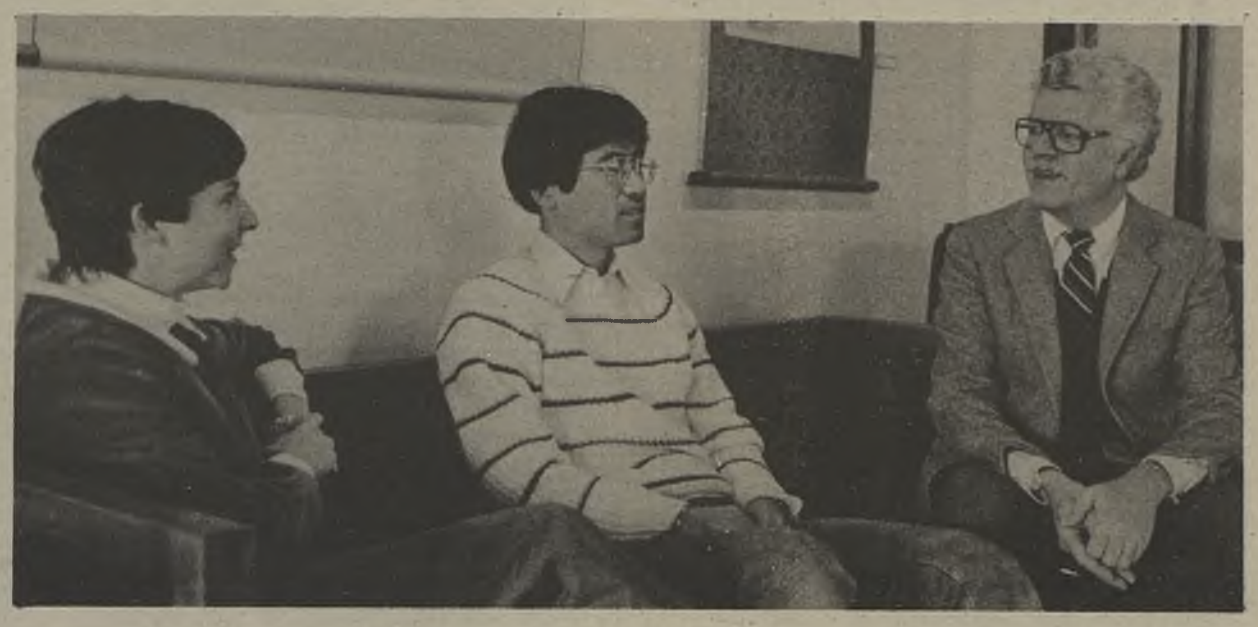
Procurement staff reduced: how you can adjust

Due to the University's budget reduction program, Procurement has had to reduce personnel. The full impact on service level is unknown at this time. However, with your help and cooperation, a reduction in service level may not be a problem.

The following are some of the ways departments can help:

1) **Plan ahead.** Submit requisitions early, as soon as you become aware of the need for materials or services. Consolidate orders to reduce the number of requisitions in the system. Order two or three months' supply of an item.

2) **Economies and convenience through Stores.** Save time and money by buying through Stores. Stores is happy to add stock items that are ordered frequently by departments through Procurement. Please call Stores Customer Service at 7-9606 to request a Stores catalog or to find out more about adding Stores items.



3) **Submit complete requisitions.** You can be assured of prompt processing by making sure you submit *complete* requisitions. Here are some of the items frequently omitted from requisitions:

* Account number (including fund number);
* Appropriate signatures;
* University Property Administrator's signature, for SU-15s;
* Supporting documentation.

Procurement welcomes any ideas or suggestions you may have to improve our service to your department. Please call any of the following Procurement operations managers with your thoughts or questions: Jim Gallaher, Special Contracts, 7-9406; Petchy Sargent, University/Hospital Buying, 7-1001; Jim Middleton, Facilities Procurement, 7-2429; Hector Allen, Stores, 7-3794; Kenn Klitgaard, Commissary, 7-3745.

The International Center—a global microcosm

Lee Zeigler works to broaden campus view of the world

Lee Zeigler (right) chats with English-in-Action volunteer Lisbeth Deisenroth (right) and student Hiro Yoshida

Our ideal role is to make Stanford a more international place," says Bechtel International Center Director Lee Zeigler.

"We want to help the people who are here from other countries for limited periods of their lives have the maximum exposure to the diversity of American life as it's presented here.

"At the same time, we'd like the whole Stanford community to be more aware of the rich international opportunities *they* might have through interacting.

"All international work is very two-way. You're helping people understand what we're all about, and you're learning what they're all about."

Zeigler, now in his 12th year as director, remarks that the I-Center's responsibilities have increased continuously since he took over.

Besides foreign students, the staff now handles programs for postdoctoral scholars and short-term foreign visitors. The Fulbright, Marshall, Rhodes, and Churchill Fellowships are now administered by Cathy Gamon of the Overseas Resource Center. And the wives' programs have kept on growing.

Zeigler attributes the I-Center's success to two things—a marvelous staff and the hundreds of volunteers who give their time and energy to make the programs work.

"I have a fantastically talented staff," he says—"people who are mostly overqualified for the jobs they're holding, and who work in many different ways.

"Most of the staff here are not confined to a particular role. They get involved in other programs, or they follow up on their own ideas for interaction."

What could happen to the programs without the volunteers?

"We wouldn't have them. We couldn't run this place on staff alone. All our hospitality services and our new student orientation, our English-in-Action program, the meals we provide for the luncheon discussion groups, our international visitor services—those are all dependent on volunteers.

"People ask what it's worth in dollars. I don't like to quantify volunteer work—it cheapens it. People give of themselves in a lot of different ways that are beyond a price tag.

"For instance, take international visitors. Last year there were 1,400, this year it will be more. That's one staff person (Maria Bun) with about 15 volunteers who help her different days of the week."

Zeigler became interested in things international when he was a Stanford undergraduate and a Latin American studies major. He spent summer and fall quarters between his junior and senior years studying and teaching English in Guatemala.

After receiving a master's degree at NYU, he spent five years with the Bi-National Centers program of the U.S. Information Agency in Ecuador, Bolivia, and Chile.

"I became convinced that the most effective exchange was with people who could come to this country and see it for themselves, rather than the propaganda method of going to other countries and telling them what we were all about.

"Therefore, when I came back to the U.S. in 1955 I tried to get a job as a foreign student adviser, but at that time there were very few opportunities."

Zeigler spent four years as assistant to the director of the World Affairs Council in San Francisco, "all the time hoping that some day I could get back to foreign student work."

The chance came in 1960-61, when he filled in for a Stanford assistant foreign student adviser who was on leave.

"The temporary job at Stanford was a launching pad for me," he recalls. "I met many people in the field and was offered several positions. The one I accepted was at the University of Hawaii—I went there in 1961 as director of their international student office and remained until 1969."

Zeigler came back to Stanford in 1969 as associate director with Ken Cooper and was appointed director in 1971.

His basic philosophy in operating with international students and scholars is simple—"Our first line of responsibility is to maximize their stay by minimizing their problems.

"If we help them to resolve their immediate needs when they come here and help make them comfortable, then they will reach out more and enrich their stay beyond the classroom or the laboratory.

"We give a lot of emphasis to the orientation period—helping people during the first weeks of their stay when they need basic things like housing, shopping, banking, settling in, and child care.

"This is a time when our volunteers give hours and hours and hours. I don't think the University has ever realized the contribution they make."

The I-Center remains a social point for some foreign students, who spend time there almost every day. Others develop their social lives in other places, such as Escondido Village or among their colleagues, and only appear for special events.

"We try to be broad enough to serve needs in a lot of different ways," says Zeigler—"everything from the official visa-related matters to the informal feeling comfortable here."

American and foreign student leaders run the four luncheon discussion groups held at the I-Center, and others are members of the program board. Each week a group comes in to cook their nationality's food for a special Sunday supper.

One of his ongoing wishes is to promote more interaction between American and foreign students. Stanford undergraduates seem to be so wrapped up in pressure to study and the social life of their residences that they don't reach out much beyond those things.

"People don't realize that we're more than a place for foreign students," says Zeigler. His ideas for joint programs with the residences so far have found few takers.

"Years ago the Row houses used to invite foreign students to eat with them several days a week, and there was an ASSU scholarship program through which foreign students would live in different residences for each quarter. That doesn't happen anymore."

Zeigler worries that the situation contributes to the fact that Americans in general tend to be naive and uninformed about international affairs and cultures.

"Americans are traditionally lacking in the need to communicate with people from other countries," he laments.

"As the world becomes increasingly interdependent, and the global powers are no longer the leaders they once were, economically and politically, survival demands more international understanding and more language communication.

"I think languages are terribly important for people to study. It broadens their whole perception of the world culturally by being able to perceive other people through their language."

Last fall's ASSU Course Guide contains a statement from him upholding the language requirement at Stanford.

Zeigler exempts the local community from his comments on Americans' naivete about other cultures. In fact, he has noticed that the people in this area have traveled and worked in other countries far more than the average American. These people are a rich source of volunteers for I-Center programs, and they also attend many of the I-Center events.

"We would like to get more students coming to our Thursday films and Tuesday noon lectures," he says. "We are primarily a student-oriented organization. As it happens, lots of staff and community people come."

The Thursday evening Other Cultures Film Series is Zeigler's particular pleasure. It began five years ago when the I-Center addition was built, providing space for an assembly room.

His two main sources for the international films are the University of California Extension Media Center—"They have a wealth of international films"—and the Australian consulate.

"Australian documentaries cover a lot of other countries, and they're extremely well done," he relates. "One of our community volunteers discovered the film archive at the Australian consulate, and we now have a special relationship with them.

"I've used 15 or 20 different sources, and I keep exploring, looking for others. We use the consulates,

Meet the International Center's magician, Mary Clark

Mary Clark's boss refers to her as "a phenomenon" and says it would take three people to replace her if she left.

She herself is very modest about what she does as associate director of the International Center, but the fact is that she probably knows more than anyone else at Stanford about immigration law.

"It was a gradual thing," she says. "When I first started here in 1969 we had something like 900 foreign students. The work for foreign scholars was done in the personnel office by Ida Dickinson, but when she retired in 1972 it seemed reasonable for that work to be transferred to the I-Center. We were getting a lot of expertise in immigration regulations.

"So I inherited that, and as part of the inheritance I learned to do immigrant visas, temporary worker visas, and exchange visitor visas—the kinds of things we had no familiarity with.

"Since I do it so much, I guess I've become an expert. I enjoy it tremendously.

"It's been a long process of learning, keeping in touch with attorneys, getting their interpretations about things I don't understand. It's the kind of thing where you never know it all—it's constantly changing."

To help keep abreast of all the changes, she subscribes to the twice monthly *Interpreter Releases*, the *Operating Instructions* of the Immigration and Naturalization Service, and the *Technical Assistance Guide* of the U.S. Department of Labor.

Clark was a student wife at Stanford in the 1950s (her husband, Donovan Clark, was a Ph.D. candidate in anthropology), and worked in the Office of Public Exercises.

When the Clarks returned to the Bay Area in 1968 after a two-year stay in Washington, D.C., and four years in Asia, Mary spent a year as a secretary at SLAC before transferring to a similar position at the I-Center. She and the new associate director, Lee Ziegler, arrived on the same day, July I, 1969.

Since then the I-Center's work load has grown tremendously.

"In 1969 there were about 900 foreign students—currently there are 2,052. Last year we had 1,158 foreign scholars, so it's been an incredible increase in our clientele. Furthermore, as we become more expert, we're expected to provide more information.

"Our advising back in the early 1970s was pretty much confined to helping people find housing, helping them with health insurance and day-to-day settling-in problems. There was very little advising about immigration—people would go to attorneys.

"We now refer students, faculty, or staff to attorneys only when it goes beyond our expertise—if it's a deportation case of if someone wants to make a big investment in a U.S. company, for instance."

What's the most common problem with visas?

"Students are extremely careless about keeping their student status up, and that presents a lot of difficulties. There are cases where someone has goofed, and the Immigration Service takes a hard line with them. Then we step in, and frequently we're able to help."

Have students actually had to leave?

"Not often, but we did have an Iranian student who had to leave. There again, it was a situation of carelessness on his part. He permitted his stay to expire, and it was during the Iranian crisis."

As Stanford hires more noncitizens on a permanent basis, and getting immigration status becomes more and more difficult, Clark's paperwork burgeons.

"For example, if a department wants to hire an alien as an assistant professor—they've already singled him out—I then start his immigration papers. We're talking about a process that could take as much as a year-and-a-half, and it is very time-consuming because during that time we have a lot of contact.

"The Labor Department is terribly backed up. More and more every year want to become immigrants, and they don't have the labor force in their own offices to handle these petitions quickly.

"They're getting very, very fussy, due to the unemployment here—we have to demonstrate that we've really tried to find an American for the position. That's done by means of advertising.

"The advertising requirements are very specific—if you advertise and 100 people reply to that ad, you have to show why the 99 you turned down were not suitable.

"In 1975 it was much easier. If a person had a Ph.D. he could simply present himself at the Immigration Service and say he wanted to stay and they would have given him immigrant status.

"That has all changed. In 1977 it was made much more difficult, and it becomes more difficult all the time."

On top of all this, Clark has somehow become known in the local area as a person who has all the answers to everyone's visa questions.

"We have people who have no connection to Stanford coming in wanting information. Tourists will walk in and ask 'How can I get a job at Stanford?' 'How do I get a work permit?' 'How do I stay in the U.S.?' That's an everyday occurrence."

Clark also is active in the National Association for Foreign Student Affairs (NAFSA), a large organization which helps U.S. schools keep up on the changes in laws regulating immigrants and aliens. She is on the national team of the Council of Advisers to Foreign Students and Scholars, an elective office with a term of two years.

It's the regional section that takes the most time, however. Clark was cochairman for the regional conference in Asilomar in February. In the past she's been regional chair, district chair, and editor of the district newsletter. She conducts yearly workshops for all the foreign student advisers in this district.

Clark also functions as the I-Center's office manager, handling personnel, purchasing, and building problems. But the unoffice-like atmosphere and a staff that gets along well together make the work enjoyable.

"The I-Center is a wonderful atmosphere for work," she says—"if you don't mind people practicing the piano and little kids screaming.

"Marvelous smells come wafting up from the kitchen. Foods from all over the world are cooked there—and there are always leftovers for us!"

The I-Center is the first place foreign students go when something goes wrong in their lives. It might be a strained marriage, illness, or trouble with a landlord, but they expect help with the problem.

"They think we're magicians," says Clark. "Sometimes we've been able to help, sometimes not. If we can't, there are other people out there who can."

Mary Clark

One definition of magic is "an agency that works with wonderful effect." Maybe you *could* call Mary Clark a magician.

Marcia Makino's role

Although immigration matters comprise much of the advising at the I-Center there are many other areas of concern to the foreign students at Stanford.

Marcia Makino, assistant director for foreign student advising, confronts a multitude of problems relating to students' visas, extensions of stay, employment permissions and re-entries to the United States. In addition, she helps students sort out their financial problems, working closely with the Financial Aids office.

Solving financial dilemmas involves much more than supporting short-term loan requests, according to Makino, who has been at the I-Center since her undergraduate days when she first took a part-time job in 1975. Currency flow from abroad, possible part-time employment, and other funding sources such as foundations and civic organizations are all considered.

Communication with departmental academic advisers, discussion with landlords, car salesmen, merchants, foreign government sponsors, international companies, placement officers and residential education staff are all routine for Makino in her continuous efforts to help students from abroad work through troubling situations.

Makino, who has held her present position since September I981, spent three months at Kiel University in Germany on a direct staff exchange initiated by Lee Zeigler. A staff member of the foreign student office at Kiel spent the same period at the I-Center.

Makino's activities extend beyond problem solving, including continuous liaison with the nationality groups on campus, planning orientation programs for newly arriving students and working with the annual workshops for mid-Peninsula high school students to "Experience Another Culture at Stanford."

Teenagers get a chance to know Stanford students and their families in a variety of cultural-immmersion activities each winter.

More I-Center stories on the next page

Zeigler. . .

continued from page 10

places like the Goethe Institute, public libraries, private sources, the National Film Board of Canada. . . .

During the interview for this article, a student came by to offer a student-made film on Bali. Zeigler told her to find a free evening on the I-Center calendar and schedule it for showing.

"We get that kind of thing every day," he says. "Although we put on a number of programs, the real life of this place is the contribution of many other people—nationality groups and other campus groups, community people. . . . "

The I-Center could be seen as Stanford's microcosm of the rest of the world. Anyone who feels a need to have his or her horizons stretched should take a short trip over there.

Overseas experience is a must, says Catherine Gamon

Catherine Gamon of the Overseas Resource Center

"We want as many people as possible to get abroad."

The speaker is Catherine Gamon, director of the Overseas Resource Center (ORC) at the International Center. A person with a lot of overseas experience herself, she is convinced that direct knowledge of other cultures is a priceless asset.

"Overseas experience is valuable for any individual, and its value is more than a selfish one," she says. "People in positions of influence and power have to know what other people are thinking and doing, and they should experience it firsthand instead of merely reading about it.

"We facilitate this process."

No one at the I-Center remembers who started the collection of information on study, travel, and work in other countries. The legend is that it began about 12 years ago with a shoe box full of travel folders.

Now it's a whole room, filled with catalogs from foreign universities and overseas programs of U.S. institutions, background information on U.S. firms with international offices, and lots of material on travel.

The Overseas Resource Center is more than just a collection of written materials, however. Staff members there draw upon their own international experience and stay in touch with others on campus who can advise students about international study, work, and travel or about particular regions of the world.

"We work closely with Overseas Studies, International Relations, theme houses, and other international and area studies programs on campus in order to serve people as effectively as possible," says Gamon. "Each quarter we organize several programs to promote specific options for study, work, or travel, and programs focusing on particular countries or areas. Often these programs are sponsored jointly by the ORC and other departments or programs.

"Our focus is on student needs," says Gamon, "but faculty and staff members often use the travel information and that about higher education in other countries."

In addition to maintaining the library of materials on international study, work, and travel, ORC staff members are actively involved in the administration of numerous scholarships for study abroad.

"We administer the campus competition for such diverse programs as the Rhodes, Marshall, and Churchill Scholarships for study in Britain," Gamon says, "plus two graduate Fulbright programs, direct exchanges at the undergraduate and graduate level with German universities, the Haas-Koshland Scholarship for study and personal development in Israel, and the International Student I.D. Card Scholarships for undergraduate research or volunteer work in developing nations in Latin America, Africa, and Asia.

"We urge students to explore *all* funding sources for international study, many of which are listed in grants directories in the Overseas Resource Center. But of course we work most closely with those students who are applying through us for one of the scholarships we administer."

Gamon enjoys hearing, through her correspondence with them, about the fellows' and scholars' experiences abroad.

"One person is in Papua-New Guinea," she remembers. "Correspondence has to go to Port Moresby, then on a once-a-month missionary plane to somewhere, and then three days on foot if someone is found who can take it."

Gamon grew up in an American foreign service family. She was born in Italy, started school at age four in Martinique, lived in Sri Lanka when it was still Ceylon, and met Prof. Jim Gibbs of Stanford's Anthropology Department when she was a high school student in Liberia.

"I had always taken moving for granted," she remembers, "but I wanted to be *American*—to eat hamburgers, etc. It was in high school that I began to be seriously interested in international experience."

As Gamon started her freshman year at Stanford in 1973, her parents moved to South Africa.

"I was full of liberal ideas about how horrible that country was," she relates. "But then I spent my sophomore summer there working for the U.S. Information Service, advising South African students who wanted to come to the U.S.

"It was my first chance to meet black and colored South Africans. I found that people *were* working for change within the country. I also began to appreciate the importance of educational exchange."

Gamon had also spent a quarter at Stanford's Tours campus during her sophomore year, but the travel bug soon bit again.

"After my junior year I decided I needed more international experience, to experience being in another country and to look at it from an academic and intellectual point of view.

"My parents had just moved to Pakistan and suggested that I come. I said, 'No way!' but a couple of weeks later I was packing my bags."

Gamon spent the year teaching English to Saudi Arabian female dental students sent for training to Pakistan.

"For me, Pakistan seemed very restrictive, but to them it represented freedom. They could go out together in twos, and they didn't have to cover their faces in public."

She also did part-time secretarial work for projects on anopheles mosquito eradication, water resources, and implementing technical changes in villages, with the resulting sociological stresses.

"That year helped me learn a lot more about the world," she says, "and I wanted to facilitate the same thing for other people. I decided I wanted to work in educational or cultural exchange."

Gamon graduated from Stanford in 1978 with a major in international relations and worked in Meyer Library that summer. Then a job at the I-Center opened up, and she's been there ever since.

Like the other areas of the I-Center, the ORC relies on outside help, from both students and community volunteers.

Work-study students take care of developing and keeping up to date the library materials. When the office is very busy, they take on back-up advising, too.

Community volunteer Nancy Rogers has worked in cooperation with the Career Planning and Placement Center to develop the ORC's file of organizations with international scope.

Anna Maria Limerinos walked in one day and asked for something to do—she has helped with the office work ever since.

"We could not function without students and community volunteers," says Gamon. "We hope they get as much out of their being here as we do."

The ORC issues international student ID cards (1,500 each year) and Youth Hostel cards, which keeps them busy just before each Stanford group leaves for an overseas campus.

Gamon wants students to explore all the options at the ORC.

"There are foreign university programs for foreign students, and both U.S.-sponsored and foreign-sponsored programs. People with language fluency can enroll directly in foreign universities—that's a good, inexpensive option.

"We want to promote all the scholarships as well as the specialized programs in specific countries."

Like others at the I-Center, Gamon appreciates the value of speaking other languages. She has a working knowledge of French and some Spanish,

CCIS: the I-Center wouldn't function without them

A few months after Werner Warmbrunn became Stanford's first foreign student adviser in 1952, he called together five women to discuss the needs of the international visitors.

The five became the core group of the Community Committee for International Students (CCIS), an organization whose history is an integral part of the International Center.

Chairman of that first group was Joan Lane, a recent graduate of Smith College and newly married to Melvin Lane of Sunset Publishing Company. The other four were Sheila Spaeth (wife of Law Dean Carl Spaeth), Virginia Page (wife of Geology Prof. Ben Page), Pat Chadwick, and Barbara McFarlane.

The first thing they did was start the Homestay Program, in which foreign students live with local families for a short time prior to registering at Stanford. It was only the beginning of a multitude of services to make their stay at Stanford a success.

The International Center's first real home was the late Prof. Bailey Willis's old house on Lasuen Street, near where the Post Office is now situated. It opened in 1957 after students, staff, and CCIS volunteers cleaned, painted, and furnished it. It had a sidewalk cafe with five-cent coffee and became a center for discussions, cultural events, and social life for international students.

When the house burned down in 1961, CCIS joined the search for new quarters, while the I-Center's offices and programs were scattered in available space around the campus.

The I-Center's home since 1963 is the former Zeta Psi house, which was remodeled with a major gift from Stephen Bechtel and the proceeds of successful fundraising by CCIS. The library is named after Guy Post, who led the fund-raising effort to obtain the house. A CCIS member who is a professional

Gwyn Dukes gives foreign families something of their own at Stanford

Gwyn Dukes (center, in plaid shirt) enjoys a Thursday morning coffee hour with international students' wives and their children.

When a foreign student or scholar comes to Stanford, he (four-fifths of them are men) knows exactly what he will do. He'll attend classes, study, participate in research projects, and develop friendships with his fellow students.

If he is married, his wife will have a little more trouble building herself a satisfying life in the Bay Area.

Often wives have not yet learned English. Sometimes they are newlyweds and have not had the experience of running a home even in their own countries. They have left support systems of relatives and friends behind and must cope alone with setting up housekeeping, marketing, getting around town, and finding new friends and activities.

Enter Gwyn Dukes, adviser to wives and families at the I-Center, and a battery of volunteers. There's a possibility that the foreign wife will end up as busy as her husband is.

There are English classes, morning and evening coffee hours, and trips to explore the local scene. There are women's circles in which people get to know each other so well they keep up contact long after leaving Stanford and visit each other in their home countries.

It's not merely "kaffee klatch talk," either. They have lively discussions on the role of women in their respective countries, comparative medical care and education, for instance. Last year one group attended the debate between Phyllis Schlaffly and Stanford Assistant Prof. of Law Catherine MacKinnon and came back to their own discussion afterward.

"It's a way of learning about each other and learning other points of view and perspective," says Dukes, who has an infectious enthusiasm for her job.

"The thing that excites me the most is to understand the underlying value systems and patterns of communication of people from different parts of the world," she continues.

"I like to try to see people from other cultures in their own context, instead of looking through the little lens of my own culture. I want to be able to see how the Japanese behave from a Japanese perspective, and to understand Latin Americans according to their frame of reference.

"There are many aspects of our own value system that one might differ with or question. It's so refreshing to find a society that is less materialistic, for example."

Dukes grew up in Washington, D.C.—"You automatically get interested in foreign relations there," she says.

She received her bachelor's degree in government from Denison University (Ohio) and a master's degree in student personnel administration from Columbia. While at Columbia she was an intern at International House in New York, one of three such residences in the U.S., where international and American students live together.

Dukes came to Stanford in 1964, and after a year as director of Union residence joined the staff of the I-Center, where she has worked as program coordinator and foreign student adviser. After the birth of her son she took a few years off, returning as coordinator of programs for wives and families in 1972.

Under her direction, the support system for international wives starts on orientation day, with an information table for them at the I-Center. Soon after that several couples from different countries, who have been at Stanford for at least a year, form a panel to talk about what it's really like to live in the Bay Area. Afterwards, newcomers and veterans break up into language groups for follow-up discussion.

The wives get a calendar of events and classes, plus someone to call up in their own language in case they have problems or questions.

After that, volunteers will help them learn English, teach them about basic American cooking and marketing, provide them household items from the Loan Closet, show them all the interesting places in town, and bring their children to participate in international playgroups.

"We're more organized than anyone expects us to be," Dukes comments.

"We try to give people an idea of what the typical problems are and give them some resources and ideas on how to meet the challenge."

She saw a need for the women's circles as a way to put people in touch with each other on a continuing basis, and to build a sense of community for wives who had no direct contact with the University.

"We tried lectures, but it seemed that the people in the groups had interesting things themselves to say, and that it would be much more important for them to build the relationships with one another."

Dukes soon discovered that the international wives represented a gold mine of talents and skills.

"We plan a lot of classes according to what interests we find," she says. "Each year there have been people who came forward with many different special interests. We want to convert the talents there are here into things that everyone can enjoy and benefit from.

"They have so much to give, both to each other and to the American community."

Dukes very much enjoys another part of her job—the Speakers' Bureau, which gives people in the local community the benefit of learning firsthand about other cultures.

"We've worked with the Extended Resource Center of the Palo Alto Unified School District, individual teachers and schools, as well as other organizations," she says.

"We've supplied Chinese, Mexican, French, and Iranian cooks for a Palo Alto High School cooking class. Wilbur wants someone to speak French with the Students, and Jordan wants someone to come to a Spanish class. A German student recently discussed economic issues with a Woodside High international relations class.

"Any chance our school children have of being exposed to other points of view, other ways of looking at the world situation, other ways of doing things, is to their benefit.

"Children here complain that they have so much homework, when actually, compared to a child in Japan, they hardly have any homework at all. The relationships with teachers are different there, the hours are longer."

Some of the foreign women interrupt their education to take leave from jobs of great responsibility to accompany their husbands to Stanford.

Some, who expected to find jobs here, have settled for volunteer work in their fields instead. Others have taken degrees at Foothill, San Jose State, or UC-Santa Cruz, or concentrated on perfecting a craft or sport.

Dukes coteaches, with volunteer Judy Shea, an English class for foreign wives which prepares them to go out to local schools to share their cultures and skills. Other English classes are based on learning about American culture or reading American short stories.

Cowell social worker Charlotte Siegel spends two mornings a week at the I-Center, counseling students and wives on family or personal problems.

Sometimes there are concerns about pregnancy, given the high cost of maternity care here. As a

studied Urdu during her year in Pakistan, and has a beginning in Hindi, which uses the same alphabet. This quarter she has begun studying German, to aid in the administration of scholarships for study in Germany.

People at Stanford tend to take all these resources for granted, but those who have tried to find the same type of information at other universities see it differently. Stanford's ORC is probably one of a kind.

Medical Center MEMO

Eat and play your way to slimness, advises Wood

Encouraging people to ultimately eat more, not less, should be the goal of any worthwhile weight loss program, contends Dr. Peter Wood, deputy director of the Stanford Heart Disease Prevention Program (SHDPP).

What sounds like a unique twist to modern theories of weight control stems from Wood's scientific observation that slim people generally eat more—and do more exercising—than their overweight friends.

As Wood explains in his new book, *The California Diet and Exercise Program* (288 pages, Anderson World Books, Inc., $13.95), the problem with most popular diets is that they focus too heavily on the wrong side of the calorie equation.

"The idea that being overweight is due to, and sustained by, eating inordinately large amounts of food has been with us for many centuries, and dies hard: the gluttony model," the professor of medicine (research) said in an interview.

Actually all it takes, Wood said, is 14.4 calories too much each day for 30 years to store up 45 pounds of extra fat by age 50. This is about a fifth of a banana too much each day, hardly an amount fit to prohibit or prescribe.

"Since the early 1900s Americans have actually decreased their food intake, become more sedentary, and grown fatter. It's clear that the problem is not eating too much, but exercising too little," Wood observed.

In studies at the SHDPP, Wood and colleagues compared lean, middle-aged runners (40 miles per week) and tennis players (10 hours singles per week), of both sexes, with average, randomly selected men and women.

"The case of the tennis playing women was particularly striking," said Wood. "They reported eating about 62 percent more than their sedentary counterparts." They have to eat a lot, he said, to remain very active.

Progressive plan

Wood's book sets forth a systematic approach to weight control, intended for those who've been moderately overweight as adults. Extending over a full year, the program is purposely gradual. "People can be easily discouraged if pushed too fast to change, and that's why so many give up on other diets."

Also, he added, "Most experts agree that a true loss of one to two pounds of body fat per week is the fastest you should go."

The sort of exercise Wood advocates is "play"—that which is enjoyable. He urges people to vary their activities and exercise in company, increasing social contacts as well as physical benefits.

"Of course," he said, "the more vigorous activities burn fuel faster. Jogging, cycling and swimming are champion fat burners." The London born researcher has been an avid runner himself since the age of seven, and authored *Run to Health* in 1980.

"But remember that if you have the time, a mile walked slowly will use nearly as many calories as a mile run fast," he said.

In Wood's program, menu plans work side by side with play plans, the two intricately dependent on each other. Caloric intake is decreased somewhat at the beginning of the year, but gradually increases with level of play, until by the end of the program the individual is both playing more and eating more than before.

"People ask more of car salesmen than they do about new diets."

—Peter Wood

(seen here in one of his frequent runs around the Stanford campus)

"Rewards are built in at intervals," Wood explained. "At the end of the year the body is in balance, neither gaining nor losing calories (or fat). This is the state we need to reach, one of equilibrium."

Wood believes that a full year on his program will accustom the individual to a new lifestyle, ensuring weight maintenance rather than the instant gains so commonly experienced after dieting.

He pointed out that an active lifestyle brings with it numerous health advantages besides weight loss. These include improved cholesterol pattern, decreased inclination to smoke, muscle build-up, benefits to bones and joints, improved heart function and respiratory function, lower resting pulse rate, less constipation, increased resting metabolic rate, improved sleep, and improved mental outlook.

Eating heartily also, Wood said, is what Nature intended for human beings. "There are many disadvantages and some dangers in the permanent low-calorie approach to weight control.

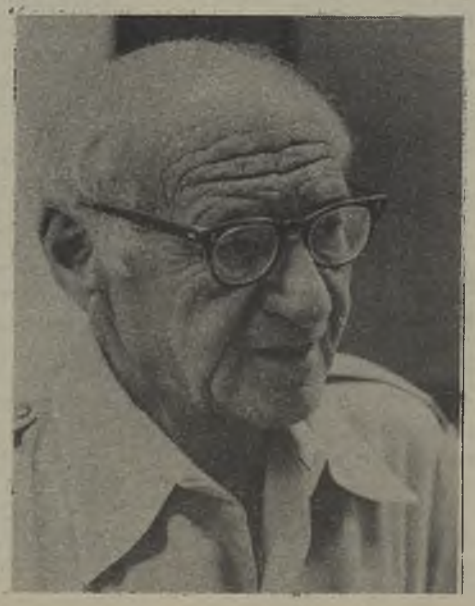
"In my view, low-calorie diets should be used sparingly and therapeutically to achieve loss of accumulated fat; *not* prescribed as a permanent, desirable, modern, with-it, and thoroughly admirable way of life," he said. "Life—especially Californian life—requires food!"

And, he added, "When your body gets a lot of food and exercise, the natural mechanism for balancing the two works very well." As an example, Wood said he has to be careful that his own weight doesn't go too low.

Advantages of hearty eating include a higher resting metabolic rate, improved nutrition (provided that foods are chosen wisely), less constipation, and more enjoyment.

Also, "Several long-term scientific studies now agree that people who go on to suffer heart attacks are more likely to have been eating *less*, years earlier, than similar people who remained well," said Wood.

"What the data are probably telling us is that the people in the studies who were eating more were also more active and leaner; and these two attributes accounted for their reduced heart disease rates."



Wood designed his weight loss program with safety and efficacy in mind, as well as a special concern for the older person. His plans provide ample amounts of nutrients (protein, vitamins, minerals) and other components to maintain good health (like fiber), and are low in items that should be low (salt, cholesterol, saturated fat).

"Many natural foods are beneficial to health, and may help, along with good exercise, to ward off the major chronic diseases of the age, heart disease and cancer." While dieting, Wood said, many people may inadvertently increase their risks of future disease by omitting some basic food essentials.

This is where most popular and self-designed diets go wrong, he added. "But unfortunately, people ask more of car salesmen than they do about new diets. Some of the fads that have been promoted are outrageous—but you name it, they sell it."

Besides becoming well-informed oneself, it's a good idea, Wood said, to inform one's doctor when embarking on a considerable change in lifestyle. "Those more than 80 pounds above their ideal maximum, or having known major health problems, should certainly consult with their medical advisors before beginning any weight loss or exercise plans."

—Lisa Ames

George Feigen

Prominent Stanford researcher and teacher dies after illness at 66

Dr. George A. Feigen, a Stanford University physiologist whose wide-ranging interests joined the fields of immunology and pharmacology in more than 44 years of teaching and research, died at Stanford University Hospital Sunday evening, after suffering a ruptured aorta. He was 66.

"He was an international leader in research who literally trained students from throughout the world," said Dr. Eugene Robin, acting chairman of the department of physiology.

Head of the department's Ph.D. training program for the last ten years, Feigen was "a man of the highest standards, who insisted that the highest level of performance in hands-on training in the lab was critical to the education of excellent young scientists," said Robin.

Born in Rostov, Russia in 1916, Feigen came to the United States in 1930. Doctorate degrees in physiology and immunology from the California Institute of Technology in 1947, sparked a career that explored the effectiveness of various blood substitutes, examined the mechanisms of shock triggered by severe allergy, and investigated the effects of allergic reaction on the heart and blood vessels.

Anaphylactic shock—the most severe allergic response—was Feigen's special area of expertise. In 1967, scientists identified a special protein, called immunoglobulin E (IgE) which plays a key role in triggering an allergic reaction.

Only two so far in 1983

Donor scarcity holds up heart-lung transplants

Scarcity of donors has restricted Stanford's heart-lung transplant effort, the program's principal investigator said last Wednesday, May 18, after the first such operation in more than four months.

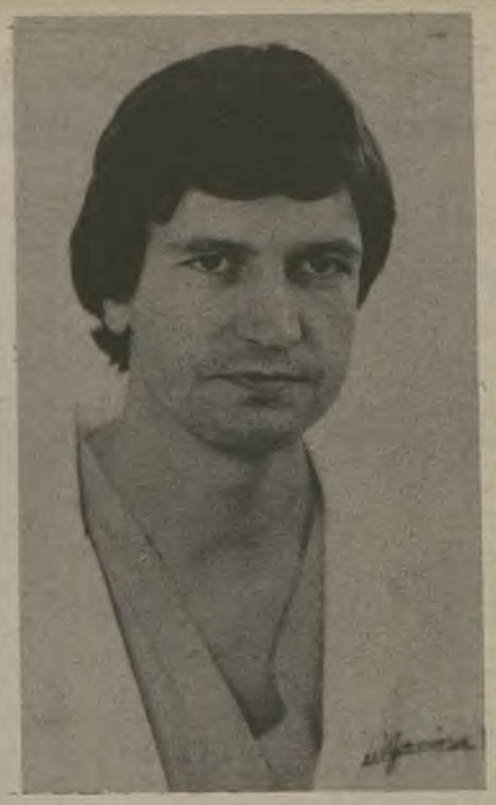
"We have been hoping to perform about 12 such transplants a year, but today (Wednesday) was the first time we have found a suitable donor since January," making it only the second heart-lung transplant this year, said Dr. Stuart Jamieson, assistant professor of cardiovascular surgery and head of the heart/lung program.

"Three of the 10 persons waiting for new hearts and lungs have died since last January, and we can expect to lose more unless potential donors are brought to our attention."

The physician said only about 20 percent of potential heart transplant donors are suitable for the double transplant operation, which has been performed 12 times at Stanford since March 9, 1981. Eight of the patients, including the four most recent before Wednesday, have returned to their hometowns and are doing well, Jamieson said.

The difficulty, Jamieson said, is that the lungs often become damaged before they are removed and can be used in surgery. Pneumonia is the most common condition which afflicts brain dead donors while mechanical equipment keeps their hearts beating and their lungs ventilated until the organs are transplanted into a recipient, Jamieson explained.

When the lungs are found unsuitable, the heart often can be used for a heart-only transplant. Eight such operations have been performed since the last heart-lung operation was performed, bringing the heart-only total at Stanford to 263 since January 1968.



Heart-lung transplantation is newer and was made possible by recent improvements in medication intended to prevent patients' bodies from rejecting their new organs. A new drug, cyclosporine, permits healing of the windpipe.

"Heart-lung transplantation has been proven to be helpful to a small number of patients who otherwise would face certain death without the procedure," said Jamieson. "But our ability to perform the operation is limited because of our difficulty in having potential donors brought to our attention."

Donors, he said, must be brain dead but free of other disease. Their families must give permission to donate their organs after death.

"Our whole problem," Jamieson said, "depends on public awareness of the need for this precious resource."

The most recent heart-lung patient was identified as Fernando Flores, 32, of Mercedes, Texas, who was reported in critical but stable condition after the five-hour operation. On Thursday morning he was awake and breathing unassisted. By this week he was reported in stable condition, eating solid foods and walking in his hospital room.

"We'd like to be able to perform more of these operations. The critical factor is donors."

—Stuart Jamieson

"He still has a long way to go, but he is doing well," Jamieson said.

Flores, who had worked as a career counselor, suffered from a ventricular septal defect. A hole present from birth allowed blood to flow between the chambers of heart, causing a volume overload of blood which eventually damages the lungs. The condition ultimately is fatal unless both the heart and the lungs are replaced.

A 38-year-old Visalia, Calif., man, Dennis Vinyard, was the last heart-lung transplant recipient at Stanford. He has returned home after hospitalization and treatment following up his Jan. 10 operation, Jamieson said.

Stanford's first heart-lung transplant, Mary Gohlke, now 47, has returned to her Mesa, Ariz., home. She has worked as a newspaper advertising executive and has been working on a book recounting her experiences.

"We'd like to be able to perform more of these operations," said Jamieson. "The critical factor is donors."

The physician stressed that hospital personnel can play a critical role in identifying potential donors and explaining during a very stressful time to families how the brain dead patient's organs can be used to save someone else's life.

Medical personnel or families who may have a potential donor may call Stanford's Department of Cardiovascular Surgery, (415) 497-5771, 24 hours a day.

"We are able to accept donors from throughout the United States or Canada," Jamieson said.

Stanford Medical Group on the move in more ways than one, says Jacobs

With more than a year of successful operation behind it, the Stanford Medical Group (SMG) is looking at ways to expand and improve its services, according to co-founder Dr. Michael Jacobs, clinical associate professor of medicine.

Established by the Medical School's department of medicine in 1981, the clinic provides members of the Stanford and surrounding communities with the opportunity to receive high quality medical care by faculty physicians without being part of the teaching format.

Two more physicians—Dr. Susan Kritzik, currently a staff physician at Palo Alto Veterans Administration Medical Center, and Dr. Terrigal Burn, currently a clinical instructor in the division of general and internal medicine, and the department of mental health and community nursing at the University of California, San Francisco—are scheduled to join Jacobs and Dr. Scott Wood in the University-based group practice this fall. Co-founder Dr. Armand Gelpi, clinical professor of medicine, will be leaving the clinic.

The new physicians will enable the clinic to expand its consultation service, which currently serves all clinical departments at the medical school and northern California physicians, as well as its medical-psychiatric inpatient service.

"We also need to address the question of what a service-oriented practice group is doing in what is primarily an academic center," Jacobs continued. "We have to integrate our practice with the academic goals of the medical center without risking the quality of care."

The way to accomplish this, Jacobs explained, is to assign select senior residents to work with patients in the clinic. This will be done initially with the inpatient consultation service, followed by "establishing an outpatient rotation for carefully screened senior medical residents especially interested in the practice of primary care internal medicine.

"This would be a natural step for someone who plans to go into private practice within the next few months."

Jacobs said he hopes the group physicians will be able to start documenting original clinical observations. This, he said, will contribute to the "scholarly credibility" of the group.

The idea for the group practice evolved in response to individuals' expressed desire to have a full-time faculty member as their personal physician. SMG is based on similar programs in existence at about half the nation's medical schools. Jacobs and Gelpi formed the original core of physicians, aided by about 12 affiliates from the department of medicine. The group, which also includes a full-time nurse, offers patients complete outpatient and inpatient care on a 24-hour basis.

The faculty member chosen to be the personal physician is fully responsible for the patient's care. The physician arranges consultation with other specialists if needed, and is available for visits in the clinic during office hours. If hospitalization is necessary, the doctor admits the patient to SUH, and assumes the attending or teaching function on one of the teaching services.

During its first year of operation, the group received more than 3,200 outpatient visits, Jacobs said. About 40 percent of the referrals came from SUMC physicians, while about 60 percent came from outside physicians.

"The group achieved a balanced budget in its first year, which is a distinctly unusual occurrence in comparable programs," he added.

In 1982 Wood joined the group. He cares for SUH employees' job-related illnesses, and performs all intake examinations on them.

"Attaining this contract between the SMG and the hospital was important because it justified adding a third full-time physician after only a year of operation. Also, Wood is in an ideal position to attract new patients to the group," Jacobs observed.

The group, which is administratively and financially independent, is also planning to move into new office space, as part of the Boswell Building renovation plan. The $6.5 million construction, equipment, and remodeling program will upgrade the physical facilities of the Stanford University Clinics. The clinics serve as offices for the medical school faculty.

—Shirley Kraus

George Feigen dies. . .

continued from page 14

Through their study of guinea pigs, Feigen and his colleagues discovered the biochemical reactions that IgE uses to unleash histamine—a potent chemical, normally sequestered in certain cells of the body. Sudden release of histamine into the bloodstream can produce severe and sometimes fatal symptoms.

Feigen spent two decades seeking to understand why a defense system usually so powerful in protecting a person from infection, "goes overboard" under certain circumstances, producing poisons detrimental to the host.

One recent project explored theories that certain cases of female infertility may result from immunization to sperm. Feigen showed that human fallopian tubes are extremely sensitive to histamine, and that the the intensity of an anaphylactic response varies at different phases of the menstrual cycle.

Researchers in Feigen's laboratory are also currently studying the effects of vitamin C on the immune system.

"As a teacher he was feisty and demanding, but extremely loyal to his students," said Robin. "George Feigen radiated integrity."

Feigen joined the Stanford faculty in 1949, after several years of teaching at Cal Tech and the University of Southern California. He spent a year at the University of Oxford, England, in 1956-57 as a traveling scholar of the American Heart Association, and returned to Oxford in 1963-64 as senior post-doctoral fellow, courtesy of the National Science Foundation.

A member of numerous scientific societies, including the American Physiological Society, Sigma Xi, and the New York Academy of Sciences, Feigen served often as guest teacher and lecturer to universities throughout the world.

He is survived by his wife of 35 years, Priscilla R. Feigen. Memorial services will be held 4 p.m. June 2, in the upstairs lounge of Tresidder Memorial Union.

According to the family, memorial contributions can be made to the George A. Feigen Memorial Fund, and sent c/o Professor Robert Hofstadter, Department of Physics, Stanford University.

So many aching backs: wh

BY LISA AMES

Three things are established about back pain:

- It hurts.
- It's a widespread problem, with overlapping causes often difficult to pinpoint.
- Human beings' ancestors were originally four-footed animals whose hands were later freed by evolution for more useful pursuits. But their backs have paid the penalty of being forced to maintain balance in the upright position.

When you suffer from back pain what are your chances of receiving help? Great progress has been made in understanding back pain—but what about cures?

Some prominent orthopedists, neurosurgeons, and physical therapists in the community and Stanford University Medical Center were recently interviewed about this. They agreed that most of the 75 million Americans who hobble to the doctor's office each year seeking relief are *not* candidates for surgery.

Rather, many suffering from back pain find relief with mild analgesics and anti-inflammatory drugs (like aspirin), muscle relaxants, bed rest, therapeutic exercise, heating pads and warm baths. "In most cases the pain will go away with conservative measures and time," said Dr. Eugene Bleck, professor and chief of Stanford's orthopedics division. Even slipped discs can sometimes resolve themselves.

Physical therapist Joan Smithline said that patients should be taught at the first onset of back pain how to take care so their problems don't escalate to the point of needing surgery. "Once you've hurt your back," she explained, "you're much more prone to having the pain again unless you really treat it well."

"It's best for people with histories of back problems to avoid activities that vertically load the spine: horseback riding, running, and anything that pounces," added Dr. Frances Conley, associate professor of neurosurgery.

Dr. David Hull, a Palo Alto orthopedic surgeon and clinical faculty member, has treated many patients with back pain during his 28-year-old practice. He summed up:

"The most important factors in treating lower back pain are correct diagnosis and evaluation, careful patient selection for the various treatments available, and above all prevention through public education.

"The latter is crucial," he said, "because back pain is a strain not only on sufferers but on the nation's economy, taking its toll annually in the millions of dollars." About 85 percent of the American population, he said, have at some time experienced back pain severe enough to seek medical care. Back problems account for a large number of worker's compensation claims and workday absences.

It's not an easy field to be in however, Bleck admitted. Correct diagnosis is especially difficult in the back, because the spine and nerve roots are deeply seated. It takes at least an hour and maybe many more visits for a physician to get to know a patient and determine the likely sources of pain.

The first decision is whether the patient has a mechanically induced problem from injury (most common); disc or joint disease (second in frequency) fracture of the spine; arthritis or rheumatism; a benign or malignant tumor; or perhaps a "tension headache in the back—one of the most difficult conditions to treat," Bleck said.

His colleagues added to the list of possible causes: infections (especially among drug abusers); complications of diabetes; diseases of the kidneys, pelvic and abdominal organs; internal bleeding into the lower back (especially with chemotherapy patients); abnormalities in bone growth; congenital defects; and vascular disorders.

To diagnose the problem, physicians test motor strength, sensation and range of motion, take a medical history, and conduct a clinical neurological exam. When necessary, they may opt to use myelograms (dye injected into the spine making abnormalities visible by X-ray), CT bone scans (three-dimensional X-ray), blood counts, and bacterial cultures.

Once a diagnosis is made, non-surgical treatments can often be selected, depending on the condition. In home lumbar traction, the patient is suspended on a surfboard-like device which uses gravity to separate the vertebrae and help take stress off the nerves. There are also other types of traction which may be beneficial.

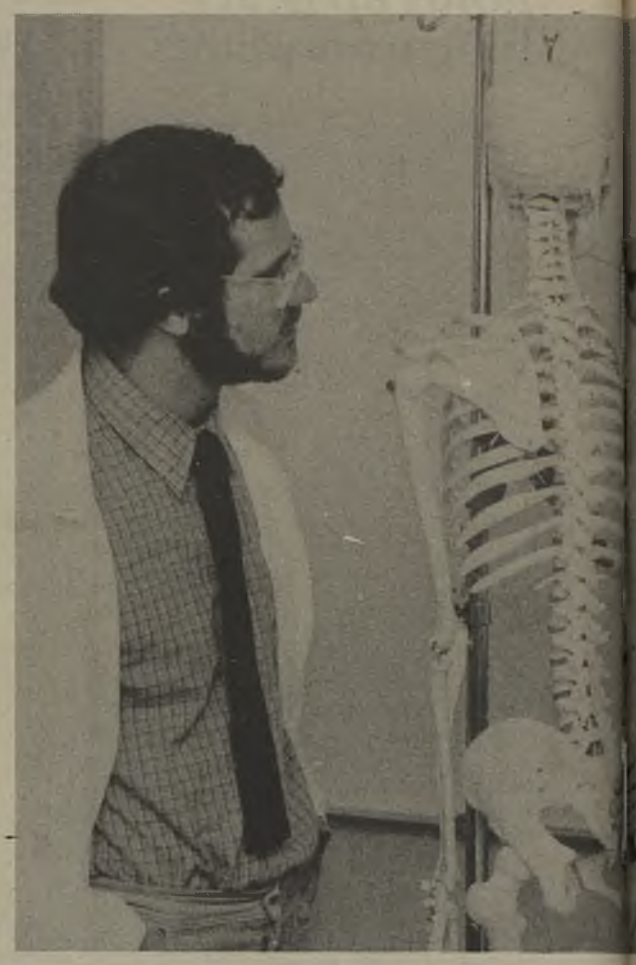
Transcutaneous electrical nerve stimulation, administered through a small device worn by the patient, may be used as a last resort to control pain in some cases.

And then there is a promising drug, chymopapain.

An enzyme extracted from the papaya plant, chymopapain was only last fall approved by the Food and Drug Administration for use in this country under the brand name "Chymodiactin." Injections of the drug have long been used effectively in England, Russia and Canada to dissolve slipped discs, avoiding surgery for many back patients. The procedure is called chemonucleolysis.

Though chymopapain poses some risks, the danger of death is as low (though existent) as with back surgery, said Conley. "We haven't started using chymopapain here yet," she said, "so we don't know how effective it will be with our tertiary patients, most of whom need salvage surgery."

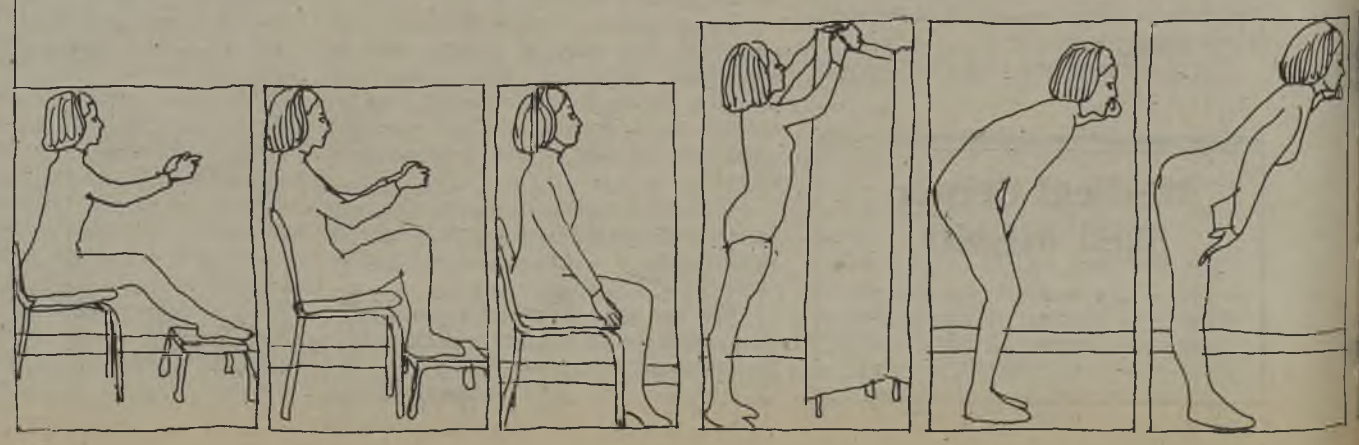
The surgery Conley performs with Dr. John Hanbery, professor and chief of neurosurgery, is an attempt to reestablish and/or preserve the anatomic alignment of the back using stainless steel rods, coupled with spinal fusion. The purpose is to preserve enough space for nerve roots to pass where disc degeneration or removal has occurred.



"Our success rate for the carefully selected group of patients we treat is very good," said Conley.

She explained that disc degeneration is a normal part of the aging process which begins at about age 20 in everyone. The discs, which are gelatinous shock absorbers between each vertebra of the back, begin to lose fluid and can no longer distribute vertical loading forces evenly. With routine movements of the back, the gel of a disc begins to migrate through the fibrous capsule which encloses it.

The term "slipped disc" covers both prolapsed and herniated discs, only the latter of which implies a full movement of the inner gel structure from where it belongs. Prolapsed discs are those in which some migration of the gel has occurred.



If the runaway gel places abnormal pressure on a nerve root, this causes pain and neurologic dysfunction. In these cases, Conley said, "I don't think chymopapain could be delivered safely to dissolve the disc without damaging the nerve root."

But in cases where disc degeneration has just begun, she added, chymopapain may help hasten the natural process by which fibrous connective tissue replaces disc material. "For these patients, chymopapain might be gentler and less costly than surgery, but the injections must be directed at the disc with absolute accuracy."

The FDA's approval of the procedure culminates a 20-year struggle by its developer, orthopedist Lyman Smith, to prove its efficacy in the face of sometimes contradictory clinical trials.

Conley noted the FDA has approved use of the drug only when conservative methods fail.

Patients with chronic back pain who haven't responded to conservative or other treatments are often referred to the pain clinic at Stanford, directed by Dr. Lorne Eltherington, associate professor of anesthesia.

Eltherington said many non-surgical patients can benefit from "nerve blocks"—injections of steroids or local anesthesia.

Steroids, he said, can fight the inflammation and swelling of nerves that sometimes cause obstruction of blood nourishment and pain. "But steroids also give people a 'high,' so there's the question of whether *that's* why pain is relieved," he added.

Sometimes, he said, a steroid injection into the "epidural space"—the area around the lining of the spinal cord and nerve roots through which all nerves pass—relieves a patient's back pain permanently. In other cases, repeated injections are needed periodically. Fortunately, the treatment is relatively complication-free.

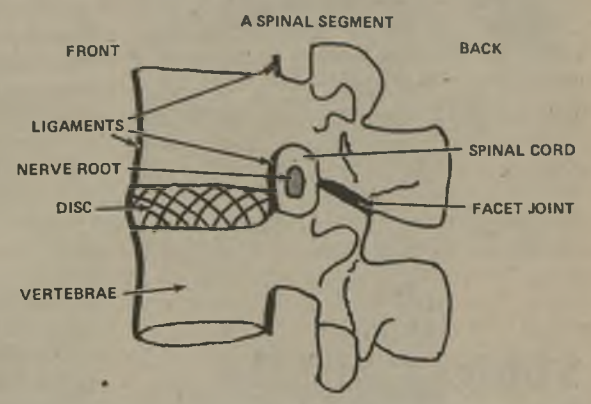
Often patients come to the pain clinic after they are shown to have no identifiable pathologic or organic problems, with complaints out of proportion to reality. "Many back patients develop dependent emotional behavior," Eltherington explained, "even when the initial injury is long since resolved."

For this reason bed rest, though beneficial, is not recommended for prolonged periods of time, since it can add to depression and dependency as well as weaken vital muscles.

"Approaches that can help include behavior modifying psychological interventions such as stress reduction, self-hypnosis, and biofeedback."

But the public, the experts agreed, can lower their odds of having to undergo expensive tests and treatments by bearing in mind the importance of healthy habits in preventing back problems.

We're all vulnerable," said Smithline, outpatient clinical coordinator in the hospital's department of physical and occupational therapy. "Standing with correct posture puts no real stress on the back. But bending, lifting, or working in the garden can change the alignment if not done right."



It is most important, she said, to maintain normal spinal alignment of the three curves of the back—the cervical, thoracic, and lumbar—while going about one's daily routine.

Hull added that maintaining muscle tone and keeping one's weight down is essential. "Our bodies are not designed for heavy loading. Unfortunately, many people in civilized cultures are sitters, standers and eaters rather than doers," he said.

Hull advocates firm mattresses and regular exercise such as swimming, walking, or biking to keep the back in good shape. "Every bit of exercise helps," he said. "But we've also found that sit-ups and push-ups, if done incorrectly, can aggravate back problems, as can toe touches."

Sit-ups are recommended because they help strengthen the abdominal muscles, which are important—like a corset—in properly supporting the back. But traditional long-lying and flexed knee sit-ups can, it has been found, overexert the spine.

Bleck recently tested a sit-up variation which he and colleagues devised, to maximize muscle activity while minimizing flexion (bending) of the lumbar spine. The variation was compared and found superior in these regards to the traditional forms. In the flexed knee position, the individual raises himself only enough to elevate the shoulder blade from the mat.

COURTESY DEPARTMENT OF PHYSICAL AND OCCUPATIONAL THERAPY, STANFORD UNIVERSITY HOSPITAL

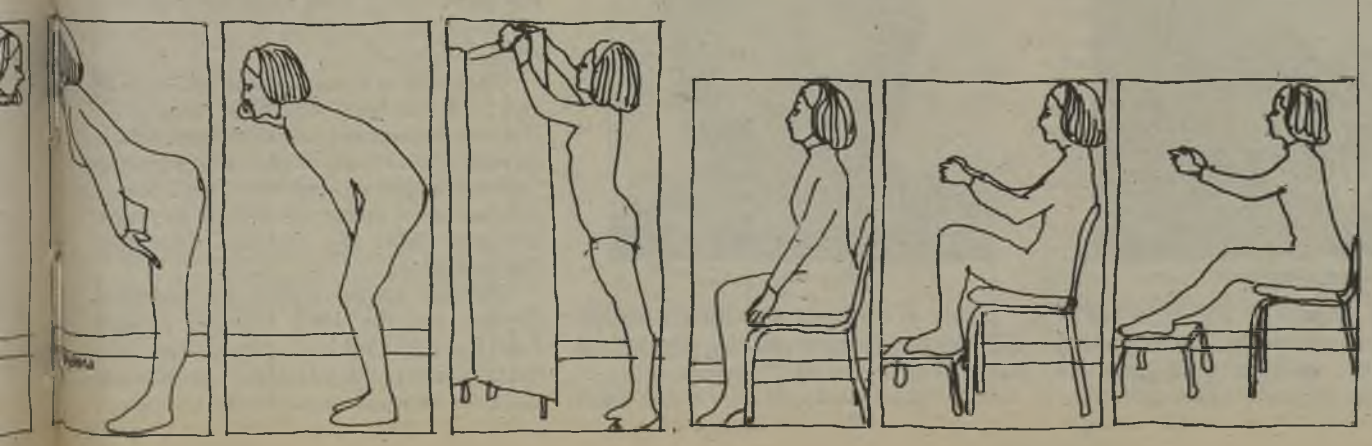
Healthy habits and proper seating should begin at a young age. "We believe that early childhood education in proper posture, strength and mobility may significantly alter the unnecessary abuses that we unknowingly impose on our lower backs as adults," said Dr. John Medeiros, acting director of the medical school's physical therapy division.

Recent research in the division has compared a more traditional regimen with the so-called McKensie protocol for preventing and alleviating lower back pain, with results suggesting greater effectiveness of the latter.

A physiotherapist from New Zealand, Robin McKensie developed a specific exercise regimen which calls for both flexion and extension of the back muscles. "In the past," explained lecturer Gail Chamberlain, "only flexion, or bending forward, was emphasized as important."

Other current research activities in the division include: a comparison of methods of teaching children proper lifting techniques; clinical evaluation of the abdominal muscle strength in normal children aged three to seven; and the use of electromyography and mobility testing to evaluate the effectiveness of a clinical exercise device that maximizes spinal extension.

Thus, whatever current theories and philosophies are espoused, the quest goes on for ever more effective diagnostic and therapeutic tools with which to treat lower back pain. Two possibilities being studied in various medical centers, for example, involve the use of localized ultrasound, and lasers, to selectively remove disturbing disc material.



Meanwhile, health professionals guide the aching masses through the phases of back pain, attempting at least to make it more bearable. "We teach relaxation techniques and give our patients emotional support by maintaining a positive attitude," said Smithline.

This is important because, compounding the anxiety of often incomprehensible pain is the confusion posed by today's wide variety of specialists and available treatments. For many patients the pattern of pain, depression, and medical overshopping has become a vicious cycle.

Though frustrated patients may find fault with physicians for not coming up with easy and uniform answers, Hull admonished, "Back problems have existed for centuries, and modern medicine continues to help increasing numbers of patients."

Conley added, "The problem is not medicine's failing to deliver a cure-all; it's the popular media's failing to communicate the message that there is no cure-all." Americans, she said, have been conditioned to expect magic from their doctors.

"It's important to keep in mind that back pain is not like a cut finger," Chamberlain remarked. "It can take a long time to heal. We encourage patients to look for and celebrate small improvements, perhaps from one week to the next, as they work to strengthen their backs."

Anne Gaddy

Student Affairs has new leader

Anne Gaddy, administrator in the department of general internal medicine, will be replacing Diane Winkle as administrative director of student affairs at the Medical School.

Winkle is leaving Stanford after nearly five years to pursue a position in the real estate field.

Gaddy, who will assume her new responsibilities by July 1, plans to stay involved with both of her offices in the interim, in order to help train her replacement and to receive training from Winkle.

Gaddy received master's degrees in education and business administration, and has held positions as both a faculty member and administrator. She feels her new position will be the perfect blend of her past experiences, she said.

One of Winkle's major contributions in the student affairs office, both women agreed, has been initiating the installation of a computerized data base management system.

"Computerizing much of the student information will allow the office to be more of a student service rather than a data gathering operation," Gaddy said. "Not having to manually look up information will create more time to spend with the students, and will improve the office's rapport with them as well."

Chief gardener proud of SUMC's outdoors

"Stanford University Medical Center has the chance of being one of the prettiest places in the state," said Malcolm Kirkwood.

As supervisor of grounds, he's doing all he can to turn that chance into reality.

The quality of care he gives to the landscaping around the medical center is obvious with a glance at the abundance of well-trimmed trees and shrubs, green grass, and clean walkways. A tour of the area with Kirkwood leaves no doubt that his love for vegetation is deep-rooted.

"I have as much pride in doing my job as a doctor does doing surgery," he explained. "It's just like another branch of medicine. I save lives too—the lives of trees!

"When people come here, the first thing they see are the grounds," he continued. "If they're tacky, the visitors may think the doctors are tacky too."

His job presents a constant challenge then, because he feels there is always room for improvement. One of his goals for the coming year is to mix color in with the various hues of green. The areas that are seen the most get top priority.

"The atmosphere of the center can be controlled by the types of plants here," he said. For an example, he points to the Japanese rock garden in the psychiatry building. "People coming here for help need to be able to be calm. I wanted to capture a peaceful, relaxed feeling there."

Kirkwood is gearing up to enter the center's landscaping in a national competition, sponsored by the Professional Ground Maintenance Society. Membership in the organization is by invitation only, and Kirkwood was honored earlier this year. An invitation to join is just the first step, however. To be certified by the group, he has to take oral and written exams, and must complete a week-long take-home test in which he must develop a long-range landscaping plan for a hypothetical place.

"There's much more to the job than just cutting grass," Kirkwood said. With an annual budget of about $100,000 and six staff gardeners, he matches the growing conditions required by the vegetation with what's available at the center. Rather than make all the planting decisions himself, Kirkwood asks employees who work near the area in question what types of greenery they'd like to see around them.

"When people come here, the first thing they see are the grounds."

—Malcolm Kirkwood

(far right, conferring on a project with staff gardener Perry Morrison)

Kirkwood's fondness for vegetation branches out much further than the scope of his job. The apartment he shares with his wife, Maxine, a staff nurse at Stanford Unversity Hospital, is full of plants, he admitted. And "if it's the last thing I do," he said, he wants to have a greenhouse in which to grow orchids.

"I've always loved nature and the outdoors," Kirkwood recalled. A San Francisco native, he opted for a rural location when it came time to go to college. On a basketball scholarship, he played center forward for Whitworth College in Spokane, Wash. The aggressive position on the court is in sharp contrast with his easy-going, laidback manner at the center.

And while his bachelor's degree in sociology helps him in dealing with his staff, he said, it was an oldtimer he met while working in Idaho's forestry service who gave him the start of his nature education.

He's supplemented that knowledge with information gleaned from seminars, classes, and books—information he passes on to his staff gardeners. "When my staff needs help, I'll show them where to find it, but I want them to learn for themselves," he said. "That way they'll learn they don't have to be dependent on me."

Plants are just the beginning of Kirkwood's affection for nature, which includes animals, people—all living things. He always has a friendly word for passersby at the center. "I like people, and a friendly word goes a long way," he said.

He spends his free time camping, hunting, and fishing, and wants to learn photography so he can capture the beauty of what he sees on his ventures. Future plans, he said, include an African safari on which he'd like to hunt and take photographs. And by that time, he revealed, he hopes he and Maxine will have children to take along.

"Everything in nature has a purpose, and a right to live or die," he explained. "I hope my kids will be able to blend in without destroying what already exists."

—Shirley Kraus

Two SUH dietitians recognized this month by professional association

The California Dietetic Association (CDA) honored two Stanford Hospital dietitians at its annual meeting May 3-5 in San Diego.

Citing her "unique contribution in the area of legislation and public policy" affecting dietitians, the CDA presented Ann Coulston, R.D., with the 1983 Distinguished Service Award.

Coulston is a senior research dietitian in the clinical research center (CRC). The association of 5,000 registered dietitians honors a member each year whose special leadership and achievements have greatly contributed to the profession.

Coulston served as president of the CDA in 1979-80 and is presently a state delegate to the American Dietetic Association (ADA). Active in state governmental affairs affecting dietitians, she helped select the CDA's first legislative advocate and was instrumental in the drafting and passage of the Title Act in 1982, which established a standard definition of the registered dietitian in the California Business and Professions Code.

Ann Coulston

Patsy Obayashi

Coulston has been with the CRC since 1978 and a lecturer in the division of gerontology for the past two years.

Patsy Obayashi, M.S., R.D., was selected as one of nine California Recognized Young Dietitians for 1982-83 at the conference as well. This award acknowledges the "outstanding contribution and leadership in the field of dietetics" of up-and-coming members of the ADA. Each state nominates its own recipients in proportion to its number of ADA delegates.

Obayashi, a clinical dietitian in W2B and E2B, has been with SUH since 1977. Her many Stanford contributions include serving as a member of the SUH Nutrition Committee and editing *Nutrition Notes*, a publication of the department of dietetics. She also chairs the Dietetics Education Committee.

She has helped coordinate nutrition displays for the 1982 Stanford Health Fair, the 1983 Children's Health Fair, and the upcoming Heart Health Fair. She has also been active in various CDA activities.

Fair points way to healthier hearts

PHOTOS BY
ED SOUZA

To promote public awareness of available resources for the prevention of heart disease, R.N.s, dietitians, and other professionals staffed a variety of display booths (NICU above) at SUH's first annual Heart Health Fair, held Friday at the Stanford Shopping Center. Information included anatomy and physiology of the heart, cardiac risk factors, surgical procedures, intensive care, rehabilitation, and more. Blood pressure checks were offered, and Stanford Blood Bank donations were scheduled. For a close-up on the paramedics units that help save cardiac victims, see photo feature, p. 20.

Jane Chappell (far left), an R.N. in Stanford's cardiovascular intensive care unit and owner of Heartbeat, Ltd. of Palo Alto, led students from her aerobics fitness class in a demonstration of beneficial exercises.

Ten-year-old Bryan Beresford, a former SUH patient who had open heart surgery at the age of two, watched as surgical ICU nurse C.C. Kettering checked his electrocardiogram (ECG).

Medical Center Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, MAY 25

Nursing grand rounds: "Career Development: New Directions for Job Joy." Guest speakers will describe various strategies for job expansion including lateral transfers, administrative opportunities, clinical nursing specialist research, and combining nursing with other careers (such as medical law). 3:30 till 5 p.m., M104. For further information, call Karen Kawauchi days at 497-6923, or Kit Laird nights at 497-6377.

Medical School Human Resources Group orientation program for new employees: 8 a.m. to noon, Fairchild Auditorium. To register, call HRG at 497-7541.

Div. of Hematology Wednesday noon conference: "Pediatric presentation"—Dr. Bertil Glader. Noon, L201.

Hematology Support Group: Meetings for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

Dept. of Clinical Social Work and the American Cancer Society: "I Can Cope"—a program for cancer patients and their families. Wednesdays through June 22, 5:30 to 7:30 p.m., TF-122c. For further information and to register, call 497-5091.

Dept. of Structural Biology seminar: "Three Crystal Structures for Citrate Synthase: Catalytic Activity Requires Large-Scale Conformational Changes"—Dr. James Remington (Univ. of Oregon at Eugene). Noon, Fairchild Building D102.

Div. of Orthopedic Surgery grand rounds (two topics): "Anatomy—Foot and Ankle"—Dr. Gary Watson, 7:30 a.m.; and "Cement Fixation"—Dr. Steven Woolson, 8:30 a.m., M114.

Dept. of Neurology grand rounds: "The Synthetic Street Heroin Story: A New Model for Parkinson's Disease"—Dr. William Langston (Santa Clara Valley Medical Center). 5 p.m., C364.

THURSDAY, MAY 26

Dept. of Pharmacology seminar: "Regulation of Collagenase Gene Expression in Fibroblasts by Cell Shape"—Dr. Zena Werb (UCSF). 4:15 p.m., Dermatology Library R358.

Dept. of Medicine grand rounds: "Newer Aspects of Hyperthyroidism"—Dr. Joseph Kriss. 8:30 a.m., Fairchild Auditorium. Medical service meeting to follow.

Div. of Family Medicine Friday noon lecture series on Women and Health: "Women and the Nuclear Arms Race"—Dr. Deborah Gordon (physician, co-president of Redwoods chapter of Physicians for Social Responsibility). Noon, M114.

FRIDAY, MAY 27

Div. of Child Psychiatry grand rounds: "Febrile Seizures and the Use in Pediatrics of Drugs with Psychotropic Side Effects"—Dr. Alvin Rosenfeld. 11 a.m., central conference room, Children's Hospital at Stanford.

Dept. of Genetics seminar: "The Organization and Expression of the Human Cytomegalovirus Genome"—Deborah Spector (UCSD). Noon, Genetics Library S336.

Dept. of Pediatrics grand rounds: "Water Intoxication in Infancy"—Dr. Donna Chaet, senior resident; Case Presentation by Dr. Catherine Albin, junior resident. 8 a.m., M106.

Dept. of Biochemistry seminar: "Dideoxy DNA Sequencing Applied to Epstein Barr Virus"—Dr. Toby Gibson (MRC Laboratory of Molecular Biology). Noon, M316.

TUESDAY, MAY 31

Dept. of Biochemistry colloquium: "Cell-Cell Communication in *Dictyostelium*; Sensorary Adaptation cAMP Activated Adenylate Cyclase"—Dr. Peter Devreotes (Johns Hopkins). Noon, M316.

WEDNESDAY, JUNE 1

Dept. of Structural Biology seminar: "Mechanisms of Control of Gap Junction Conductance in Early Embryos"—Dr. Andrew Harris. Noon, D102.

JUNE 1 and JUNE 10

The Hypocritic Oaf Strikes Again! If you missed the live performance. . .this is your chance to catch some of the glamour of April 29, 1983. Two special video screenings of the Medical School musical will be held: Wednesday, June 1 at 7:30 p.m.; and Friday, June 10 at 3:30 p.m. in Fairchild Auditorium. Sponsored by the Office of Public Events. Everyone is welcome!

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Paramedics: vital to the community, coordinated part of emergency medical care

A man is stricken with chest pains. One of his coworkers calls emergency.
Within minutes, medical technicians and paramedics are by his side. They send ECG patterns over radio to a nurse (pictured here is Susan Lee) in SUH's emergency department. There, a doctor and nurse decide the man should receive drugs immediately to halt a rhythm disturbance of his heart. The nurse radios orders to the paramedics, who then prepare to bring the cardiac victim to the nearest emergency department.
SUH's emergency department serves as the base station for six paramedic units in the northern and central part of Santa Clara County.
The department's pre-hospital care program has offered field care training for the past nine years to nurses and paramedics from all over northern California and many western states.

Balding men still needed for study

Men with a specific type of balding are needed to participate in a study of the effectiveness of a drug that stimulates hair growth.

The Department of Dermatology is seeking healthy males between 18 and 49 years of age with early, progressive, male pattern baldness. Such balding begins at the crown of the head and spreads outward (*see accompanying diagrams*).

Those selected will be involved in a one-year double-blind study of the effectiveness of locally-applied Minoxidil, a drug which is regularly used in oral form to treat high blood pressure. Because the drug has shown some potential for promoting hair growth, the FDA has approved it for testing in a topical ointment form.

Interested volunteers who meet the above general requirements may call Olive Charles in dermatology at 497-7893, during the following hours:

- Mondays, 9 to 5 p.m.
- Tuesdays, 1 to 5 p.m.
- Fridays, 1 to 5 p.m.

Volunteers must not have more hair than this.

Volunteers must not have less hair than this.

...News Notes...

The Medical Board at its April meeting approved formation of a **Health Care Legislative Policy Committee.**

The action comes at a time when many issues affecting medicine, such as policies relating to third party payers and freedom of choice for patients to choose providers, are undergoing changes, many driven by legislation.

The board is to be composed of at least four members of the medical board but other physicians and non-physicians may be added, according to the board's action.

* * * *

The newly opened **Cafeteria North,** *between the PATS lounge and X-Ray North, is now available for use as a meeting or conference area, according to Peter O'Connell, director of Dietetics.*

The room will be used for cafeteria seating between 10:30 a.m. and 2:30 p.m., Monday through Friday, but other daytime hours may be reserved, O'Connell said.

First priority for use of the room goes to all Hospital departments. All other Medical Center departments must first receive approval of Hospital Administration. Otherwise, the first-come, first-served principle will apply.

The space accommodates 150 people, and a catering order form (SU-13) must be submitted to Dietetics indicating the desired meeting time.

For more details on reserving the room, call the dietetics office at 497-6904.

* * * *

Four medical center physicians were commended for special service by the Santa Clara County Medical Society at the Society's annual business meeting and awards banquet May 9.

Dr. Frederick Armstrong, *a clinical professor of medicine, was honored for his "outstanding contribution to the medical society."*

Dr. James McCort, *clinical professor emeritus of radiology, was awarded for his "outstanding contribution in medical education," as was* **Dr. Donald Alcott**, *clinical professor emeritus of pathology.*

Rodney Beard, *professor emeritus of family, community and preventive medicine, received recognition for his "outstanding contribution to the community."*

* * * *

The policy on **paid personal time off (PTO)** *for University employees has been revised effective May 1, said Felix Barthelemy, manager of University Employee Relations.*

While the total yearly number of PTO hours will not change, the new policy allows for use of up to eight hours per month, with supervisory approval.

Part-time regular staff are eligible for PTO in proportion to their work schedules.

The above changes do not affect Hospital personnel. Questions on the policy may be directed to the university's employee relations office at 497-4433.

* * * *

Medical School staff are reminded of the **Recognition Reception** *to be held Thursday, June 2, from 3 to 5 p.m. in the Fairchild Auditorium lobby.*

The event is by invitation for those with five, 10, 15 and 20 or more years of service. If you didn't receive an invitation and feel you should have, contact your department administrator or the Human Resources Group (497-5975).

* * * *

The **SUH Auxiliary** *has donated $6,235 to the* **Pain Clinic** *for a device which can ease pain for months or even permanently.*

The device, according to Dr. Lorne Eltherington, director of the pain service, is a neurostat, a needle probe which transmits extreme cold to the nerves in a process called cryosurgery.

Cryosurgery renders nerves temporarily unable to send pain messages to the brain, providing a few weeks to months of relief. The process is repeated when pain recurs, and occasionally the nerve is deadened permanently, ending the pain altogether.

Eltherington said he believes that, although the procedure itself is widely used for other purposes, Stanford is one of the few centers in Northern California employing it in the relief of chronic pain.

* * * *

Human Resources Development (HRD) *is offering summer classes for all medical center employees.*

The courses, which include such diverse topics as Supervisory Skills and Laughter in Health Care, are intended to "help employees increase their own knowledge and skills" to better serve the hospital.

Laughter in Health Care addresses the positive effects of laughter and play and shows health care professionals ways of translating these principles to their patients, helping to lower stress and relieve chronic pain.

The Supervisory Skills course is designed to help supervisors improve communications with employees by learning techniques that can be used to set job standards, improve employee performance, correct problem behavior, and overcome resistance to change.

Other course offerings include: better meeting organization; "Eat Light," a course on the psychology of weight loss; "Geodex," a management training course; assertiveness training; and three classes in confident public speaking.

Continuing education credit is available, fees are charged, and space is limited, in most courses.

For further information, call HRD at 497-5233.

* * * *

Second quarter **fire drills** *are scheduled for late May and June in the hospital, according to Ruben Perez, assistant director for Safety. Drills will take place on every work shift at both the main center and Hoover, and evaluations will be given in each department or nursing unit.*

* * * *

Roger Knobles *has been appointed accounting manager for SUH Finance, said Ron Kreutner, assistant director of Finance/Controller.*

Knobles, who has extensive accounting experience and has been the hospital accounting supervisor since 1981, fills the vacancy created by Tom Connelly's recent retirement.

Policy makers ignore powerful anaytical tools, Dantzig says

Computers and mathematical modeling have given policymakers a magnificent tool for decision-making, but most of them chose to ignore the possibilities, a Stanford scientist said today.

George Dantzig, professor of operations research and computer sciences, said in a paper prepared for the Detroit meeting of the American Association for the Advancement of Science on Saturday, May 28, that the problem is a lack of "infrastructure" in organizations that would accept models.

"Policymakers continue to make decisions without the benefit of the powerful analytical tools that are available to them. That the decisions they make are bad, is self-evident."

In the paper and an interview, Dantzig said that the power of modeling techniques is that they can handle a very high number of variables, "the number of the combinations of the ways to combine these variables is astronomical, and. . .the techniques are so powerful that. . .what they can do are absolute miracles."

They are widely used for some things. Every oil refinery in the world makes use of these models for production, yet the upper executive officers of these same oil companies have a deliberate policy of not using models for economic issues.

Models ignored

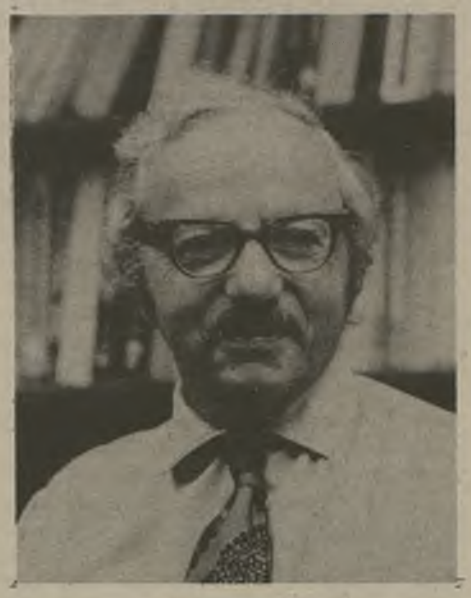
Dantzig quotes a Congressional aide as saying that a planning model used by the Department of Energy "is irrelevant to anything we do around here. No one, and I mean no one, takes it or any other model seriously."

He quotes another as saying that "the only influence or impact that modeling has is on the incomes of the modelers." Perhaps no more than a third of the models prepared under federal contracts have any influence on policy.

Models generally fall into two categories: predictive and prescriptive. Predictive models are "those that simulate an existing system and try to predict how it will change over time." Prescriptive models are "those that model a variety of possible futures with the idea of selecting one that is more attractive than the others according to some specified criterion."

In predictive models "you try to guess human behavior and put the human behavior in the model. I have my reservations about doing that. I think they can be predictive if you put a lot of 'ifs' on it."

Testing not possible



One of the problems with models, Dantzig admitted, is that they cannot really be tested without actually trying them out.

"The only 'laboratory,' unfortunately, is society itself, and once a policy is tested on it, it is too late."

There are other problems preventing wide acceptance, including the complexity of the programs required for modeling, the sometimes unfirm basis on which some models must be made (i.e., "modelers seem to accept the casual relations found in economic theory"), and the unpredictability of some events. Additionally, sometimes there is too much detail, sometimes not enough.

Despite all of this, modelers are "oblivious" to the pitfalls. One writer has likened them to fortune tellers and astrologers "because of their practice of forecasting economic phenomena for next year, or for a decade from now, which we are unable to measure today."

The main problem with getting models used in decision making may be in the nature of special interest groups which have a keen interest in the decisions. Their opinions are vital to the decisions because

George Dantzig

they sometimes know more about the situation than the policymaker, Dantzig said.

But, he added, "their decisions with respect to an issue are typically narrowly focused, with little knowledge or interest in how it affects others. Each issue is treated by them in an ad hoc manner; their guidelines are often inconsistent and their objectives multiple and vague."

Often these groups are incapable of even articulating their objectives, or what is wrong with the other person's objectives, making reaching a decision nearly impossible.

"They are sure that the other people are all wrong, and so they are busy throwing monkey wrenches into the machinery," Dantzig said. "In this crazy world we live in which lawyers are helping everybody with their trouble-making, it's even worse."

Here, however, is where the models might be useful. The models could be used to show the special interest groups what implementation of their demands would mean on the system as a whole, "using models to test whether proposed plans are feasible, and to determine what the short- and long-term tradeoffs are."

"The latter information is required for bargaining and arriving at a compromise solution."

Articulating needs

If he were a government planner, Dantzig said, he would get all the interest groups together and help them articulate what they want.

"If all the special interest groups say, 'I want this,' and all the other guys say 'I want that,' and you add it up across the board and it's not feasible, i.e., they want more than the resources available, the coordinating people can come back and say. . .it's not feasible. This will encourage them to cut back on their demands.

". . .In that kind of situation, the models that you have in the back room can be brought forward to give the exchange rates in order for you to get things more feasible, what to do, or how much to give up in the immediate present in order to make the future better—our children's future versus our own."

If groups and decision-makers can acquire the discipline to do this, then the infrastructure will exist for better decisions through modeling, Dantzig said.

Dantzig, the winner of the National Medal of Science, is considered the father of linear programming, the scientific method used widely in government and business for laying out a schedule of activities to be performed. —Joel Shurkin

Revised system for student evaluation of teaching approved

The Stanford Faculty Senate has approved a revised system for student evaluation of teaching.

The action was taken without dissent May 12.

It followed recommendations from the Committee on Academic Appraisal and Achievement (C-AAA), which said student evaluations were "worthwhile" but should only be part of an integrated system for improving teaching.

Prof. Nathaniel Gage, education and psychology, said the simplified form suggested for the student evaluations would be more helpful to administrators than to the improvement of classroom instruction.

The present research literature provides "good evidence" that evaluations midway through a course can help improve classroom performance, especially if accompanied by expert consultation, Gage said.

Little or no research has been done on the effectiveness of student evaluations at the end of a quarter or semester in improving future teaching, he added.

Associate Prof. Susan Matisoff, Asian languages, who heads the C-AAA, noted that mid-term evaluations are difficult to mandate.

One purpose of the simplified forms recommended by the C-AAA was to improve participation in the present program. Almost 40 percent of the courses covered by present policy are not evaluated, and 30 percent of the students asked their opinions about the remaining courses fail to reply.

President Donald Kennedy suggested that the Associated Students *Course Guide* might be more useful if it became "more subjective and rather more venturesome in its evaluations," instead of being "hung up on statistics."

A confidential guide?

Harvard students publish a "Confidential Guide" which is "hated by the faculty, but they line up two deep on Boylston Street to buy it," he noted.

Matisoff noted that there was a "wide diversity of opinion" over the value of student evaluations among department heads at Stanford, some of whom expressed "vehement objections" to the practice.

Prof. Ronald Rebholz, English, said the C-AAA suggestions were a "considerable improvement," particularly in reducing the number of questions from 30 or so to a half dozen.

Prof. Herant Katchadourian, vice provost for undergraduate studies, was "very much in favor" of the simplified form. The basic questions boil down to 1) how good is the course? and 2) how good is the teaching?

Prof. Bernard Roth, mechanical engineering, said the idea of using mid-term evaluations to improve teaching was "sensational."

Provost Albert Hastorf said he found it helpful to do so simply by picking a half dozen students at random and asking about his own course.

"They're a little bit hesitant at first," he said. "Of course, it's always a shock to learn you're not crystal clear" as a teacher, too.

Gage observed that "teaching isn't public; it's private. The only ones with intimate knowledge are the students."

Comparing student evaluations with various norms fosters competition between faculty and isn't that meaningful, he added. "Some comparisons are spurious—is Smith a better physicist than Brown is a harpist?"

Evaluations depend on the subject, whether or not it's elective, class size, and other factors.

"Math departments get low mean (average) ratings across the country," he said, simply because the subject is difficult. This results in an "unjust hardship" on math instructors, when compared with their colleagues in other fields.

The C-AAA recommended that the faculty review the new evaluation system in another four years.

Sarah Rivers, 56, dies at hospital

Sarah Rivers, 56, a Stanford campus resident since 1962, died of apparent cardiac respiratory arrest at Stanford Hospital Monday, May 23.

She collapsed at her home around 10:30 p.m. and was taken to the hospital by paramedics and Dr. Robert DeBusk, a neighbor and cardiologist. She died at 11:41 p.m.

A home gardner, Rivers was active in a campus investment club and often hosted students at home.

A native of New Orleans, she met her husband, Prof. William Rivers of the Stanford Department of Communication, while both were at Louisiana State University.

He and two daughters survive. They are Gail Rivers-Zimberg, of New York City, and Mariane Ball, of Bieques, a small island off Puerto Rico.

Cremation is planned. No decision has been made on whether to hold a memorial service.

High tech helps physically limited find jobs, thanks to Marjorie Linvill

Michael May graduated with a B.A. in political science from UC-Davis, spent three months in a small village in Ghana, West Africa, and then attended Johns Hopkins School of Advanced International Studies.

Even before the conferring of his master's degree, he was hired by the Central Intelligence Agency as a political analyst in the African Affairs section. His was a resume which anyone would have been proud to show a prospective employer. There was just one problem.

May had been blind since the age of three.

Like most physically limited people, May had overcome many obstacles on the road to self-sufficiency. Few were greater, though, than his attempts to look for meaningful employment in the private sector.

"On the basis of my experience and skills, I was often invited for interviews, but I found that people were reluctant to take responsibility for hiring a blind person and reluctant to give responsibility to a person who needed to accomplish his job tasks in somewhat unconventional ways," the bearded young man explains.

Returning to Walnut Creek, where he grew up, May expanded his job search to include a wider range of business opportunities. "I changed my tack," he explains. No longer restricting himself to international loan positions, he began applying to oil and electronics companies as well as to banks.

Finally, in January 1981, after a year of searching, an offer came. BankCal agreed to hire him as an operations analyst, one step on a management-training ladder.

Some nagging questions remained, though. How would May be able to handle the enormous amount of paperwork inherent in the job? How could be write reports and read those of his colleagues? How could be gather information at meetings and interviews?

Ten years ago, the answers would have been "impossible." But today, thanks to the genius and compassion of engineers and scientists all over the country, technology is becoming the miracle worker of the 20th century.

Marrying Technology and the Disabled

During his first week at BankCal, May's Department of Rehabilitation counselor requested the services of the Sensory Aids Foundation, a Palo Alto based nonprofit organization whose sole business is to bring technology, employers, and the physically limited together.

A Sensory Aids Foundation vocational specialist visited May in his office to analyze his job tasks and to determine which of numerous new electronic sensory aids on the market might serve him. Together they decided that a VersaBraille, a device which stores braille-encoded information on a cassette tape and plays it back under the user's fingertips, would be just what May needed to enable him to take and edit braille notes during meetings.

The VersaBraille could also be connected to BankCal's word processor to enable him to read reports written by his colleagues and to process his reports from braille to standard type.

Today, May is able to use many of those same sensory aids in his new job as a political analyst for Electromagnetic Systems Laboratories in Sunnyvale. He is eager to add even more devices, perhaps even a talking computer terminal, to enable him to work more independently.

"No one device does everything," he says, laughing. "It's important to figure out which device can serve you best. I'd like to have one of each. And then I'd get a much larger office to hold it all."

Since 1975, the Sensory Aids Foundation has helped over 350 people like May enter the job market by strengthening or replacing their senses, which have been lost or diminished, through the use of up-to-date sensory products, many of which are manufactured right here in Silicon Valley.

In addition to identifying and researching job opportunities for disabled people, SAF also offers employers consultation services on recruitment of disabled persons with appropriate job skills, identification of appropriate jobs, job retention, acquisition of sensory aids, and follow-up support services.

The foundation is funded by grants, primarily from the government, but increasingly from private corporations. Contributors read like a who's who list of California industry: Ampex Corporation, Ford Aerospace & Communications Corporation, Rockwell International, ROLM Corporation, Lockheed, Xerox, Verbatim Corporation, Syntex, and the

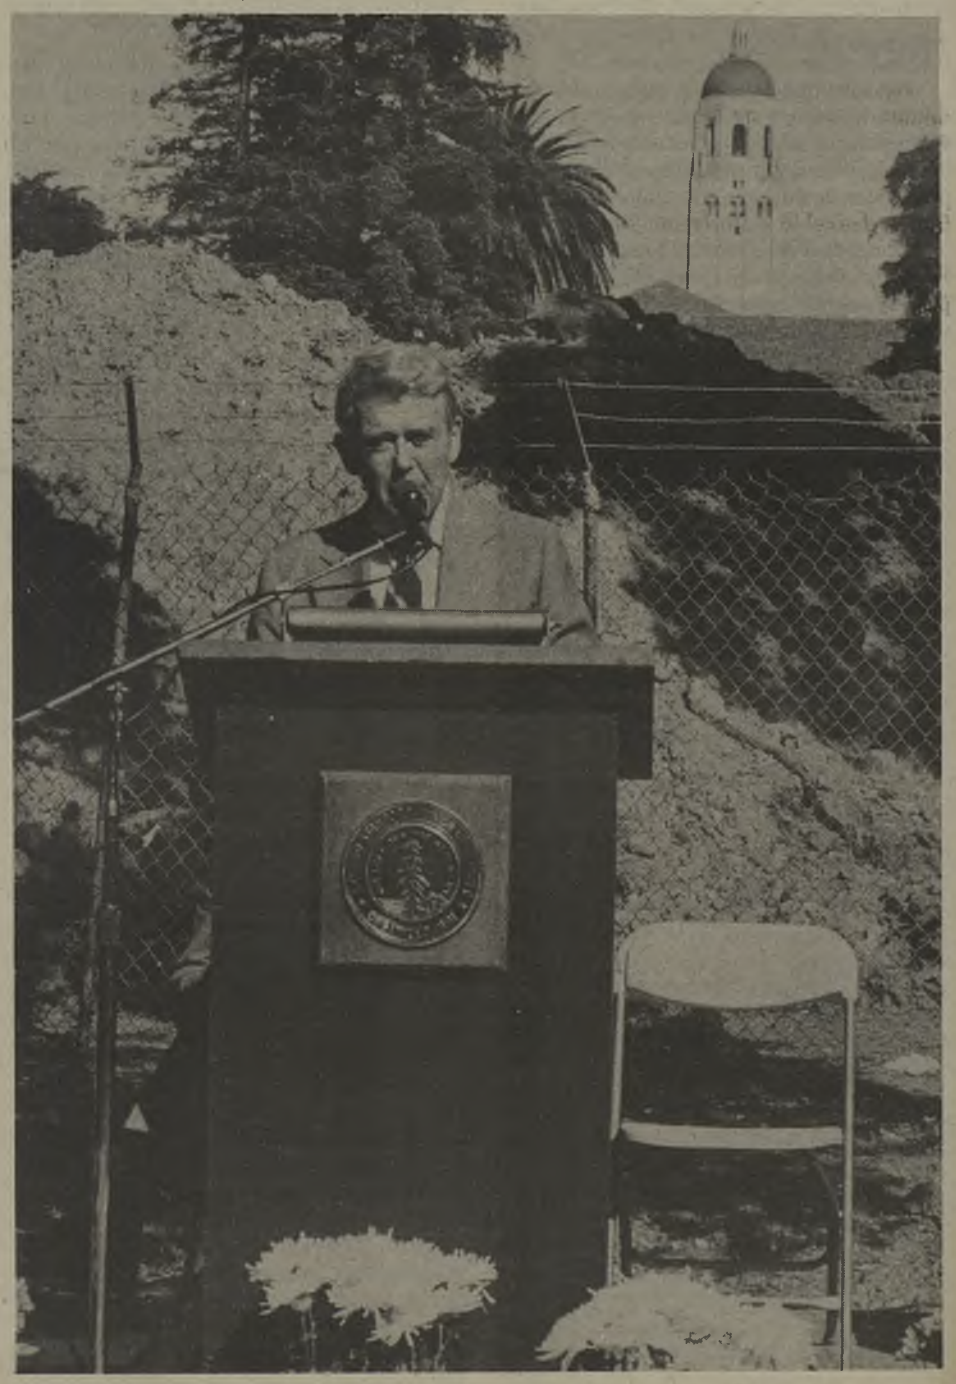
Hewlett urges more industry support for research, education in CIS talk

American industry should become "a more vigorous supporter" of university research and take "a more direct and active role" in strengthening education, William Hewlett, cofounder of Hewlett-Packard, said Thursday, May 19.



In remarks prepared for the groundbreaking of Stanford's new $14.5 million Center for Integrated Systems, Hewlett cited the new center as "a splendid example" of how companies can realize the benefits of basic research "without the inordinate expense of each establishing a critical mass to do such work on its own.

"Through such shared efforts, participants can partake in ventures well beyond the capacities of all but a few large corporations, and do so without inhibiting ultimate competition in the marketplace."

Industry should provide incentives to make faculty positions "more attractive and competitive," especially in science and technical fields, Hewlett said. His firm recently committed $6 milion over five years for this purpose. Ten outstanding Ph.D.'s annually will be encouraged to continue teaching and will be rewarded "for not coming to work on our payroll," he said.

The new center is America's largest joint effort by industry, universities, and government to conduct research in electrical engineering, computer science, materials science, and related fields.

Its construction has been made possible by $750,000 from each of 19 firms: General Electric, Hewlett-Packard, TRW, Northrop, Xerox, Texas Instruments, Fairchild Camera and Instrument, Honeywell, IBM, Tektronix, Digital Equipment Corporation, Intel, International Telephone and Telegraph, General Telephone and Electronics, Motorola, United Technologies, Monsanto, American Microsystems-Gould, and Philips Signetics. Profs. John Linvill and James Meindl are serving as codirectors.

William Hewlett

Kennedy urges editors to examine UC's need for more state support

Stanford President Donald Kennedy Friday, May 20, urged California editors to pay more attention to the "extraordinarily serious" financial problems now confronting the University of California.

Kennedy said: "This state has produced surely the most distinguished example of public higher education ever accomplished in the world.

"It is simply an extraordinary, irreplaceable asset. I do not have the sense, at the moment, that it is being taken seriously enough by this state government, or that the range of economic solutions recommended to protect it are adequate."

Kennedy spoke in answer to questions at the 45th California Newspaper Editors conference at Rickey's Hyatt in Palo Alto, hosted by the Stanford Department of Communication.

Asked about Stanford faculty petitions concerning the Hoover Institution, Kennedy said, "I think the temperature of the controversy is going down now, as people begin to understand that political head counting. . . is not important." Questions concerning governance and appointment procedures are "more interesting and fundamental," he observed.

Kennedy said he planned to join with the presidents of Yale and Harvard in hosting a conference on major research universities and the public schools at Stanford late this summer. The climate now is "very receptive" to efforts to improve primary and secondary education, he noted.

About 200 persons attended the CNE luncheon.

SAF/ continued from page 22

Hewlett-Packard Company are some of the enthusiastic donors to the Sensory Aids Foundation cause.

Local Miracle Worker

The chief "Miracle worker" at Sensory Aids Foundation is Marjorie Linvill, a pretty, motherly figure who also happens to be the wife of Stanford professor of electrical engineering John Linvill.

The Linvills interest in sensory devices for the blind came from personal need: their daughter, Candy, had gone blind at the age of eight months as the result of a tumor.

While Mrs. Linvill laboriously encoded books into braille and taught Candy to read, John Linvill and his colleagues began seven years of research to develop what eventually became the Optacon, an ingenious book size electronic device which enables blind persons to read ordinary printed material directly and independently.

Users "read" by means of a tiny camera which, when passed over the pages of a book, turns reflections given off by the letters into vibrating images which can be felt by the user's index finger. Since 1971, the Optacon has been manufactured by Telesensory Systems, Inc., and has become a worldwide reading instrument used by over 9,000 persons.

The Optacon was the first of many electronic devices which have since been developed to enable disabled people to lead fuller, more productive lives.

VersaBrailles, talking computer terminals, talking calculators and auditory switchboards have all been developed in the last 10 years to give blind and other physically limited people opportunities to find and excel in mainstream jobs.

Certainly the need is there. In the San Francisco Bay Area alone, 50,000 or one percent of the population, is blind or visually impaired.

"I could see the impact that the Optacon had on Candy," Mrs. Linvill recalls. "With it, she graduated from Stanford and continued to earn a Ph.D. in clinical psychology. When I look around and see all the new devices which have been developed in the last 10 years, I think it would be incredible if disabled persons couldn't take advantage of them."

Foundation organized

Marjorie Linvill and a corps of trustees began Sensory Aids Foundation in 1975 with an initial grant of $175,000 from the Department of Rehabilitation.

Job placement results have been quite impressive. For example, when the California Department of Motor Vehicles contacted the Department of Rehabilitation and Sensory Aids Foundation to determine if a blind person could successfully perform as an information officer, representatives of SAF and the Department of Rehabilitation responded with a visit to the DMV facility.

With a few minor modifications and the translation of printed reference material to braille, the job became accessible to the blind. Once they were sure that a blind person could be successful on the job the DMV hired not one, but seven blind persons to fill empty positions.

Similarly, two years ago Rockwell International's Information Systems Center contacted Sensory Aids Foundation and expressed a desire to hire a disabled person for a switchboard opening.

After an onsite evaluation by SAF, a Rockwell personnel representative interviewed Lillian, a legally blind woman who had been trained as a switchboard operator at the Braille Institute. Lillian was hired to operate a 120-button call director and take messages for Rockwell computer professionals.

Rockwell, Sensory Aids Foundation, and General Telephone worked together to divide the board into four sections. Each section had a different audible signal which enabled Lillian to immediately identify a quadrant of 20 buttons where the incoming call was located. The board was also modified to cut glare and Lillian was given instruction on scanning techniques.

In addition to job placement, the Sensory Aids Foundation has been active in the field of vocational counseling for blind and visually impaired youth. In a summer program, SAF instructors traveled weekly to the homes of physically limited youth aged 14 to 21, working with them on skills such as cooking, cleaning, laundry, and clothing management.

"It took one student four hours to make spaghetti," one instructor recalled, "but he did it by himself with no aid from me."

In addition to individualized training, SAF held group sessions for the youths to provide them with information on job seeking skills, career options and sensory aids, and gave them hands-on experience with Optacons, VersaBrailles, and talking computer terminals. The students are also able to talk with blind working people about finding and holding a job. One participant remarked, "It's nice to have blind people teaching me how to do things, because they know how to explain things the way I see them."

Aids the deaf, too

Although the Sensory Aids Foundation started as an organization to help blind or visually impaired people, it has since expanded its services to help people with a whole range of physical disabilities, especially those who are hearing impaired.

One of SAF's most ambitious projects is its effort to encourage development of a speech recognition device for deaf persons known as Vidvox (Latin: video = I see, and vox = voice).

The device would display a stream of phonetic symbols as a speaker talks, enabling hearing-impaired people to "read" what people are saying to them. The obstacles to producing such a device are enormous however. Donald J. Ruder, an engineer who acts as an adviser to the Foundation, notes that "Most commercially available speech recognition systems recognize only isolated words, have a limited vocabulary, and respond seconds after speech is uttered."

Ideally, the Vidvox would recognize speech segments and continuous speech at normal rates. "Athough the problem of speech recognition is a difficult one, we think it is one worth pursuing, despite uncertainty about its success," Ruder says. Development of a large-scale model of the Vidvox by a firm in Cambridge, Mass., is expected to continue at least until the end of 1984.

Benefits exceed cost

Marjorie Linvill is convinced that the time and money spent to develop sensory aids and to help disabled people enter the employment mainstream is worth it. And she has the figures to back it up.

During seven months in 1981, the Sensory Aids Foundation spent $31,110 on employment development for 16 disabled persons. Were they not working, those 16 employed persons would have received estimated total welfare payments of more than $35,000. Therefore, the program cost of $31,100 was $3,890 less than the public assistance money that used to be spent sustaining these individuals.

In addition, they earn a combined annual income of $179,000 and will pay an estimated total of $46,000 in state and federal taxes—$11,000 more taxes to the government than they used to receive in welfare.

Federal cuts hurt

Such results have people in government talking. In a letter to Sensory Aids Foundation, former Congressman Pete McCloskey noted, "In this day and age of billion-dollar deficit spending, I believe it both ethically and financially appropriate to support Sensory Aids Foundation.

"SAF's achievements in placing former dependent disabled persons in productive careers within the electronics industry has proven to be a successful and cost efficient program. I strongly endorse your organization, and in gratified the SAF resides within my Congressional district."

Despite such glowing praise government support for the Sensory Aids Foundation isn't as great as Linvill would like it to be. Federal budget cuts, especially, have hurt the foundation tremendously.

"In 1981, 74 percent of our funding came from the government," she explains. "In 1982, only 57 percent came from the government. In 1983, we expect only to get 44 percent of our support from the government."

Luckily, she says, private industry has been more than willing to pitch in and help. With an annual average budget of $250,000, annual fundraising drives are a must. The foundation's large staff of volunteer workers helps tremendously, Linvill notes. "Eighty-six cents of each dollar contributed goes directly to program services."

The impact that the program has had on individual lives, she adds, cannot be measured in numbers—but it is enormous.

"Raising Candy, I always felt that it was important for a blind child to become a part of sighted society," she explains. "For adults it is even more important. The hardest part about being blind is being dependent on other people. Our goal has always been to take advantage of the marvelous technology available to make blind and disabled people independent, to make them feel good about themselves and their capabilities.

"It hasn't always been easy. Even though we had qualified people and up-to-date technology to help them do their jobs, employers were reluctant to take them on.

"Some were concerned about insuring physically limited workers. Others worried about the safety of blind persons in their plants, or whether they could even get to work on their own, or how other employees would interact with them. Each year, as more and more physically limited persons are out in the working world, these types of concerns have lessened."

High reliability

Not only have they lessened, but many employers report that physically limited workers are among their best in terms of attendance, reliability, and competence.

A survey of DuPont, a corporation with an exceptionally good record of hiring physically limited workers, notes that 96 percent rated average or above average in safety compared with 92 percent for nonimpaired employees.

In performance of job duties, the physically limited improve their rating from 91 to 92 percent average or above, compared with 91 percent for nonimpaired employees. In attendance, those who rated average or above rose from 79 to 85 percent in 1981, compared with 91 percent for nonimpaired employees.

Government and donors willing, the Sensory Aids Foundation will be around to help employers tap this enormous human potential for many years to come.

"We've been very fortunate," Linvill says. "More and more people are beginning to realize that this is an exciting program and an important program. It's important to the people who are helped and it's important to the general public, in terms of getting people off welfare and into productive careers.

"By hiring the physically limited, everyone benefits."—Terry Becker

International Relations Council named

Stanford University has announced the establishment of an advisory and visiting committee to its Program on International Relations, to be known as the International Relations Council.

Invited to serve initially for a period of two years, its members are Lindy Boggs, member of the U.S. House of Representatives;

Walter E. Hoadley, former executive vice-president and chief economist of Bank of America, now at the Hoover Institution;

Leon Sloss, formerly a foreign service officer and currently president of the Stanford Alumni Association;

Richard H. Solomon, head of the Political Science Department of the Rand Corporation and formerly senior staff member of the National Security Council;

John K. Steinbruner, a Stanford alumnus currently director of the Foreign Policy Studies Program at the Brookings Institution;

Walter J. Stoessel, Jr., another Stanford alumnus who recently retired as undersecretary of state for political affairs; and

Strobe Talbott, diplomatic correspondent for *Time* magazine.

The Council will be asked to review the program and curriculum of the International Relations major, to make recommendations for improvements, to advise on placement of graduates and possibly on their improved preparation for careers in international relations as well as for graduate and professional training.

The International Relations Council joins other advisory groups in the School of Humanities and Sciences through which departments, programs, and the School seek to benefit from the knowledge and perspective of professionally competent peers from outside the university.

It provides for the faculty a knowledgeable sounding board as they assess future directions, strengths and problems of the program, a more formal means of communication with relevant constituencies outside the university, opportunity for students to meet and listen to acknowledged leaders in the field, information about fields related to the International Relations program, and knowledge about the impact of Stanford's International Relations program in the international world.

The Hoover debate continues as Senate session approaches

Drekmeier: News accounts relate a 'story of greed' in acquiring Volker Fund

Editor, *Campus Report*:

A recent statement of George Marotta, public affairs coordinator for the Hoover Institution, mentioned that Hoover's relation to Stanford needed no further clarification since that relationship had been spelled out in the May 1959 resolution of the Board of Trustees, and reaffirmed in the 1970s when the Volker Fund was donated to the Hoover Institution.

That last verb, "donate," brought back memories of the court struggles needed to wrest that huge sum of money from the charitable organizations of Missouri which had a legitimate claim to the philanthropist's legacy. But, I thought, that is history—although fairly recent history. And then, with Peter Duignan's recent ruminations regarding signers of the Hoover petition (*San Francisco Examiner and Chronicle*, May 8), I had second thoughts.

Mr. Duignan, a Hoover fellow, disregarding his boss's concerns about character assassination, would take us back to the late '60s to see the beginnings of that virus that has produced the current disease—the request that there be an inquiry at faculty and trustee levels into the place of Hoover at Stanford. "This is the same gang that was against the Vietnam War, supported the partisans in Nicaragua and now backs the rebels in El Salvador." (Such a remark can only encourage delusions of grandeur in many of us, I fear.) Mr. Duignan goes on to suggest that the motivation of Hoover's critics is based on greed. Greed which has made us envious of the various Hoover emoluments.

Indeed there *is* a story of greed in this whole matter. Some of the history of purloined documents and CIA links can be read in a lengthy account that appeared in *The Wall Street Journal* of June 2, 1967.

Among the comments on Hoover's sources of support, the staff reporter quotes a spokesman for the Allen-Bradley Co. of Milwaukee as saying "One of our basic policies is to support anti-Communist and conservative organizations. The Institution falls right in with this policy." The article testifies to the richness of the archival holdings, but raises questions (admittedly sometimes difficult to answer) about the ethics of their acquisition.

It is, however, the William Volker Fund and the role of Hoover and Stanford in *its* acquisition that ought to be of interest to those who apply to Hoover for research money or other kinds of assistance. This is the story.

In September 1977 the attorney general of Missouri won a temporary restraining order against the fund and its directors, preventing them from giving Hoover $9 million. The attorney general contended that the fund was created primarily to aid people and institutions in the Kansas City area. From the establishment of the fund in 1932 until Volker's death 15 years later the fund was administered in such an eleemosynary way.

"The articles of incorporation of the fund show that Volker's original intention was to devote the initial endowment and its interest to such humane and liberal causes as 'to care for the sick, aged, and helpless, and to relieve those who are distressed in the mind, body, and estate. . . .' " (*San Francisco Chronicle*, Oct. 5, 1977).

The will required the fund's liquidation 30 years after the philanthropist's death. At that time the directors of the fund determined that Hoover should have the bulk of this estate. The chairman of the directors, Morris A. Cox of Pebble Beach, Calif., was described by the *Chronicle*'s education correspondent "as (being) every bit as conservative as the Hoover Institution" (loc. cit.). Roy Dietrich, Volker's own attorney, alleged that Cox's "ruling motive in life is to spread conservatism" (*Daily*, May 17, 1978).

Of the other four directors, three lived in California. They were, and possibly still are, executives of Chlorox, Dean-Witter, and something called the College-University Corp., respectively. The director who remained in Missouri, Dietrich, voted against the Hoover grant as being contrary to the intent of William Volker.

If Hoover were to get the grant, Cox would receive a $25,000-a-year job as adviser to Glenn Campbell. A Stanford release of Oct. 5 stressed that this appointment and that of the three other directors to an unpaid advisory committee were not conditions of the grant itself. Later, evidently after questions about the propriety of Cox's salary, he declined compensation for whatever services he might render.

In justifying the grant "Cox maintains that the kind of recipient has changed over the years because the government now takes care of most of the problems Volker tried to solve" (*San Francisco Chronicle*, Oct. 5, 1977). If an accurate reflection of Cox's rationale, he was admitting Volker's commitment to the care of the sick, the aged, and the poor.

We might ask what Mr. Cox would say now that the Reagan administration has tried its best to minimize such support for such downtrodden and "distressed" people. (And done so with the counsel of Hoover fellows and their monetarist and supply-side arguments.) Cox contended that "the money would be better used now preserving the free enterprise system and trying to end the 'welfare state.' "

George Marotta noted at the time that if Cox was successful in giving $9 million of the $10.5 million Volker Fund to Hoover, that gift would almost *triple* the Institution's assets. Those assets were not inconsiderable, as was pointed out in a letter to the *Kansas City Star* (June 1, 1978) from a faculty member concerned that the people of Missouri not mistake Hoover for a charity.

"The Hoover Institution is already heavily endowed and its resources are staggering compared with most units within this University. . . . The Institution is clearly not in the business of aiding the sick, aged, and helpless, and is by no stretch of the imagination a charity. . . . Moreover, it has traditionally maintained a political stance in opposition to governmental programs devoted to carrying out the spirit of this will."

In June of 1978 a circuit court judge in Kansas City, under terms of an out-of-court settlement of the attorney general's suit, awarded Hoover $7 million and Kansas City charities $3 million.

This revision of the "distribution plan" was adopted "to avoid legal proceedings that could deplete the funds intended for charitable purposes, according to a statement by (the Fund's directors), (*San Francisco Chronicle*, June 19, 1978). There were a number of Stanford lawyers on hand in Missouri to help with the formulation of this winning phrase.

On April 1, 1960, President Wally Sterling promised members of the Academic Council, many of whom were unhappy over the manner in which Herbert Hoover had engineered the appointment of Glenn Campbell, that the Institution would be placed under "intensive scrutiny." Twenty-three years later that may happen.

Giraud: Faculty should conduct its own inquiry

Editor, *Campus Report*:

I hope the faculty will encourage their representatives in the Senate to vote in favor of the inquiry into the relationships between the University and the Hoover Institution. Prof. Rebholz's petition urging that the Board of Trustees initiate the inquiry seems a very modest proposal.

Personally, I should have preferred that the faculty conduct an inquiry of its own, because our concerns do not necessarily coincide with those of either the administration or the trustees. I found it somewhat disturbing to read that Board President Kimball, in commenting on the matter, echoed some of the defensive arguments of Hoover fellows. Also, it seems to me that, since a number of our trustees are also members of the Hoover Board of Overseers, they would be put in the anomalous position of investigating themselves.

Nevertheless, despite some misgivings, I support Prof. Rebholz's petition, which I have signed. Furthermore, I do not think that President Kennedy's indication that the trustees may appoint a group of individuals to "look at the relationships and give us some advice" diminishes the Senate's responsibility to assert the faculty's own conviction of the necessity of an inquiry.

Obviously, the allocation and use of university money, as well as the processes of appointment, are questions of capital importance. I think, however, that political considerations are equally important, not for witch-hunting, but rather to establish the extent to which the very obvious political orientation of the Hoover Institution invites inquiry into the quality of their association with Stanford and debate on the question of whether the two should be more closely identified or more clearly distinguished from one another.

Some of my conservative colleagues have considerately expressed concern that such inquiry can lead to repression of academic freedom not only for Hoover, but also for that institution's liberal counterparts in the University.

I do not see it that way. I do not see Hoover fellows being inhibited in the expression of their views. Nor do I find any counterparts to the Hoover elsewhere at Stanford. I see no department or institute here, nourished with millions of dollars from the University's funds each year, and charged, for example, with the mission of demonstrating "the evils of the doctrines" of Adam Smith or Milton Friedman.

But the relevance of politics does not reside in the identification of individuals whose stand on particular issues might be seen as repugnant, one way or the other, as defenders or opponents of the Vietnam War or regimes in South Africa or Latin America. The question is rather the degree to which the University has become institutionally associated with a partisan political stance.

In a probing inquiry there would be careful examination of statements made through the years to ascertain whether they constitute implicit or even explicit revelations of an institutional Hoover petition (apart from ex-President Hoover's famous articulation of the Institution's mission).

Such statements would certainly include the material quoted by Profs. Manley and Rebholz from the Hoover Annual Reports. But there are others attributed to individual fellows that suggest not simply a personal view but a group position. Hoover Fellow Thomas G. Moore, for example, who is director of domestic studies there and who refers to what he calls "a vicious attack" on Hoover (*Campus Report*, May 18), apparently told *Newsweek* magazine (Jan 12, 1976) that "Hoover might become the next government in exile." Hoover Fellow Peter Duignan identifies proponents of an inquiry as "the same gang that was against the Vietnam War" (San Francisco *Examiner*, May 8) and then goes on to say: "they keep turning up and are intolerant of *our views*" (my emphasis). Mr. Duignan also seems to have an administrative position at Hoover, since he is identified as their "coordinator for international studies."

A responsible inquiry would ransack the record for similar statements and from them seek to establish whether, apart from the irrelevant counting of Democratic, Republican, and even "Socialist" heads at Hoover, there is not after all evidence of a predominant institutional political thrust. Such an inquiry would then go on to investigate the extent and the manner in which such a political thrust (if it exists) affects Stanford through the various ways in which we are connected with the Hoover, by governance, appointments, funding, and association in the media.

Only then can we decide whether an even more intimate marriage or a divorce of the two institutions would be in the best interests of the University.

Raymond Giraud
Professor of French

Hilton: Attacks on Hoover 'less than candid'

Following is a letter from Prof. Em. Ronald Hilton to President Donald Kennedy concerning the Hoover Institution:

You have certainly received more mail than you need about the Hoover controversy. However, since I came to Stanford in 1941 and was soon thereafter put on the first committee to study Hoover's place in the university, my testimony may have some historical value; there is no one on campus who has been following Hoover affairs for a longer period.

No one would claim that Hoover is perfect; it is a large institution and therefore moves slowly, as indeed the university itself does. This is why I have often been impatient with both. However, it has none of the viciousness which characterizes some of its enemies, who are silent in the face of the most outrageous violations of academic freedom coming from the left.

I myself am in the School of Humanities and Sciences, but the *World Affairs Report*2, which I edit, has formal ties with the Hoover Institution which were originally proposed by the University administration. Three members of our board are senior members of the Hoover faculty, and, until his illness, Milorad Drachkovitch was chairman. This has been sufficient for us to be victims of the campaign which has repeatedly hit Hoover.

The tenth anniversary of the *World Affairs Report* was marked by a long series of symposia, supported by the University, in which specialists from all over the world analyzed methodically the problems of each area. This was the first time such a grand-scale assessment of world affairs has been attempted anywhere. Now the *World Affairs Report* is the first journal in any language or in any field, the complete text of which is being put on line. Through DIALOG, the largest information system in the world, it will be available at 19,000 terminals in many countries. Both of these are firsts of which Stanford should be proud of.

Yet some of the very faculty members who should have applauded did all they could to sabotage the enterprise and to stifle publicity about it. They should be ashamed, and I trust the administration will not listen to their less-than-candid attacks on Hoover.

Manley, Rebholz: Juilland confuses academic freedom with academic license

Hoover and Academic Freedom
by
Profs. John F. Manley and Ronald A. Rebholz

No one likes to be called names and told they are engaged in a "witch hunt," but if you look past the rhetoric, Prof. (Alphonse) Juilland, by raising the issue of academic freedom, has done the University a great service.

Academic freedom is one of the central underlying issues in the debate over Hoover: the freedom to ask dangerous and unpopular questions and have them debated responsibly in a university community. Open discussion of issues that some people would rather avoid lies close to the heart of what a university is all about; hence, the University should be better off for having these issues raised than having ignored them.

Before responding directly (if briefly) to Prof. Juilland's concern, we would like first to explain why the Hoover Institution, to the extent that it engages in political and partisan activity, represents a problem for the University.

As a university, Stanford claims to be nonpolitical, nonpartisan, and politically independent. Our *legitimacy* as an institution of higher education—the most precious thing we have—is in complex and fragile ways dependent upon the validity of these claims. To honor these claims we not only allow but we encourage the widest possible political expression on campus, *and* we guard against any one view becoming too closely identified with the University per se.

When President Reagan says "... during the recent campaign, I called on more people from the institution to help with my campaign than from any other institution," and when he tells a White House reception for Hoover's Board of Overseers "... you built the knowledge base that made the changes now taking place in Washington possible," it seems to some of us that Hoover has entered national partisan politics in a big way, and that Stanford is involved too.

The question that then arises is:

If Stanford University, as a university, is committed to nonpolitical, nonpartisan, and politically independent values, how can these values be squared with a multi-million dollar research organization that justly lays claim to being the leading conservative think tank in the country, that openly and proudly engages in partisan politics, and that necessarily involves the University in such activities?

Many answers have been offered, but the nagging questions for Stanford won't go away by reference to Harvard and Kennedy, or the academic freedom of Hoover scholars to do as they wish.

Contrary to Prof. Juilland's petition, we are not proposing an inquiry into the political orientation of Hoover (that seems generally well established); rather, we are proposing a debate over the proper relationship between Hoover as a political research institution and the University.

The reason this is vitally important to the University is that, whatever the benefits of having Hoover connected with Stanford, Stanford also benefits Hoover. By supplying valuable assets to Hoover, does not Stanford help Hoover advance its political mission? To the extent that Hoover engages in political and partisan activity, does not Stanford get drawn into such activities? If so, how can we continue to maintain that we are nonpolitical and nonpartisan? These questions, like all good questions, are hard to answer and generate controversy. But it is for precisely this reason that they should be asked, not suppressed out of false fears over threats to academic freedom.

If the University's legitimacy were not at issue, we could all rest content with a few changes in the way Stanford and Hoover do business. But if there is any real basis for the concern over legitimacy, a little better governance may not suffice.

We think Stanford must face up to the difficult question of whether or not we want to be so closely linked to certain sources of money and political causes that we become increasingly known as the conservative, western counterweight to our leading rival in the east. In this what "Harvard of the west" is to mean? With no discussion?

That these concerns are University-concerns, and not reducible to a political attack on conservatives is amply demonstrated in the public media. Carl Irving, for example, in a May 8, 1983, news article in the San Francisco *Examiner*, calls attention to Hoover's $60 million endowment, and cautions the University: "As the institution became widely known for leadership that openly backed conservative causes, endowment funds flowed in, reaching $60 million earlier this year." A 1978 article in the *New York Times Magazine* flatly declares: "It is the brightest star in a small constellation of conservative think tanks that serve as workshops where out of office intellectuals can fabricate the underpinnings of domestic and foreign-policy positions for the Republicans."

In short, if Hoover and Stanford are joined ever more closely, and if Hoover engages in political activity, it appears that Stanford directly and indirectly aids a political cause. This contradicts the University's commitment to nonpolitical activity, and, at some point, might endanger the University's legitimacy and reputation as well. If we allow this to happen, it will be a sad day in the history of a great university.

Prof. Juilland fears a liberal witch hunt if we discuss these issues. We share his concern. There is always the danger of violations of academic freedom when academics exercise their rights freely. At a practical level we find it hard to imagine a Board of Trustees witch hunt into the Hoover Institution, or a board of distinguished scholars selected by Donald Kennedy burning the Political Science Department at the stake, but let us acknowledge the potential danger of which he warns.

Prof. Juilland's petition, however, in the name of protecting academic freedom would shut down free and open discussion of Hoover. Why? Because the debate *might* get out of hand. This does not give the Stanford community much credit for being able to conduct discussion responsibly, but it is also a rather strange definition of academic freedom.

We think academic freedom means not the avoidance of tough questions but their responsible pursuit through reasoned discourse. Isn't the University committed to the responsible exploration of *all* questions? We believe it is, therefore fears of a possible witch hunt are outweighed in favor of responsible academic discussion.

Prof. Juilland also objects that this is a liberal witch hunt. Notice first how this contention shifts attention away from Hoover to the motives of those who signed the petition. We do not have to concern ourselves with the validity of the question, it is enough to know or be suspicious of the motives of the questioner.

This problem aside, let us, merely for the sake of argument, grant Prof. Juilland's point. Are liberals then to be prevented from asking questions simply because their motives are suspect? Are liberals to be intimidated by the term "witch hunt" and let Hoover do whatever it pleases—no questions asked?

Even if every signature on the petition were liberal, would this negate the validity of the questions that have been asked about Hoover's political activities? Might not such a position in the name of defending academic freedom destroy it? Such a position seems to state that certain questions cannot be asked because the motives behind them may be political. And such a position logically leaves Hoover free to do whatever it wants politically, to receive as much money as it and the Board of Trustees decide is appropriate, and to use its resources to pursue its objectives—all with the aid of Stanford, and with no questions asked.

What, then, are we to do? Liberals are especially sensitive to questions of academic freedom because they have often been on the receiving end in the past. Yet it would be no less a travesty of liberal values to cower from a debate over controversial questions for fear of being called a name than to engage in a witch hunt itself.

Any university worth its salt must be a place where questions are asked—responsibly and openly and freely. Certainly conservatives and liberals must agree on this if nothing else.

And, if we agree, we must reject Prof. Juilland's position as a confusion of academic freedom with academic license. With people like Prof. Juilland around to uphold the fairness of public debate we see no reason why that debate, far from endangering the University, might not demonstrate the University's highest principles in action.

Campbell welcomes Kennedy statement on petitions

In answer to several press inquiries concerning President Kennedy's comments on the Hoover petitions, Dr. W. Glenn Campbell, director of the Hoover Institution, Thursday, May 19, issued the following statement:

I welcome President Kennedy's statement on the Hoover Institution petitions, particularly his emphasis that the discussion "will be forward-looking and productive, and concentrate upon how the Hoover Institution and Stanford can improve upon a relationship that has been increasingly valuable to both."

Likewise, I strongly share his view that the various political charges that the petitioners, virtually all of whom still remain anonymous, have hurled at the Hoover Institution and its distinguished scholars can only turn into a discussion that is unnecessarily strident on both sides.

I am confident that in the discussion of governance, President Kennedy will inform the Academic Senate, and the Stanford community in general, of the many binding resolutions and agreements that have been entered into by the Stanford Board of Trustees, the Hoover family, and the Hoover Institution Board of Overseers, which have been scrupulously followed during the years that I have been director of the Hoover Institution. This includes the appointment procedures that have been worked out over the years between the president of the University and the director of the Hoover Institution based on the above resolutions and agreements.

Hoover/ continued from page 1

"In light of the misinformation that has been circulated regarding the public release of the names of the faculty signers we feel compelled to explain the procedures that were followed in gathering and releasing the names," Manley and Rebholz said.

"When individual faculty members were asked to sign the petition they were being asked to endorse Faculty Senate discussion of a resolution calling on the Board of Trustees to initiate an inquiry into the relationship between the Hoover Institution and Stanford University.

"They were not asked for their permission to have their names made public, and the academic secretary, with the concurrence of the organizers of the petition drive, decided against releasing the names to the press. The organizers of the petition drive judged the initial petition to be an in-house document to the Senate, not a public statement.

"In the interest of open public discussion, signers were then asked if they had any objection to having their names made public, and they were given until May 16 to reply. This procedure was taken because of the aforementioned failure to get permission to declare the names when the petitions were first circulated, and to give signers a chance to decide explicitly whether or not they wanted their names released.

"In retrospect, it was good that this procedure was followed, because of the 84 signers, eight elected not to have their names made public.

We cannot, of course, speculate on the reasons why 76 faculty members allowed their names to be made public, any more than we can explain why eight did not, but it should be emphasized that this list does not represent a list of 'accusers' of Hoover.

"All that the signers agreed to was the proposition that the Senate should debate the resolution. No valid inferences can be made about the beliefs and views of the signers beyond that."

Juilland: Hoover accusers never missed a chance to politicize campus life

continued from page 1

Juilland said, "Hoover's accused of politicizing the life of the University. The accusations come from the most political people on campus, who never missed a single opportunity to politicize academic life.

"These are the people who 15 years ago tried to rewrite academic programs and requirements along political lines in the name of relevance, of reconstituting the University. They flooded departments with political motions. . . .

"It's a classic case of the pot calling the kettle black."

In a written statement, Manley and Rebholz charged that Juilland's petition "in the name of protecting academic freedom would shut down free and open discussion of Hoover." It is "a confusion of academic freedom with academic license."

"What we are saying," Juilland replied, "is ask any questions you want, but don't ask them in a discriminatory fashion. Do not single out conservative programs for this kind of inquiry. Liberal programs also qualify."

Stanford has made different institutes, centers, and programs, and those with a perceptive bias are "pervasively liberal" except for Hoover, he said. To focus on the one conservative institution "blows my mind."

He accused Rebholz and Manley of being "champions of intolerance and conformity. . .before going to the barricades, they should have given some evidence they used channels" to obtain information about appointments and governance.

To look at the governance of Hoover now "seems discriminatory, particularly in the politically charged climate caused by the accusations," Juilland added. "If they want to investigate Hoover, then they should also investigate Department 'X' which shows prima facie liberal bias."

If the Faculty Senate does not table the petition or defeat it, it would be best to pass a substitute motion asking University President Donald Kennedy to look into the problem within the context of existing agreements and then make a report, Juilland said.

Among the Senate's 53 elected representatives, Rebholz and three others—Anne K. Mellor, English; Leon T. Rosenberg, medical microbiology; and Bernard Roth, mechanical engineering—signed the original petition.

Three Senate members signed the counter-petition: James M. Gere, civil engineering; Gerald Gillespie, German; and W.H. Northway, radiology and pediatrics. Juilland plans to attend the Senate meeting as an observer.

Juilland met with President Donald Kennedy Tuesday afternoon and gave him a list of faculty who had signed the petition to that time. He described their discussion as "cordial and fruitful."

Those signing the counter-petition were:

Andreas Acrivos, professor of chemical engineering; George Albright, associate professor of anesthesia; Malcolm Anderson, assistant professor of radiology; James Angell, professor of electrical engineering; Bert Auld, professor (research) of applied physics; Khalid Aziz, professor of petroleum engineering; Peter Banks, professor of electrical engineering; Jack Barchas, professor of history; William Bark, professor of history; Klaus Bensch, professor of pathology; Joseph Berger, professor of sociology; Douglas Bernheim, assistant professor of economics; Norman Blank, professor of radiology; Elliott Bloom, professor at SLAC; Frederick Bowser, associate professor of history;

Ronald Bracewell, professor of electrical engineering; Douglas Breeden, associate professor of business; Arthur Bryson, Pigott professor of aero/astro, mechanical engineering; Alan Campbell, professor of biological science; Charles Carrington, associate professor of pathology; Robert Cannon, Powell professor of aero/astro; Robert Chase, professor of surgery; Robert Cohn, professor of French; Roy Cohn, professor of surgery; Wendell Cole, professor of drama; James Collman, Daubert professor of chemistry; Thomas Cover, professor of electrical engineering, statistics; Aldo Da Rosa, professor of electrical engineering; Robert Davis, Kresge professor of business; Daniel DeBra, professor of aero/astro, mechanical engineering;

Carl Djerassi, professor of chemistry; Richard Eastman, professor of chemistry; Joseph Eliason, assistant professor of surgery, opthalmology; Lorne Eltherington, associate professor of anesthesia; Dieter Enzman, assistant professor of radiology; Von Eshleman, professor of electrical engineering; William Evitt, professor of geology; John Farquhar, professor of medicine; Willard Fee Jr., associate professor of surgery; Thomas Feeley, associate professor of anesthesia; Michael Flynn, professor of electrical engineering; John Fondahl, Leavell professor of civil engineering; George Foster, associate professor of business; Robert Fowles, assistant professor of cardiology; Joseph Franzini, professor of civil engineering;

Gerald Fuller, assistant professor of chemical engineering; James Gere, professor of civil engineering; Gerald Gillespie, professor of German, comparative literature; David Goodwin, associate professor of radiology; Roger Gray, Holbrook professor, Food Research; Richard Gross, professor of education; Carl Grumet, associate professor of medicine; Robert Hall, professor of economics; Paul Hanna, professor of education; John Harbaugh, professor of earth sciences; Donald Harrison, Irwin professor of cardiology; Walter Harrison, professor of applied physics; Warren Hausman, professor of industrial engineering; Leroy Heinrichs, professor of gynecology and obstetrics; Ronald Hilton, professor of Spanish and Portuguese;

Leo Hollister, professor of medicine; Robert Horn, professor of political science; Ronald Howard, professor of industrial engineering; Grant Ireson, professor of industrial engineering; Richard Jahns, L'Anphere professor of geology; James Johnston, professor of mechanical engineering; Alphonse Juilland, Bonsall professor of French and Italian; John Kaplan, Reynolds professor of law; Robert Kessler, associate professor of surgery; Steven Kline, professor of mechanical engineering; Robert Kovach, professor of geophysics; Konrad Krauskopf, professor of geology; Joseph Kriss, professor of radiology; John LaPlante, assistant professor of art; Louis London, professor of mechanical engineering;

Richard Mamelok, assistant professor of pharmacology; Tag Mansour, Baxter professor of pharmacology; John McCarthy, professor of computer science; James McClenahan, assistant professor of medicine; Walter Meyerhof, professor of physics; Craig Miller, associate professor of surgery; John Miller, professor of pediatrics; Katharina Mommsen, professor of German studies; Harry Mosher, professor of chemistry; Richard Muth, professor economics; William Nix, professor of materials science; William Northway, professor of radiology, pediatrics; Bruce Parker, professor of radiology; Elisabeth Pate-Cornell, assistant professor of industrial engineering; Robert Pecora, professor of chemistry;

Mitchell Polinsky, professor of law; Antony Raubitschek, professor of classics; William Reynolds, professor of mechanical engineering; James Rosse, professor of economics; Eugene Sandberg, associate professor of gynecology and obstetrics; Kenneth Scott, professor of law; William Shockley, professor of electrical engineering; John Shyne, professor of materials science; Oleg Sherby, professor of materials science; Douglas Skoog, professor of chemistry; Norman Sleep, associate professor of geophysics; William Spicer, Ascherman professor of electrical engineering; Lewis Spitz, Kenan professor of history; V. Srinivan, professor of business; Patrick Suppes, Stern professor of philosophy;

Michael Taksar, assistant professor of engineering; John Troxell, professor of business; Leonard Tyler, professor of electrical engineering; Tjeerd VanAndel, professor of geology; Joseph VanCampen, professor of Slavic; Kenneth Vosti, professor of medicine; Robert Ward, professor of political science; Roger Warnke, professor of pathology; Paul White, assistant professor of anesthesia; Charles Williams, associate professor of electrical engineering; Howard Williams, Lillick professor of law.

Claude Buss, professor of history; Edward Feigenbaum, professor of computer science; Jean Mayer, professor of aero-astro; Richard Popp, professor of medicine; Bruce Ransom, assistant professor of medicine; Saul Rosenberg, professor of medicine; John Schroeder, associate professor of medicine; F.B. Simmons, professor of surgery; Pamela, Strathairn, associate professor, athletics, physical education and recreation; Arthur Veinott Jr., professor of operations research; Steven Wheelwright, associate professor of business.

Hoover's visiting scholars to include Joseph Pechman, of Brookings

Twenty-one visiting scholars are among those expected to do research at the Hoover Institution, Stanford University, during the academic year 1983-84, according to Institution Director W. Glenn Campbell.

The domestic and foreign scholars will pursue a wide variety of research projects during their visits which vary in length from weeks and months to a full academic year.

Joseph A. Pechman, director of the Economic Studies Program at the Brookings Institution, will study the operation and effects of the U.S. tax system.

James B. Ramsey, professor and chairman of the Economics Department of New York University, plans to examine the policy perspectives and prospects of long-run supply and demand responses to OPEC pricing activities.

Richard N. Rosett, former dean of the University of Chicago's Graduate School of Business, will write a series of essays on U.S. foreign policy.

Staffan Linder, former Swedish Minister of Trade, will study the Swedish welfare state.

Ira Lapidus, professor of history at UC-Berkeley, plans a study of the role of Islam in the national development of Muslim countries.

Joseph Stiglitz, professor of economics at Princeton University, will spend his time at the Hoover Institution analyzing the problems of imperfect information as it relates to the field of microeconomics in its role as the foundation for macroeconomics.

Wang Bingzhange, of the Clinical Research Institute of Montreal, will continue a manuscript about current conditions inside Communist China.

John Blakeway, former British consul general of Istanbul, plans a research project entitled "Communism in the Churches."

Aurel Braun, an associate professor in the Department of Political Economy at Erindale College at the University of Toronto, plans to complete a study of the Warsaw Pact.

Peter Chelkowksi, professor of Near Eastern Studies at New York University, will study the Shiites and Iran.

Chi-Nung Chen from the Institute of World History, Chinese Academy of Social Sciences, Beijing, China, to research Japanese Imperialism in China between the Sino-Japanese wars.

Donald Gillin, from Vassar College, will supplement his research on the conflict between the Chinese Communists and Nationalists in the late 1940s.

Marcellus Snow, a professor of economics at the University of Hawaii at Manoa, plans a research project on telecommunications and media policy in the U.S. and the Federal Republic of Germany.

Rett Ludwikowski, political science scholar at Jagiellonian University in Krakow until his defection from Poland to the U.S. in 1982, will complete a manuscript entitled "Will the Crises of Communism Begin in Poland?"

A. Shtromas, from the Department of Political and Contemporary History at the University of Salford, England, will study continuity and change in Soviet Politics after Brezhnev.

Douglas Rimmer, from the University of Birmingham, will write "An Economic History of Africa Since 1945."

Sammy Smooha, political science professor from the University of Haifa, Israel, will write a manuscript entitled, "Ruling with Dissent: Arab-Jewish Relations in Israel."

Anthony Kirk-Greene of St. Antony's College of Oxford University, will study the history of the British Colonial Service in Africa.

Nora Beloff, Soviet and East European expert from London, plans to write a manuscript entitled "Yugoslavia: The Making of a Myth."

Keith Middlemas, reader in history at the University of Sussex, Brighton, England, will study politics in industrial society.

CIS talk...

continued from page 1

Defense Department's Advanced Research Projects Agency has "always been a pusher of new concepts."

But ARPA's time-sharing system "sat on the shelf for a decade" before being commercialized. Packet switching, still in its commercial infancy, is now being "picked up by the Europeans," he added.

Japan's widely heralded "Fifth Generation" computer stems from an ARPA project at Stanford, Carnegie Mellon, and MIT, he added. "It's been sitting around almost five years, and nobody picked it up" until the Japanese made it their number one research and development project for the next decade.

"They're now spending a half billion dollars over the next five years to capture 40 percent of the world market in information systems."

Why not the U.S.? "We have a queer process. I was part of it for 23 years," DeLauer said. In industry, "we make a forecast, look at the market, figure how much the investment's going to be, discount the cash flow, and if it doesn't match interest rates or what you can do with something else, forget it.

"That's terrific for Wall Street but not very good for getting long-range risky projects into being. . . .

"That's the reason we're so gung ho about the Center for Integrated Systems. It's the first time when we really have a partnership."

Speaking extemporaneously, he said that in seeking company support "if they didn't enjoy (supporting CIS), they were afraid of being left out. . . .

"The real heart of this thing (CIS) is that it is an educational institution. We want graduate students to work for us" in industry. DeLauer recalled telling companies "if you don't get two or three people from that university down to Dallas. . . " drawing a big laugh from hundreds of Stanford professors, students, and Silicon Valley executives in his audience.

"There's no question education is critical. That's the heart of why we want to do this," he added. Besides 19 corporate sponsors, 60 faculty are affiliated with CIS. Where the center initially projected 100 master's degree students and 30 Ph.D.'s might conduct their research as part of its programs, 462 graduate students already are involved.

"We're way ahead of schedule. That's very gratifying," DeLauer said.

While the Defense Department is the "daddy rabbit" of research, he said, rapid technology transfer is vital. "The basis for our security has to be our economy, the well-being of the society.

"There's no question technology has to be at the forefront of our security." English military theorists have shown that success in warfare is linear in relation to capability and numbers of people, but quadratic with weaponry.

"We'll never outnumber our opposition,' he said. "That means that if they have double our numbers, we have to be four times as good in the effectiveness of our equipment.

"We have a tremendous opportunity with microelectronics and computers to make that four-fold difference that is absolutely necessary," he added. The Defense Department represents only eight percent of U.S. manufacturing capability and only three percent in electronics, "so nowhere can you look to the Defense Department for the well-being of these two sectors." But it can help provide the "leading edge" through research.

During the past five years, the Defense Department spent about a half billion dollars on very high speed integrated circuits. While this has involved some industry-university collaboration, Stanford "stayed on the fringes" because of Congressional restrictions on involvement of foreign nationals. Now this research is far enough along to try putting it in the industry sector.

Teacher training scholarships offered

The nation's schools now have over 274,000 computers, but few teachers trained to use them. To help educators learn how to use computers in their schools, over $40,000 has been donated to a scholarship fund by the Luke B. Hancock Foundation, Raychem Corporation, IBM, and the David & Lucile Packard Foundation.

The scholarships will be awarded to teachers and administrators interested in attending the Stanford Institute on Microcomputers in Education. The Institute is cosponsored by Interactive Sciences, a nonprofit research group, and the Stanford University School of Education.

The funds are especially targeted for those who teach subjects other than math or science.

"Often, computers end up in the math department," says Jeff Levinsky, codirector of the Institute. "But math and science teachers are already in critically short supply. They can't be spared to take on new duties."

Computers have many exciting uses in other areas in the school, Levinsky states. "But once they start in the math department, it's hard to get them out. Therefore it's important for other teachers to learn about the new technology."

The intensive five-week Institute enables educators to serve as resource persons for their school and district. In addition to extensive hands-on learning in small groups, participants will tour Bay Area computer sites and see demonstrations of advanced computer products. Industry leaders, including IBM, Apple, Radio Shack, and Atari are supporting the Institute with equipment and software.

The scholarships funds are primarily for California public school educators, and especially for those from districts serving low-income or minority students. The scholarships will be awarded as requests are received, so early application is advised.

Further information on the scholarships and the Institute, which starts June 27, may be obtained from the Stanford Institute on Microcomputers in Education at (415) 497-9788 or (415) 497-2102.

Organizations or individuals wishing to add to the scholarship fund or to donate equipment should contact the Institute.

Memorial Day recreation schedule given

The following recreational facilities will be open on Memorial Day—Monday, May 30:

Encina lockers and showers, 9 a.m.-6 p.m.; Roble complex (except pool), noon to 5 p.m.; Encina weight room, noon to 5:30 p.m.; deGuerre Pools, 1-5 p.m.; deGuerre Courts, 11 a.m.-11 p.m.; Angell Field, Olympic Gamefield, Perrier Parcourse, open daylight hours; Tennis courts, sign up as usual; Tresidder Recreation Center, regular hours; Golf course driving range, 7 a.m. to one hour before dark.

CLOSED: Football practice fields, Maloney Fields I and II, Maples Pavilion, Roble Pool, and the Golf Course.

Urban design critic to talk

Gray Brechin, urban design critic, author, and architectural historian, will speak on "The Champs-Elysees That Never Made It" at 8:15 p.m. Thursday, June 2, in Annenberg Auditorium.

His lecture is the last in a series on San Francisco architecture sponsored by the Committee for Art at Stanford. Outstanding critics and writers have explored the changing face of San Francisco architecture and its impact on the spirit of the city and the lives of its citizens.

Admission is $4 for the general public, $1 for students.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

33617-VW (JCC:1988) UNIV MANAGER IV: Dir of Div of Lab Animal Med; As Asst Dean, the Dir will be reponsible for all admin & operational matters pertaining to housing & care of lab animals; serv on Admin Panel for Lab Animal Med; represent the Div to the public & scientific community regarding the care & use of animals in research; welcomes nominations of women & minority group members & applications fr them; QUALIFICATIONS: must have a D.V.M. & Board Certified in Lab Animal Med; must demonstrate significant past exp in mgmt of a similar animal research unit.; C10; $3494-4255.

33006-JB (JCC:2038) ADMIN SERVICES MGR II: Business Mgr/Analyst combines analytical & evaluative work w/ fiscal mgmt & facilities maintenance; respon for provision of analytical & admin support services, sys, & facilities to ten service cost ctrs; purchasing, estimating & pricing, billing, mgmt of automated business & production sys, budget admin, payroll & personnel admin, capital eqpt mgmt, bldg inventory & maintenance, analytical support to line mgrs, liaison w/ other Univ admin units; clerical support; QUALIFICATIONS: requires strong analytical & organizational abilities; working knowl in acctg, info sys, data processing, business mgmt, oral & written commu, quantitative methods & organizational behavior; MBA & several yrs of exp or equiv; demonstrated excel supervisorial skills; ability to delegate; ability to manage complex financial sys efficiently; knowl of Univ policies & procedures.; C07; $2113-2724.

29478-PM (JCC:2070) ADMIN ASST II: Direct liaison w/ MBA student organizations, meeting periodically w/ the groups or w/ their chairpersons; initiating designated student support activities, & assisting the student organizations in meeting their goals; principle assistant to Dir of MBA Program; recording sec to MBA Academic Coordinating Committee; participates in an active student counseling process, assisting students w/ both academic & personal problem-solving; coord specific on-going or periodic activities w/in the Program; supv a sec'l assistant; QUALIFICATIONS: strong interpersonal skills; strong commu skills; ability to develop & write effective rprts containing complex data; ability to work w/ a diverse student & faculty in a stressful environ; ability to understand & interpret GSB Faculty's policies regarding the academic programs; send appl/resume to Gary Williams, GSB 130.; C05; $1670-2086.

20174-JB (JCC:2120) ACCOUNTANT I: Control, submit, & correct batches of student financial documents; order & distribute computer-generated rprts; post & balance the Tuition Register; prep journal entries to distribute tuition & fee income; reconcile selected genl ledger accts; reconcile Tuition Register w/ other subsidiary ledgers; disburse funds to student organizations & health insurance carrier; asst w/ Univ registration process, etc; QUALIFICATIONS: Bachelor's degree in acctg or equiv acctg exp; able to work independently & apply sound acctg principles in resolving complicated transactions; strong analytical & problem solving skills; good organization skills & neatness required; extremely accurate in preparing & maintaining financial records; excel oral & interpersonal skills; use of 10 key by touch; computerized acctg sys desirable.; C05; $1670-2086.

27182-LL (JCC:5588) LIFE SCI RES ASST I: Asst in developing new analytical procedures for measuring drug concentrations in biological fluids & tissues; preparing samples for analysis by automated HPLC apparatus; performing analyses of drugs by gas & high pressure liquid chromatography; carrying out routine maintenance on these instruments; tabulating & aiding w/ data analysis; ordering & maintaining records of supplies, samples & consumables used in the lab; QUALIFICATIONS: BS in chemistry, biology or related subj or equiv exp; prev exp in a chemistry lab desirable.; C05; $1670-2086.

32949-TC (JCC:6826) SOC SCI RES ASST III: 50%; participate in an American Cancer Society research proj to develop methods for identification of cancer patients who need assistance in coping & to develop methods of intervention to assist these patients; conducting in-depth explorator intake interviews of cancer patients using therapeutic interaction skills & maintaining a close clinical association w/ patients; recording of responses; collection of data; developing & teaching mini-courses; QUALIFICATIONS: requires a social serv bkground to perform res in a clinical setting, sensitivity to psycho-social needs, especially those of cancer patients; exercise initiative & theoretical judgment in solving problems & making decisions; interviewing skills that are therapeutic; skill in grief counseling & exp w/ patient problems inherent in those w/ life-threatening illness; skill in commu w/ physicians.; C05; $835-1043.

33835-DS (JCC:2270) FIN/MGMT ANALYST III: Investment Financial Analyst to work in Treasurer's Office, as part of the professional investment staff; will be given projs of an investment analysis & financial evaluation nature, incl the review & recommending of action on investment of funds; work w/ Datapoint computer sys, doing investment performance computations & developing a monitoring sys for Univ's separate funds; spec projs will incl evaluation of different investment strategies & alternatives, incl review of proposals fr outside sources & determination of approp asset mix & specific securities holdings for specific funds; QUALIFICATIONS: MBA emphasis on Finance & Investments; computer exp, especially rate of return computations.; C08; $2464-3139.

Bargaining Unit

32388-TC (JCC:5638) LIFE SCI TECH I: TMS Unit; 8-5 & able to work late on occasion & on some wkends or holidays to complete experiments; work on proj in nucleic acid enzymology research; respon for prep of buffers & reagents; use of radioisotopes; lib searches; numeric & graphic data analysis; QUALIFICATIONS: college level course work in biology & chemistry; prev exposure to & ability to follow protocols in enzyme purification & assays, DNA isolation, column & thin-layer chromatography, gel electrophoresis, immunoglobulin purification & assay.; A18; $ 7.50.

Nonexempt

31169-PM (JCC:1747) LIBRARY SPEC I: Perform duties in Gov't Documents Dept, Federal Division; typ monograph & serials cards, ltrs, minutes, binding tickets, manuals & any lists/guidelines needed by the librarian & specialist; carries out claiming proj or other related info for missing periodicals; files cards & other misc filing tasks; processes requests & orders, etc; QUALIFICATIONS: typ 50; require demonstrated clerical & organizational skills; atten to details; knowl of basic lib operations & ability to compose simple business ltrs desirable; contact: Bob Johnson, Green Library, Room 223 (497-3152).; B10; $595-623.

33734-BP (JCC:2454) OFFICE ASST II: Answer phones; receive Ctr visitors; sort & deliver E-mail; organize bulletin board mat[illegible]e postage meter; order supplies; update [illegible]ailing list & asst w/ large mailings; provide support to other offc secretaries, etc; QUALIFICATIONS: typ 40; excel phone answering skills, as well as interpersonal skills; atten to detail; ability to work under pressure at times; send appl/resu to Estela Estrada, CROW, Room 30, Chemistry Bldg, Stanford, 497-1994.; B09; $1130-1189.

43552-BP (JCC:2462) OFFICE ASST III: Assistant to Dept Administrator; some checking & adjusting of dept accts requiring basic reconciliation & control; occasional sec'l assistance for dept chairman & professors; typing reports; responses to routine requests, reqs & other forms; maintaining inventory of dept offc supplies, petty cash, mailing lists, dept publications, directories; conference room & audio visual eqpt scheduling; acting as receptionist, genl reference source & problem solver for dept & mail distributor; QUALIFICATIONS: typ 50; 2-3 yrs exp (w/ some acctg duties) preferred; exp in setting prior; command of English (grammar & spelling); good interpersonal skills for interaction w/ faculty, visitors, students & staff; well organized but flexible w/ pleasant personality; send appl/resume to J. Ph.D. oral exams

FRIDAY, MAY 27

Irina Reyfman, Slavic languages and literatures, "V. K. Trediakovskii: Hero of the Myth of the 'New Russian Literature,' " 2:15 p.m., Room 279, Bldg. 260.

MONDAY, MAY 30

John Thomas Clark, physiology, "Monoaminergic Modulation of Copulation in Male Rats," 12 noon, Physiology Library.

TUESDAY, MAY 31

Auguste Claude Boissonnade, civil engineering, 2:15 p.m., Terman Bldg., Room 251. **Bruce Carl Fuller,** education and sociology, "The Organizational Construction of Intrinsic Motivation: Staff Views Within an Employment Program Bureaucracy," 2:15 p.m., 204 CERAS. **Andrea Klimt,** anthropology, 9 a.m., 111-J. **Robert C. Kunath,** history, "Cultured Politics in Germany, 1914-1933," 1:15 p.m., Room 124. **Reid Maki,** history, "Local Study During the Depression," 2 p.m., History Corner, Bldg. 200, Room 307. **James W. Mehring,** electrical engineering, "The Satellite Applications of Amplitude Companded Single Sideband Modulation," 4 p.m., Durand 301.

Murray R. Metcalfe, engineering-economic systems, "The Adoption of Innovation in Systems of Interconnected Technologies," 2:15 p.m., Terman 217. **Frank J. Murray, Jr.,** English, "British and American Fiction and Drama, 1890-1980," 2:15 p.m., Bldg. 40-41F. **Nelson H. Oliver,** chemistry, "Rotational Motion of Small Rodlike Probes in Hindering Environments, as Probed by Fabry-Perot Interferometry," 2:15 p.m., Chemistry Gazebo. **Craig Edward Richards,** education, "Race and Educational Employment," 2:15 p.m., e114 Education Bldg. (Cubberley). **Neil Rowe,** computer science, "A Rule-Based Expert System for Top-Down Estimation of Statistics on a Database," 2:15 p.m, Jacks 146. **Robert John Tibshirani,** statistics, 2:15 p.m., s120.

WEDNESDAY, JUNE 1

Jean Davison, education, "Lifelong Education in the Lives of Kenyan Women," 2:15 p.m., e114 Education Bldg. (Cubberley). **Philip R. Fletcher,** education, "Mass Education as a State Agency of Legitimation in Brazil," 9 a.m., 204 CERAS. **Ji Soo Kim,** graduate special, "Post-Graduate Science and Technology Education in Korea," 2:45 p.m., ERL Room 232. **Timothy Jack Ross,** civil engineering, "Direct Shear Failure in Reinforced Concrete Beams Under Impulsive Loading," 3:15 p.m., Terman 251. **Jack Wright,** psychology, "The Structure and Perception of Behavioral Consistency," 2:15 p.m., 358 Jordan Hall. **Aaron A. Zick,** chemical engineering, "Fluid Mechanics," 4:15 p.m., Chemical Engineering Conference Room.

THURSDAY, JUNE 2

Kenneth N. Allen, history, "19th and 20th Century Germany," 2 p.m., Bldg. 200, Room 124. **Conrad Crane,** history, "U.S. Strategic Bombing, 1919-1945," Bldg. 200, Room 307. **Jeffrey Russell Koseff,** civil engineering and mechanical engineering, "Momentum Transfer in a Complex Recirculating Flow," 10 a.m., Terman M-33. **Elizabeth Forrester McCord,** chemistry, "CIDNP Studies of Amino Acids, Polypeptides, and Nucleic Acids," 2:15 p.m., Chemistry Gazebo.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, May 31 in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Those mouth-watering meals that are served at the International Center's luncheon events are cooked right in the I-Center's kitchen—by volunteers. These members of the Stanford Mothers' Club were there last Thursday, preparing one of those lunches that has the I-Center staff hoping there are going to be leftovers for them. Left to right, they are Liz Watkins, Mid Schubert, Norma Pollock, and Myrtle Harris. The I-Center's volunteers make it one of the liveliest places on campus.

Gwyn Dukes...

continued from page 13

counselor who knows community resources, Siegel can be helpful in a variety of situations. A professional staff member of the Cowell Student Health Center, she has for 12 years provided liaison between the International Center and the medical and psychological resources on campus and in the community.

Like others on the I-Center staff, Dukes enjoys getting out of the U.S. occasionally. Her last trip took her to Japan several years ago, where she visited several of the families she met through her work at Stanford.

"I realized the great value placed on sensitivity to another person's feelings and situation," she relates.

"I was struck by how, if a society values something, it really pulls that quality out in people. To experience that thoughtfulness, their help, and their sensitivity was an overwhelming experience."

One of the rewards of working at the I-Center seems to be having someone to visit in almost any country one might go to. Many of the volunteers have the same experience.

"It's another example of the continuing contact," says Dukes. "Volunteers often become close friends or 'extended family' to the students they assist, and renew the contact when they travel abroad—meeting not only their former international student friends, but also their parents and relatives!

"There are even several babies around the world who have been named after their adopted American "grandfather" or "grandmother," and countless families whose friendship has continued for more than 10 or 20 years following their stay at Stanford."

How many volunteers help with Dukes' programs?

She begins enumerating them: a pool of 20 drivers; eight teachers and four substitutes in the English classes; about 120 volunteers for English-in-Action (informal conversation); three who teach cooking and one who teaches quilting; one coordinator and four leaders for the playgroups, and each playgroup has about eight American women who are partners with women from other countries. . . .

It seems that she's succeeding in her goal of spreading the benefits of the international visitors as far as possible.

CCIS...

continued from page 12

decorator donated her services to make the new center warm and homelike.

With the new space and an ever-increasing number of foreign students, programs at the I-Center have burgeoned.

Ken Cooper became the second director of the International Center in 1964; the current one, Lee Zeigler, took over in 1971.

By 1972 CCIS had grown so large that one chairman couldn't handle the work involved. The result was a classic Stanford solution—the council of presidents, now including those for business affairs (Ann Whitcomb), continuing programs (Lynn Phillips), and new student services (By Robinson).

Members of the organization come from all the towns around Stanford, with men playing an increasingly active part.

Stephen Bechtel made further gifts to the I-Center—first for enclosing the central courtyard, and then, with a contribution from the Lane family as well, for adding a new wing in 1978. As it is now, the old Zete house has completed its transformation into the perfect International Center.

CCIS will celebrate its 30th birthday on June 5 with champagne, music, and a host of distinguished guests. If one asks just how many members participate in I-Center programs, no one seems to know exactly—it's somewhere between two and three hundred.

"They're militantly nonfundraising," says Zeigler. "They have annual membership dues, and on that they manage to pay their bills. They want *people*, they want *involvement*.

"Volunteers come to the I-Center thinking that they want to give something," he continues. "They end up saying, 'Gosh, I learned so much more than I gave!' "

In this unique marriage between a University organization and a volunteer group, it's the service that means the most. As any I-Center staff member will verify, there wouldn't be much action there without the CCIS.

Information for this short history was found in several issues of the CCIS newsletter, Communique. *For more information about CCIS, call 326-5252.*

The I-Center's coffee hours for wives includes many toddlers like this one.

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

I-Center's final spring film show features stories of French families

French families will be highlighted in two films, "Faces of Man; Faces of France" and "Two French Families,"to be shown at 7:30 p.m. Thursday, May 26, as the last in the International Center's Other Cultures series for spring quarter.

"Faces of Man; Faces of France" visits five families in France—each in a different region and each with a distinct mode of living. All are deeply attached to their land and to their unique way of life, as the French people have been for centuries. The different regions shown in this film are: Brittany, Marseilles, the Alps, the valley of the Loire River, and Paris.

"Two French Families," a half-hour film, takes a look at the lifestyles of a traditional large farming family in western France and a young urban couple with one child in Paris. The film is narrated by Dr. Lawrence Wylie, a Harvard anthropologist and author of numerous works on France.

It shows that despite growing differences in their life styles, French families whether traditional or modern, remain strongly attached to the same basic principles. The film attempts to provide a deeper insight into this time-honored institution and the significance it has in French national life.

The films are free, though a donation of 75 cents is requested to defray costs of the films.

Help on relations with aging mothers

The Stanford Help Center will present a workshop on "You and Your Aging Mother" from noon to 1:30 p.m. Wednesday, June 1, in the Tresidder Union small lounge, Room 282.

The workshop will be presented by Andrew Scharlach, licensed clinical social worker and Stanford Ph.D. candidate in psychology.

Issues to be addressed include understanding your aging mother, community resources for the elderly, the strain of being a "woman in the middle," and how to improve filial relationships.

To reserve a place in the workshop call 497-4577 by Tuesday, May 31.

The Help Center is an employee benefit program open to Stanford University Children's Hospital, Medical Center, and SLAC employees and their immediate families. All workshops, seminars, support groups, lectures, and counseling sessions are free.

Summer Sports Camp expands a bit

The annual Stanford Summer Sports Camp, to be held June 20 through July 14 at the Roble Gym complex, has added an afternoon session for children who want a full day or just an afternoon's activity.

The campers, aged 7 to 12, will participate in badminton, basketball, bowling, dance, field hockey, fitness and exercise, football, frisbee, golf, New Games, softball, soccer, tennis, track and field, swimming, racquetball, and more.

They'll have access to Roble and deGuerre pools and raquetball courts, the Encina Weight Room, and Roble tennis courts.

Most of all, the camp will provide lots of fun and excitement for the children enrolled, with a staff assembled from the Stanford Varsity and Club sports coaches and the Stanford Teacher Education Program.

The morning session from 8 a.m. to noon and the afternoon session from 1-5 p.m. (including a supervised brown-bag lunch hour for full-day campers) Monday through Thursday provides a wide range of options.

For information, prices, and registration, call Shirley Schoof at 497-3089 or Bob Garcia, 497-2103.

Hollander gives piano concert June 4

Lorin Hollander, concert pianist, will give an informal performance at 2:30 p.m., Saturday, June 4, in Dinkelspiel Auditorium at Stanford.

The performance will be geared to families with children and will include discussion of pieces and questions from the audience.

Hollander made his Carnegie Hall debut at age 11. Since that time he has played with virtually every major symphony orchestra in the world and has given recitals in most of the world's music capitals and major universities. He appears regularly on national TV and radio and performed in the sound track of the film "Sophie's Choice."

Additionally, he is committed to activities outside the traditional concert hall setting. These include: lectures, recitals, teaching, workshops, and seminars on creativity and consciousness.

This performance is sponsored by the Alumni Association of the Stanford University School of Medicine in cooperation with the Community Outreach Program of the Lively Arts at Stanford. On the morning of June 4, Hollander will be a speaker at the Medical Center in a symposium on Early Experience and Creativity.

Admission to the afternoon performance is free and open to the public. In particular, families with children are encouraged to come.

Housing. . .

□ **June 15 to July 30:** PARIS. Apt, 1BR, furn. W/D, DW. 16th Arrondisment. Wish to EXCHANGE for similar accommodation nr Stanf. Call 497-3555, day.

Stanford strengthen's arms control efforts with foundations' support

Stanford has established a new Center for International Security and Arms control to strengthen teaching, faculty research, and public outreach in these fields.

Already regarded as one of the nation's top three centers for arms control education and research, Stanford has attracted support from the Ford Foundation, the Hewlett Foundation, the Weingart Foundation, the Columbia Foundation, and anonymous private donors for the new center.

It succeeds the Arms Control and Disarmament Program, established in 1970. John W. Lewis, the William Haas professor of Chinese politics, will continue as director.

The basic undergraduate course sequence, offered through the Department of Political Science, will be expanded to three quarters from two.

The number of scholars involved in the Center's programs will increase from 18 to 42, drawn from the Schools of Humanities and Sciences, Law, Business, Medicine, and Engineering, as well as the Stanford Linear Accelerator Center. They will be joined by scholars from a number of other institutions, both in the U.S. and abroad.

The Stanford program has long been unique in drawing support from such a wide variety of disciplines. Its basic textbook, *International Arms Control: Issues and Agreements* has been revised in a second edition nearing publication by Stanford University Press. A new film, "Confronting Catastrophe: Lessons for the Nuclear Age," taken at a Stanford alumni college in March, 1983, is ready for release.

Initially the Center will concentrate its resources in four areas:

* *Undergraduate education.* Beginning in academic year 1984-85, the Center will offer a three-quarter course sequence under the auspices of the Political Science Department on international security and arms control.

The fall quarter course will concentrate on contemporary international security issues, with special reference to the formation and conduct of American and Soviet national security policies.

During the winter quarter, students will study the negotiation, content, and significance of all major post-World War II nuclear and conventional arms control agreements.

The spring quarter course will be an advanced seminar/tutorial for highly motivated undergraduates. Additional undergraduate and graduate-level courses may be developed in future years.

* *Advanced training.* The Center will expand fellowship opportunities for graduate students and post-doctoral scholars, with special emphasis on the recruitment of qualified candidates from countries traditionally underrepresented in such competitions, such as East Asia. The Center will also encourage applications from candidates in the natural and physical sciences, in addition to such disciplines as Political Science and History. The competitions will be held annually.

* *Collaborative research.* A principal purpose of the new Center will be to encourage more collaborative faculty-level research on problems of arms control and international security.

Research projects will be both short-term (one year or less) and multi-year in duration. Each major study will result in the publication of a book or conference volume.

U.S.-Soviet arms control and disarmament efforts, American defense and military policies, and European and East Asian security and arms control concerns will constitute the substantive research agenda of the Center's staff and associates.

To advance the Center's work, Prof. Alexander George will be in residence on a half-time basis during the 1983-84 academic year. Prof. David Holloway, an internationally known Soviet specialist at the University of Edinburgh, will join the Center in August 1983 as a senior research associate and a member of several joint projects the Center will undertake with Soviet counterparts.

* *Public education.* The issues upon which the Center touches in its teaching and research efforts are of such great interest and importance to the American public that those associated with the Center are committed to a significant increase in public education and community outreach activities.

The Center will offer intensive summer workshops and weekend seminars for such specialized audiences as journalists, teachers, and Congressional staffs.

In addition, the Center plans to utilize the most effective tools of mass communication—television and radio—as well as the production technologies of videotape and film, to extend the knowledge and expertise housed within the Center past the boundaries of the University, to the Bay Area and beyond.

Associated with the Center are nearly 40 Stanford faculty members and research scholars, as well as arms control specialists and former government officials from outside the University.

Coit D. Blacker, senior research associate, is associate director of the Center and Condoleezza Rice, assistant professor of political science, serves as assistant director.

Additional information may be obtained by writing to: Center for International Security and Arms Control; 320 Galvez Street; Stanford University; Stanford, Calif. 94305; (415) 497-9625.

Summertime at the Music Department: concerts, workshops and lessons

Stanford's Department of Music will not take a vacation this summer.

Fourteen concerts are scheduled between June 18 and Aug. 10, including a Computer Music Festival July 14 in Frost Amphitheater. Music Department summer concert calendars will be available at Tresidder's Information Desk and from the Department of Music: 497-3811.

Barbara Allen will return to Stanford for the summer to teach class piano once again. The classes will run for eight weeks, June 21 to Aug. 11. Each class, limited to 10 students, meets once a week for two hours. Students are grouped according to ability and study technique, sight-reading, and repertoire. The classes are open to the community for $100, and free to Stanford students for one unit credit. Classes will be scheduled Tuesday, Wednesday, and Thursday from 3-5 p.m., 5-7 p.m., and 7-9 p.m.

Barbara Allen (left) and Eric Kujawsky (below)

New this summer is the University Summer Orchestra, to be conducted by doctoral candidate Eric Kujawsky. The orchestra will be open to all, and no auditions are required. It will meet from 7 to 9:30 p.m., Wednesdays throughout the summer session, ending with a concert Aug. 10. All interested musicians are invited to attend the first rehearsal on Wednesday, June 22, in Dinkelspiel Auditorium.

The orchestra's tentative program includes Rossini's overture to the opera *Semiramide*, Debussy's *Prelude to Afternoon of a Faun*, and *Symphony No. I* by Brahms. For more information about the orchestra, call Eric Kujawsky, 328-1543.

The Music Department also offers three special workshops this summer: *Baroque Music & Dance* (June 20-July 1) taught by Wendy Hilton, Virginia Hutchings, and Susan Bindig; *Clavichord & Fortepiano* (Aug. 1-12) with Joan Benson; and *Computer-Generated Music* (June 20-July 22). The computer workshop is already full, but applications are still being accepted for the other two, which may be taken on a credit or non-credit basis.

The Memorial Church Choir will be conducted by Prof. William Ramsey this summer. All are welcome. Rehearsals will be from 7 to 10 p.m., Thursdays, for Sunday morning services and a formal concert Sunday evening, July 31. All those interested should attend the first rehearsal June 23 in the choir room of Memorial Church.

For more information about these summer music activities, call the Department of Music, 497-3811.

Banjo Jubilee to benefit cancer research at Children's Hospital

The Peninsula Banjo Band will present the 11th annual Banjo Jubilee from noon to 6 p.m. Sunday, May 29, at the Marriott Hotel in Santa Clara—with all proceeds going for cancer research at Children's Hospital at Stanford.

Featured performer will be the nationally known "Banjo Prince," Scotty Plummer. Also appearing will be the talented and popular local artists Charlie Tagawa and Henry Clay Landram, along with a variety of bands and soloists from around the country.

Doors open at 11 a.m. with showtime at 12 noon. Admission is $5 for adults, $3 under age 17. The Band has provided Children's Hospital with more than $50,000 in the past 10 years.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., May 25, to cover the week of Mon., June 6, through Sun., June 12. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

TUESDAY, MAY 31

Center for East Asian Studies Film: "Rebuilding an Old Japanese House". This film records the delicate process of reassembling a traditional Japanese house which was shipped in pieces from Kyoto to the Children's Museum in Boston. The film-maker, Rachel Strickland, will be present to discuss the film. Noon. Room 102, Lou Henry Hoover Bldg.

Beyond War Film Series: "What About the Russians?", with talks by Paul C. Warnke and Admiral Gene La Rocque. Noon . GSB, room 82.

The Stefan Bergman Memorial Lectures on Mathematics: "Monodromy of Hypergeometric Functions," by Prof. G.D. Mostow, Yale University. 4:15 p.m. room 380-c, Math Corner.

Numerical Analysis Group: Special Lecture. 4:15 p.m. Margaret Jacks Hall, room 352.

Applied Mechanics Seminar: "A Perspective on Theoretical and Applied Computational Fluid Dynamics," with Dr. Paul Cutler, NASA, AMES. 4:15 p.m. Material Science Room 550a.

Condensed Matter Physics Seminar: "Synchrotron Radiation Lithography for Sub-Micron Circuits," by Warren Grobman, IBM Watson Research Center ,Yorktown Heights, New York. 4:15 p.m. Applied Physics 200.

WEDNESDAY, JUNE 1

Beyond War Film Series: "What About the Russians?" with talks by Paul C. Warnke and Admiral Gene La Rocque. Noon. Skilling Rm. 193.

Structural Biology Seminar: "Mechanisms of Control of Gap Junction Conductance in Early Embryos," by Dr. Andrew Harris, Biological Sciences at Stanford. Noon. Fairchild Bldg. , Room D102.

Stanford Univ. Libraries Gifts & Exchange Division: Book Sale. Hardbound 75 cents, paperbacks and periodicals 10 cents. Books in many fields. 11 a.m. to 2 p.m. Green Library, West Wing, First Floor, Room 101.

Center for East Asian Studies Colloquium: "U.S. China Policy from Truman to Nixon," by Zi Zhog-yun, associate researcher, Institute of International Studies, Ministry of Foreign Affairs. 4:15 p.m. Room 238, Lou Henry Hoover Bldg.

THURSDAY, JUNE 2

The Stefan Bergman Memorial Lectures of Mathematics: "Lattices and Arithmeticity," by Prof. G.D. Mostow, Yale University. 4:15 p.m. room 380-c, Math Corner.

Berkeley at Stanford Lecture Series: "The Problem of National Identity in Medieval Korea," by Prof. Michael Rogers, Dept. of Oriental Languages, U.C. Berkeley. 4:15 p.m. Room 238, Lou Henry Hoovr Bldg.-

Nuclear Film Program Series: "A Look at the United Nations" with four short U.N. films. Includes discussion with John Barton, author of the book *The Politics of Peace*. 7:30 & 9:30 p.m. Meyer Forum Room.

Lectures on Architecture of San Francisco: "The Champs-Elysees That Never Made It," by Gray Brechin , author and architectural historian. Members of Committee for Art $3; nonmembers $4; Students $1; Stanford students are free. 8:15 p.m. Annenberg Aud.

FRIDAY, JUNE 3

Latin American Studies Lecture: "Economic 'Long Swings': Mexico and the United States," Dr. Matthew Edel, Professor of Urban Studies, Queens College , City University, New York. Noon. Bolivar House.

Applied Mathematics Seminar: "Path of Singular Points and their Computation," by Prof. Allan Jepson, Dept. of Computer Science, University of Toronto. 1:15 p.m. Dept. of Mathematics, Bldg. 380, Rm. 380-C.

SATURDAY, JUNE 4

Stanford Medical School Alumni Assoc. Concert: Lorin Hollander, concert pianist, informal performance. The performance is open to the public and will be geared to families with children. 2:30 p.m. Dinkelspiel Aud.

SUNDAY, JUNE 5

University Public Worship, Senior Sunday: Preacher: R.G. Hamerton Kelly, Dean of the Chapel. 11 a.m. Memorial Church.

ASSU Sunday Flicks: "The Graduate". 7 & 9:30 p.m. Memorial Aud. $1.50.

The Stanford Quadrangles: Design & Construction. An exhibition of materials relating to the early planning, development and construction of the university; compiled from the resources of the University Archives. Second floor gallery, Green Library. May 23July 28.

CAMPUS REPORT

Volume XV, Number 35 | A publication for Stanford University faculty & staff | June 1, 1983

Faculty survey shows good compliance on consulting

A random sample survey of 60 faculty members has shown no significant problems in compliance with Stanford policies on consulting, according to Provost Albert Hastorf and Vice Provost Gerald Lieberman, dean of graduate studies and research.

The internal audit was done voluntarily by the University.

"There was a little sloppiness but nothing significant," Lieberman said.

There were three cases of consulting which "exceeded very slightly" the 13 days per quarter limit permitted by the University.

None equalled or exceeded the limit of 39 days for an academic year. Such averaging requires advance approval by department heads or deans. A follow-up indicated that approval would have been given in all three cases.

Among those surveyed, 26 (43 percent) reported they had not engaged in consulting during the past year, and an equal number said they had consulted less than 13 days in any one quarter.

Five (8 percent) said they had consulted 13 days in at least one quarter. None consulted as much as 39 days during the academic year.

Eight faculty members—nearly one fourth of those engaged in consulting—said they had hired or supervised students in outside consulting arrangements last year. Since December, 1982, the University has required that such arrangements be approved in advance by department heads or deans.

This new policy "appears to have been

Committee on Research backs present policy for SSRL

The Stanford Committee on Research has voted 7-2 to reaffirm present Stanford policy that research projects should be judged on their scientific merit, not on potential applications.

The May 23 action followed expressions of concern to the committee from faculty and staff at the Stanford Linear Accelerator Center that they would be forced into "involuntary servitude" in providing beams used for a weapons-related research proposal at the Stanford Synchrotron Radiation Laboratory.

No final decision on the proposal has been made by SSRL Director Arthur Bienenstock, and the proposal was not included in President Reagan's fiscal 1984 budget. Whether or not it proceeds also depends on relative scientific merit and potentially conflicting demands for beam use at the laboratory.

These are expected to take several weeks or more to resolve.

In a report prepared for the Faculty Senate May 31, Prof. James Meindl, chairman of the Committee on Research, said "the vast majority of the. . . proposal was reported by the SSRL faculty to be very basic research.

Kennedy to ask trustees for committee to study Hoover ties

President Donald Kennedy of Stanford said Saturday, May 28, he will ask the Board of Trustees to consider establishing a committee to investigate governance and appointments at the Hoover Institution.

The action was requested by the Faculty Senate Thursday, May 26, after it set aside a motion whose preamble asserted the Hoover Institution was "a partisan organization."

The Board of Trustees meets June 10. But Kennedy indicated the trustees might not formally act on the request for a committee until the fall.

Kennedy told the Senate he and Board President William Kimball felt the committee was "a good idea."

But the composition and charge for such a group must be carefully considered, Kennedy said Saturday.

The June trustee meeting customarily is the shortest one of the year. The board's next meeting is in September.

Nonpartisan vote

With a lone dissent in a voice vote, the Faculty Senate Thursday, May 26, backed a non-partisan review of the relationship between Stanford University and the Hoover Institution.

The surprisingly broad consensus followed weeks of prolific debate in the campus, local, and national press.

The Senate urged President Donald Kennedy "to consult with the Board of Trustees with a view to appointing a committee in the near future to explore and reassess the relations between the Hoover Institution and the University, including governance and appointment procedures, with the goal of promoting more effective and cooperative relations."

A move to strike the word "cooperative" failed in a 15-22 show of hands.

Midway in a two-hour debate, Kennedy said he and Board of Trustee President William Kimball agreed informally earlier this month it would be "a good idea" for a visiting committee to study governance and appointment processes. He indicated a visiting committee probably would be appointed by the trustees, including both board members and outsiders.

"We will get on with it as quickly as we can," Kennedy told reporters after the Senate vote. He said it was "inconceivable (the board) would study

People

Richard Staar

Communist Regimes in Eastern Europe, a reference book on the governments and politics of eastern Europe by Hoover Institution Senior Fellow Richard. F. Staar, has been translated into Spanish and released by Madrid publishing company Editorial Playor. The Spanish edition is titled *La Europa Comunista: Economia y Sociedad*. Previous editions have been translated into Chinese, German, and Korean.

Originally published by Hoover Institution Press in 1967 with new editions appearing in 1971, 1977, and 1982, *Communist Regimes in Eastern Europe* has been adopted as a textbook in 267 colleges and universities throughout the world.

William Clebsch

A John Donne essay discussing suicide, first published in 1608, has been transcribed into modern English by Prof. William A. Clebsch, religious studies.

Suicide: Biathanatos Transcribed and Edited for Modern Readers (Scholars Press Studies in the Humanities, Number One) translates Donne's prose, and frequent Latin passages, "into vocabulary that is readily understandable today," Clebsch said.

He added that the concept for the book, the only one of its kind, was developed in his course, Introduction to the Humanities, in which honors students "delved into the conundrum of suicide as an anomalous human decision.

"While the essay does not advise readers to commit suicide," Clebsch said, "it was the first writing to challenge the traditional Christian condemnation of all suicides.

Edward Teller

Edward Teller, senior research fellow at Stanford's Hoover Institution, has received the National Medal of Science from President Ronald Reagan.

Teller was one of 12 scientists honored at the White House May 24. He was cited "for his outstanding contributions to molecular physics, understanding the origin of stellar energy, the theory and application of fusion reactions, the field of nuclear safety, and for his continued leadership in science and technology."

At Hoover since 1975, Teller has served on the White House Science Council since 1974.

A physicist who played a central role in development of the hydrogen bomb, Teller has strongly supported Reagan's emphasis on the need to develop strategic defense systems, saying the—President's action could mark a turning point from "mutually assured destruction to mutually assured survival."

Fernando Alegria

Prof. Fernando Alegria, Spanish and Portuguese, was honored May 20 by the Northeast Pennsylvania chapter of the American Association of Teachers of Spanish and Portuguese, for his contributions to Latin American literature.

Alegria is the author of more than 20 books of criticism, poetry, and fiction, which have been translated into 10 languages. He also has received many other awards, including the Latin American Literary Prize, the Diploma of the Congressional Hispanic Caucus, and Guggenheim Scholarship, and an NEH award for his contribution to Hispanic scholarship in the humanities.

James Gibbons

The Texas Instruments Foundation has announced that its 1982 Founders' Prize of $36,000, tax free, has been awarded to Prof. James F. Gibbons of the Stanford Department of Electrical Engineering.

The award recognizes outstanding achievement in the fields of physical sciences, health sciences, management sciences, engineering, and mathematics. It honors Texas Instruments Incorporated founders J. Erik Jonsson, Cecil H. Green, the late Eugene McDermott, and former chairman, the late Patrick E. Haggerty.

Gibbons has been widely recognized for his highly innovative research concepts in semiconductor electronics. He has trained many students who have become important investigators.

Gibbons has many accomplishments recognized as firsts in semiconductor processing, the most recent being his concept of the use of lasers or electron beams for recrystallizing polysilicon films on insulating substrates.

Members of the selection committee are Mrs. Patrick E. Haggerty; Philip R. Jonsson; Paul W. McCracken; Edmund Ezra Day, university professor of business administration, the University of Michigan; Frederick Seitz, president emeritus, the Rockefeller University; Richard A. Muller, professor of physics and faculty senior scientist, Lawrence Berkeley Laboratory; Jerome B. Wiesner, president emeritus, Massachusetts Institute of Technology; and S.T. Harris, general director of Texas Instruments Incorporated and a director of the Texas Instruments Foundation.

Marilyn Reed Hoskins

Marilyn Reed Hoskins has been appointed to the staff of the Counseling and Psychological Services of Cowell Health Center, effective immediately. She previously had been in an acting capacity.

Selected after an extensive national search, she will continue to have her office at Huston House where she helped implement the conference on "Feeling Good; Mind, Body, and Soul" presented jointly by the Black Mental Health Committee and Counseling and Psychological Services.

Hoskins received an M.S.W. from Simmons College of Social Work. Prior to joining the Stanford staff, she was senior social worker at the Tufts New England Medical Center from 1972 to 1979 and subsequently a senior social worker and director of Social Work Training at the Counseling Center for Tufts University from 1979 to August 1981.

Tjeerd Van Andel

Prof. Tjeerd Van Andel, Stanford geophysicist and oceanographer, is among 12 individuals elected to the California Academy of Sciences.

His election was announced May 29 by Bruce Bolt, president of the 130-year-old academy.

Moses Abramovitz

Prof. Moses Abramovitz of the Stanford Department of Economics has been named one of three Columbia University alumni to receive awards for excellence for 1983.

Former president of the American Economics Association, Abramovitz has been managing editor of *The Journal of Economic Literature* at Stanford since 1981.

Arthur Barnes

Music Prof. Arthur Barnes will conduct the El Camino Youth Symphony's final concert of the season at 8 p.m. Sunday, June 5, in Spangenberg Auditorium.

The program will include works by Mozart, Liszt, Handel, and Tchaikovsky. The two training orchestras, the Chamber Strings, and the Preparatory Ensemble, will be conducted by Sara Salsbury.

Tickets are $2 ($1 for youths and seniors).

Lipoprotein research associate

Research associate position available immediately in the Stanford Heart Disease Prevention Program at Stanford University School of Medicine.

Individual will supervise operation of the Lipoprotein Laboratory and conduct research in the general area of exercise and lipoprotein metabolism.

Candidates must have a Ph.D. in biochemistry, physiology, or organic chemistry and, preferably, two or more years of relevant research experience.

Please submit curriculum vitae and names of three references to Dr. Peter D. Wood, deputy director, Stanford Heart Disease Prevention Program, 730 Welch Road, Stanford, CAlif. 94305. *Stanford University is an equal opportunity employer and we are eager to identify qualified women and minority applicants.*

Roy Hoyer

Roy Hoyer, buyer at the Stanford Bookstore, served as a panelist for one of the educational sessions of the Annual Meeting and Trade Fair of the National Association of College Stores in San Francisco April 11-15. The session was entitled, "New Horizons in Technical Books."

Nearly 1,500 bookstore personnel from nearly every state in the union and several foreign countries gathered for this year's meeting, held at the San Francisco Hilton and the Civic Center. More than 60 educational sessions were conducted; the Trade Fair featured 470 exhibiting companies displaying books, products, and services in 672 booths.

National Association of College Stores is headquartered in Oberlin, Ohio, and serves 2,527 member college/university stores in the U.S., Canada, and 15 foreign countries.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.

Published by the Stanford University News Service. Patricia J. Black, editor; Karen Marman, design assistant; Debbie Jeppson, production assistant; Charles Painter and Ed Souza, photographers; Medical news editor, Lisa Ames, ext 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

Davis advises Zero Population Growth as global goal to avert wider poverty

BY DONALD STOKES

Unless an effective population policy is soon adopted, or some cataclysm intervenes, our children will grow up in a world in which:

* Living standards will suffer as more than 80 million more people are added each year to the world's population;

* More than nine out of every 10 of the babies will be born in the less well-developed countries, those least able to educate and train them adequately;

* Enormous pressures for migration from developing to developed countries will be generated;

* Aging of the population in industrial countries will cause struggle between the old and young for the goods and services of society.

These are the prospects as seen by Kingsley Davis, one of the nation's leading demographers and a senior research fellow at Stanford's Hoover Institution.

Davis, former president of the Population Association of America, gained fame in 1967 by coining the phrase Zero Population Growth. He invented the phrase, he explains, because he was writing a critique of family planning as the sole approach to fertility control.

"In order to evaluate a policy one must know what the goal is, and in the family planning literature the goal appeared to be no population growth at all—in short, ZPG," he said.

His paper was published in *Science*. Soon, an organization was formed to promote population limitation; it was called ZPG.

For many years Davis has been a radical in the field of population policy. He has been a persistent critic of family planning—meaning the furnishing of contraceptives, abortion, and sterilization—as the sole approach to fertility limitation in the developing countries.

"The evidence that this policy does not succeed is the growth of the very phenomenon it is supposed to control—namely, the world's population.

The family planning movement got started in most of the developing countries in the early 1960s. Since then, 1.7 billion people have been added to the world's population, and the projections of the United Nations forecast another increase of that size by the end of the century.

"There has been a slight decline in the *rate* of growth in recent years, but the absolute increase per year has continued. Currently, some 80 million people are being added to the earth's population each year.

"These figures demonstrate that the exclusively family-planning approach to fertility control is a failure. The reason is that family planning provides the *means* for fertility control, but not the incentives.

"In all traditional societies of the Third World, the institutional structure embodies rewards for having children and penalties for not having them. Bearing sons is a woman's mission in life; being childless or having only one child is a terrible misfortune.

"Further, children provide labor, prestige, and social security. Unless those incentives are somehow altered, people will not use the contraceptives offered them or submit to abortion or sterilization.

"To be sure, the traditional incentives are altered when a country becomes industrialized, educated, or urbanized, as is happening in many developing countries today—such as Costa Rica, Trinidad, Hong Kong, Sri Lanka, Taiwan, and Malaysia. In such countries, couples seek out birth-control devices in order to avoid the huge families which occur along with high birth rates combined with low infant and child mortality.

"In these countries it is not the family planning program but rather economic development that has brought down fertility. The purpose of population policy is not to wait for development, but to lessen population growth so as to make possible, or hasten, economic development.

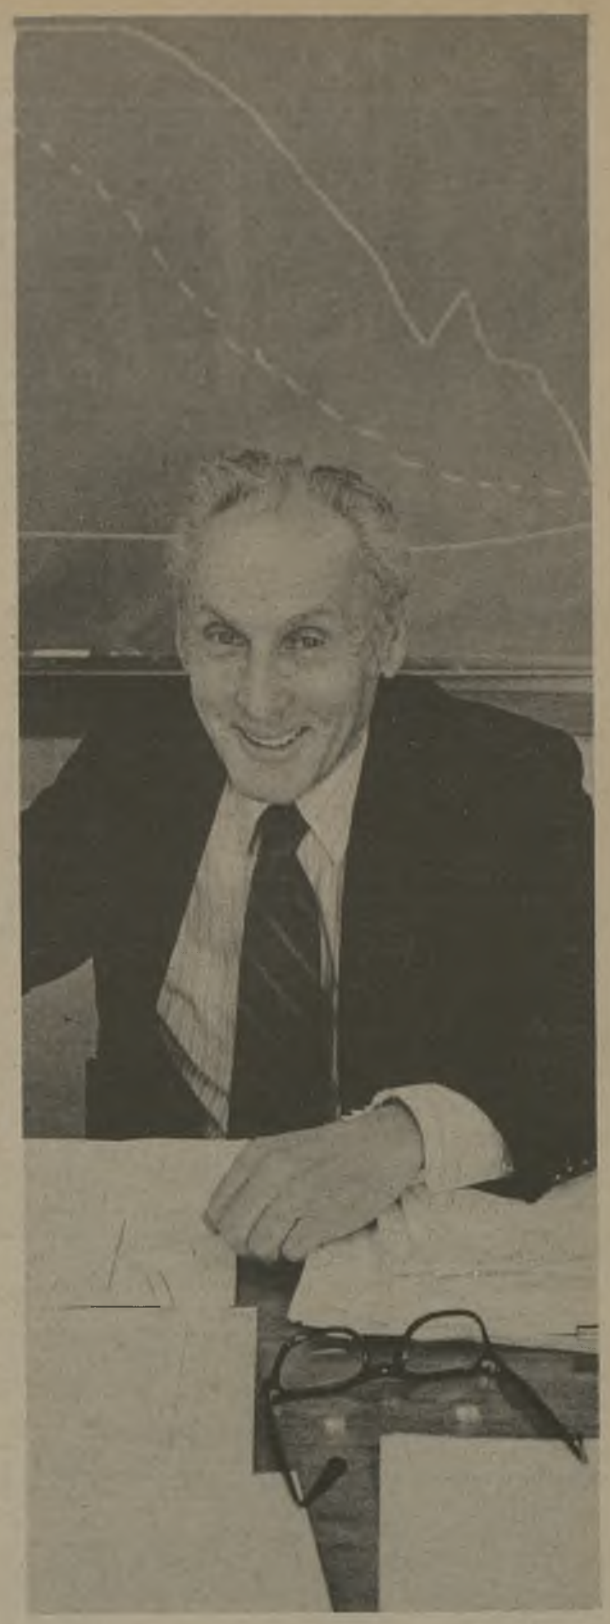
"If we wait for economic development to lower birth rates, we will have to wait for a very long time in countries such as Bangladesh, India, Pakistan, Nepal, Indonesia, and virtually all of Africa.

"In these countries, runaway population growth is a principal impediment to development. Policies must therefore be adopted which eliminate this impediment. How? By providing ahead of time incentives for small families and disincentives for big ones."

Davis points to China as the country which has seen most clearly the vital necessity for population control. "Here more than a billion people are crowded together on land deforested and eroded for thousands of years. Trying desperately to reverse the traditional incentive system embodied in the world's most familistic society, the Communist government has sought to use its grassroots political and economic controls to provide incentives to late marriage, childlessness, and one- and two-child families, and to penalize couples who have unauthorized pregnancies.

"Americans have condemned the Chinese policy as being 'compulsory,' but all forms of social control have compulsion involved in them.

"There is no painless way to curb population growth; to think there is, is to stick one's head in the sand."



In the industrial countries birth-rates are now generally so low that, on a stable basis, they would not replace the population, said Davis. For this reason the advanced nations are sometimes said to have 'solved' their problem of population growth. However, they cannot escape the consequences of the Third World's unprecedented population increase. They cannot ignore the poverty or the demands of the Third World for loans, grants, food, and technical assistance. Above all, they cannot ignore the almost irresistible pressure for migration from the less developed world.

Davis says that the deteriorating international economic situation can be seen clearly in the data on land and energy. In the Third World the number of people per square mile of arable land is now more than twice the number in developed countries, while the number of agriculturists per square mile of arable land is seventeen times the number in industrial nations.

Although the cities of the Third World are increasing in size at a dizzy pace they are not able to draw off the natural increase of population in the countryside, as the cities did during the early growth of underdeveloped countries. The reason is that cities today in less-developed countries are growing by their own excess of births over deaths, not simply by rural-urban migration. The result is that people are being stacked up in the countryside.

"At the same time the price of energy is causing disastrous deforestation and draining foreign exchange in many less well-developed countries. This is in spite of the fact that they use only one-tenth as much fossil energy as the industrial nations.

Hamstrung by mindless population growth, said Davis, the Third World countries seem to be falling further behind, which is the root cause of the so-called North-South conflict. Although new loans may be made to enable the poorer countries to pay interest on old loans, the probability is that most of the debtor countries will never repay the loans. They are getting deeper into debt, and in many cases deeper into political instability.

There is no painless way to curb population growth; to think there is, is to stick one's head in the sand.

—Kingsley Davis

"It is little wonder that throughout the Third World millions are seeking to migrate to advanced countries. Many succeed, creating ethnic minorities competing for jobs with the poorest of the native workers, taxing schools, overloading schools, welfare agencies, and health facilities. They come both legally and illegally, and their potential number is seemingly endless."

Davis calculates that if the 38 poorest countries of the world were to achieve ZPG by out-migration, the net number of emigrants each year would be 31 million. This would be a larger movement in one

Aid for new projects in curricular development

Provost's Innovation Fund aims to fill gaps in undergraduate education

The Provost's Innovation Fund for Undergraduate Education is primarily intended to encourage new projects in curricular development and improvement. Its purposes are academic, defined in fairly restrictive terms, rather than more broadly educational. The strengthening of the undergraduate curriculum is its main goal; improvements in support activities like academic advising may from time to time be appropriate for funding, but are generally considered secondary to more strictly curricular projects.

The Innovation Fund is expected to help meet those important needs in undergraduate education that do not seem to be readily met in the normal course of events. Priority in funding will be given to proposals that are likely to reach significant segments of the undergraduate population, especially in areas where there is a demonstrable need.

For example, seed money could be provided for the development of courses which would meet distribution requirements in areas 6, 7, and 8 for students who are not majoring in the natural sciences or engineering; courses that bridge the natural and social sciences and the humanities; new Western Culture tracks; courses in non-Western Cultures which will fulfill distribution requirements; pilot ventures offering advanced research or writing opportunities; and other special academic projects for undergraduates.

The Innovation Fund is, by necessity, limited both in its scope and in the level of support it will be able to provide. Thus, many worthwhile general contributions to the educational and intellectual life of the university will be outside its intended purposes. Nor is the fund expected to substitute for existing resources at the departmental and school levels or replace the yearly university budget cycle as the main avenue for obtaining incremental funding. On the contrary, applications will be strengthened by promises of matching funds from department, program, or school. Therefore, requests for summer salary to develop narrowly defined departmental courses are not likely to be funded nor are applications to support conferences, lectures, special interest publications, and the like.

The Innovation Fund is primarily intended for the use of faculty and academic officers of the University. In exceptional cases, applications from students and staff may also be considered for projects that stand to benefit the undergraduate population at large (the Advising Associate program, for instance, is the type of activity that could be of interest). As a rule, one-time funding of less than $10,000 can be provided, but larger sums and budget base monies may also be made available to support efforts of particular importance.

Application and Review procedures. The Innovation Fund goes into effect in 1983-84. There will be three review cycles, one for each quarter of the academic year. No applications will be considered outside of this schedule. One may apply during a given quarter for support in the next or any subsequent quarter within the following two years. The application schedule is as follows:

Application Deadline	Decision Date
October 15	November 15
January 15	February 15
April 15	May 15

Funding proposals should be submitted in writing, stating in a few pages what the applicants intend to do, why, and how. We shall ask for additional clarification if necessary. We intend to keep our review procedures simple and not time consuming. Based on experience, these procedures may be revised to better serve all concerned.

Applications should be addressed to Herant Katchadourian, Vice-Provost for Undergraduate Education, Building 10, Stanford. They will be reviewed by the Coordinating Committee for Undergraduate Education whose members are Carolyn Lougee, associate dean for undergraduate programs, School of Humanities and Sciences; Gilbert Masters, associate dean, School of Engineering; Irwin Remson, representing the School of Earth Sciences; Sally Mahoney, registrar; and Herant Katchadourian (chair). The Committee will forward its recommendations to Provost Hastorf, who will make the final decisions.

Immigration pressure grows, as does conflict of young, old

continued from page 3

year than the total migration into the United States during the 60 years from 1870 to 1930 when U.S. immigration was at its peak.

"Naturally, the industrial countries will never permit such a flood across their borders. Accordingly, they face a world in which resources are not only becoming scarcer but also more unequal. The demand for migration will probably be so insistent, both in the countries of origin and by employers looking for cheap labor in the industrial nations, that a sizable migratory movement will occur.

"One kind of movement that will probably continue is the admission of so-called 'guest-workers,' who are supposed to return home at the end of a specified period. Experience shows, however, that guest-workers often find ways of staying beyond their time limits, and if they do go home it is often with negative economic consequences to their native economy.

"Contrary to general belief, emigration usually fails to cure the problem of chronic unemployment so characteristic of sending countries, and when workers return home due to recession, the problem is aggravated.

"In view of the lack of benefits to 'people exporting' countries, policies encouraging emigration appear to be misguided. A far better solution to the problem of overpopulation, in terms of both economic and human costs, is fertility control. Reliance on emigration is rather like taking aspirin for a toothache; there may be temporary relief, but the basic problem remains."

In addition to the problems created by explosive population growth in the Third World, the industrial nations face a new situation at home—the aging of their populations, says Davis.

In the United States, mainly as a result of low birth rates, the proportion of the population aged 65 or over has risen from 4.1 percent in 1900 to 11.3 percent today, and it is expected to rise to 17 percent in 2030. In Sweden it is already 16.1 percent.

The consequences of an aging population depend not only on the number of the elderly, but also on policies adopted with respect to them. In advanced nations generally, there has been a tendency for the elderly to be withdrawn from the labor force even when they are able and willing to work. Their support has increasingly been shifted from earned income and from family members to impersonal agencies such as Social Security, pension funds, and saving.

As a result there is little restraint on their needs and demands, as there was when families were responsible for them.

"In the United States, the income of the elderly has been rising faster than that of most other age groups, especially that of young workers.

"As a result there is a sort of class struggle going on between the generations. The elderly naturally want to get as much as they can from the economy even though they are not working. The young naturally want to pay as few taxes as possible.

"It is the young workers who are being squeezed hardest, because they are the ones who are supposed to be having children, to be buying houses, to be contributing to their own future welfare and security, as well as producing goods and services for the population as a whole.

"The support of an idle elderly population is for them an inevitable burden, no matter how disguised and impersonal it may be.

"As a consequence, to make ends meet, young workers are increasingly postponing marriage, and after marriage, the wives are increasingly entering the labor market and are reducing their fertility.

"Ideally, if abundance prevailed, the elderly could all retire at an early age and the younger labor force, working only a four-day week, could take care of them and themselves.

"Instead, under conditions of increasing resource scarcity, we may have to return to the ancient policy of keeping the old at work as long as they are able, using part-time arrangements as necessary, and paying wages proportional to their productive contribution.

"If pursued, however, this policy will encounter massive resistance. It will be resisted by the elderly themselves, many of whom (if they continue working) will want the same high pay they built up by seniority.

"It will be resisted by the young, who under the commonly believed myth that there is a fixed job-pool, think that the retirement of the elderly will create more jobs for the young.

"It will be resisted by the labor unions, which count early retirement as a fringe benefit. It will be resisted by business and industrial firms which wish to replace expensive senior workers with young and cheaper ones.

"In the past family solidarity was the force that minimized the struggle between the generations and provided a division of labor by complementarity. In contemporary industrial societies, however, changes in the family and a simultaneous aging of the population have shifted the context of intergenerational relations to the wider economy."

Where will it all end? Davis was asked. Will the world's population keep exploding till there is widespread starvation?

"I don't think that lack of food will be the limiting factor. There are several possible paths ahead. One has a familiar ring, because it rests on the tautological proposition that *if* people take notice of the dangers ahead and take concerted action to avoid the danger, they will succeed.

"If the Third World were to institute effective fertility control policies overnight, the world's population problem would not be solved, for that would have required fertility control long ago, but at least the worst results would be avoided.

"It is more likely that there will be a decline in fertility in most of the less-developed countries due to altered conditions, and that the interim population growth will be wholly or partly wiped out by a rise in mortality, due either to warfare or deterioration of health resources.

"The earth can probably support a larger population, such as the six billion predicted for the year 2000, but it may have to do so in ways that seem strange to us. It may have to use advanced technology to support more people at a low level of living. We are used to associating high technology with high consumption. We may have to get out of that habit."

* * * *

When Davis received the highest award of the American Sociological Association last year, the citation summed up his career.

He has had "a profound effect upon the profession and upon social policy in a scholarly career of nearly four decades," ran the citation. "His voluminous works cover such diverse fields as demography, urbanization, development of Third World countries, family and youth, social statification and theory."

He is now writing a book on the economic and social consequences of underlying demographic changes in industrial societies.

"It is slow going," smiles Davis. "There are so few demographers and so many things to do in this exciting field."

Sally Ride studied space here before going there. . .

When Sally K. Ride, age 30, becomes the first U.S. woman to soar into space she will be the first astronaut to have already explored, in the laboratory, the physical nature of outer space.

Ride, a Stanford Ph.D. whose expertise is radio astronomy, will fly on the seventh scheduled mission in the space shuttle program. She will be a specialist aboard the Challenger space shuttle. Along with Air Force Lt. Col. John M. Fabian she will handle scientific tasks which bear on her own years of research.

Arthur B. C. Walker, Jr., professor of applied physics at Stanford, supervised Ride's thesis work for her doctorate. Walker explained the nature of Ride's research:

"She studied the interaction of interstellar grains by means of X-rays. The space between the stars is not a complete void—it is filled with material called the interstellar medium. It consists of gas and small grains of dust which are exceedingly small, in fact microscopic in size.

"The nature of those dust-grains, how large they are and what they are composed of, has been a problem for astronomers for years. One of the recently-discovered techniques for studying interstellar grains is to observe their interaction with X-rays and to see how they modify the X-rays from objects which are shining behind the grains.

"In other words, the X-rays are pitted by objects in space and as they traverse interstellar space to reach the earth the interstellar dust-grains modify the X-rays. This means that by studying how the X-rays are modified we can determine the structure and composition of the dust-grains."

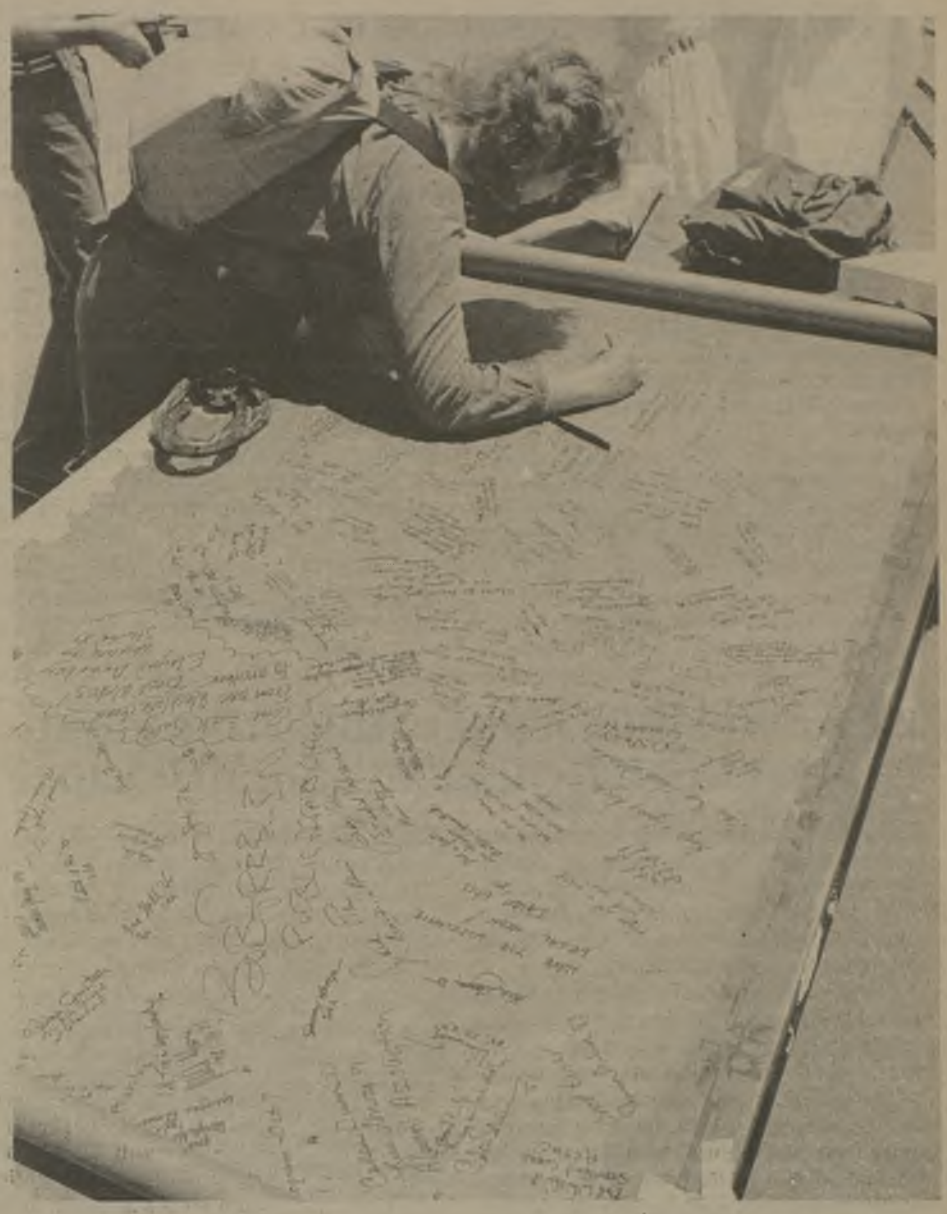
Asked whether Ride had aimed X-rays into space, Walker replied, "No, she analyzed how one would interpret the observation. The X-rays are coming from objects in space, from the stars and other sources.

"We observe those X-rays because the wave-lengths of the X-rays and their spatial distribution is modified by the presence of the interstellar dust-grains, so by studying how the X-rays are modified, compared to how we think they would have been if the dust-grains had not been there, we can make determinations about the nature of the grains.

"Sally Ride made a significant contribution to these studies."

John F. Madey, senior research associate in the Hansen Laboratories, was a research associate of Ride's. "All of us here are delighted at her selection to be the first American woman in space. She was very popular here and highly respected."

"After Sally had finished her Ph.D. work she received an appointment as a postdoctoral fellow. She published two theoretical papers during that time on laser-related subjects.



"She worked closely with another member of our group, Bill Colson, who is now at UC-Santa Barbara. They were co-authors of those papers.

"At the time she was here the intramural sports program in the department was very strong and she was an active participant in it. She helped to raise our department's team to a position of eminence.

"Sally has a strong competitive urge. She wants to be up at the top, whether it is in sports, in academics, or whatever."

Peter F. Michelson, acting assistant professor of physics, was another research associate of Ride's: "She was very popular here, and highly respected. She was far from bookish and was into every sort of sport or games that was around."

The space shuttle program is expected to carry, in the future, a large telescope into orbit. This will be a valuable instrument for studying X-ray stars. Ride's research will help form a valuable base for the work.

Stanford sophomore Elizabeth Menning signs a campus scroll which will he sent to Sally Ride, America's first woman in space, who holds four Stanford degrees.

. . .Tennis foe Hargadon feels the gentle touch of her humor

Sally Ride—'really excited about what she's doing, not just going up'

Sally Ride, America's first woman in space, is "attractive, bright, and stable, with a good sense of humor," says Stanford Admissions Dean Fred Hargadon.

Hargadon admitted Ride to Swarthmore as a freshman, then changed institutions and admitted her to Stanford as a transfer student in 1970.

They remained close friends as she went on to earn four Stanford degrees—bachelors in English and physics, plus a master's and doctorate in physics.

"Whatever she does, she does well," Hargadon says. "She has better 'on' and 'off' switches than we do. If she plays tennis she does that well; if she does physics, she does that well, too.

"The press makes more of her being the first American woman in space than she herself makes of it.

"I don't think she has a star's temperament, so I suspect she's finding all the publicity not only unusual but difficult.

"She's a very sincere, straightfoward person. But I imagine her being straightforward and confident probably comes off to some in the media as being 'cool.' She's confident because she's knowledgeable about what she's going to do."

When asked whether she weeps under stress, she suggested the question be directed to one of her male colleagues, for example.

In talking with Hargadon about a previous problem on a Shuttle flight, "she made it seem like a flat tire on a bike," he recalls. "She didn't think it was any big deal."

Hargadon has stayed at the Ride home with her parents. "It's a house where they have an awful lot of fun and laughter." He's talked recently with her parents, who are "probably under seige from the media."

Hargadon visited Ride in Houston. "She's really excited about what she's doing, period—not just going up," he says.

"She really appreciates the faculty she had here. No doubt she was a very capable person coming in, but there's no doubt she gained a lot from the faculty here. There's a good deal of mutual respect."

When Ride called Hargadon in August and asked him to send her a Stanford banner for the flight, he sent her two different sizes of the rectangular banner with Stanford in block letters.

He was invited to watch the launch June 18 and will stay for the return landing. He'll take a huge scroll signed by Stanford colleagues saying "from the Foothills, to Outer Space, Stanford is with you Sally Ride," which will probably be given to her parents.

Hargadon remembers his one tennis match with Ride, who was a nationally ranked player. "I don't think I gained a point," he says.

It all came back when he got the official invitation for the launch. It was signed "40-Love, Sally."

Score one for Ride's sense of humor.

Commencement: record 15,000 to hear Schultz, see protests

A record-breaking crowd of 15,000 will fill Frost Amphitheater to the brim when Secretary of State George Shultz delivers the featured address at Stanford's 92nd commencement at 10 a.m. Sunday, June 12.

Currently on leave as a professor in the Stanford Graduate School of Business, Shultz will face a coalition of groups protesting Latin America, Middle East, South Africa, and human rights policy.

Graduates will be urged to wear sashes to symbolize their opposition to Reagan administration policies. "There won't be any disruption during the ceremony," one spokeswoman for the protest coalition said.

Admission to Frost is by ticket only. About 2,800 graduates are expected to attend, an all-time high. (Berkeley and USC likewise have reported a surge in graduates attending commmencement this year.)

About 500 faculty are expected to march in the colorful procession. The amphitheater itself has been extensively rebuilt to enlarge its capacity.

Participating graduates have received three free tickets each for use by their families and friends. According to *The Stanford Daily* one student traded an Atari computer for three additional tickets and initial prices have ranged as high as $25 apiece.

Individual tickets will be checked and taken at the Amphitheater gates, which will remain open only from 8:30 to 10 a.m., when the main ceremony starts.

Frost will be secured, starting Tuesday. Signs carried by demonstrators will be permitted so long as they do not obstruct the view of others and are not on sticks.

An estimated 4,500 degrees will be conferred by President Donald Kennedy, who also will address the class. Following the Frost ceremonies, diplomas will be handed out in 37 separate locations across campus. Total attendance is estimated at 19,000, an all-time high.

Formal portions of the commencement weekend program include an address by Prof. John G. Gurley, economics at Phi Beta Kappa initiation ceremonies at 8 p.m. Friday, June 10 in Dinkelspiel Auditorium.

The Rev. David H. C. Read of the Madison Avenue Presbyterian Church, will deliver the baccalaureate sermon at 9:30 a.m. Saturday, June 11, on the Inner Quadrangle. One of America's leading preachers, he is the author of 25 books and numerous magazine articles, and gave the 1966 baccalaureate here.

Dedication of the Senior Class plaque will follow at 10:45 a.m. Speakers at Class Day luncheon in the Bowman Alumni House Grove will include President Kennedy, Alumni Association Director William Stone, Admissions Dean Fred Hargadon, and Profs. Eleanor Prosser, drama and English, Gil Masters, civil engineering, and William Durham, anthropology.

This year's class presidents are Joe Del Hierro, Mary Ruckelshaus, Katy Dore, and Kevin O'Beirne.

The president's reception for graduates, faculty, and alumni will start at 5:30 p.m. Saturday at the President's House, 623 Mirada.

Commencement coordinator Nan Bentley of University Events and Services reports about 125 students will help in this year's ceremonies. They serve as flag bearers, ushers, chair and sound crew, among other functions.

Dean Wessells names Hilgard, Wright, Goodenough to hear Mosher grievance

Three nationally prominent scholars will review the dismissal of Steven Westley Mosher as a Stanford graduate student, Dean Norman K. Wessells of the School of Humanities and Sciences has announced.

Serving as grievance officers will be emeritus Profs. Gordon Wright and Ernest Hilgard of Stanford and Prof. Ward Hunt Goodenough of the University of Pennsylvania. Currently on sabbatical leave in Hawaii, Goodenough is curator of the Oceania Ethnology Museum at Pennsylvania.

Wright is former president of the American Historical Association, Hilgard former president of the American Psychological Association, and Goodenough is former president of both the American Ethnological Association and the Society of Applied Anthropology.

Mosher was dismissed as a Ph.D. candidate for "illegal and seriously unethical conduct" while in China that "endangered his research subjects," according to an 11-0 vote of the Stanford anthropology faculty Feb. 24. Mosher has blamed his expulsion on a popular Taiwan press article he wrote documenting forced abortions in China and on "slanderous" allegations by his former wife.

According to wire service reports to Stanford News Service, Mosher's grievance maintains he was deprived of his rights under the University's regulations governing student conduct.

Under the Univesity's student grievance procedures, Wessells asked the three scholars to "review the case thoroughly and provide me with a report of your review, your recommended findings, and the way you recommend that I rule" on the grievance. Mosher appealed his dismissal April 25.

While the procedures suggest that grievance proceedings be completed, if possible, within 30 days, Wessells asked the group to submit its report by June 30.

"The report document itself should be written so that it can be made public or a summary document also should be provided that can be made public without endangering innocent third parties," Wessells said.

Further appeal is possible to the vice provost and dean of graduate studies and research, Gerald Lieberman. After that, students may request President Donald Kennedy to review the case.

Antiapartheid coalition protest

Members of the Stanford anti-apartheid coalition have drawn up and are circulating a petition against -apartheid to be presented to Secretary of State George Shultz while he is on campus to deliver the 1983 Commencement speech. The petition asks that Dennis Brutus be given political asylum in the United States, that Nelson Mandela be freed from prison, and that the ban on Winnie Mandela be lifted.

Dennis Brutus is a South African poet and athlete who has been teaching at Northwestern and has been served with deportation orders. Jailed since 1961 for his political activities, Nelson Mandela is a leader of the African National Congress. His wife, Winnie, also active in the A.N.C. has been banished to a remote area where she is only allowed the company of one person at a time.

The petition is being addressed to Secretary Shultz since he represents the Reagan administration which has declared a policy of constructive engagement with South Africa. In reality, it is a policy of material support and friendship which has resulted in increased collaboration with the white South African regime by both public and private investors from the U.S.A.

The member organizations of the coalition are: Stanford African Students Association, Southern Africa Liberation Solidarity Committee, Black Student Union at Stanford, Amnesty International Stanford group, and Social Education and Action Committee of Stanford Memorial Church.

Copies of the petition are available upon request from the round room at Memorial Church (415) 497-1762.

Ph.D. orals

WEDNESDAY, JUNE 8

Loren F. Stokes, electrical engineering, "Resonant Single Mode Fiber-Optic Sensors" 2:15 p.m., Applied Physics 200.

FRIDAY, JUNE 10

David B. Tuckerman, electrical engineering, "Heat Transfer Microstructures for Integrated Circuits," 2 p.m., McCullough 240.

Mosher charges anthropology faculty 'secretly peddle' report to press

Following is an open letter to Donald Kennedy from Steven W. Mosher, former Ph.D. candidate in anthropology.

President Kennedy:

On February 24 of this year the faculty of the Department of Anthropology voted to terminate my doctoral candidacy. The only public explanation they offered for this unprecedented act—and this only after a lag of several weeks—was a vague and unconvincing reference to "illegal and unethical" behavior.

There can be only one explanation for their unjustified and ultimately irrational action: I was denied my Ph.D. in retaliation for my revelations concerning forced abortions and infanticide in the People's Republic of China, which deeply offended faculty members.

On April 16 I sent a registered letter to Norman Wessells, the dean of the School of Humanities and Sciences, protesting this unfair action. To date, over a month later, I have received no response to this appeal, not even so much as an acknowledgement that it has been received. Since University procedures establish 30 days as the period of time in which the dean has to rule on such an appeal, I am puzzled by Dean Wessells' inaction. Is it the University's intention to ignore my appeal?

Whatever the explanation for the administration's behavior, I wish to inform you that in my opinion it is no longer possible—if indeed it ever was—for my appeal to receive a fair and unprejudiced hearing from Dean Wessells and others in the administration, including yourself. The irresponsible, not to say contemptible, behavior of certain faculty members of the Department of Anthropology has brought this about.

Up until several weeks ago anthropology faculty members, with the exception of the chair, Clifford Barnett, consistently stonewalled the press. Although this ploy was primarily intended to veil their actions from public scrutiny and to protect their sources, it had the unintended side-effect of allowing the appeal process to go forward in an atmosphere clear of the rumor mongering that had marked the departmental investigation. Unfortunately, this is no longer the case.

Stung by the growing wave of criticism that their decision has generated, as many as a half-a-dozen faculty members decided to grant secret interviews to reporters from *The New York Times*, *Science*, and perhaps other news outlets as well.

After having extracted from these correspondents promises of complete confidentiality, they proceeded to press them with the same slanders and distortions that they cooked up in their "secret" report. In short, while publicly claiming that the release of the report would "harm innocent persons," they secretly peddle its contents to the press. It would be surprising if they were not similarly slandering me to others within the Stanford community.

That such conduct is cheap and despicable goes without saying. But it is more than that. It is severely prejudicial to the appeal that I filed with the university administration last month, making it unlikely that that appeal will receive a fair hearing.

I therefore write to request that Stanford University at once acknowledge its fault and error in permitting the anthropology faculty to undertake an investigation that resulted in my explusion from the University and in condoning other faculty actions, including that given above.

I further request that Stanford University immediately and without delay take the steps necessary to grant me a Ph.D. in anthropology on the basis of my outstanding academic record, research accomplishments, and publications, and award me substantial financial compensation for the harm Stanford has caused me.

Sincerely
Steven W. Mosher

Energy savings of $250,000

Savings of over a quarter of a million dollars annually may result for a project to improve energy management at Stanford.

A new $1.6 million computer-based control system will measure and regulate the production and distribution of electricity, steam, and chilled water throughout the campus.

The Energy Management and Control System (EMCS) will replace the existing Honeywell/IBM system, which has become increasingly difficult to maintain and support. The new system will benefit from recent advances in hardware, software, and microprocessor technology. In addition, the EMCS will have the flexibility to implement the more sophisticated energy management strategies that are dictated by rising energy costs.

The EMCS will consist of a computer, located in the Central Energy Facility, that is connected through a network of microprocessor base units to sensing devices and controls for fans, pumps, and valves around campus.

"By measuring and scheduling on a more timely basis, we will be able to tailor precise changes in control strategies," said Dennis Antweiler of Stanford's Central Energy Facility. "It will be a very versatile system."

Antweiler is a member of a team of engineers working on the project that includes William Macomber and Eric Swenson representing Facilities Project Management, Byron McDonald from Operations and Maintenance, and Karl Johnson of the Energy Program Office.

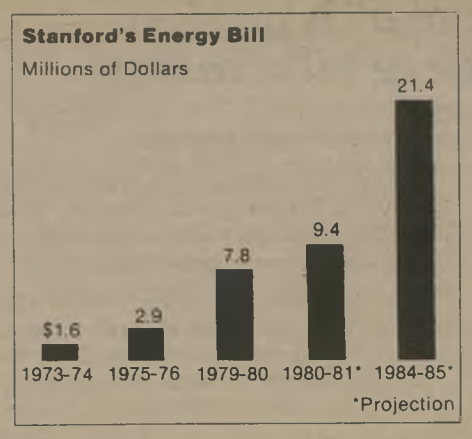
Since last fall, this group has evaluated proposals for the project from 17 companies in the field of large-scale distributed processing systems. Three final candidates have been recommended: Staefa Controls, MCC Powers, and Ronco/Beckman.

If final project approval is received at the June Board of Trustees meeting, these vendors will supply firm pricing for the design engineering, hardware, installation, start-up, and testing of the EMCS system. A contract will be awarded in September, and the entire system should be in place by December of 1984.

The project will generate savings by cutting down on energy use in buildings or portions of buildings that are unoccupied. The existing system is limited in its ability to measure and control energy. Meter data is now collected manually, and generally only once a month. If there is a malfunction in a heating or cooling system the meter data might not show the problem until readings are taken the following month.

The present system is capable of turning a given fan, pump or valve on and off a maximum of twice daily, and is only able to distinguish between weekend and weekday schedules. Finally, its ability to control single rooms is very limited: usually the heat or air-conditioning in an entire building has to be on or off.

The new EMCS will be much more flexible. It will have a virtually unlimited number of daily on-off setpoints, as well as different schedules for each day of the week.



An improved data-gathering system will be able to provide on-demand readings of temperatures, pressures, flow rates, and other conditions in the buildings. Information will be presented in a variety of "user friendly" formats such as color graphics, building schematics, and charts.

The second phase of the EMCS project will depend heavily on the new system's capacity for growth. The project plan calls for using the central computer facility to assume control over more energy-using equipment than the present system is capable of handling. In addition, many more individual rooms will be independently scheduled. The EMCS will also be capable of proportional control over some equipment instead of simply turning it on and off.

Centralized energy management can also create intangible savings through improved productivity and reduced maintenance. The EMCS will greatly simplify the task of pinpointing and correcting a problem. Indirect cost savings from a similar system at MIT have been estimated at more than $1 million annually.

Project engineering manager William Macomber noted that the Energy Management and Control system will actually be more dependent on individual building energy managers who work in each building than the present system is.

"We're predicating the success of the whole project on tighter scheduling," Macomber said. "That means the input of the building energy managers will be even more important, because they can best determine the optimal schedules for their buildings."

ENERGY CONSERVATION AT STANFORD

Hart backers plan rummage sale Saturday

The Stanford chapter of Students for Hart, a national organization of college students who support Democratic presidential candidate Gary Hart, is planning a large rummage sale Saturday, June 11, to raise money for their candidate.

The sale will run from 9:30 a.m. to 6 p.m. on the intramural athletic field between the El Camino Real and Stanford Stadium.

Hart, a U.S. senator from Colorado, spoke at Stanford in April and was warmly received by a standing room only crowd in Kresge Auditorium. This visit sparked the formation of the Students for Hart group, which now has a mailing list of over 200 students.

The students anticipate their annual summer exodus from their dorms will produce a lot of unwanted or unstorable items. "We may not have much in our checkbooks to give to Hart, but we do have a lot of plants and used record albums," spokesman Jeff Phillips said.

"Besides it goes along with Hart's grassroots campaign philosophy." Hart is the only candidate who has announced he will not accept donations from any special interest political action committees or the PACs as they are popularly known. Instead he is relying on many small individual contributions.

Anyone wishing to donate items should call 327-7133 to request pick-up of the articles or bring them to the athletic field the morning of the sale.

This summer Students for Hart will be networking their hometowns to find volunteers for the 1984 primary campaign and to spread the word about Hart's issue-oriented campaign which he calls "a campaign of ideas."

Civil engineers build small energy conservation lab behind old Firehouse

Twenty Stanford undergraduates are learning the practical side of energy conservation in a small laboratory they helped build as part of a class in civil engineering.

The students—not all of them engineering students—have put up a laboratory to test such things as solar photovoltaic cells, solar water heaters, and passive house heating. They are also experimenting to find out how much heat is lost through the cracks in a normal house, and how much air pollution is created by such things as indoor kerosene heaters.

The lab, located behind the old Firehouse on campus, is its own test station. Every part of it is used for experiments.

"The purpose of the lab is to look at various aspects of energy conservation in buildings," said Gilbert Masters, adjunct professor of civil engineering, who runs the class.

"We are not doing anything original, we are just catching up with what others are doing," he said. "It's a teaching lab. I hope in the near future to do original work."

The course is one of two Masters teaches on energy. The other is more theoretical. Masters said that this course is appropriate for non-engineering students who have some affinity for numbers. He teaches what mathematics they need in the course.

The students are working on ways to measure the amount of heated air that leaks out of buildings. Masters said he believes as much as $30 billion is wasted in this country on heating air that eventually flows out the cracks of buildings, around windows or doors.

One lab technique uses a blower door, a door with a large fan attached, which is wheeled up to the door of the test building. The fan blows air into the building, increasing pressure inside. By measuring the inevitable decrease in pressure over time, the students are able to determine leakage.

The students have used this to test various Eichler development houses in the Palo Alto area.

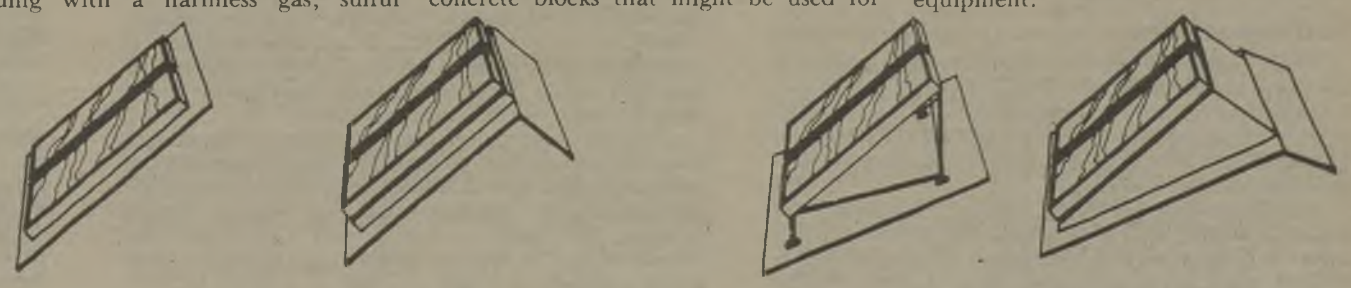
Another technique involves filling the building with a harmless gas, sulfur hexafluoride, and analyzing the air as the gas leaks out.

The students are also testing a large, commercial kerosene heater in one of the lab rooms to determine the amount of carbon monoxide produced. The heaters are illegal in some states, including California, but still sold widely.

One manufacturer of one heater has sued Consumers Union for a magazine report calling the heaters dangerous. Masters and his students are duplicating one of CU's tests.

The lab is also testing whether heat exchangers would work in ventilating rooms while retaining heat or air conditioning.

Students are testing several passive methods of home heating using solar energy.



One method involves a series of concrete blocks that might be used for the floor of rooms. The idea is that the blocks would be heated by the sun's rays and retain their heat through the night.

Master's lab has a series of such blocks testing how deeply the heat is absorbed and how long it is retained.

Another idea is called a Trombe Wall, named for its inventor, which consists of a concrete wall just behind a window, heating up the stones.

The lab also tests solar water heaters and has an array of solar voltaic cells, which produce about 230 watts of direct current. The current goes into a car battery and a converter which operates the lab radio.

Money for the lab came from the Wheeler Fund to the Energy Institute, the department of Civil Engineering and the dean of the School of Engineering. Several companies have donated equipment.

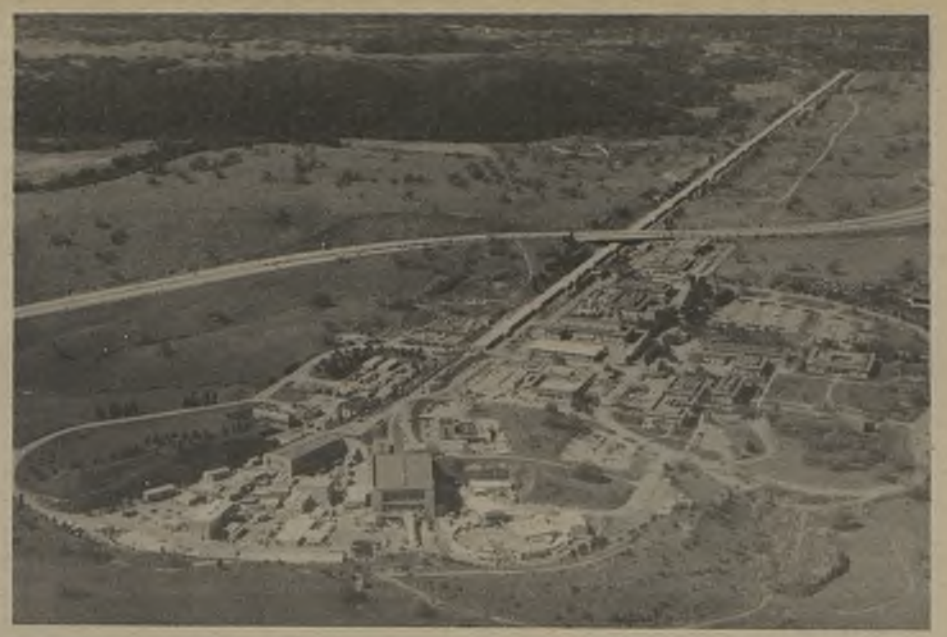
Weapons-related research protest continues with Ellsberg talk, march

Noted anti-nuclear activist Daniel Ellsberg will address a noon rally Wednesday, June 1, in White Plaza at Stanford.



Also speaking will be Mary James, a graduate student and staff member at Stanford Linear Accelerator Center.

Following the rally, the opponents of a proposed weapons-related research project plan a "Dead Week Death March" to the office of University President Donald Kennedy and Dean of Graduate Studies and research Gerald Lieberman. The protesters will deliver "death certificates" for alleged "complicity in the nuclear arms race" for their unwillingness to stand in the way of the proposed research project at the Stanford Synchroton Radiation Laboratory.

The protest follows a 7-2 decision May 23, by the Committee on Research, that prevailing research policy is adequate to handle the proposed research project.

Jon Adelstein, a leading student opponent of the proposed research project, said: "The committee is unwilling to protect Stanford researchers from being placed in a position of moral compromise.

"It will allow their academic freedom—the freedom to assure that their work is consistent with their conscience—to be violated. Many students do not intend to accept this passively; we will struggle to defend the integrity of our University."

Research principles 'myopic, irresponsible' for nuclear weapons—Mairson

The following opinion on the SSRL research dilemma was contributed by computer science graduate student Harry Mairson.

Much of the tremendous controversy that has surrounded the proposed nuclear weapons research at the Stanford Synchrotron Radiation Laboratory (SSRL) has centered on the so-called "end-use" policy of the University.

This policy is that there should be no such policy: the "Statement of Principles Concerning Research," adopted by the Faculty Senate in 1971, and quoted in Donald Kennedy's recent address to the Academic Council, states that appraisal of proposed research should be "based on (its) scholarly and educational merits. . . and not on speculations concerning the political or moral impropriety of the uses which might be made of its results."

As a member of the University and as a researcher looking forward to an academic career, I am offended by the invocation of these principles by the Stanford administration and Dr. Kennedy, especially in the context of proposed nuclear weapons research at Stanford.

What disturbs me most about the university policy is that end use is *not a valid criterion* by which a research proposal can be judged. It's not that Dr. Kennedy or the Committee on Research disagrees with me on weapons research at Stanford: they simply find my end-use arguments *irrelevant* to University decision-making! I might as well object to the proposed research on the equally irrelevant basis of the poor pitching staff of the Boston Red Sox.

The "Statement of Principles" goes on to assert that the responsibility of *individuals* that research and applications be consistent with personal judgment and conscience is reinforced by the "no end-use" policy.

What, then, should those who have end-use objections do? Dr. Bienenstock, the SSRL director, can reject the weapons research proposal if he is willing to single-handedly face down the government agencies that fund his laboratory, but what is everyone else to do? Vote with their feet and leave Stanford? Our University, given the policy, cannot *as an institution* address the problems of political and social impropriety of its research.

Now of course, the Stanford "no end-use" policy was not created to stifle free expression, but rather to preserve some time-honored standards of all universities. Briefly stated, these standards are that individual scholars should be free to select any subjects of research and to seek support from any source, in accord with openness and freedom of publication. The search for knowledge leads one to unexpected places, so researchers should be given free rein to proceed with the March of Science.

Furthermore, to foster this freedom, the University should not take a stand on national or global political issues: Stanford is a forum for individual research and opinion, but should not involve itself as an institution in a political issue beyond the campus borders.

Nobility of intent

While I genuinely trust that there is nobility of intent in the above standards, I believe they trivialize and romanticize the true relation of the University to the world around it. As a result, I find the application of the "Statement of Principles" in the context of nuclear weapons research to be myopic and irresponsible.

Let's begin with the March of Science argument, that scientists should be free to choose the subject of their research. Stanford already has strict conduct regulations in medical experiments concerning what may be done to human and animal subjects. I presume researchers would not be allowed to, say, interface a computer to the brain of a terminally ill patient. Universities have restricted or controlled recombinant DNA research because of potential hazards to the community. For example, Harvard retreated on this issue during the early 1970s in the face of objections of the Cambridge City Council as well as researchers within, notably biologist George Wald.

The "end-use" judgment is simply an extension of those principles which already have a strong foothold in the medical community. While medical ethics restrict experimental *conduct* and not later *application*, what ties the two together is responsibility. Conduct is not an issue at SSRL, since no one will be hurt as a pure consequence of the experiments therein, but the responsibility is that of Dr. Bienenstock, the scientists providing support to the experiment, and the entire University community.

Yet when Robert Oppenheimer exclaimed "Mr. President, there's blood on my hands" to Harry Truman after Hiroshima, I think Dr. Oppenheimer, while not flying the Enola Gay, was expressing some misgivings about his conduct. Do we remain blameless because nuclear detonation will not occur *in* the laboratory, but perhaps sometime later *on* it, as a result of nuclear weapons experiments conducted there?

But how are we to judge where research will lead? Better, says Dr. Kennedy, that one not judge: he told the Academic Council that "the search for knowledge leads to unexpected places; no research can safely be expected to be free from harm."

To what "unexpected places" does Dr. Kennedy think nuclear weapons research will lead? This research proposal is not like Democritus postulating the atom, millenia ago. Democritus was conducting pure research, but his Office of Military Appropriations in the Energy Department, which will fund the SSRL proposal, is not.

End uses won't disappear

It is patently obvious where nuclear weapons research will lead: to the further development of nuclear weapons. It is blind and absurd to ignore the fact that weapons research will in this case strengthen the political hand of the weapons establishment, a National Security Council that is ignorant of foreign policy, and an arms control team that opposes arms control. Of course, as a positive byproduct, it will supply needed funding to the University.

So now that Stanford has decided to ignore end use, has end use gone away? Certainly not. Now end use is defined by forces outside the University. By providing funds for certain research and denying funds for others, the Defense Department and other funding agencies define for the University what its end use will be.

As an example in my own field, computer science, there has been explosion of research and interest in computer systems. The fact that the Defense Department has been making multimillion dollar computer equipment grants is not entirely coincidental. Research areas in computer science, or any other field, do not rise and fall in prominence purely on the basis of their "inherent intellectual value." They respond to the marketplace, and to the government—to the end uses of others.

Principal investigators like SSRL Director Bienenstock cannot continually take on alone the Energy Department, so unless the University is willing to fulfill its institutional responsibility to negotiate with the relevant funding agencies, the University will be told what to do. The "freedom" that Dr. Kennedy defends is not much more than that of a puppet on a string.

If the Stanford administration was truly concerned about the freedom of its researchers, it would be better to challenge the funding policies of the federal government, for example, the decline in "peer review" funding as opposed to "project" funding. It would be better to defend Stanford laboratories against the invasion of military-oriented research projects, *if the University community objects to them*, and get Dr. Bienenstock off his current hot seat, having to choose between irate lab scientists and irate funding patrons.

Scientists denied forum

Universities have not always been so noncommital and nonjudgmental on questions of end use, and have in the past been quite willing to become institutionally involved in national and global politics, especially during times of national crisis.

The outstanding examples of such involvement are the Manhattan Project at Los Alamos and the development of radar at the MIT Radiation Laboratory. To European physicists such as Einstein, Fermi, Szilard, von Neumann, the Bomb was not just an advancement in human knowledge, but part of a desperate race with the Nazi war machine. To say "end use" was on the minds of those physicists and the institutions they represented is an understatement. For their service to the nation, these institutions have been richly rewarded: as an example, SLAC was built in 1958 at a cost *then* of 100 million dollars.

So academic institutional contributions to political issues is nothing new. It's part of what put Stanford on the map. Now, when the dangers of a nuclear exchange are frightening, it is time for the scientific community and the institutions of which they are a part to make an altogether different contribution, one which if anything *threatens* the source of funds. Stanford's current policy on end use may preserve its funds, but stifles this important contribution.

The weakest arguments for the current policy come from Dr. Kennedy's appraisal that end-use judgments are "knotty," "tricky and difficult," that "once you begin making value judgments about the possible outcomes of scientific work, there is no place to stop," and finally that the issues were definitively settled by the Senate in 1971.

Who said end-use judgments were easy? That is why they deserve detailed attention. Where do we stop making value judgments about scientific work? The responsibility of each generation of scientists is to answer exactly that, in accordance with what they believe and the predicament of the world around them.

Finally, why should the 1971 "Statement of Principles on Research" be the Mosaic end-all of decision making in this area? Just as historians come to new and different understandings of history, influenced by the contemporary issues and controversies surrounding them, the scientists must constantly reevaluate their institutional relationship with and contribution to society. Perhaps in 1943 it was reasonable for universities to participate in weapons research, and maybe the "Statement of Principles" was a legitimate expression of Stanford's policies in 1971. Twelve years later, with the threat of nuclear war much greater, it is not so appropriate.

A dynamic University must change to deal with the global community around it, and the desires of the community within it. Stanford's irresponsible "no end-use" policy, especially in the context of the nuclear weapons research proposal, does a disservice to both communities. It denies a legitimate forum to Stanford scientists who wish to participate in the decision making of the University. I believe that role, and that responsibility, is our fundamental right.

Kennedy meets with SLAC faculty while 50 workers make silent protest

Continuing their protest against weapons-related research, approximately 50 SLAC workers stood by peacefully as Stanford President Donald Kennedy arrived for a meeting with SLAC faculty members Thursday night, May 26.

The workers had requested a public meeting with Kennedy to discuss concerns about proposed weapons-related research at Stanford Synchrotron Radiation Laboratory, which uses the SLAC beam for its experiments. Kennedy instead arranged to meet with SLAC's faculty members and about a dozen invited guests.

Approximately 20 of the 31 SLAC faculty members attended the private meeting.

The protestors, gathered outside the building in which the meeting was held, quietly carried placards, including "Weapons Work is for Wimps," "Hell No, We Won't Glow," and "Welcome to SLAC—We Build Nuclear Weapons."

Robert Mayer, vacuum technician at SSRL, told reporters he was upset about a May 23 meeeting of the Faculty Senate's Committee on Research, in which proponents of a proposed research project at SSRL "were given 45 minutes to espouse the scientific merits of their proposal, while we got only five minutes to present our views. They should at least consider what we have to say."

The committee voted 7-2 to continue the University's 12-year-old research policy, which states projects are judged only on scientific merit, not possible end results.

One protestor, a visiting scientist from West Germany, claimed Thursday night that "indirectly other countries are supporting research that is not in their interest" because "a high percentage of SLAC workers are foreign visiting scientists."

SLAC faculty member Roger Miller said before the meeting with Kennedy that he expected divergent views to be presented. About half the SLAC faculty signed petitions earlier protesting a proposed weapons-related research project at SSRL.

"SSRL was set up with the understanding it would have a symbiotic relationship with SLAC," he said. If SSRL performs the proposed research, "the relationship will no longer be symbiotic—it will be very damaging to SLAC." Under such circumstances, SLAC's relationship with SSRL should be "severed," Miller added.

The protestors, who said they were a loose coalition of workers including many staff physicists, passed out copies of comments received from a questionnaire they sent members of the SLAC community.

"If we are to be prostitutes, we may as well do it at the big weapons labs and get paid accordingly," one wrote.

Another said: "Perhaps the true patriot is the one who does not march in lockstep with the government. We have all hidden here in our scientific Eden, and now the snakes have slithered in, with offerings of money, or maybe threats of no money. In any case, Eden is gone."

A third commented: "The pure research orientation of SLAC is one of the most important reasons for working here. It is positive, constructive. Regardless of monetary and other benefits, I have never (and will never) considered working at facilities which contribute to the development of nuclear and other weaponry."

Professor points to issue of 'involuntary servitude'

continued from page 1

"Moreover, they reported that all of those projects which had been described by the Department of Energy as 'weapons-related' offered a wide variety of potential applications unrelated to weapons and were of considerable scientific merit."

The controversial proposal was developed by scientists at Lawrence Livermore, Sandia, and Los Alamos National Laboratories, who seek $5 million in funds from the Department of Energy's Office of Military Applications. An additional $1 million from the University of California would support UC faculty research on the same beam line.

Four members of the Committee on Research read 12 currently funded Stanford research proposals selected from all current projects sponsored by the Defense Department, NASA, and the Department of Energy. Most of those projects chosen had titles suggesting possible military applications.

"Neither the scientific quality nor the degree of 'weapons-relatedness' of the (National Laboratories-UC) proposal appeared to differ significantly" from this group of 12 current Stanford projects, Meindl said.

Stanford President Donald Kennedy has repeatedly backed present research policy, which sets no limits based on prospective end use. He did so again Thursday, May 26, at a meeting with SLAC faculty and an invited group of about a dozen staff members concerned about "involuntary servitude."

Asked if it were possible for a departmental faculty to adopt more restrictive rules than the University as a whole, he replied that this may be conceivable, in theory. But he strongly questionned such a course of action, pointing out that this could have consequences among those "3,000 miles to the East" who vote on research appropriations. The proper forum for research policy remains the Faculty Senate.

According to Prof. David Leith, SLAC faculty secretary, there still was a great deal of dissatisfaction that Kennedy and the Committee on Research had not responded adequately to the issue of "involuntary servitude." Present policies were based on decisions by principal investigators acting as individuals, not as part of large interrelated organizations.

In an interview Tuesday, May 31, Prof. Gregory Loew of SLAC noted that the 1971 Faculty Senate statement of principles says, in part:

"The. . . principles circumscribe the University's role with respect to University-connected research. They in no way diminish, and indeed they reinforce, the individual researcher's personal responsibility to assure that the sources of funding for his research, and its perceived applications, are consistent with his judgment and conscience."

In the case of the national laboratories-UC proposal, Loew said, the application is openly declared—not just perceived.

Prof. Roger Miller of SLAC said he was "a little surprised at the headlines" after Thursday's session at SLAC, which emphasized that the faculty might adopt restrictions based on end use. But when the closed meeting ended, the situation was confusing with "five people talking all at once," he said.

Miller said he was considering the possibility of suggesting a SLAC faculty meeting to discuss modifying the present operating agreement with SSRL. Others still feel it would be better to seek a change in University-wide research rules through the Faculty Senate, he said.

"My own feeling would be to seek restrictions with respect to nuclear weapons," he said. "But it certainly isn't obvious that we can get a majority."

He and several others contacted at SLAC planned to attend a discussion with researchers from Lawrence Livermore on the controversial proposal at SLAC Tuesday afternoon, May 31.

Scientific merit should be major issue, says committee chairman Meindl

Following is a May 31 memo to the Senate of the Academic Council from James D. Meindl, chairman of the Committee on Research, on Senate Charge to Committee to Study Weapons-Related Research:

On March 31, 1983, the Senate adopted the following resolution:

"That the Committee on Research study the volume and character of weapons-related research at Stanford. It is desirable that a preliminary report of issues and procedures be delivered to the Senate during the spring quarter of 1983."

In response to the Senate's charge, the Committee on Research (C-Res) attempted to define "weapons-related research," but did not succeed. We concluded that virtually all research done at Stanford could conceivably have some military application.

Moreover, concern was expressed by Committee members that a review of the University's research projects according to selected subject matter is inappropriate, assuming all projects conform to research policies, especially those related to secrecy.

The Committee then reviewed trends over the past 10 years in the volume of Stanford's government sponsored research expenditures, to determine if the proportion of research funded by various federal agencies has changed significantly. Attached for the Senate's review are a table and a graph showing Stanford's sponsored research expenditures by government funding agency for the 10-year period 1972-73 to 1981-82. (These will be printed next week—Editor)

An analysis of these data indicates that the proportion of research funded by the Department of Energy (DOE) and the Department of Defense has increased somewhat, while the proportion of support from the National Aeronautics and Space Administration, National Science Foundation and Health and Human Services has declined slightly over the past 10 years. However, no conclusions regarding changes in the volume of "weapons-related research" can be drawn from these data.

To study the "character" of weapons-related research, a subgroup of four members of the Committee read 12 currently-funded Stanford research proposals selected from all current projects funded by DOD, NASA, and DOE. Most of the proposals they chose to review had project titles suggesting military applications.

The findings of this review were that all of the projects appeared to be of high scientific quality, and while each could have potential defense applications, all offered a wide variety of nonmilitary uses.

Because the Senate's charge to the Committee was prompted by a sepcific proposal (referred to as the "PRT" proposal) made by a consortium of researchers (from several University of California campuses, Los Alamos Labs, Sandia Corporation, Lawrence Livermore National Laboratory) for research to be conducted at the SSRL, the Committee devoted considerable attention over the course of several meetings to that particular proposal and associated issues dealing with the relationship of SLAC to SSRL.

Several Stanford faculty members affiliated with SSRL who had read the PRT proposal were invited to three different Committee meetings to describe the proposed research.

Based on the analyses presented to the Committee by Professors Bienestock, Lindau, and Spicer, the C-Res subgroup referred to above agreed that neither the scientific quality nor the degree of "weapons-relatedness" of the PRT proposal appeared to differ significantly from the 12 proposals they had reviewed.

The vast majority of the PRT proposal was reported by the SSRL faculty to be very basic research; moreover, they reported that all of those proposed projects which had been described by the DOE as "weapons-related," offered a wide variety of potential applications unrelated to weapons and were of considerable scientific merit.

The Committee also heard from several Stanford faculty, staff, and students, most of whom are affiliated with SLAC, who opposed the proposed PRT project on the grounds that weapons research is inappropriate in a University setting and that SLAC heretofore had been a single-purpose facility, not engaged in weapons research.

Some individuals at SLAC who are morally opposed to "weapons research" expressed concern that they would be forced into "involuntary servitude" (since SLAC delivers the electrons for SSRL's research) by having to "participate" in weapons-related research if the PRT proposal is accepted by Stanford.

In executive session at our May 23rd meeting, the Committee adopted the following resolution, by a vote of 7 in favor and 2 opposed:

Resolved: That the Stanford statement of Principles Concerning Research, as adopted by the Senate in December, 1971, is adequate to handle the current SSRL-SLAC controversy regarding the PRT proposal.

In reaching their decision, the majority of the Committee reaffirmed University policy that research projects should be judged on scientific merit and not on potential applications.

The minority view was that the University's current policies do not adequately address the issue of "involuntary servitude."

In view of the difficult questions raised by these issues, the Committee agreed unanimously to recommend that the Director of SSRL develop means of monitoring the research activities performed at SSRL during periods of any user's "dedicated time" on the beam lines to be sure that the research actually performed is consistent with the research as proposed. This recognition applies not just to the PRT proposal (if it is accepted), but to *all* research done at SSRL within any user's guaranteed time on the lines. The director of SSRL will be asked to report to the C-Res the means by which this recommendation will be implemented.

We trust that the actions taken by the C-Res respond substantively to the Senate's charge. Unless otherwise requested by the Senate, no further action by the Committee is planned during this academic year.

Simplot, Treybig, Kurtzig, Dixon draw 1,200

Silicon Valley fever spreads in new student generation

Silicon Valley fever is spreading.

A new generation of student entrepreneurs and community capitalists—1,200 strong—cheered their elders and their peers at the second annual student-run conference on entrepreneuring at Stanford, May 21.

In Memorial Auditorium, where Yippie leader Jerry Rubin once told a stomping student crowd to burn books and kill their parents in the late 1960s, the new generation gave a standing ovation to J.R. Simplot, Idaho pig farmer who invented the frozen French fry and parlayed hogs into a high-tech fortune.

"I've been to China and Russia, and they haven't got one thing we want," he said, to wide applause.

"Entrepreneurs are what built America. Make democracy work for the future, as long as we can see it." Together, capitalism and democracy can "produce utopia for many millions more people.

"Individuals make jobs, not the government. Entrepreneuring is what puts people to work.

"You've got to get big to stay competitive," he advised. "Don't sell out. Hang on."

For a better life, the 74-year-old recommended "stop sucking on cigarettes," stay off booze, and "stay in shape, stay running." More applause, followed later in the day with soft drinks, bottled water, wine, and cheese.

"You're the most enthusiastic, bright-eyed group of people I've ever met," Simplot observed.

Two Stanford alumni who likewise founded their own companies also urged balance in personal life.

"Think about developing your own abilities and skills," said Jim Treybig, founder of Tandem computers. The first few people in a new venture "set the tone of the company forever."

"My long range plan was to start a family," confided Sandra Kurtzig, founder of ASK Computer Systems. The part-time job she started in her apartment took only 20 hours a day. "Four hours was enough to start a family," she smiled.

Her father refused to accept stock in her company in return for a loan, saying he'd just papered his bathroom. But eventually, he paid much more buying stock in a public offering, she chuckled.

Keys to success

The key to success was similar: "Hire the best people. . .better than yourself," she advised. A good outside board of directors, a sharply focused product, and a belief in yourself also are important. "If you want insider advice, just call a staff meeting."

Friday beer busts, a highly publicized feature of both Tandem and ASK, help keep communication channels open as the company grows, they agreed.

Treybig still interviews prospective employees every week and said his company "works hard not to have divorces" among its workers. A former four-pack-a-day smoker, he's now a confirmed jogger.

David F. Dixon, founder of the United States Football League, said ethical concerns are good business practice. He called the injuries in football "a national disgrace," and said his league hoped to have at least one person working full-time with researchers to see how these can be reduced.

While Al Davis is "one of the most progressive men in any sport," his decision to move the Oakland Raiders to Los Angeles was "a disgrace" to fans who filled Oakland stadium to capacity. Sports have a social obligation, especially since they are "very subsidized by the public," Dixon observed.

Nolan Bushnell, founder of both Atari and Pizza Time Theater, said robotic football could become a reality, both on the playing field and in home game rooms, where players could simulate "George Plimpton without bruises."

Instead of being restricted to the weekends, friendly touch football games could become an everyday occurrence in a more leisured future, he added.

As early as 1987-88, America may see its gross national product booming ahead 15 to 18 percent annually, with "tremendous labor shortages" that could be solved only by "opening the Southern border."

In the fast emerging "robotics age," he added, "it may be possible to eliminate an awful lot of the poverty in the world in our lifetime."

Linking computer aided design to computer assisted manufacturing may produce a "cornucopia of consumer goods" with real deflation in prices. "A new car could be cheaper than a physician's house call."

He urged entrepreneurs to avoid "the paralysis of perfection." Likening people to computers, he said "You are a collection of program bugs. That's your personality. Anyone who does it exactly right becomes boring."

Both he and William F. Miller, president of SRI International and a Stanford Business School professor, said entrepreneurs are engaged in "creative destruction" of established industries.

"Every time you destroy jobs, you improve the welfare of the nation," Bushnell said. "Jobs have to be thought of as transitory phenomena."

Miller, speaking at one of 40 workshops, said that throughout history "new technologies create more jobs than they destroy," after some "blips" in conversion.

In sheer numbers, the gains in electronics may prove small in comparison to the "spillover" to other services. As Pacific Telephone has become highly automated, its work force has doubled, as more services have been added. A similar change is taking place in banking.

The quality of workers will be more important than sheer numbers, Miller said. Rate of change in jobs far exceeds the proportion of new workers, which means industry must help present employees develop new skills.

Between now and 1990, only 10 percent of the total work force will come from new employees, Miller said. Three-fourths of those who will be employed in the year 2000 already are on the job.

Yet 25 percent of the jobs will change by the end of this decade, and 40 to 45 percent will be different by the year 2000.

Paradoxically, for the first time in two centuries, the present student generation in the U.S. will not surpass or even equal its parents in educational skills, he said.

In a recent international comparison of 17-year olds in 19 subject areas, Americans were not ranked first or second in any field and came in dead last in seven among youths in industrialized countries, he noted.

Increased support for education from business and

all sectors of society will be needed to "avoid a Luddite movement" and keep the U.S. competitive in world markets, Miller said.

SRI has compiled more than 1,000 examples of successful "grass roots" cooperation by the private and public sectors to meet this and similar challenges, he said to help spur retraining, he suggested, the government might provide unemployed workers from declining industries with "vouchers" to be used in training by new employers, who could apply them as tax credits.

This would put retraining in the same category as research and development.

Industry will bear major responsibility for retraining workers, he added. Through purchasing policy, it can demand more "user friendly" equipment or demand appropriate educational support for new equipment.

Some of the states and industries most affected by the decline in "smokestack" manufacturing are now developing the "most imaginative" ways of meeting competitive challenges, he added.

Creative view of shortcomings

Students were urged to take a similarly creative view of their apparent shortcomings by Michael Boone and John Halamka, Stanford undergraduates now deep in their own ventures—Boone Computers and Colossus Computers.

"Being naive is an advantage," Boone said. People are glad to provide "free help for the young." Instead of being paralyzed by potential pitfalls, highly motivated and energetic young entrepreneurs may simply forge ahead, learning quickly from their initial mistakes.

Started in a Stanford dorm room, and backed by a venture capitalist, Boone's firm now employs 15 people and introduces its first product line in June. This includes a very sophisticated computer simulation of the Pebble Beach golf course.

Halamka, a Stanford senior, has done consulting work for Arthur Laffer, Milton Friedman, Edward Teller, and McGraw Hill. He recently signed contracts totaling $300,000.

Another software entrepreneur, Marcia Klein of The Learning Company, said children can learn concepts much earlier than previously thought. Programs designed for seven-year-olds are attractive to three and four-year-olds. The subjects include logic, math, spatial relations, and matching.

Based in Portola Valley, TLC has nine programs, 15 staff, sales of more than $1 million and hopes to be "a fairly major player" in a market projected at $1 billion by 1987, Klein said.

The Stanford Business School interns are helping develop a long-range business plan for TLC.

James Levy, founder of Activision, told a news conference that "lean and hungry" students make "the best entrepreneurs."

Stanford is "terrific" to provide an umbrella for students, who formed the Center for Entrepreneurship this year with initial grants of $1,500. Once started, the University should "get out of its way," Levy suggested.

Simplot felt entrepreneuring should be emphasized in curricula as early as the first grade. Dixon said he's encouraged Tulane, Loyola, and the University of New Orleans to follow Stanford's example.

Student spirit commended

Howard Head, inventor of the Head ski and Prince tennis racket, said universities should not take the lead in developing entrepreneurial centers. "This should come from the primitive, naive spirit of students."

Head, a featured speaker at last year's conference, said "the best ideas come out of good needs of your own." Too much knowledge and experience can block creativity.

Education doesn't promote spark, drive and risk-taking, Head added. Some of the most creative engineers were biologists and physicists as undergraduates.

Prof. Karl Vesper of the University of Washington, a Stanford engineering alumnus who serves with Head as an adviser to the Stanford entrepreneurs, said student interest in entrepreneuring "has to be triggered. That is not happening at most schools." He cited Babson College as an outstanding exception.

Since 1967, Vesper said, the number of colleges offering courses for entrepreneurs has risen from about a half dozen to 160. The number involved in research on entrepreneurialism has grown from three to about 40 or 50.

"Teaching rose rapidly from student stimulus," he said. "Research will provide a more permanent home."

Levy of Activision said business school curricula are "not structured to deal with entrepreneurs." Courses emphasize control and measurement.

Treybig of Tandem suggested that Stanford should "get more aggressive" in emphasizing creativity and productivity.

Both he and Levy emphasized that Silicon Valley has "a fantastic support system" for entrepreneurs that is "hard to create anywhere." It might come in time to Austin, Texas.

In West Germany, Treybig noted, people "aren't proud to be president of a four-person firm. Here, even if you fail, you can be proud.

Companies are not abandoning Silicon Valley, Levy said. Some are expanding manufacturing elsewhere, but "the brainpower and corporate structure are tightly wired in here. . .I don't want to go anywhere else."

Stanford Engineering Dean William Kays told the conference, "in all my years here I can't remember any activity that has excited so much interest in both students and the surrounding community. It is evidently filling a need that we didn't know existed."

J.R. Simplot, opening speaker at the conference, was an Idaho pig farmer who invented the frozen french fry and parlayed hogs into a high-tech fortune

Kays noted a paradox in the conference dedication to the late Fred Terman, former Stanford engineering dean, provost, and popular "father of Silicon Valley."

"Fred was not himself what I like to think of as an entrepreneur," Kays said. "Central to entrepreneurship is both the willingness and eagerness to take a risk.

"That was not Fred Terman. Fred only bet on things when the probability of success was close to 100 percent. There was no risk at all.

"Fred studied a problem with a thoroughness that you would have to see to believe. So he always knew the facts. Fred did very well for himself. He wrote books for a newly emerging market about which he knew all the facts (radio engineering, and then electronics), and then he invested the proceeds in some of the enterprises of his students.

"He picked far out, risky people to back like Bill Hewlett, David Packard, Russell Varian (the founders of Hewlett-Packard and Varian Associates). But Fred did help create an environment in this valley where entrepreneurship abounds."

We are moving from an economy which rested on the motor car to one which rests on the computer. Now that economy is shifting from being hardware driven to being software driven.

—John Naisbitt

Stanford President Donald Kennedy told the conference: "Much of our current economic vigor depends upon the jobs created and technologies developed in the venture sector of this economy. To have a good idea, to get others to share some risks in its behalf, to stick with it until it's worth something, and then to persuade everyone else that it is—these things take a lot of personal courage and initiative. I suspect you all rate these qualities high on the list of virtues. I certainly do."

But, Kennedy added: "Not everyone is in the position to have a great commercial idea, or to benefit from the good ideas of others. Whether we like it or not, American society is not, probably never has been, a perfect market in which the benefits of entrepreneurship are distributed broadly and there are no external costs.

"That is why it is not enough merely to do well by doing good. It is especially important for those of you who are focused on that kind of success, and very likely to achieve it, to remember that you have a more direct obligation to the society at large, and especially to those less fortunate than you, that is not discharged merely by the success of your ideas, or even by the tax revenue they generate. Ironically, the more successful the idea, the more this is true.

"So I hope you will think about the need to devote some of the personal energy and creativity you bring to the business of innovation to the public good in other ways as well."

In a special message to the conference, President Ronald Reagan said: 'As you move toward fulfilling the goals and dreams of the future, your vision and commitment will play an important part in maintaining this nation's health and vitality.

"What you conceive of now can be the reality of America and the world in an era yet to come."

About 625 of those attending came from the community. About 120 student volunteers helped run the program, in which another 325 or more students participated. Workshop speakers, their guests, and press brought attendance to 1,200.

Besides the conference, the Stanford Center for Entrepreneurship places student interns in startup companies, provides consulting through the Business Development Association of the Graduate School of Business, arranges on-site tours of Silicon Valley venture firms, and publishes a newsletter, *Entrepreneur*.

In its premier issue, Stanford alumnus John Naisbitt, author of the best selling book, *Megatrends*, notes that the U.S. now is "in an incredible entrepreneurial explosion," similar to the one which occurred when the country shifted from agriculture to an industrial base.

"We are moving from an economy which rested on the motor car to one which rests on the computer," Naisbitt says. "Now that economy is shifting from being hardware-driven to being software-driven.

"There are two things different this time around. The first is women: as many as a third of the companies formed are created by women. (The second is) young people—the 14-year-old who writes software programs, then incorporates and sells stock."

The Student Management Committee of the Entrepreneurial Center is headed by Thayer Wendell. Conference cochairs were Mary Van Maren and Bruce Johnson. Further information may be obtained by writing the Stanford Center for Entrepreneurship, Post Offie Box 3678, Stanford, Calif. 94305 or phoning (415) 497-9651.—Bob Beyers

Universities' two-year confrontation with N.I.H.

Donald Kennedy 'vexed' in long struggle over indirect costs

Following is a widely circulated position paper on the NIH proposals on indirect cost by President Donald Kennedy.

For two years now, the National Institutes of Health have been trying, by administrative means, to compel a reduction in the reimbursement of indirect costs NIH owes universities under established government rules.

Last year, an arbitrary 10 percent reduction in recovery was proposed; it was averted when the Congress recognized the effort for what it was and instructed the agency not to do it. This year the attempt has been renewed in a more complex disguise: NIH proposes to reduce indirect cost recovery by a formula that would decrease reimbursement in proportion to the ten-year history of indirect cost recovery in each grantee institution.

Now, this is not the first time that the universities and the government have addressed the problem of indirect cost. It has been repeatedly recognized that the indirect costs of doing research are *real* costs, even though they cannot be specifically identified with individual projects.

The universities are spending real dollars to pay them, and therefore—if they are not reimbursed—university general funds must support them. The cost-accounting principles used to calculate these costs, and thus to set the recovery rate, have been worked out over the course of years of negotiation between the universities and the government. The Office of Management and Budget is not exactly noted for its soft, cozy approach to how the government's money should be spent, and the cost-accounting principles are OMB's.

But because the costs are *indirect*, they naturally arouse some suspicion in members of Congress and others who encounter them for the first time. That is why numerous studies of their appropriateness have been ordered and performed by the General Accounting Office and by independently auditing firms.

In each case, these studies have documented both the reality of the costs and the appropriateness of the accounting principles under which they are reimbursed. And the reimbursements are made only after government-conducted audits of actual expenditures at the recipient universities.

So why, after all this history, are there now questions about indirect costs?

The answer is that one government agency among many—NIH—has set itself some goals for research support that are impossible for it to accomplish within the resource limitations established by the president's budget.

It has decided unilaterally that the number of grants is somehow more important than adequately funding research according to the recommendations of study sections and in accordance with accepted cost principles. This will result in the awarding of greater numbers of grants, at the expense of university general funds and the quality of research.

It is, in other words, a new and creative form of forced cost-sharing. For a university like (Stanford), the largest single source of unrestricted revenue is tuition; therefore the effect of a failure to reimburse the real costs of research is to move student tuition dollars to the support of faculty research.

NIH has made its proposal superficially attractive to a few principal investigators, who see it as a way to increase their own research support. Others, who understand that it will merely require the reallocation of tuition income from such other expenses as faculty salaries and building maintenance, are less enchanted with it.

Abrogation of an understanding

What bothers the universities most about this proposal is the understanding it abrogates. Years of faithful institutional effort went into the negotiations of the cost principles in OMB Circular A-21, and—before that—into building an understanding with Congress and the Executive Branch about the legitimacy of indirect costs.

A-21 represents a compact with our government. We are not free to change the accounting principles, or to alter OMB's disallowances of what we regard as legitimate costs. But, it now turns ut, a single government agency can apparently jettison the agreement when it pleases.

Appeals to OMB, to the Office of Science and Technology Policy, and to the Secretary of Health and Human Services have elicited sympathetic hearings and helpful comments, but no insistence that NIH alter its budget proposal. We have, in effect, been told that it is up to Congress to insist that the Executive Branch play by its own rules.

What justification does NIH present for this extraordinary action, apart from its desire to fund a larger number of grants? It asserts that indirect costs have risen at an unacceptably high rate: they have used phrases like "out of control" and "disproportionate growth," enhancing the impression that something untidy and quite possibly illegal is going on. In fact, there are a number of perfectly good explanations for the increases that have occurred in indirect cost rates.

First, costs in universities that are more intensively associated with research than with other activities have been growing faster than the rate of inflation. This alone will increase the indirect cost rate.

Second, in funding the *direct*—cost component of research proposals NIH has consistently understated the actual rate of cost rise. That will make indirect costs rise faster than directs.

Third, equipment sharing and increasingly complex research requirements have resulted in more pooled costs that are legitimately attributable to the indirect cost categories.

Finally, better management and improved identification of costs—required by government rules—has often resulted in the identification of more costs that must be allocated to research. In fact, the indirect cost rates charged by universities are far below those charged by private industry or by non-profit, non-academic research organizations. It is simply not legitimate to argue that increases in the indirect cost rate over a period of years amount to a wrong that must be put right.

Now let me turn from the *general* issue of indirect costs to the *specifics* of the proposal NIH has made. The NIH formula would base each institution's indirect cost reimbursement on a level equal to its average percentage of total costs over the last decade.

In other words, institutions that have experienced significant rises in indirect costs over the preceding 10 years will be affected heavily, whereas those that have experienced little increase will be held harmless. There are a great many things wrong with this proposal, but three are especially disturbing, and I want to discuss them in turn.

1) The proposed formula would impact different kinds of institutions differentially, and unfairly.

In essence, the formula selected by NIH will be hardest on institutions that have kept careful track of indirect costs and done the cost-accounting studies necessary to identify and allocate them.

Some senate institutions, for example, have lower indirect cost rates because reimbursements from the federal government are not returned directly to the university; instead they go directly to the state treasury. Those universities therefore have had little incentive to fund the cost-accounting activities necessary to justify realistic overhead rates and as a result their rates have been low, and relatively constant.

It would be a bizarre public policy indeed to reward such historical accidents at the expense of other institutions, but that is exactly what the NIH proposal will accomplish.

At the same time, the proposal is likely to penalize selectively those places that have achieved the highest quality. Partly as a result of NIH support, the most powerful programs of biomedical research have grown up in the nation's major academic health centers. These are the institutions that would pay the largest share of the reimbursement—shortfall—although *all* universities will feel substantial negative impact.

2) The formula will be cumbersome and difficult to administer.

Though it purports to be simple, the new and unprecedented formula proposed by NIH is in fact very complicated, and will prove highly problematical to administer in actual practice.

Total cost is not a generally recognized base to which we could apply the rate, and such a base would create substantial inequities among the individual projects. Nothing is said about the differential indirect cost recovery rates between off-campus and on-campus projects, or what they would be under the new formula.

No plan has been produced that would allow for exclusions from the base, for such items as equipment or subcontracts. No recognition is given to over or under recoveries from prior periods.

And what would be done about institutions that have actually showed declining rates since the recent revisions in OMB Circular A-21? Would these be reimbursed at a figure *above* their current negotiated rates?

The frantic haste with which this proposal has apparently been gotten together allowed its authors no time to think through how it might be applied in the real world.

3) The formula was arrived at unilaterally, without adequate consultation.

In its instructions to NIH a year ago, the Congress said (in the report of the House Committee on Appropriations)

"The Committee is persuaded that indirect costs are a legitimate component of the costs incurred in performing biomedical research and should be adequately reimbursed."

The Committee went on to identify the perception that federally sponsored research may be bearing more than its fair share of these costs, and accordingly it instructed the Secretary of Health and Human Services

". . . In cooperation with the NIH director, to make a careful review of this matter, including consultation with the universities and other research organizations most directly affected, and to submit a report setting forth conclusions and appropriate recommendations to the Committee for discussion in advance of hearings on the 1984 budget request."

Shortly after that language appeared, the presidents of the university associations wrote to the Secretary of Health and Human Services, urging the department work with us to carry out the directive of the Congress, and proposing an organization from the universities' side.

Nearly two months later, we received a letter from the Assistant Secretary for Health stating NIH's intention to consult; but the next real contact did not occur for another three months, on Feb. 14.

Then several of us were given three days notice to attend a meeting in Washington—at which, the agency announced, it intended to lay before us five different "policy options" for reducing indirect cost recovery! In effect, we were asked which of several surgical approaches to amputation we preferred.

My colleagues attended the meeting, but only after notifying the Assistant Secretary for Health and the Director of NIH that they were participating under protest. Those representing the universities who were able to get there on short notice tried to get NIH to change its position, but to no avail. It is thus misleading—indeed, disingenuous—to claim that the formula NIH is now offering results from any consultation with the universities.

To the contrary, consultation was avoided for as long as possible, and the meeting of Feb. 17 was hastily arranged just before NIH's reauthorization hearing was scheduled to take place. One can only surmise that NIH was embarrassed by its failure to comply with the instructions of Congress; it certainly had something to be embarrassed about.

Kennedy's long perspective

Let me conclude with one more general observation. If I sound vexed in these remarks, it is because I am. The vexation emerges out of my long respect for the National Institutes of Health, and its relationship to the conduct of biomedical research in the country.

I have viewed that relationship from a number of perspectives: as a biology graduate student; as an NIH grantee for 25 years; as a professor and then chairman of a distinguished biology department; as a senior consultant to the Office of Science and Technology Policy in the White House, and then as head of a sister agency in the Public Health Service; and finally as the provost and president of a major research university.

From every one of these viewpoints, the NIH appears as an institution of extraordinary worth. It pioneered in the development of the peer review system of scientific evaluation, brought the status of biomedical research in the nation's universities to its present extraordinary level, and developed an intramural program in which generations of distinguished investigators received their first exposure to science. We of the academic community have reposed our trust and hope in it through parts of five decades now.

Were this merely an argument about how many grants NIH should fund, or how it should balance its intramural needs against its extramural ones, it could be put down as another friendly family dispute.

But it is not about that; instead, it entails a unilateral abrogation of enduring understandings among three parties: NIH, the universities, and the investigators. It will not escape your notice that this issue is almost ideally structured to stir up differences between university administrators and their own faculty colleagues, as well as between the government and some of its most valuable client institutions.

The universities are perfectly prepared to reassess any aspect of the indirect cost recovery provisions on a government-wide basis, in the same way we have in the past. But I do not think we should be asked to suffer huge and unexpected losses as a consequence of a unilateral agency action which is arbitrary, unfair, and undertaken without consultation. It was the Congress who ordered the consultation, and it is the Congress that now must put things right.

John Kaplan

Kaplan sees no quick fix for heroin law, policy

On the whole, our present policies on heroin are about as good as we're going to get," a Stanford expert concludes after an exhaustive study.

"Heroin maintenance won't work and free availability would be even worse. Increased law enforcement may not prove very cost effective," says Prof. John Kaplan of the Stanford Law School.

"The choices are difficult, and none is very promising," he concedes in a new book, *The Hardest Drug: Heroin and Public Policy* (University of Chicago Press, 247 pp., cloth, $20).

"Decriminalizing heroin use might be a short step toward reducing this tough, long-term national problem. But even this might not work.

"Heroin users who commit other crimes should be prosecuted for their acts, and heroin addicts who do so should at least be coerced into drug treatment programs."

A former federal prosecutor, Kaplan is an expert on criminal and constitutional law, and author of "Marijuana: The New Prohibition." His research was supported by a grant from the National Institute of Law Enforcement and Criminal Justice.

"Although there is hope that the cumulative effect of many small improvements may eventually lower greatly the cost of heroin in our society, it looks very much as though no dramatic change will rescue us from the problem," he declares.

Withdrawing criminal sanctions from otherwise law-abiding heroin users may permit the development of informal social controls governing its use, Kaplan believes. "An increasing percentage of heroin users today are moderate, controlled users, most of whom—along with some addicts—do not pose any special risk of crime."

When heroin users commit a crime, coerced treatment is "a much more cost-effective means of reducing both his heroin use and the crime produced by such use than are the usual processes of criminal law," he adds.

Even so, he concedes, "we have hardly begun to discover which kinds of treatment work best with what kinds of addicts." Therapeutic communities, minimal treatment beyond routine monitoring, and maintenance on methadone or other opiates each may help different people.

"Even something so simple as escorting an addict from the courtroom to the treatment program makes a great difference in the retention rate," Kaplan reports.

"We may develop outreach programs which contact addicts or heroin users before they come to official attention. In one experiment, youth workers were able to catch a heroin epidemic at its very beginning. Without significant coercion, they talked many of those who were becoming dependent into treatment before the worst personal and social effects of addiction had surfaced."

Contrary to the popular image of the heroin "pusher," Kaplan says, "the sellers of heroin use considerably less pressure and inducement to market their wares than do most marketers of automobiles, detergents, toys, and breakfast cereals.

"Most commonly, heroin use spreads within a peer group in areas where its use is already endemic. Typically, these are core areas of our large cities where there are always more heroin users and sellers than the police can apprehend or the courts process.

The inevitability of addiction is another myth, he declares: "It is now clear that there exists a sizable population of nonaddicted but regular heroin users who seem well integrated into society and in many ways are indistinguishable from the rest of the population. These users bear the same relationship to heroin addicts as normal drinkers do to problem drinkers or alcoholics."

Contrary to the popular view, "heroin addiction is neither continuous nor permanent," he adds. "Less than half of the addicts who have been on the street for a year will have used an opiate daily during the entire period.

"Often the addict will go through voluntary withdrawal because the buildup of his tolerance has made his habit too large and expensive. . . . Many addicts permanently give up heroin at an early age and after a relatively brief period of addiction. . . . Like smokers and alcoholics, heroin addicts are not quite so intractable as we have thought."

Even though as much as half the street crimes in Manhattan in 1971 involved heroin addicts or users, "the causal connection between heroin and property crime has been grossly exaggerated in the past," he adds.

"Virtually every study of the onset of addiction shows that, on the average, the addict's first arrest precedes his first use of heroin by about one and a half years. Rather than causing crime, heroin use has merely been adapted by various criminalistic groups."

But addicts on a "run" of heroin use can be prodigious thieves, he adds. One Baltimore study showed 237 addicts committed more than 500,000 crimes during an average of 11 years on the street.

In 1971, there were approximately 500,000 drug arrests, of which roughly a quarter probably involved heroin use or trafficking. Six years ago, estimates of the total heroin addicts ranged from fewer than 150,000 to more than a million.

The most popular estimate of the total cost of heroin addiction in the U.S. is about $10 billion annually. All these numbers "may well be wildly in error," Kaplan cautions.

"The drug area is full of surprises." Where Western Europe seemed virtually immune to heroin five years ago, in 1981 it consumed more heroin than the U.S.

Similarly, seven years ago, few would have predicted that cocaine would bring more money into the illegal market than heroin. Yet that has happened now.

The way it was....

75 YEARS AGO (1908)

Yamato Ichihashi, a Japanese graduate of the class of 1907, was appointed an assistant professor in the Department of Economics. The appointment was the first of its kind on the Pacific Coast and was in line with President Jordan's repeated declaration for equal rights to the Orientals. Ichihashi was thoroughly qualified because of his extensive acquaintance with the political and economic history of both the United States and Japan.

* * * *

A resolution of the Board of Trustees instituted an era of absolute prohibition of the use of liquor on campus and in student boarding houses off campus under penalty of suspension. A second resolution provided for the annulment of leases of property upon which the liquor regulations were violated and made the whole fraternity liable for the acts of each member.

* * * *

The Board of Trustees considered President Jordan's proposal to change the University into a postgraduate institution and decided that Stanford would never put itself out of touch with the common school system. It was felt that such a radical innovation could not be made until the secondary school system was vastly improved, and the high schools could offer freshman and sophomore courses.

50 YEARS AGO (1933)

As a result of the new policy which increased the number of coeds at Stanford, the new Stanford Union, which had been a men's residence, Madrono Hall, and the old Sigma Kappa house were designated for the use of women students who could not be accommodated in Roble Hall.

* * * *

The Pacific Coast Conference voted to permit radio broadcasting at football games with the institutions holding complete control of sponsorship and distribution. The losing battle against broadcasting was led by Stanford University.

25 YEARS AGO (1958)

Work began to lengthen Stanford's Mark III linear electron accelerator to 310 feet and step up its power to more than a billion volts.

* * * *

Stanford s new campus in Germany, in the village of Beutelsbach near Stuttgart, was formally opened with the arrival of 63 students for the June to January session. Stanford was represented by President Wallace Sterling, his assistant, Frederic O. Glover, and Prof. Robert A. Walker, chairman of the Committee on General Studies. Representing the German government at the ceremonies were Dr. Gebhard Mueller, minister-president of the state of Wurttemberg-Baden, and Dr. Peter Boerner, former director of the Goethe Museum in Dusseldorf, who had been appointed resident director of the campus.

* * *

Eleven foreign students were selected to attend Stanford in the fall as a result of funds subscribed by the student body to cover both tuition and housing. They were from Japan, Scotland, Yugoslavia, Lebanon, Poland, Australia, Germany, Egypt, England, and France.

CHAD pledges due June 20: Jan Skrove

Editor, *Campus Report*:

Most of you are aware that the Combined Health Agencies Drive (CHAD) is currently taking place on the Stanford campus. The University has but two campaigns during the year, and both of those are undertaken with absolutely no personal solicitation. CHAD is held in the spring and United Way in the fall. Last year both campaigns were extremely successful, and thanks to the generosity of the Stanford community, $45,234 was raised during the 1982 CHAD campaign. Hopefully, this year with medical costs rising so rapidly, we can surpass that amount.

CHAD lists 15 agencies which it supports and the money it receives through the generosity of the donors on the campus, at the Medical Center, and at SLAC gives vital support to medical research, education, and service programs of those agencies.

I would like to remind those of you who prefer to pledge your gift that the deadline for getting pledge cards to the Cashier's Office is June 20, in order that they may be processed in time for the July paycheck. Naturally, persons preferring to send a check are not bound by this deadline. However, no matter how we decide to donate the gift, the pledge card enables us all to contribute to the agency or agencies of our choice in the county of our choosing.

I would also like to add that although the May 23 letter from Dr. John Nicholls, chairman of Stanford CHAD, suggested that CHAD be contacted directly by anyone wishing to receive additional materials, I would like you all to know that I have the materials you may be missing and will be happy to send anything you need if you will call me at 7-2862.

Let me close on a happy note by informing you that as of May 26 the Cashier's Office had already received a total of $31,080 in pledges and cash donations to CHAD. With the support of us all we may well exceed last year's figures.

Jan C. Skrove
Office of Public Affairs

Medical Center MEMO

Eating disorders addressed by June conference

A conference on eating disorders, sponsored by Stanford's department of psychiatry and behavioral sciences, is scheduled for Saturday, June 25.

The behavioral medicine program is presenting the day-long conference in response to growing community concern about obesity, anorexia and bulimia, to broaden public understanding of such disorders and describe the most current treatments available, said Dr. Stewart Agras, director of the program and one of the speakers at the conference.

Anorexia, a condition usually found in girls and women, is characterized by a distorted body image and resultant adherence to a rigid, extreme diet which leads to excessive weight loss. Bulimia, also primarily affecting women, tends instead to compel people to eat excessive amounts of food. Most binge and then purge themselves of the food by inducing vomiting, or taking laxatives or diuretics.

Ongoing research continues to question what connections exist between the two disorders, or if in fact they are different facets of one illness.

At the conference, Dr. Agras will give an overview of eating disorders and will specifically address obesity. Speaking on bulimia will be John Bachman, Ph.D., director of the behavioral medicine clinic. Dr. Barr Taylor, associate director of the program, will discuss anorexia nervosa. All three regularly see patients in the eating disorders clinic.

In addition, other faculty and staff from the clinic will participate in afternoon small group discussions of each of the topics.

The conference will respond to growing public concern about obesity, anorexia and bulimia.

—Stewart Agras

The conference, scheduled to last from 9:30 a.m. to 4 p.m., will be held in M104 of the medical school. Pre-registration is recommended, as space is limited. A fee of $50, or $75 a couple, will be payable at the door.

Lunch will be available for purchase at the medical center and on campus.

For further information or to register, call 497-7871.

Medical School proposes center for NMR research

A new center to explore applications of nuclear magnetic resonance (NMR) in medical research and practice received unanimous approval Friday by the executive committee of the Stanford University School of Medicine.

"NMR, co-invented by Stanford's Nobel laureate Felix Bloch in the mid-forties, has evolved into one of the most extraordinary body-imaging tools of the future," said Dean Dominick Purpura. "It's therefore fitting for Stanford to establish a center dedicated to the continuing development of NMR."

The proposal for the new center, estimated to cost $3.3 million, will now move through the University administrative review process before it is submitted to the Stanford Board of Trustees for approval in the fall, said Purpura.

"I view the development of the NMR center as a component of a much broader based program in molecular and genetic medicine which is currently in the planning stages," Purpura said. "Clearly we are preparing for entry into the twenty-first century with an approach that would permit rapid transfer of basic science information to the clinical domain.

"NMR is but one aspect of molecular medicine and an important one. The proposed NMR Center will be the first of its kind anywhere, and Stanford should maintain this leadership as a tribute to Professor Bloch."

New to medicine, but long used by physicists and chemists, the analytic technique of NMR depends on the ability of chemical elements to respond to intense magnetic fields and bursts of radioenergy by emitting signals that indicate the structure of molecules or the state of health in human organs. NMR needs no hazardous X-rays, no injections, no drugs and no surgery to perform its detective work. In medical jargon terms, it is noninvasive, and therefore safe.

In 10 minutes or less, NMR can produce computer-generated images of cross sections of a patient's whole body, or of a single organ, more completely than CT and PET scanners can. Moreover, it can deliver chemical as well as physical information.

"The technique has enormous potential as a tool for diagnosis and for evaluating biochemical changes in the body during treatment," Purpura said. "It will have a particularly dramatic impact on the analysis and treatment of a variety of neurological and psychiatric disorders because of its ability to image metabolism in different brain areas noninvasively."

NMR instruments use extraordinarily intense magnets cooled by liquid helium to temperatures of about 450 degrees below zero. The magnets generate fields more than 40,000 times as intense as the earth's magnetic field.

Stanford already has a strong program investigating biological applications of NMR under the direction of Dr. Oleg Jardetzky, professor of pharmacology. The program is already building one of the most powerful laboratory magnets in the world to generate magnetic fields nearly 300,000 times more intense than those of the earth. The powerful new NMR magnet will be used for biochemical studies, not for human patients.

But both this instrument and three additional NMR machines will be housed in the proposed center. The building will be shielded from outside radio waves,

Dominick Purpura

while a different type of shielding will prevent the scanners' magnetic fields from affecting electronic equipment in the immediate area.

Stanford researchers will use the clinical NMR machines for body-imaging studies, and metabolic studies, looking at how disease changes the body's use of energy. Metabolic changes in the body often occur before any change in anatomy that could be picked up by using X-rays, Purpura said.

The proposed NMR center, whose use will not be limited to biomedical researchers but will be available to all University departments, will be governed by a policy board, Purpura said. A three-member directorate with one member designated as the director will guide the day-to-day operations.

The directorate and governing board will represent the basic sciences, the radiology department and other clinical departments.

Funding for the proposed center will be sought from private sources and federal government, he added.

—Spyros Andreopoulos

Building for the Future

What's new with SUH modernization?

The Architectural Review Board of the City of Palo Alto met at SUH last week for a briefing focused on the exterior design of the hospital modernization.

Architect James Jonassen of The NBBJ Group, Palo Alto, described the massing and shape of new construction and possible landscaping plans.

Two triangular portions that will house eight new nursing units, an interior courtyard, and a rectangular portion for diagnostic and treatment functions, comprise the new construction. An atrium will connect the new areas to the present hospital. One floor of the four-story building will be below ground level, so the height of the new construction will be similar to the present buildings.

Members of the Architectural Review Board expressed opinions about the aesthetic character of the design, some describing it as "monumental," others as "elegant." All agreed that it showed a "clear expression of function."

The board members will officially review the plans later this year as they are developed.

Interior design services for the hospital modernization will be provided by the firm of Marquis Associates, San Francisco.

The selection was recommended by the hospital's interior design selection committee and announced by Elvia Garwood, director of the modernization.

Marquis Associates was responsible for the interior design for the Green Library restoration on campus, particularly the rotunda. They are the architects and interior designers for the Braun Music Center on campus, and also designed interiors for the Governor's Corner student housing.

The interior designers will work with the hospital modernization staff and the architects in selecting colors, materials, finishes and furniture for areas such as the atrium and public areas, cafeteria, nursing stations, patient rooms and offices.

Editor's note: This column will appear periodically to keep readers informed of the status and progress of the hospital modernization.

Services for Feigen

The Stanford community is reminded that memorial services for Dr. George Feigen, who died at Stanford University Hospital May 22, will be held 4 p.m. Thursday, June 2, in the upstairs lounge of Tresidder Memorial Union.

Feigen was a physiologist who joined the Stanford faculty in 1949. His wide-ranging interests joined the fields of immunology and pharmacology in more than 44 years of teaching and research.

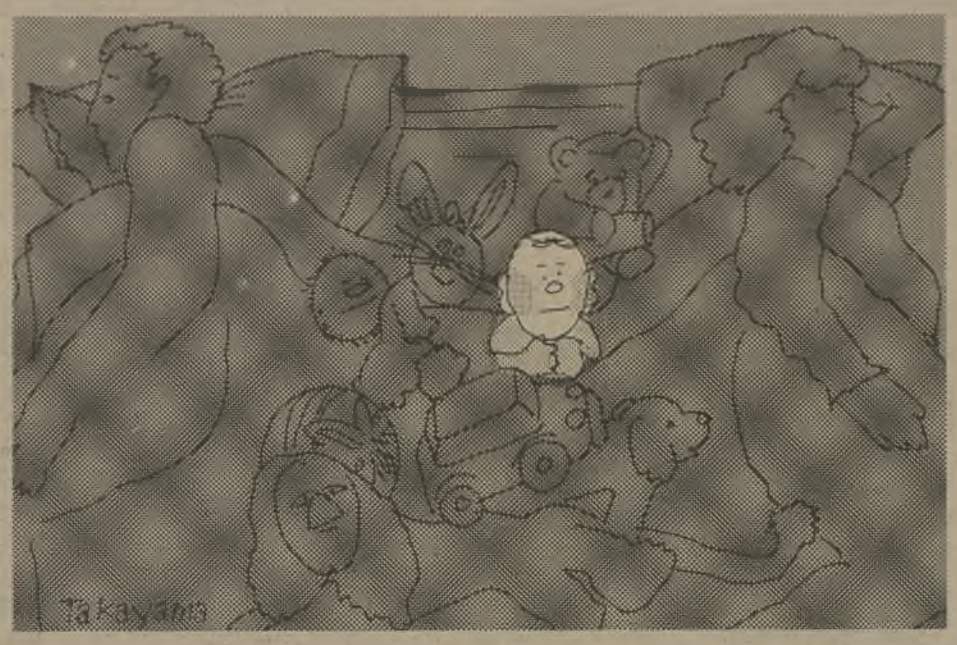
Feigen died at the age of 66, after suffering a ruptured aorta.

It's okay to let child in parents' bed, says Rosenfeld

Many children apparently crawl into their parents' bed when scared or sick at night, and that's not necessarily a bad thing, a Stanford University researcher contends.

The opinion of Dr. Alvin Rosenfeld, assistant professor of psychiatry and behavioral science, follows a study of 576 children aged two to 10. The view differs from that of renowned pediatrician Benjamin Spock, who wrote the all-time best-selling guide for parents.

"Better not to let the child in your bed," wrote Spock in the 1976 edition of *Baby and Child Care*, ". . .always bring him promptly and firmly back to his own bed."



Rosenfeld believes that letting a feverish or frightened child stay in the parents' bed for a while can sometimes be helpful. Far too much attention, Rosenfeld said, has been paid to actions rather than the attitudes which motivate them.

"And Dr. Spock agrees," said Rosenfeld who has been corresponding with the noted baby doctor. In a recent hand-written letter, Spock told Rosenfeld:

"I agree entirely that the pathological effect of any parental procedure comes from the attitudes, not the procedure. But how do you explain that in a book for all parents?"

Explain for the public is what Rosenfeld now is trying to do.

"I believe my study is important, because we are just beginning to do real research on children's sexuality—on relationships and the foundations of intimacy. Most sexual research to date has really been animal research in the sense that it looks at biological or mechanical data, not at information about how

people feel about each other or the needs and wishes that sexuality fulfills.

"Many psychiatrists can cite instances of patients who have behavior problems who slept with their parents when children. But no one before has studied how typical, non-pathological families behave in this context."

Rosenfeld's study, published in August 1982 in the *Archives of General Psychiatry*, was conducted at two daycare centers and a summer camp in an affluent community near San Francisco. It is one part of a much larger study of sexual and affectional life in normal families.

The study showed that 68 percent of the children came to their parents' bedroom when they awoke ill or frightened, and 92 percent of the parents let their children come into their bed.

None of the families reported serious behavior problems, Rosenfeld said. The vast majority of parents said they were able to return their children to their own beds during the night, after the youngsters were reassured.

"I'm not contradicting Dr. Spock, who must be respected for humanizing child care in America. I'm simply trying to state that responsible parents must be the judge of what is best for their own child, and I think this study is an indication that they are.

"People look to so-called experts for answers, and these authorities need data on which to base their answers."

He said that one misconception on the effects of co-sleeping or other childraising procedures stems from taking extreme cases where the child comes to psychiatric attention. These cases are then pointed to as examples of how a practice is supposed to be detrimental.

"I can recall a colleague who told of a patient who became a pornographic filmmaker after sleeping regularly in his parents' bed and watching them have sex about 1,800 times during a 15-year period.

"Of course that is harmful. Sex is much too confusing, exciting and stimulating for children to view. And taking your child into bed every night for 15 years is certainly highly pathological. It also shows no common sense, which is what we're really talking about.

"But parents shouldn't panic if their children stumble in on them when they're having sex; that's an isolated, undoubtedly unavoidable incident which need not be a cause for alarm. And if the parents do not overreact, there is no reason to believe their children will ultimately suffer.

"The basic rule of thumb should be that parents should do what is comfortable for them in a deep sense. If they truly feel comfortable having their children see them nude, for example, it might be appropriate behavior within the family. Finnish people are raised that way.

"But parents shouldn't walk around nude feeling uncomfortable just because intellectually they believe it would be a good idea and will somehow make their children free."

—**Mike Goodkind**

...News Notes...News Notes...News Notes...

June Ogilvie, R.N., *clinical nursing coordinator on W2A for the past 21 years, has been given the Outstanding Orthopedic Nurse Practice Award.*

The National Association of Orthopedic Nurses (NAON) honored her at their third annual Congress in Reno last week (May 22-26) for her "sincere concern for high quality health care of the orthopedic patient." She was characterized as showing special skill in caring for such patients and maintaining rapport with staff at all levels, and in demonstrating an ongoing desire for personal and professional growth.

Besides receiving an honorary plaque and special recognition at the meeting, Ogilvie will also be cited in NAON publications.

The **Lane Medical Library** *has announced that searches will be conducted free of charge for users during the month of June on the* **Protocol Data Query (PDQ)** *database.*

Developed by the International Cancer Research Data Bank Program of the National Cancer Institute, PDQ contains descriptions of **active** *cancer therapy protocols supported by the National Cancer Institute. PDQ currently contains about 700 descriptions of clinical investigations of anticancer agents and treatment modalities.*

Each PDQ record provides the protocol Objective and Entry Criteria, along with a list of the investigators to contact at institutions that are using the protocols. PDQ is updated every month.

For further information contact Valerie Su or Gloria Linder, at 497-6831.

* * * *

The Blood Bank has a new nursing supervisor, **Polly Burn**, *effective May 31, 1983.*

She is currently the blood bank's apheresis coordinator and has served as a chairperson for the California Blood Bank Systems Apheresis program.

* * * *

Beginning this week, **Blake-Wilbur Road**, *in the area next to the Cancer Biology Research Building, will be* **closed to through traffic** *because of southwest parking lot expansion, said Hilary Ryniewicz, director of Safety/Security Services.*

He estimated the project will take six to eight weeks to complete. The road extends from Campus Drive North to Pasteur Drive. During this time, access to the southwest corner parking lots of the medical center will be via Jordan Way.

Ryniewicz pointed out that this construction will ultimately result in increased parking availability, hoped to outweigh the temporary inconvenience it causes.

Letters to the editor

Chiropractors treat back pain, too

Editor, *Medical Center Memo*:

While I do appreciate your sincere approach in uncovering a little more about backs and the problems associated with them (May 25, "So Many Aching Backs: What do the Experts Say?"), I find it unbelievable to the point of being ridiculous that you did not even allude to chiropractic care! Chiropractors are to a spine what dentists are to teeth!

Contrary to certain popular rhetoric, chiropractors have been successfully treating back problems (and oftentimes visceral problems as a consequence) without surgery and drugs in most all cases. They are also tuned into the value of nutrition and stress preventative measures to avoid back problems from occurring. They are the "experts" you should be interviewing.

If you were interested in learning more about chiropractic and its application, I would be happy to discuss it with you.

Again, I appreciate your intention, yet I could not refrain from personally expressing my concern.

Sheila Kahler
Medical Records

P.S. Did you know that chiropractic students, hour for hour, spend as much and sometimes more time in studying such courses as radiology and anatomy as do medical students as part of their required training?

Medical Center Calendar

WEDNESDAY, JUNE 1

Dept. of Structural Biology seminar: "Mechanisms of Control of Gap Junction Conductance in Early Embryos"—Dr. Andrew Harris. Noon, D102.

Gala Video Screening of "The Hypocritic Oaf." Don't miss this chance to see your favorite medical musical stars on the silver screen. 7:30 p.m., Fairchild Auditorium. Everyone welcome!

Div. of Orthopedic Surgery grand rounds: "Anatomy—Foot and Ankle, Surgical Approaches"—Dr. Gary Watson, 7:30 a.m.; and "Osteosarcoma—Adjuvant Chemotherapy"—Dr. Michael Link, 8:30 a.m.; M114.

Dept. of Biochemistry seminar: "Regulation of Early Development in *Xenophus laevis*"—Dr. John Newport (UCSF). Noon, M316.

Dept. of Clinical Social Work and the American Cancer Society program: "I Can Cope"—intended for cancer patients and their families. Wednesdays through June 22, 5:30 to 7:30 p.m., TF-122c. For further information or to register, call 497-5091.

SUH Auxiliary Volunteer orientation meeting: 9:45 a.m., W001. To register, call 497-6636.

Hematology support group: meetings for patients with leukemia, myeloma, hemophilia and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

THURSDAY, JUNE 2

Div. of Otolaryngology/Head and Neck Surgery grand rounds: "Bilateral Neck Dissection: To Operate or Not"—Drs. Willard Fee, Nelson Powell, Steve Dennenberg, Chris Daniells, and Clough Shelton. 6:15 p.m., Wang Library R117.

Dept. of Biochemistry seminar: "Rho Termination, Retroregulation, and RNA Processing"—Dr. Terry Platt (Yale). Noon, M316.

Staff Recognition Reception: for five, 10, 15, and 20-year employees of the Medical School. Hosted by the Dean's Office and Human Resources Group. 3 p.m., Fairchild Auditorium.

Dept. of Pharmacology seminar: "Cellular Availability of Liposome Encapsulated Agents"—Dr. Frank Szoka (UCSF). 4:15 p.m., R358.

Dept. of Medicine grand rounds: "Hypersomolar Diabetic Coma"—Dr. Larry Crapo. 8:30 a.m., Fairchild Auditorium.

FRIDAY, JUNE 3

Div. of Child Psychiatry grand rounds: "The Meaning of Fairy Tales"—Bruno Bettelheim, Ph.D. (visiting professor emeritus of psychiatry). 11 a.m., Faber Auditorium, CHAS.

Dept. of Pediatrics grand rounds: "Biliary Atresia"—Drs. Stephen Shochat and Barbara Carroll; case presentation by Dr. Mary vander Velde. 8 a.m., M106.

SATURDAY, JUNE 4

Stanford Medical Alumni Association and the School of Medicine present: A symposium, "Creativity and Early Experience." 8 a.m., Fairchild Auditorium. For further information or to register, call the Medical Alumni Office at 497-5064.

Annual Hematology Research Symposium. 9 a.m. to noon, M114. For further information, call 497-5007.

MONDAY, JUNE 6

Dept. of Medical Microbiology seminar: "Characteristics of the Infectious Agent of Creutzfeld-Jakob Disease"—Dr. David Kingsbury (Naval Biosciences Laboratory, Oakland). 1:15 p.m., M114.

Dept. of Psychiatry and Behavioral Sciences lecture: "Benzodiazepin and Gaba-Receptor Interaction in Mammaliam Brain"—Dr. A. Guidotti (Laboratory for Preclinical Pharmacology, NIMH, Bethesda, Md.) 3 p.m., M114.

TUESDAY, JUNE 7

Dept. of Genetics seminar: "Cloning in *Streptomyces* with Phage Vectors"—Dr. Keith Chater (John Innes Institute, Norwich, England). Noon, M106.

Nursing grand rounds: "Monoclonal Antibody Therapy." Presented by nursing staff of Cancer Research Center B. Aspects discussed will include basic immunology, development of the therapy, and monoclonal antibody treatment at Stanford. 3:30 to 5:30 p.m., M104. *See related story in this issue.*

Dept. of Biochemistry seminar: "Roles of Coated Vesicles in the Exocytic Transport of Acetylcholine Receptors and Acetylcholinesterase"—Dr. Richard Fine (Boston University). Noon, M316.

Dept. of Dermatology: "Anti-histamine Therapy: Recent Advances"—Dr. Malcolm Greaves (Institute of Dermatology, London, England). 10 a.m., R136.

THURSDAY, JUNE 9

Dept. of Dermatology: "Arachidonate Metabolites: Role in Inflammatory Disorders and Psoriasis"—Dr. Malcolm Greaves (Institute of Dermatology, London, England.) 8 a.m., R136.

Dept. of Psychiatry grand rounds: "Facing Nuclear War: Our Responsibility as Physicians"—Dr. Gary Lapid (President of Mid-Peninsula Physicians for Social Responsibility). 7 p.m., Fairchild Auditorium.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Death of intern confirmed suicide

The death of a Stanford University Hospital intern has been confirmed as a suicide, according to the San Mateo Coroners Office.

The Office had been investigating the case of 30-year-old Lorraine Johnsrud since she was found dead in her Menlo Park apartment by police May 6.

The death certificate cited Desipramine intoxication as the cause of death. Desipramine, generically known as Norpramine, is commonly used as an antidepressant drug. It affects the respiratory system as well as the heart.

Johnsrud had been severely depressed in recent months, and had been receiving professional help, colleagues said.

Experts consider state of the heart

Two Stanford faculty members will participate in a conference on "The State of the Heart," Friday, June 3 in Monterey.

Dr. John Farquhar, director of the Stanford Heart Disease Prevention Program and professor of family, community and preventive medicine, and Dr. John Schroeder, director of the hospital's coronary care unit and associate professor of medicine, will take part in the day-long program, sponsored by the Mid-Coast Health Systems Agency, Santa Clara County Health Systems Agency, and Central Coast Area Health Education Center.

Intended for policy makers, health care professionals, business people and educators, the conference addresses, among other concerns, how to promote health and prevent heart disease, methods available to diagnose and treat heart disease, alternatives to surgery, how individuals can affect public policy, and the costs and benefits of new technologies.

Speakers besides Schroeder and Farquhar include Dr. David Fletcher, currently on active duty in the U.S. Army, assigned to the Preventive Medicine Activity at Fort Ord; and Dr. Bernard Towers, co-director of the Program in Medicine, Law and Human Values at U.C.L.A.

The conference will take place from 11:30 a.m. to 4:30 p.m. at the Monterey Holiday Inn, 2600 Sand Dunes Drive, Monterey. Preregistration is recommended, and a fee is charged. To register or for further information, call the Mid-Coast Health Systems Agency at (408) 757-2044.

Nurses discuss monoclonal antibodies

Nurses skilled in caring for patients undergoing experimental cancer therapies will share their insights 3:30 p.m., Tuesday, June 7, during a nursing grand rounds presentation on "Monoclonal Antibody Therapy"—the experimental harnessing of a patient's immune system to help fight his cancer.

"It's the concensus on our unit that the general population has been reeeiving mixed messages on monoclonal antibody therapy," said Patricia Kinney, a nurse in Stanford University Hospital's Clinical Research Center, which will sponsor the program in room M104 of the Medical School. "Our presentation will, we hope, clarify some misconceptions and reinforce the need for such medical reserach."

Touted in the national media as "magic bullets" to battle cancer, monoclonal antibodies have raised the hopes of cancer patients and physicians alike that an effective therapy for previously untreatable cancers may be in the offing, Kinney said.

In their enthusiasm over early successes with the specially tailored proteins, created through the fusion of mouse and human cancer cells, many cancer sufferers gloss over the fact that, so far, the antibodies have been useful in only a very few patients who are suffering from a few specific types of cancer, said Kinney.

"One of the toughest parts of being a nurse working in these studies is telling a patient, 'No, it hasn't worked for you,' or 'No, you don't have the type of cancer that can be treated with monoclonals,' " she said.

Though these patients are told that the treatment is experimental, and most have already exhausted conventional forms of radiation and chemotherapy without success, expectations that the new therapy will work for them are high, she said, and require special sensitivity on the part of the nurse.

Blending that sensitivity with strong research skills presents special challenges to the nurses on the unit, Kinney said.

Though directed towards nurses, who can earn continuing education credit for attending, the program is open to the public. Basic immunology, the development of the antibodies, responses to treatment and the nursing care will be discussed.

New book teaches medical Spanish

A new Spanish guide has just been published, *Medical Spanish: The Instant Survival Guide*.

Coauthored by Susan Lister, a regular instructor of medical Spanish at SUMC and Children's Hospital at Stanford, and her colleague, Cynthia Wilber, the spiral-bound manual offers more than 300 pages of questions and responses to various medical situations. Sections include "Emergency Information," "Patient Information," "Procedures," and "Equipment and Supplies," among others.

The authors decided to compile the guide, said Lister, because for years medical personnel have besieged them wanting to know how to communicate with their Spanish-speaking patients. "The problem is compounded because many of the patients pretend they understand English when they don't," Lister said.

The resultant lack of communication, she explained, can range from inconvenient to life-threatening. For example, parents who do not understand English will not know that the drops the doctor prescribed for their child are intended for ears rather than nose or eyes.

And more serious situations can occur, such as the baby born diabetic, whose mother nods as if she understands the nurse's instructions on the baby's diet and drugs. In this instance, the mother cannot comply with vital requirements for her baby's well-being.

The book is available at Stacey's Bookstore and the Stanford Medical Bookstore, both in Palo Alto. A booksigning will take place at Stacey's, 2 p.m., Saturday, June 4.

For further information on the manual, or on participating in the medical Spanish course Lister teaches, call her at (408) 338-3252.

Senate 'did a thoughtful job' in resolving Hoover controversy, Kennedy says

continued from page 1

something so important without their own representation" on the committee.

"The Senate did a thoughtful job," Kennedy said.

Prof. John Manley, political science, who organized a petition drive criticizing the Hoover as "a partisan organization" said he was "absolutely delighted" with the outcome.

"This points the way toward establishing a responsible forum within which our concerns can usefully and responsibly be explored," he said.

Manley and Prof. Ronald Rebholz, English, obtained 84 faculty signatures, of which 76 were made public, urging an "immediate and independent inquiry" by the trustees of the relationship. Students and other backers obtained an estimated 1,500 signatures on a similar petition to the board.

Petition preamble criticized

During the debate, several faculty members sharply criticized the petition's preamble, which stated that "the existence of a partisan organization, whether liberal or conservative, within the University, raises grave questions concerning the academic independence, integrity, and national reputation of the University." The Senate adopted a substitute motion with no preamble.

Rebholz said the outcome was "quite surprising. Overall, I was quite pleased," although "I would have liked to see divorce held out as a possibility" between the two institutions.

Prof. Alphonse Juilland, French, almost singlehandedly organized a counter-petition, signed by 131 faculty, saying an investigation of alleged partisanship by Hoover would be a "grave threat. . . to academic freedom."

After quietly observing the debate, Juilland said he was "satisfied" the motion adopted "did away with the political dimension of this debate." He and Manley smiled, shook hands, and said they might get together for a drink at the Faculty Club.

The outcome fulfilled Kennedy's hopes, expressed to alumni attending the May 14 campus conference, that the debate "will be forward looking and productive, and concentrate upon how the Hoover Institution and Stanford can improve a relationship that has been increasingly valuable to both.

"The important issues, it seems to me, have to do with governance and appointments, and not with who has what kind of politics. Consideration of the latter not only is an improper criterion for appointment or evaluation under our principles of academic freedom; it can also turn a discussion into one that is unnecessarily strident on both sides."

Hoover Institution Director W. Glenn Campbell said Friday, May 27: "The Stanford University Board of Trustees is the proper place to conduct any review of the relations between the Hoover Institution and Stanford University.

"I wish to take this opportunity to thank the many distinguished professors at Stanford University who signed the petition organized by Profs. Juilland, John McCarthy, and Oleg Sherby which deplored and opposed as a grave threat to academic freedom an investigation of the alleged partisanship of the Hoover Institution.

"Academic freedom has been rigorously adhered to in the years that I have been director of the Hoover Institution and will continue to be.

"Finally, let me state how proud I am of the internationally renowned scholarly staff of the Hoover Institution who, during a lengthy and difficult period of unwarranted attacks, acted with restraint and forebearance."

On May 19, Campbell said "I am confident that in the discussion of governance, President Kennedy will inform the Academic Senate, and the Stanford community in general, of the many binding resolutions and agreements that have been entered into by the Stanford Board of Trustees, the Hoover family, and the Hoover Institution Board of Overseers, which have been scrupulously followed during the years that I have been director of the Hoover Institution.

This includes the appointment procedures that have been worked out over the years between the president of the University and the director of the Hoover Institution based on the above resolutions and agreements."

* * *

Opening the Senate debate, Rebholz noted that a 1962 Board of Trustee resolution requires that the director of the Hoover Institution must be "previously approved" by the trustees of the Hoover Foundation, Inc., a New York corporation.

The present charter also specifies that the director "must be a man who reflects the purposes of the institution. He should be of an age which gives him a substantial period of service before the retirement age of 65," Rebholz observed. "Surely, looking to the future, any inquiring body should ask if those specifications should be changed."

The director's power of appointment also should be questioned, Rebholz said.

Hoover operates as "an independent institution within the frame" of the University. Senior fellows, the highest ranking scholars at Hoover, are subject to review by the president of the University. Any appointments made jointly with Stanford's regular academic departments are subject to normal faculty review. Others are not.

Manley, speaking as a Senate guest, said concerns had been raised that if departments continued to seek help from Hoover in making joint appointments, the Institution might at some point feel free to suggest or demand "reciprocity."

"Does it sound reasonable to you that if we allow the existence of an organization like Hoover, with its millions of dollars and other resources, that Hoover will give and give and give and not, some day, expect something in return?" he asked.

"Millions of dollars from right wing and from conservative donors have poured into Hoover and established within Stanford University the leading conservative think tank in the country," he said.

"As long as the Hoover Institution, as a research organization, remains part of Stanford, it will continue to divide the Stanford community, embarrass those who believe the University should be nonpartisan, endanger the political independence of the University, and call into question the most precious asset a university can have—reputation and legitimacy among the American public."

Counter-petitioners comment

In a written statement to the Senate, Juilland, McCarthy, and Sherby strongly supported Kennedy's statement that "the important issues have to do with governance and appointments, and not who has what kind of politics."

"We are also satisfied that the petitioners now concede that political considerations have no bearing on the debate," the three counter-petitioners added.

They also agreed with emeritus Prof. Philip Rhinelander, who served briefly as acting director of Hoover in 1959 that "there is more diversity of opinion among the fellows of the Hoover Institution today than there was 25 years ago. Hence there is less reason to be concerned over the 'partisan' character of the Institution. . . .

"The notable progress made by the University over the past 25 years is ample evidence that its academic prestige has not suffered from its association with the Hoover Institution, which has been widely known for having a special orientation."

Before the substitute resolution was introduced, Sherby told the Senate that "the inquiry has become a political football. If we go ahead at this time, it will be viewed as a politically motivated move.

"This will be terribly unfair to the people at Hoover. . . the political aspects will prevent any serious discussion of the governance issues, which are in-house matters, not national political matters."

Prof. Leon Rosenberg, medical microbiology, expressed concern over "institutional partisanship" by Hoover.

"I believe an educational institution needs to be a custodian of heterodoxy. . . to be partisan institutionally to the most powerful force in society is a very dangerous position for an educational institution."

Prof. Gerald Gillespie, German, said the preamble of the original petition was "extremely loaded." Its adoption would "send shock waves around the country and internationally." Hoover scholars would be viewed as "some kind of tainted group," much in the manner Sen. Joseph McCarthy sought to portray the Harvard faculty in the 1950s, he warned.

Prof. Jonathan Roughgarden, biological sciences, said: "I don't see a prima facie case that the Hoover Institution is a political action group. I don't find the evidence convincing."

But the apparent anomalies of governance and appointments are "very persuasive" and worthy of further investigation, he added.

Prof. Robert Hall, economics, a senior fellow at Hoover and Senate guest, said it was "remarkable how few conservatives there are at Hoover." The senior fellows play a central role in its appointment process, which he described as "a piece of the University not under faculty control."

Prof. Carl Degler, history, argued that the preamble of the original petition was "not part of the motion," but acknowledged that "an atmosphere stands behind that resolution. . . . We can't be bound by the atmosphere in which we meet."

Kennedy commented that, in the public's perception, it might not be possible to separate the preamble charging Hoover is "a partisan organization" from the request for an inquiry.

Prof. Robert White, electrical engineering, said there was no reason to question Hoover's integrity on political grounds. He noted that "three-fourths" of Manley's and Rebholz's argument amounted to political analysis.

Trustee role debated

Kennedy then declared *The Stanford Daily* "quite faithfully" reported what he said in a May 17 interview. This quoted Kennedy as saying the trustees probably would ask "an eminent visiting committee to look at the relationships and give us some advice."

While this is "a reasonable thing to do," Kennedy added, there was "no commitment on the timetable or the charge" to such a committee in his discussions with Kimball.

Rebholz said the trustees should not participate directly in the study because "there's too much overlap (in membership) with the Hoover Board of Overseers. I like the idea of visiting scholars."

Prof. G. L. Bach of the Graduate School of Business, a faculty representative in 12 of the 15 Senates since 1968, then introduced the motion which his colleagues subsequently adopted, after making several changes in wording.

Prof. Sanford Dornbusch, sociology, said there should be no investigation of political bias. The problems are those of governance and appointment, he said, recalling the 1960 "tumult" among the faculty to disavow the specific political goals of the Hoover Institution.

Two decades ago, Dornbusch publicly said a high proportion of Hoover's scholarly work was "garbage," he recalled. "The quality of research has improved enormously. Some of the great scholars at Hoover are among the most distinguished at the University. It is by no means the monolithic institution it once was."

Profs. Paul A. Robinson, history, and Victor Fuchs, economics, both supported Dornbusch. The words "governance" and "appointments" were inserted as a friendly amendment in Bach's resolution.

Roughgarden felt budget matters should be included in the proposed study. Prof. Elizabeth Cohen, education, said the Hoover Institution's annual report appeared "quite shocking" in lacking evidence of affirmative action. Hall replied that the Hoover had proportionately more women and blacks among its scholars than does the Stanford faculty.

As the customary 5:30 p.m. deadline approached, Bach's motion was fine tuned as a substitute for the one proposed by the petitioners. When Prof. Alexander Fetter, physics, Senate chairman, called for the "ayes," there was broad assent among more than 30 voting representatives. But there was one clear "nay," not immediately identified.

What one reporter had dubbed "the great debate" of spring quarter was over. Several reporters from off campus media, barred from the meeting but listening outside as it was routinely recorded, came in to get quick comments from the principals.

Senate report

Senate adopts nonpartisan resolution on Hoover study

FIFTEENTH SENATE REPORT NO. 13

Summary of actions taken by the Senate
May 26, 1983

At its meeting of May 26, 1983, the Senate took the following actions:

1. The Senate accepted by acclamation a resolution honoring Professor George Leland Bach on his retirement after an unparalleled record of service to the Senate of the Academic Council. Professor Bach was given a standing ovation.

2. The Senate passed, by a divided voice vote, the following amended resolution, which was proposed as a substitute motion for the petition under discussion at the meeting:

> This Senate urges the President to consult with the Board of Trustees with a view to appointing a committee in the near future to explore and reassess the relations between the Hoover Institution and the University, including governance and appointment procedures, with the goal of promoting more effective and cooperative relations.

MINUTES OF THE FIFTEENTH SENATE OF THE ACADEMIC COUNCIL
May 26, 1983

A meeting of the Fifteenth Senate of the Academic Council was held on Thursday, May 26, 1983, beginning at 3:18 p.m. in Room 180 of the School of Law with A. L. Fetter, chair, presiding. Present were 38 representatives, 11 *ex officio* members, and a number of invited guests.

Approval of Minutes

The minutes of the meeting held on 5/12/83 (SenD#2522) were approved as submitted.

Report of the Steering Committee

In the report of the Steering Committee, A. L. Fetter, chair, called attention to the agenda for the last meeting of the Fifteenth Senate on 6/9/83. There will be a report from Benefits on alternatives to TIAA-CREF, a report from C-AAA on the transcript reflection of foreign language proficiency, and the Committee on Research will present its preliminary report on weapons-related research at Stanford. That committee's recent work on copyright policy will not require Senate action and therefore will be reported in the Annual Report of the Committee on Research for 1982, to be presented to the Sixteenth Senate in the fall.

Report of the President

President Kennedy presented no formal report. He did confirm his comments, made in response to a question at the 5/12/83 Senate meeting, that the Woodrow Wilson School at Princeton is an interdisciplinary doctoral program and the Kennedy School at Harvard is a graduate faculty like other graduate schools. There were no questions for the president.

Report of the Provost

The provost reminded the Senate that at the time of the reorganization of the Office of the Undergraduate Dean, he had promised that budget savings from that change would be used to create a Provost's Innovative Fund for Undergraduate Education. He announced that the fund now exists, and invited applications for it. A review committee chaired by the Vice-Provost for Undergraduate Education, H. Katchadourian, includes C. Lougee (Associate Dean of Humanities and Sciences for Undergraduate Programs), G. Masters (Associate Dean of the School of Engineering), I. Remson (School of Earth Sciences), and S. Mahoney (Registrar).

While the fund is limited, proposals are invited from faculty and administrative officers for new courses and academic programs. Most grants will be for amounts of up to $10,000 of one-time money, but for some special projects larger sums and even budget base monies may also be available. Applications will be received on a quarterly basis next year, on the 15th of October, January, and April. Decisions will be made within one month.

Resolution to Honor George Leland Bach

At the close of his remarks, Provost Hastorf deferred to Professor E. Webb, Associate Dean of the Graduate School of Business, for an expression of recognition of Professor George Leland Bach's unparalleled record of service to the Senate of the Academic Council. The full text of Dean Webb's comments was as follows:

> Mr. Provost. . .Mr. Chairman:
> The formal agenda is not without significant business, and I should like to add one piece to it. Today is the penultimate Senate meeting to be attended by the senior member of this body, indeed, the senior member of the Senate over its full course of history since 1968.
> In 1968, Professor George Leland Bach was a member of the enabling body that put together the form of what became the Senate of the Academic Council. He has served on all but three of the fifteen senates that have convened since 1968. As a member of the Advisory Board, he served through that unique period of 1967 through 1972 and later, in less troubled times, from 1976 through 1979.
> For many of us, Lee Bach has been Stanford's intellectual super-ego. His presence has elevated the quality of discussion in all deliberations—not only for his direct contributions, but also for that flinty core of intelligence and selflessness that has driven the rest of us to be more thoughtful and more temperate than we otherwise would have been. We have done better because we did not want to be embarrassed before his very superior quality. We at Stanford have been fortunate to have him as our colleague.
> Mr. Chairman, I would like to note for the record the appreciation of the Senate for its most distinguished colleague, Professor George Leland Bach.

Dean Webb's resolution to honor G. L. Bach was approved by acclamation, and Professor Bach was given a standing ovation.

Petition on the Relationship between Hoover Institution and Stanford University

In introducing the major business of the meeting, Chairman Fetter observed that the Steering Committee had invited a number of guests for the discussion and would like the Senate's consent in granting them the right to speak. Permission was granted by consensus.

Chairman Fetter then expressed the Steering Committee's wish that the discussion begin with a few short presentations, and that debate be encouraged for a reasonable period before amendments or other legislative actions were proposed. He also reiterated President Kennedy's comments that the relationship between the Hoover Institution and Stanford University is an important one and that the debate would be better focused on substantive matters than on who has what political bent; the future of the Hoover/Stanford connection matters more than its present or its past. He then invited Professor R. Rebholz to open the discussion.

R. Rebholz began by expressing his gratitude that President Kennedy had said that, in the normal course of events, the Board of Trustees might institute a study of relationships between the Hoover Institution and Stanford.

He concentrated his remarks on questions that such a review committee should ask. These included questions concerning governance, appointment procedures, and the Hoover Institution's apparent political mission, all of which he termed anomalies in comparison to any other unit connected with the University. He specified such anomalies in the areas of governance and appointments as

1) the procedure by which the Director of the Hoover Institution is appointed,

2) the specifications of the kind of person to be appointed to the directorship and the kind of tenure to be conferred (i.e., administrative tenure rather than academic tenure), and

3) the power of the director to control unilaterally a budget of over $8 million and to propose appointments for Senior Research Fellows and Research Fellows with no reference to any faculty committees.

Finally, he focused on what he termed the Institution's political mission, citing its publications which provide the knowledge base for current conservative government practices and also influence public opinion toward a conservative view. His final question was whether or not such an institution is compatible with a politically independent university which does not engage in partisan activities.

He concluded his presentation by moving the following resolution:

> The Academic Senate urges the Board of Trustees to initiate an immediate and Independent Inquiry, including a public report, on the relationship between the Hoover Institution and Stanford University.

The motion was seconded by A. Mellor.

The second presentation in support of the petition was made by a Senate faculty guest, Professor J. Manley. He focused on the three major beliefs which led to his initiative in promoting the petition:

1) The Hoover Institution, in asking reciprocity for budgetary assistance to a department, is a potential political influence on departmental appoinments and even on the curriculum itself.

2) The Hoover Institution is a University anomaly with respect to recruitment practices, funding, research focuses, and its public relations efforts to influence public policy.

3) The legitimacy of Stanford as an objective nonpartisan institution dedicated to the search for truth is jeopardized by implication because of the partisan mission of the Hoover Institution. At the same time, the Hoover's influence is enhanced because of its connections with a nonpartisan major university.

Following the two presentations by the initiators of the petition, the discussion was opened with a statement of opinion from J. Gere. He commented that this request for an inquiry had generated an unusual amount of interest and had become a political football with petitions and counter-petitions. Signers of such petitions have a variety of motives. The in-house matters of governance and appointments are the significant issues—not the widely-publicized national political slant. Adoption of this resolution would be widely viewed as politically motivated. It would be better to give the Board of Trustees an opportunity to review the Hoover/Stanford relationship in the normal course of events, focusing on matters of governance and appointments, without the damaging negative emphasis on politics and the resultant widespread publicity.

G. Gillespie endorsed Gere's observations that the petition was prejudicially framed, most particularly the preamble. Endorsing such a politically-loaded resolution, he predicted, would send shock-waves through this and other universities. If a study is needed, it should be approached differently.

J. Roughgarden added that inquiries ought not be undertaken without the prospect of revisionary findings, and that political bias should feature only if the organization is found to function as a politically active group. That case is not convincing. The anomalies of governance and appointments, on the other hand, are persuasive. On those grounds, as well as on the matter of funding, there appears to be reason to study the relationship between the Institution and the University.

Guest R. Hall, Professor of Economics and Senior Fellow at the Hoover Institution, commented on some of those relationships:

1) The faculty does not review the Hoover Institution and it is not clear that the faculty should. The president and Board of Trustees do run the Institution, but it is rightfully not under faculty control.

2) The politics of individuals in the Institution are irrelevant in this matter.

3) Writing to influence public policy is not a major part of the activity of Hoover scholars and is not unique to them.

4) The success of Hoover's efforts at fund-raising has been of great benefit to a number of Stanford departments.

He concluded by agreeing with earlier comments that the preamble of the petition was quite out of order, but that he personally did not oppose an impartial review of the Hoover/Stanford relationship. He also expressed his own conviction that the Hoover Institution is a very important element of Stanford University which ought to be retained.

There was then considerable difference of opinion expressed concerning whether or not the politically-loaded preamble of the petition could be separated from the resolution, which had been presented independent of it by R. Rebholz at the start of the Senate discussion. The point was made by several that public perception and un-

continued on next page

Senate/ continued from page 18

derstanding would inevitably link the resolution with the petition's preamble, even if the Senate made an effort to disavow the preamble. The conviction was that the widespread publicity given the petition would color the interpretation of a Senate adoption of the resolution, even if it were accompanied by a disclaimer of the preamble of the petition.

President Kennedy was asked, as a point of information, to clarify the plans of the administration and the Board of Trustees regarding a projected study of Hoover/Stanford relationships. He responded that this had been discussed in the context of long-range planning prior to the appearance of the petition, and that it was the intent of the president of the University and the president of the Board of Trustees to explore the matter. There has not yet been any commitment or vote by the Board.

L. Rosenberg expressed his reasons for supporting the petition for an inquiry. Political disagreement with the Institution played no part in his support of the petition. The Institution is perceived as an intergral part of Stanford. Institutionalized partisanship, as displayed in the Institution's Annual Report, is one of the most dangerous influences that can arise in a university.

To a question for information on the meaning of the term "Independent Inquiry" in the resolution, R. Rebholz responded that, in his opinion, the review should be conducted by appointees who were not members of the Stanford Board of Trustees or the Hoover Board of Overseers. He favored President Kennedy's suggestion of a group of visiting scholars appointed the President in consultation with the Board of Trustees.

There was some discussion of the differences between procedures for the appointment of senior researchers at Hoover and, for example, adjunct faculty members who do research. R. Hall expressed the view that, for senior appointments, the procedures were like those for regular faculty at the early stages, culminating with a review by an appointments committee once they reach the President's office. Junior appointments, however, are made entirely within the Institution and are not reviewed (as are faculty junior appointments) at the level of provost, Advisory Board, president, and Board of Trustees.

At this point in the discussion, G. L. Bach proposed a substitute motion, as follows:

> This Senate urges the President to consult with the Board of Trustees as to the advisability of their appointing a committee to explore and reassess the relations between the Hoover Institution and the University, with the goal of promoting more effective and cooperative relations.

He called attention to the substitute motion's politically neutral and positive rather than negative tone. The motion was seconded by J. Gere.

In the discussion of the substitute motion, S. Dornbusch considered the possibility of proposing an amendment based upon a different substitute motion which he had in mind. Giving some background for his thinking, he commented that the quality of research at Hoover has improved enormously over the years and that the direction of change at the Institution has been all to the good. Over the years, both Hoover and Stanford have changed for the better. There is historical reason for the governance and appointment patterns at Hoover in the special relationship of ex-President Hoover to the University. Focus on political bias, policy orientation, etc. should play no part in any review. These considerations has led him to formulate the following substitute wording:

> The Academic Senate wishes to express its approval of the proposed study under the auspices of the Board of Trustees of the governance and appointment procedures of the Hoover Institution.

He concluded with the statement that, though the historical reasons for the relationship between Hoover and Stanford are clear, times have changed, as have the two institutions. Now is a healthy time to reassess the relationship, especially the aspects of Hoover's governance and appointment procedures which are anomolous in the University. This should be done without any focus on political bias or sources of funding. Finally, he pointed out that both substitute proposals say that good can come from an investigation and both try to limit the scope of that investigation.

P. Robinson objected to the Bach substitute motion phrasing as not strong enough in urging an investigation. He believes there are grounds for inquiry, and reported that his senior departmental colleagues concur with that view.

V. Fuchs also supported the Dornbusch proposal as singling out the right issues about which to ask questions at this time: governance and appointment procedures.

B. Roth proposed not limiting the inquiry to just those two aspects of the relationship.

G. Bach commented that the differences between the two substitute motions were very small. Three important differences were:

1) The Dornbusch proposal presumes a study while the Bach proposal urges consideration of the possibility but permits a joint decision;

2) The Dornbusch proposal ties the inquiry explicitly to two topics. This seems too limiting.

3) The Bach proposal emphasizes a two-way street to better relations on both parts.

Several comments were made about the of possibility interpreting the term "governance" to include budget matters, affirmative action, etc. and about the meaning of terms used in one or the other of the resolutions.

S. Dornbusch then proposed a friendly amendment to the Bach motion: inserting the phrase "including governance and appointment procedures" after the word "University." This amendment was accepted by G. Bach and J. Gere.

Several other friendly amendments were proposed in sequence and given careful consideration. One proposed by C. Degler added the phrase "in the near future" after the word "committee." This, too, was acceptable to Bach and Gere. Two other proposals were not accepted as friendly amendments. One of these was later proposed by P. Robinson as a formal amendment, seconded by Rebholz. The motion was to delete the phrase "as to the advisability of" and replace it with the phrase "with a view to." This amendment passed on a divided voice vote.

Finally, R. Rebholz proposed the second rejected friendly amendment as a formal amendment. It was seconded by B. Roth. This amendment proposed the deletion of the words "and cooperative." The voice vote on the amendment was indecisive. On a show of hands, the motion failed by a vote of 22 to 15.

The Bach motion in its final amended form read as follows:

> This Senate urges the President to consult with the Board of Trustees with a view to appointing a committee in the near future to explore and reassess the relations between the Hoover Institution and the University, including governance and appointment procedures, with the goal of promoting more effective and cooperative relations.

Put to a voice vote, the amended substitute motion passed with a single dissenting vote.

There being no unfinished or new business, the meeting adjourned at approximately 5:25 p.m.

No willful violations of consulting policy found in random survey of faculty

Report of the Internal Audit of Faculty Members' Outside Consulting Activities During 1981-82
Submitted by Albert A. Hastorf and Gerald J. Lieberman
May 25, 1983

An internal audit has been conducted by the Provost and Vice-Provost and Dean of Graduate Studies and Research of 60 randomly-selected faculty members' outside consulting activities during 1981-82.

The purpose of the audit was to keep members of the faculty alert to the limitations on outside professional activities as posed by Stanford's consulting policy and to determine if violations of the policy among the sample had occurred which might warrant a similar survey among the larger number of the faculty.

The results of the audit indicated that there were no willful violations of Stanford's policy by the 60 faculty surveyed. The only problems uncovered were three cases of consulting which each exceeded very slightly the 13-days-per-quarter limit permitted by the consulting policy.

A certain amount of "averaging" between quarters is permitted by policy as long as one's consulting activities for the three quarters do not exceed 39 days per academic year.

None of the consulting activities of the three faculty involved equalled or exceeded 39 days for the academic year. However, any such averaging of time between quarters requires the prospective approval of the relevant department chair/deans, which had not been requested in these three cases. A follow-up with the relevant chair/deans indicated that in all three cases such approval would indeed have been granted had it been requested.

The 60 faculty in the sample were selected on a statisticaly-random basis from among all Stanford faculty on active duty during 1981-82 (including only the basic sciences faculty in the School of Medicine). Distribution of school of those surveyed was as follows:

Engineering	14
H&S	28
Law	3
GSB	5
Education	4
Medicine	3
Earth Sciences	3
TOTAL	60

A total of 26 (43 percent of the total) reported that they had not engaged in any consulting activities last year; 26 (43 percent) reported that they did act as consultants less than 13 days in any one quarter; 5 (8 percent) indicated that they had consulted 13 days in at least on quarter; and 3 (5 percent) exceeded the 13-day limit in any one quarter as discussed above. None consulted as much as 39 days during the academic year, which is the three-quarter limit imposed by Stanford's policy.

In addition to questions regarding both the level and general nature of their consulting activities, the faculty were asked the following three questions for the purpose of assessing whether modifications to the current policy might be warranted with respect to the nature of faculty members' arrangements with outside companies and/or disposition of intellectual property rights resulting from University research activities:

1) Were there any formal agreements between Stanford and the company for whom you consulted during 1981-82 which involved you in your role as University faculty member?

2) Were you the creator or inventor of any intellectual property which was licensed by Stanford to the company for which you consulted during the period of your consultation?

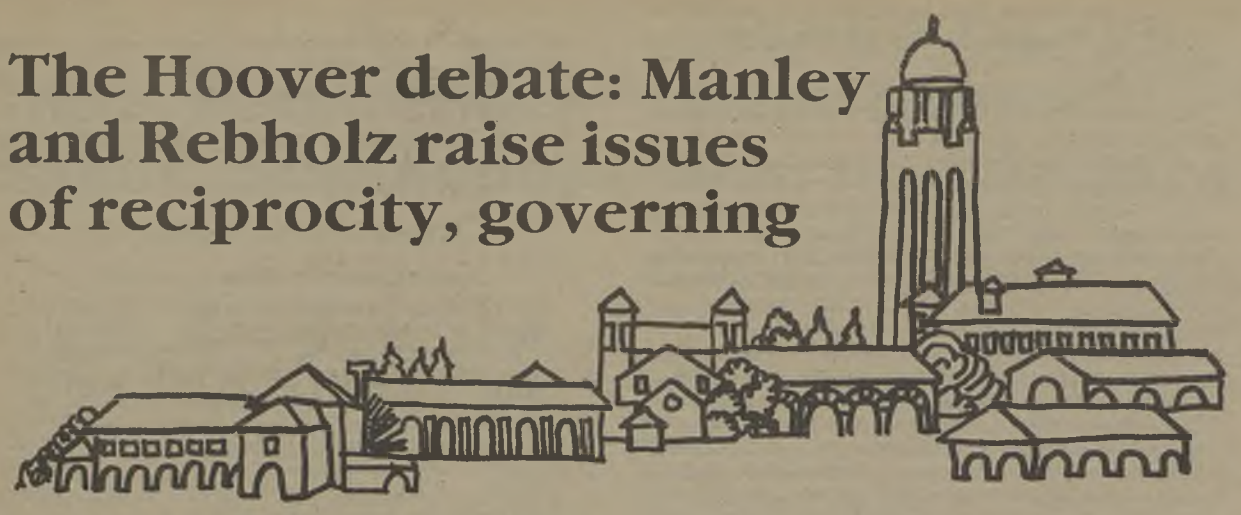
3) Did you hire or directly supervise any Stanford students in outside consulting activities while simultaneously acting as the student's adviser at Stanford or participant on the student's dissertation committee?

For any affirmative answers to the above three questions, the faculty were asked to provide explanations.

In response to question No. 1, five of the 60 faculty responded that they had acted as both consultants and as departmental liaisons for those companies participating in the faculty member's departmental industrial affiliate programs. No problems or improprieties were uncovered by responses to this question.

There were no affirmative responses to question No. 2 above. However, in response to question No. 3, eight of the respondents—almost one-fourth of all those who consulted last year—indicated that they had hired or supervised their students in outside consulting arrangements last year.

It should be noted that in December 1982, the faculty consulting policy was modified by the Senate to include a requirement for department chair or deans to approve on a prospective basis any outside consulting activities involving a faculty member and his/her Stanford students.



In view of the somewhat surprisingly large proportion of faculty who involve their students in their outside consulting activities, the recent change in the policy appears to have been a wise and timely action. No other policy changes were determined to be warranted based on responses to the above questions.

Overall, there were no significant problems uncovered by the internal audit. The three cases of minor excesses of the 13-day-per quarter limit could have been avoided had the involved faculty members reread the policy statement to be reminded of the need to prospectively inform their department chair/dean of their plans to "average" their consulting time between quarters.

All faculty are urged to reread the policy statement on a periodic basis, as it is the responsibility of each individual engaged in any such outside activities to be aware of both the spirit and the letter of the policy.

The internal audit served the purpose for which it was intended by reminding the faculty of their University obligations vis-a-vis policy limits on their outside professional activities. No violations of the policy were found which warrant a broader survey of the faculty at this time.

The Hoover debate: Manley and Rebholz raise issues of reciprocity, governing

Remarks by Prof. John F. Manley before the Faculty Senate May 26, 1983

Last week, in an encouraging response to those who were concerned enough about this University and Hoover to sign the petitions, Donald Kennedy, when asked whether or not a study would be made, told the Stanford *Daily* that the Board of Trustees would probably appoint an eminent visiting committee of distinguished persons from inside and outside the University.

Today I want to speak to Don Kennedy's proposed study, but I also want to suggest three reasons why I believe such a study should ask whether or not the continuation of Hoover as a research organization within the University is compatible with the best interest of Stanford.

I do not want to prejudge the answer to this question. It seems vital to me that the University community have ample time to discuss and reflect on such questions, and that supporters of Hoover have an opportunity to state *their* case in a Trustee-appointed, responsible forum.

But I believe that the activities of Hoover, and the actual and potential threat to the University posed by these activities, force us to ask some fairly fundamental questions, and I would like to tell you why. There are three main reasons.

The first reason why we should define "governance" broadly and explore the basic issue of Hoover's relations with Stanford deals with thp integrity of the academic departments that comprise the University.

Since the debate over Hoover began, I have often been asked what started it all? Why now? I have usually replied that I looked at the 1982 *Annual Report* of the Hoover Institution, and invited others to do the same.

What I have not discussed publicly, until today, is what led me to look at the annual report in the first place. Because the event that sparked my concern has been discussed in the Stanford *Daily* by Seymour Martin Lipset, and because the event involves Hoover's internal role in the departments, I think you should contemplate it as you reflect on the propriety of Hoover's activities inside as well as outside Stanford.

Hoover help on job offer

As my colleague Marty Lipset—a Hoover senior fellow as well as a professor of political science—told readers of the May 4 *Daily*, a colleague of ours in political science received a job offer last fall and, as part of the effort to meet that offer, Hoover was asked to help.

At this time, as Lipset also disclosed in the *Daily*, another colleague of ours expressed fears that if we continued to go to Hoover for various things, Hoover might at some point feel free to suggest or demand "reciprocity" from us. He feared a quid pro quo.

Whether Hoover raised the question of reciprocity in reaction to my colleague's comments remains in doubt, but what is not in doubt is the crucial fact that Hoover *did* raise it.

What happened in essence is this.

When Glenn Campbell was first approached, he responded favorably. Then, a few days later, Campbell informed the department's representative that after consultation with some senior colleagues, who were concerned about the department's lack of "reciprocity" for Hoover people, the answer was no—they would not help in this case. They even went so far as to mention a specific name as the prime example of lack of reciprocity—from which I drew the conclusion: you play ball with us, we'll play ball with you.

The only problem is that we are not playing ball, we're playing with departmental appointments and, as Hoover people increasingly request teaching appointments, we are playing with the curriculum itself.

When Hoover's response was reported to the department I felt that it was *improper*, and so informed my colleagues. It seemed to me that relations between the department and Hoover had just been politicized, and that this threatened to undermine generally accepted academic procedures.

How could members of the department consider future Hoover requests without in the back of our minds wondering what it might cost if we turned Hoover down?

By citing "reciprocity," did Hoover decline the department's suggestion on the individual's merits or abilities or value to Stanford, or did they say no because we had not gone along with one of their earlier proposals?

You deserve to know too that since then the Hoover senior fellow who was mentioned as the example of lack of "reciprocity" has circulated a letter arguing for appointment as professor of political science (by *courtesy*) to the entire department, with copies to Donald Kennedy, Albert Hastorf, Norman Wessells, and W. Glenn Campbell, his boss. I tell no tales out of school when I say this issue is very much alive in (and out of) my department.

Let me ask you this: does it sound reasonable to you that if we allow the existence of an organization like Hoover, with its millions of dollars and other resources, that Hoover will give and give and give and not, someday, expect something in return?

Politics in appointment

Can we expect to take and take and take and not someday be asked to give a little something back? Yes, the things Hoover proposes seem innocuous. The joint appointment they suggested to my department is not without merit. The only problem is: merit is hardly the issue. Politics is. And, not so subtly, the University and the credibility of its appointments process are at stake too.

The second reason we should ask what relationship, *if any*, should exist between Hoover and Stanford concerns the question: Why is Hoover singled out? We all know that there are lesser institutions of higher education in the east that have had ties to liberal Democratic administrations, so what's the matter with Hoover and the Reagan connection?

Doesn't Hoover just balance the liberal bias of the faculty generally?

Aren't other programs of the University partisan too? Why come down hard on Hoover—because it's conservative? That doesn't sound fair to most of us.

Hoover argues that it is not much different from other parts of the University or from other university programs, so why pick on us?

The fact is that Hoover is in no way comparable to such University programs as student-oriented Chicano programs, feminist studies, SWOPSI, Afro-American studies, CROW, conservative and liberal student organizations, and the like.

Hoover is not just another University program. *It is a multi-million dollar research institution.* To compare Hoover with these rather anemic and underfunded student programs that are normal parts of a university's pluralism is hardly plausible. These programs serve a variety of educational purposes for the students, and they are hardly comparable to an institution that can justly claim to have supplied the president of the United States with a great deal of the policy research on which he ran for office, and the expertise and personnel with which he staffed his presidency.

These crucial differences aside, let us, for the sake of argument, consider the contention that Hoover is just another part of the University, and should not be singled out for special attention. The problem here is that Hoover *is* in fact unique. It is not just another department. In fact, as near as I can tell it has little in common with a regular department.

1) *Recruitment*: the University has relatively little control over appointments at Hoover. The president of the University does have a say in the appointment of senior fellows (many of whom are Stanford faculty to begin with) but neither he nor the Board of Trustees has control over appointments of research fellows—and these make up about two-thirds of Hoover's professional staff. It appears that most of Hoover's staff is hired (and fired) by Glenn Campbell.

2) *Funding*: Most of Hoover's money comes directly from outside private sources, not from regular University funds. As far as I know Glenn Campbell decides how to spend the money at his disposal: if he wants to share this power, he can presumably share it; if he wants to hoard it and act like an old-time political boss, what prevents him from doing so? The University community, which has a stake in how Hoover is governed, has no information on these kinds of questions.

Most of Hoover's $8.4 million budget this year (over $9 million projected for next year) comes from funds earmarked for Hoover but administered by the University, and from funds solicited by full-time Hoover fundraisers from individual, corporation, and foundation sources.

What department receives the bulk of its money this way?

What department has a $9 million annual budget?

What department has full-time fundraisers?

Who gives this money? Why do they give it?

Do any of you know the answers to these questions?

3) *Research*: In addition to recruitment and funding, Hoover is special because of what it does: it is a library and archive, but the lion's share of its budget goes to support research and publication and a large public relations staff that disseminates the results of this research all over the U.S. and in several foreign countries as well.

What department has a full-time PR officer and staff whose task is to funnel the results of departmental research into the mass media and thereby affect political and policy discussion?

Look at the 1982 *Annual Report* and you will see an account of the Institution's impressive efforts to affect public opinion:

"Dissemination of research fundings in newspaper editorial essays, or op-ed articles, continues to be a major outlet for the ideas, opinions, and research results of Hoover fellows and authors. When this program was first begun in 1977, 17 articles were published. During the past year, over 240 articles carrying the by-lines of the Institution's scholars appeared in newspapers throughout the country. The same article is often carried in many newspapers, thereby greatly broadening the audience." (p. 66)

Why do you think Hoover is doing all this? Do you think any of this could qualify as political? Do you know any department that does these kinds of things on the scale of Hoover? Do you think it helps Hoover to be associated with Stanford in getting this material placed in the media? Do you think this material is evenly balanced ideologically, or is it perhaps part of the reason why conservative money is channeled into Hoover in the first place?

The conclusion I reach is that Hoover is special; that is why it is singled out.

The third reason why we need a study of Hoover, and why we should ask whether Hoover as a research (and propaganda) machine is compatible with the University is the most subtle and difficult of all, but it is also the most important. It concerns the legitimacy of the University.

I've been spending a good deal of time lately trying to break the following syllogism, and if the implications of this syllogism are correct, we really ought to pay attention to the questions it raises.

No one questions that there are many fine people at Hoover. Some of the Stanford faculty who have joint appointments with Hoover I count as my friends. Nor does anyone doubt that Hoover provides many benefits to Stanford beyond a fine library.

Benefits from University

The problem with Hoover does not lie here. It lies in what Stanford confers on Hoover, in the benefits that Hoover derives from its association with a great and prestigious university, and in the fact that Hoover is a political and partisan organization.

Let me explain.

We all know that one of the most precious things a university has is its legitimacy. Universities are special places in our society: they are looked up to because they embody the values of objectivity, nonpartisanship, and the nonpolitical search for knowledge.

In this regard, it is incalculably valuable to Hoover to be associated with a great university. In this relationship, Hoover brings benefits to the University, but the University also provides vitally important, if intangible, benefits to Hoover. By its connections with a great university Hoover's legitimacy, reputation, and influence are all immeasurably enhanced. *And so too is Hoover's ability to push its cause.*

Some look at this and say: What's to worry? They look and see the benefits Stanford and Stanford faculty reap from an ever-expanding and ever more wealthy Hoover.

I look and I see a threat to the most important thing we have.

If Hoover and Stanford are joined ever more closely, and if Hoover engages in partisan activities, is not Stanford necessarily implicated in such activities?

If Stanford is of incalculable value to Hoover, and if Hoover engages in the pursuit of partisan political causes

Remarks by Prof. Ronald Rebholz before the Faculty Senate May 26, 1983

Last week President Kennedy told the *Stanford Daily* that the Board of Trustees will probably ask an eminent visiting committee, supplemented by some people from within the University, to study the relationships between the Hoover Institution and the rest of Stanford University. I am grateful for that statement, because it means that today's discussion might focus on the questions that committee should ask. I think it is still worthwhile to move the resolution before us to add the Senate's support for the appointment of such a committee, and I will move it at the end of my remarks.

I ask the chair's and the Senate's indulgent permission to speak for about 10 minutes on behalf of the resolution because it will take me that long to isolate what I see as the major questions about the relationship between the Hoover Institution and Stanford University in terms of several anomalies which characterize that relationship and give rise to those major questions. The anomalies are first of all in governance and appointments which are intimately related and have to be discussed together. Donald Kennedy emphasized this area of concern in his statement of May 17. The other anomaly concerns the political mission to which Hoover, as an Institution, is apparently committed.

I. Governance and Appointments. The first major anomaly in the area of governance and appointments is the procedure by which the Director of the Hoover Institution is appointed. That procedure was defined by the Board of Trustees on May 20, 1959, in paragraph 7 of a statement concerning the Institution which is the most important of what Glenn Campbell referred to in *Campus Report* (May 25) as the "many binding resolutions and agreements that have been entered into by the Stanford Board of Trustees, the Hoover family, and the Hoover Institution Board of Overseers." I will hereafter refer to that statement as the Institution's "charter," and I quote from it:

The Director of the Institution shall be recommended to the Board of Trustees by the President of the University for appointment by the Trustees. He shall have been previously approved by Mr. Hoover. Such recommendation of the President shall not require approval of the Advisory Board of the Academic Council of Stanford University.

That paragraph was amended by the Trustees on May 17, 1962, to read: "He shall have been previously approved by Mr. Hoover, and after Mr. Hoover's decease by the Trustees of the Hoover Foundation, Inc., a New York Corporation." To the best of my knowledge, that paragraph still determines the procedure for appointing the director. Certainly it determined the procedure for appointing the current director, W. Glenn Campbell, on November 19, 1959. At a minimum, Herbert Hoover had the power of veto over the appointment and did not choose to exercise it. If the memories of my colleagues who were here at the time are reliable, Mr. Hoover virtually dictated the appointment of Mr. Campbell to President Wallace Sterling. Those who conduct the inquiry we ask for in the petition surely must ask the question of the propriety of allowing an outside person or body to have the power of veto over the appointment of a major academic officer of the university, and must therefore ask whether such an arrangement is indeed binding.

The second anomaly in this area is the charter's specifications of the kind of person to be appointed and the kind of tenure he will receive:

The director must be a man who reflects the purposes of the Institution. He should be of an age which gives him a substantial period of service before the retirement age of 65 years. . . . The director shall have tenure as long as he satisfactorily discharges his responsibilities. This is administrative tenure, comparable to that of the President of the University, and not academic tenure. . . .

Any inquiry should raise the question of the propriety of these specifications. Was Mr. Hoover determined to ensure the appointment of a director who reflected his purposes for the Institution? Was the change from academic tenure, which I believe the previous incumbents possessed, to administrative tenure made to exempt Mr. Hoover's candidate from scrutiny by the Advisory Board? I believe the answers to these questions are *yes*. The result is a director who, I will argue, espouses Mr. Hoover's purposes, has done so for 24 years, and whose appointment has never been reviewed by any member of the faculty. Surely, looking to the future, any inquiring body should ask if those specifications should be changed.

The third anomaly in the area of governance and appointments is the power of the director. The director controls a budget of over $8 million dollars, only one-third of which is used for the maintenance and expansion of the archive. His power over the budget is enshrined in the charter and, according to Thomas G. Moore's statement in the *Campus Report* of May 18: the director uses that power: "the director allocates the funds."

The charter also empowers the director to recommend appointments of the staff of the Institution directly to the President who then proposes those appointments and promotions to the Board of Trustees. Furthermore, and I quote, "There will be no reference to any faculty committees between the President and the Trustees."

Lyman-Campbell agreement

As I understand the recent history in this area of appointments, President Lyman and Mr. Campbell agreed in 1971 to modify the procedure with respect to Senior Fellows, so that now the President refers Mr. Campbell's candidates to the vice-president for Public Affairs who in turn appoints an ad hoc faculty committee to review the appointments before the President recommends them to the Board. But with respect to the 30 senior research fellows and the 10 research fellows, so far as I can tell the President has no role in the procedure, except to be informed of the director's intentions.

The final hiring authority for 40 of the 68 fellows resides in the director. As to the suggestion of John Moore, the associate director of Hoover, in the *Campus Report* of May 18, that review of these appointments is unimportant because they are term appointments of five years or less, those term appointments must be renewable. Otherwise men like John K. Emmerson, Paul C. Roberts, Edward Teller, Sidney Hook, and Robert Hessen, all of whom have held the position for more than five years, would no longer be senior research fellows.

It is impossible to find an analogue in the rest of the university for this procedure and extremely hard to invent one. I can only compare the director's appointment of a senior fellow to a dean's appointment of someone to a department with a review by an ad hoc faculty committee appointed by a public affairs officer but without a review of the appointment by the provost or the Advisory Board. The director's appointment of a senior research fellow or research fellow I can only compare to a dean's bypassing even the president. The director's power is in these instances virtually that of a co-President, to whose administrative tenure the 1959 regulations compares the director's.

Again, looking to the future, any inquiring body would want to question the propriety of the director's power over appointments. They would want to ask, I should think, why these appointments bypass the provost and the Advisory

Board when the latter are involved in reviewing what seem to be the most short-termed and relatively minor appointments to positions in teaching, research, or both.

When we step back and look at this entire set of anomalies in Hoover's governance and appointments, we must ask, and I should think any body of inquiry should have to ask, the reasons why they exist. The obvious answer is that Hoover as a research institution has a purpose which is different from that of the rest of the University. But what, we and any body of inquiry must further ask, is that purpose and does that purpose in fact necessitate these anomalies in governance and appointments?

Political Mission. Herbert Hoover, in the first paragraph of the charter, gave his answer to the first question. They include the now famous statement that:

The purpose of this Institution must be, by its research and publications, to demonstrate the evils of the doctrines of Karl Marx—whether Communism, Socialism, economic materialism, or atheism—thus to protect the American way of life from such ideologies, their conspiracies, and to reaffirm the validity of the American system.

The document contains other, less famous statements by Herbert Hoover about the political ideals and causes the Institution must espouse in its research and publications:

Ours is a system where the Federal Government should undertake no governmental, social, or economic action, except where local government or the people cannot undertake it for themselves.

The over-all mission of this Institution is. . .to. . .sustain for America the safeguards of the American way of life. This Institution is not, and must not be, a mere library.

When the entire document of May 21, 1959, was published some 10 months later in the *Stanford Daily* of March 29, 1960—apparently as the result of some investigative reporting by the *Daily*—the outrage of the faculty led to the Trustees' disclaimer that they "did not contemplate that Mr. Hoover's statement. . .would be interpreted as university policy" and that they stood for the principle of academic freedom. And I know that it has become a commonplace to insist that the Institution either never took seriously Mr. Hoover's definition of the Institution's purpose or that the Institution has transcended that definition. But I think we and any inquiring body must ask whether or not that commonplace is true.

Institution seeks influence

I want to emphasize the importance of this question being in the charge of any body of inquiry by arguing that there is a prima facie case for a second crucial anomaly in the relationship between the Hoover Institution and the rest of Stanford University: that Hoover, as an institution, seeks to influence political policy along lines which are ideologically conservative and thereby remains loyal to its founder's objectives.

I want to underscore one point in this position before I argue on its behalf. I am going to discuss the institution as *institution* because I think the institution and its objectives are to some extent different from its members and their individual objectives.

While this distinction may seem paradoxical, I think it is valid because of the powerful role which the Director and his immediate assistants play in appointments and in allocating the institution's funds. It is therefore entirely possible for individual fellows of the Institution to engage in research and publications which are not intended to influence policy and are not conservative in ideology, while the Director and his immediate assistants are shaping the Institution's dominant role of influencing political policy along conservative lines.

Here I think the statement, quoted in the *Daily*, April 19, of Prof. Alex Dallin, for seven years a Senior Fellow at Hoover, is crucial. "Professor Dallin said he left Hoover in part because he perceived violation of academic standards by an 'inner sanctum' of conservative activists whom he

continued on next page

Manley. . .

continued from page 20

does not Stanford necessarily help push such causes? Is our value as a University not employed on behalf of a political mission that the University, as such, has no business advancing?

Some look at these questions and shout: liberals! Your motives are suspect. Witch hunt!

This is a curious response for academics to make. By calling attention to the motives of the questioner one conveniently deflects attention away from the question. The issue now does not concern the validity of the initial question, but the motives of those who ask it.

I cannot stand here and tell you that Hoover's conservatism has nothing to do with my concern. I cannot stand here and tell you that if Hoover were a liberal think tank I would be raising these questions.

But I can say that if Hoover were liberal and if it were engaging in the kinds of political activities for the left that it performs so successfully for the right, someone would damn well wonder what such an organization is doing on a university campus—and they would be correct.

The bottom line is this.

I believe that millions of dollars from right wing and from conservative donors have poured into Hoover and established within Stanford University the leading conservative think tank in the country.

This necessarily involves Stanford University, directly and indirectly, in aiding the political cause of conservatism. I believe that as long as the Hoover Institution, as a research organization, remains part of Stanford University, it will continue to divide the Stanford community, embarrass those who believe the University should be nonpartisan, endanger the political independence of the University, and call into question the most precious asset a University can have: reputation and legitimacy among the American public.

You have an opportunity to consider supporting a responsible study of such questions. I do not know how you will vote. But I appreciate the opportunity of appearing before you and expressing my concerns. We all care deeply about this University, on that much we can agree, and I hope you take steps to protect it from becoming overly connected to one political faction and used in ways that will, in time, erode the very thing that makes Stanford an attractive target for capture: our reputation as a nonpartisan institution, on which nothing less than our legitimacy is based.

Harwood: Petitioners used a double standard of partisanship

Following is a paper on the Hoover controversy by Edwin Harwood, a national fellow at the Hoover Institution:

A week or so ago, one got the impression that the "partisanship issue" had been eclipsed by the "governance issue" in the Hoover controversy. Yet in their May 25th *Daily* article, "Hoover and Academic Freedom," Rebholz and Manley suggest that the partisanship issue is still very relevant. If Hoover is involved in political activity, they assert, this "contradicts the University's commitment to nonpolitical activity." Elsewhere they suggest that Stanford ought to be committed to "nonpolitical, nonpartisan and politically independent values."

All along the organizers and other faculty who signed the petition have claimed not to have been motivated by any partisan bias in their demand for an inquiry into Hoover's ties to Stanford. No doubt some of the signers were sincere in claiming not to have been motivated by political partisanship—"a liberal witch-hunt of conservatives" as Stanford professor Alphonse Juilland expressed it.

But is this true for all or even most?

It is quite proper to ask this question because it bears on the issue of whether a double standard is being applied to Hoover and whether Hoover has been singled out primarily because a number of Hoover Fellows do in fact take policy positions perceived as being conservative by others.

Among those leading the Hoover petition drive is Prof. Ronald Rebholz. In 1971, Rebholz was among the signers of an "amicus curiae brief" delivered to the Stanford Advisory Board which was investigating the case of Bruce Franklin, a professor who was eventually dismissed from Stanford for inciting individuals to violent activities. In fact, of the 38 signers of the 22 page Franklin brief, the names of 11 appear on the Hoover petition.

Now, the sincerity of *this* group can legitimately be questioned. Rebholz and other Hoover petition signers claim to be concerned about the threat that Hoover's alleged political partisanship poses to Stanford's "reputation" and "academic integrity."

Yet, Rebholz and the other 10 faculty who signed both documents argued that Franklin's incitement to others to engage in violent disruption was merely the exercise of his free speech. In their view, it wasn't Franklin's ferocious demagoguerie or incitement to mob violence that posed a threat to Stanford's reputation or academic independence, but rather Stanford's efforts to remove him!

That 1971 brief contains some interesting remarks. The signers affirm that "it is generally conceded that every sort of political opinion not only has the right to be heard but has the right to assume rude forms, even the nonmalicious slander of public personalities. In our kind of political system it would seem that the politician, as Bernard Crick has noted, necessarily 'lives in a world of publicity,

Juilland, McCarthy, Sherby comment

Following is a memo to the Faculty Senate from Profs. Alphonse Juilland, French and Italian; John McCarthy, computer science; and Oleg Sherby, materials science engineering:

We are gratified by President Kennedy's "Comments on the Hoover petition," which should put to rest the turmoil stirred up by the political charges made by Professors Rebholz and Manley, and clear the air for a fruitful discussion of relevant issues. We are also satisfied that the petitioners now concede that political considerations have no bearing on the debate (*Daily*, May 18). We urge the Senate to discuss the issues in the spirit of President Kennedy's statement of May 17:

The important issues, it seems to me, have to do with governance and appointments, and not with who has what kind of politics. Consideration of the latter not only is an improper criterion for appointment or evaluation under our principles of academic freedom, it can also turn a discussion into one that is unnecessarily strident on both sides.

As for our views concerning an inquiry into the Hoover's governance and appointments, they are best expressed in the cogent letter addressed to President Kennedy by Professor Rhinelander, who concluded that:

The current requests for an inquiry seem rather to assume that the issues raised have never been recognized and therefore should be looked into. But such an assumption is mistaken. A new inquiry would merely repeat former inquiries without adding anything of significance, as far as I can see.

The facts invoked by Professor Rhinelander in support of his conclusion appear to us extremely persuasive:

1. There is more diversity of opinion among the fellows of the Hoover Institution today than there was 25 years ago. Hence there is less reason to be concerned over the "partisan" character of the institution now than there was then.

2. Commitment to a partisan position or partisan ideology can seriously threaten the "free market of ideas" when such commitment is concealed or misrepresented. But we have the opposite position here. The current objection is that the Hoover Institution's links with the Reagan administration have been publicized too extravagantly, not too little. Thus nobody could claim to have been misled or deceived.

3. The notable progress made by the University over the past 25 years is ample evidence that its academic prestige has not suffered from its association with the Hoover Institution, which has been widely known for having a special orientation (*Campus Report*, May 18).

However, if further study appears desirable, we believe that it could be best handled by asking President Kennedy to look into the situation in the context of existing agreements between Stanford's Board of Trustees and Hoover's Board of Overseers, and let us know what action, if any, he considers appropriate.

Rosenberg concern for partisanship

Following is a partial, rough text of remarks by Prof. Leon Rosenberg, medical microbiology, to the Faculty Senate May 26:

The so-called conservatism of individuals is *not* what concerns me.

The issue which concerns me is institutional partisanship. My example is taken from the annual report of the Hoover Institution.

When the Institution sponsors a seminar—the Hoover Seminar—which brings to the Institution the councillor to the President, the Secretary of Defense, the Deputy Assistant to the President, the Secretary of Transportion, the former Assistant to the President for National Security Affairs, and the Associate Director of the Office of Management and the Budget—that is the entire list taken from the director's annual report—then I am concerned. The Institution is proudly displaying its Washington connections.

I believe an educational institution needs to be a custodian of heterodoxy. I strongly believe that to be partisan institutionally to the most powerful force in society is a very dangerous position for an educational institution.

And I should interject that my concern is Stanford University and its image. If the Hoover Institution has been imprudent, a question about which I'm certain many would disagree, that is not my concern.

After the description of the Hoover Seminar, attention is called in the annual report to a "Washington Seminar." I was interested to know if the attendees at these seminars were also selected in a manner suggesting partisanship and tried to find out the guest list. Several phone calls were unavailing.

I then concluded that the petition which brought this question to the Senate was entirely appropriate.

I agree that there is, and always has been, a partisan image associated with Hoover—one which he gave to it in the oft-quoted remarks which describe its mission.

The current Washington connection—of which the Institution may, of course, properly be boastful—to my mind raises serious questions for the University, which should cause the University to review and reconsider the rules under which the two institutions interact.

Rebholz/continued from page 21

was unable to influence from inside the Institution." It is possible to be "in" Hoover without being representative "of" it.

Let me make my case by a brief look at the record. In the same March 29, 1960, issue of the *Daily* which published the charter, Glenn Campbell, in an interview, is quoted as saying that the change of Hoover's title from library to institution reflected its transformation to a center for a dynamic research program and his determination to build up Hoover's reputation as an institution for research and publication.

The research, he said, would portray the growth and spread of Communism. The publications would be designed to give aid to government policy formation. Asked about the famous passage from Herbert Hoover's statement, he replied: "I see nothing wrong with it, do you? There are evils in Marxism and I hope we expose them."

When Hoover's new domestic program was announced in 1972, Martin Anderson, who proposed it, said *(Daily*, 8/8/72) "We are now faced with very serious troubles at home in a large number of areas" and went on to suggest that the mission of the program would be to address the causes of those troubles and, by implication, remove them.

The *Daily* of 1978 paraphrased Thomas G. Moore's hope that the institution's frequently conservative viewpoints were already having some influence on Government attitudes, especially in areas of deregulation.

In Hoover's annual report of 1981, Glenn Campbell said that the "highlight of the year was the election of honorary fellow Ronald W. Reagan as President of the United States."

The Annual Report of 1982, which is in today's Senate materials, speaks for itself. By running my eye down the pages I count the word "Reagan" 36 times, not including synonyms like "the president" or "the White House." There are six pictures of President Reagan; at least seven of his advisers appear in the pictures (sometimes more than once).

The elaborately printed center-section (pp.24-29) quotes the President as saying: ". . . those of us who are involved in government owe so much to the Hoover Institution. Under the leadership of your able director, Glenn Campbell, and with hard work and diligence, you built the knowledge base that made the changes now taking place in Washington possible." Mr. Campbell quotes much of the passage on p. 11, and goes on to boast that, since January 1981, more than 30 scholars and former fellows have served in positions in the executive or legislative branch of the federal government or as members of boards and commissions (pp. 12-13).

These features of the Report reveal a good deal of the Institution's ideological position. The section *Publications and Public Affairs Program* reveal some of the ways it makes that position influential. I am thinking primarily of pp. 64-67 in which in the Institution's methods of "research dissemination" are catalogued.

For me this account reaches a climax at the bottom of p. 66 where we are told of the growth of the the op-ed program. It is hard for me to imagine any department or school of this university boasting of the number of newspaper editorial essays its members had published, and the difficulty resides in my perception that no department or school shares Hoover's political mission.

Since the debate on Hoover began this year, several people have tried to downplay the Annual Report as a p.r. document not to be taken seriously. I think this view is mistaken, because the Report is clearly an indication of the Director's and the Institution's political objectives and ideology.

If the report is also an instrument of public relations, and probably it is, we must ask to what areas of the public it seeks to relate. I think of two: donors to whom the report's ideological bias would appeal; and the media, who seek the "views of Hoover scholars on current events," as Mr. Campbell says on p. 19, and who do so, I think, when they want a conservative perspective on a controversial political issue.

I would suggest that Hoover uses its report, among other instruments, deliberately to create its perceived reputation as a conservative think-tank in order to influence political policy through the media as well as through the political figures and institutions for whom it provides the knowledge-base.

If there is, as I have argued, a prima facie case for the Hoover Institution's being anomalous in its having a political mission, then the reason for its anomalies in governance and appointments becomes clear: the Institution needs a Director with an ideology which Mr. Hoover or his institutional surrogate approves, and the Director needs a large budget, which he controls, and the right to appoint, with virtual autonomy, the fellows of the Institution so that the Institution can carry out its political mission.

If this analysis is correct, the major question for a body of inquiry to ask is whether or not such an institution is compatible with Stanford University's proper insistence that, as a University, it is politically independent and does not engage in partisan political activities.

To those who have said that I would not favor a comparable inquiry into a department or into an institution like Hoover with a liberal bias, I can only respond, with respect to departments, that no department of this university has the anomalies of governance, budget, appointments, and political mission which characterize Hoover.

With respect to a liberal institution like Hoover I would want to see if it were as anomalous and as compromising of the University's integrity as I consider Hoover. If it were, i think it would warrant a comparable inquiry.

I move the resolution before you:

The academic senate urges the Board of Trustees to initiate an immediate and independent inquiry including a public report, on the relationship between the Hoover Institution and Stanford University.

Harwood/ continued from page 22

calumnity, distortion, and insult,' " (p. 10, Brief, Amicus Curiae, Nov. 9, 1971).

Is this to be taken as a defense of even the most rabid and vicious demagoguerie? More to the point: would Franklin's supporters have rushed with a similar Amicus Curiae brief to the defense of a Klu Klux Klan adherent or Nazi who incited students on campus to "thrash" property and who peppered his writings and speeches with justifications for racially motivated violence?

Franklin went quite beyond mere "distortion and insult" as any familiar with his speeches on the Stanford campus will recall and the targets of his apoplectic fury were not just limited to politicians. But the crucial point is that he was found after due academic process to have incited others to engage in violent *acts*.

For his defenders to argue that his conduct was the innocent expression of free speech when it posed such a clear threat to the legitimate academic functions of the university is so patently ludicrous as to suggest a *prima facie* case for assuming that their motives in backing Franklin were primarily partisan and that it was not the issue of "free speech" as much as the fact that Franklin was a man of the Left that prompted their support; indeed, Franklin made no bones about being a man of the very extreme Left.

Is this group really committed to the value of Stanford remaining "nonpartisan" and "nonpolitical"? If it is, then why did Rebholz and the other 10 faculty have no objection to Stanford taking a partisan position on certain matters back in 1971? On page 6 of the "Amicus Curiae brief," they affirmed that where there are questions "which are essentially educational but which have political implications. . . the university cannot remain neutral if it is to remain faithful to the principles that justify its existence."

One has to cut through some tortured phrasing to get to the point but the point appears to have been that "war-related research" and "recruitment by the military and military contractors" were presumably areas where the university could take a politically partisan stand as an institution. Although the wording is murky at points, there is a hint that the university might also establish a policy that would abridge an individual's freedom to do research that was "war-related."

Institutional partisanship

The fair question to raise is the obvious one: who is to decide which "principles" "justify the university's existence" such that Stanford *as an institution* could legitimately take a partisan stance and infringe on the right of individuals to conduct research relating to national defense or to come on to the campus to recruit for the military or firms that held defense contracts? Surely it could be argued with even greater validity that defense related research in support of our free society against totalitarianism is fully consistent with academic freedom since such freedom cannot survive unless the free society also survives.

You can't have it both ways. Either the university and its individual institutional parts can take a partisan position on anything it desires or it can't.

As the Hoover controversy began to develop momentum, Rebholz and Manley came to the view that a center may not need to have expressed its partisanship in an official way to be considered partisan.

Thus, in their May 10 *Stanford Daily* article, they remark that "just because (an) Institution does not take formal positions on issues, does this make it nonpolitical?" They answer: "Perhaps. But we doubt it."

More recently, in the May 12 issue of the *The Stanford Daily*, Manley appears to have resolved any doubts on this point. Noting that institutions like Brookings, the American Enterprise Institute, among others, do not, as far as he knew, take official positions on issues, he asks, "can anyone seriously believe that because these organizations don't take stands on issues, they are not political? . . . Just because these organizations are comprised of individuals and do not take stands on issues hardly makes them apolitical research organizations."

While I am reluctant to provide helpful pointers to the opposing camp, I must say that I think Manley and Rebholz have taken their saw and turned it on their own limb in moving the argument in this direction because if *official* partisanship by an institution is no longer at issue, what kind of partisanship is?

I see only two alternative conceptions of partisanship open to them:

1) that an institution is improperly partisan when too many of its resident scholars express partisan views of a certain complexion.

In this view, an institution is improperly partisan because of its lack of diversity or balance. (Manley and Rebholz give no help to their camp, by the way, when in rebutting Prof. S.M. Lipset's contention that Democrats outnumber Republicans, they claim it is necessary to know whether these Democrats are liberal or conservative to determine if Hoover is sufficiently diverse politically. (May 18th *Campus Report*). *If the partisanship of Hoover fellows is immaterial, as Rebholz and Manley state repeatedly, why rebut a point that will reinforce their opponents suspicions that they are in fact concerned about Hoover's political diversity?*

2) that when some more powerful or dominant group within the institution enforces its viewpoint on others either through the appointment or promotion process or more directly by dictating the political "line" others must adhere to, then it is partisan in ways inconsistent with the value of academic independence.

If the second condition existed, it would be wholly legitimate for the academic community to be concerned. But if the evidence suggests no more than that the first type of partisanship exists, then the demand for an inquiry into Hoover can quite properly be viewed as an attempt to abridge Hoover Fellows' academic freedom.

Manley and Rebholz have not provided any evidence that the second alternative holds in the case of the Hoover Institution beyond their bald assertion (May 10 Stanford Daily) that some Stanford faculty and the media "discern in Hoover a large and dominant core which sets the tone and tends to pursue overwhelmingly a fairly consistent political line."

Do they mean to imply that some Hoover adminstrators enforce their political views on other Fellows? How has this been done? Has the Hoover Press been instructed to make sure that manuscript submissions meet certain political criteria? Were candidates for appointments required to pass a political test?

Such innuendo is fine for drumming up business for a petition drive. But in demanding an inquiry before having material evidence in hand to support their allegations, their action raises quite legitimate fears that what is involved is a fully partisan undertaking—in short, a witch-hunt.

The fact that a double standard is being applied to Hoover, despite the petitioners' claim that *liberal* partisanship in a research center or institution would also pose a threat to the university, has already been raised and by itself is cause for concern.

But the much more troubling issue is the threat to academic freedom that Manley's and Rebholz's concept of partisanship poses, especially when there are good grounds for suspecting that some among the petition signers, including Rebholz, were themselves motivated to ask for the inquiry because of partisan political bias. (This was, indeed, suggested in the May 16th *Los Angeles Times* editorial on the controversy. But I am very reluctant to rest a case on editorial commentary from outside the campus. For me, the Franklin Amicus Curiae brief is alone quite sufficiently damning.)

If the Faculty Senate does decide to pursue the "partisanship" issue, the inquiry could well leave our nation's academic community with the suspicion that Stanford allows its machinery of governance to be used for partisan political vendettas. And if that proves to be the case, then Stanford's academic integrity and national reputation will truly be at risk.

Gere: Stodgiest colleagues read *Daily*

Following are rough notes used by Prof. James Gere, civil engineering, in speaking to the Faculty Senate May 26:

Normally, a request for an inquiry on this campus would be met with a casual shrug and a reaction of "sure, why not? It can't do any harm." However, this particular request for an inquiry is clearly unusual, and it has not been met with a shrug by anyone that I know.

Instead, I have noticed even my stodgiest colleagues reading *The Stanford Daily* to get the latest reactions. Editorials have appeared in several local newspapers, and *The New York Times* and *The Washington Post* asked to attend this meeting.

Reasons for this attention are clear. Staff of the Hoover Institution have been called to Washington in various roles and ideas generated at Hoover have been drawn upon by people in political positions. President Reagan has drawn upon Hoover in a variety of ways and has praised its accomplishments.

Research has influenced policy—isn't that the goal of research?

It seems clear that it is because of these ties with the Reagan Administration that so much attention has been drawn to this resolution. The public is not the least bit interested in matters of governance and appointments, which is what an inquiry should be about, as President Kennedy has said.

Some of the people who signed the original petition, calling for an inquiry, no doubt had legitimate concerns for governance and appointments.

Others, I'm sure, saw the petition as a chance to take a swipe at an organization that happens to be viewed favorably by the Reagan Administration, which they don't like.

Those of us who signed the counter-petition also had various motives. Some were seriously concerned about the welfare of the University; others no doubt saw it as a chance to swipe back.

No matter what the motives of the signers, we have to face the hard fact that the inquiry has become a political football. If we go ahead *at this time*, it will be viewed as a politically motivated move. It will certainly appear in the papers in that light.

I believe this will be terribly unfair to the people at Hoover, and I believe the political aspects will prevent any serious discussion of the governance issues, which are in-house matters, not national political matters.

Instead of "initiating an immediate and independent inquiry," as the resolution calls for, which is a very intimidating and threatening thing to do, I prefer that we oppose the resolution and instead give the Board of Trustees, as part of its ongoing process of continually reviewing University policies, an opportunity to review its relationships with the Hoover Institution at some future time, focusing on matters of governance and appointment. This is something that I am led to believe they planned to do anyway.

I am convinced that the adoption of this resolution by the Senate will do unnecessary harm to both the Hoover Institution and Stanford University, and I oppose the resolution.

Juilland: We're all overexposed

Following is a May 23 statement by Prof. Alphonse Juilland to Prof. Alexander L. Fetter, chairman of the Academic Senate.

I wish to thank you for the courtesy of inviting me as a guest to the Senate meeting of May 26. Please note that I do not intend to participate in the debate on the Hoover question.

Profs. Manley, Rebholz, and myself share at least one thing in common: we are all three overexposed. For weeks now, we have been conducting our debate in the media. We had our say, and an abundant say it was. Our respective positions are well known to the Senators, who have read or heard every argument and counter-argument we could muster. At least for myself, I do not think that I have anything of substance to add, unless it be scoring debaters points or delivering assorted pieces of florid rhetoric. I feel that I have reached the fatidic point at which discretion becomes the better part of valor.

I believe that the best service Profs. Manley and Rebholz as well as myself can now render the University is to allow the Senate to discuss the issue in peace, without interference on our part.

I shall be an interested and attentive listener; but I promise to keep quiet.

Reservations, optimism as debate ends

continued from page 1

Gillespie still had some reservations: "If we start attacking covenants, it could have a chilling effect on donors of all persuasions," he said. "Universities always evolve. . . the Hoover Institution has moved from an incredibly narrow focus. For people to go and dig up corpses of the past is rather sad. The mania to investigate disturbs me."

Manley was more optimistic: "The people who raised questions had their concerns considered and seriously responded to," he said.

"Kennedy's interview with *The Daily* really defused it," another outside journalist observed. The president told a small cluster of reporters that he "would not have supported the original version" but was "perfectly comfortable" with Bach's substitute, as passed.

—**Bob Beyers**

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

implementing such plans; maintain files; attends wkly mtgs of mgrs; participates in O&M policy decisions; prep monthly, quarterly & annual reports; QUALIFICATIONS: BA or BS in Acctg or Business Admin preferable; MBA desired but not required; exp w/ ADP applications w/ special emphasis on Hewlett-Packard hardware & software.; C08; $2464-3139.

36306-AW (JCC:2420) SPONS PROJ ADMIN II: Performs basic proposal & award review & admin; assisting exp'd Contract Officers; does analytical special studies related to sponsored agreements; assts Dir, Assoc Dir & staff in determining needs; developing solutions & procedures to deal effectively w/ specific & genl problems/requirements related to research admin; analyzes & interprets sponsor requirements, gov't regulations & Univ policies & procedures; QUALIFICATIONS: exp in res univ or similar environ; excel writing skills; demonstrated ability in analytical problem-solving; knowl of basic acctg; some knowl of federal gov't organization & admin procedures; some acquaintance w/ tech of financial & economic analysis; BA or equiv exp; MBA desirable; ability to travel for periods of up to a wk.; C06; $1854-2312.

31841-VW (JCC:3148) DEVELOPMENT OFFICER II: Respon for coordinating annual fund & large gift programs in a given geographic territory, incl Spec Gifts, Personal Solicitation & Phone Appeal programs; establish a high level of visibility & involvement w/ approx 300 volunteers; educate volunteers to univ programs & prov nec training; answer questions & complaints; keep volunteers informed of program progress situations & indiv that would prov financial support & have the skills to deal w/ them effectively; represent Stanford in the field in a variety of ways which could have important impact on a prospective donor's attitude toward Stanford & support the Univ; QUALIFICATIONS: ability to establish & sustain an effective volunteer relationship; ability to describe Univ goals; demonstrated understanding of financial/tax implications as it relates to gifts & gift procurement; good mgmt & admin knowl; good interpersonal skills; knowl of sales & nontangible marketing; excel written & verbal skills; college exp helpful but not required.; C07; $2113-2724.

26672-AW (JCC:5108) PROGR SCIENTIFIC II: Fixed term 6/1/83-8/31/84; prov support to microcomputer-related projs administered by IRIS div w/in CIT; asst w/ setup & operation of micro lab for software/-hardware demonstration & evaluation; write procedures & documentation; asst w/ training & scheduling of lab assistants, prov consulting to lab users; asst w/ planning & implementation of micro-mainframe commu & file transfer serv; asst w/ tech investigation of special applications of microcomputers, particularly in Humanities; QUALIFICATIONS: Bachelor's degree and/or equiv exp; approx 2 yrs micro & mainframe applications computing exp in an academic environ; exp w/ micro commu/file transfer software; exp in tech writing & procedures writing, class teaching, etc; excel oral & written commu skills; exp giving directions & overseeing others; knowl of Stanford academic computing needs extremely helpful; knowl of Humanities applications; proj related exp.; C06; $1854-2312.

26673-AW (JCC:5108) PROGR SCIENTIFIC II: Fixed term 6/1/83-8/31/84; prov support to microcomputer-related projs administered by IRIS div w/in CIT; conduct res in the use of microcomputers by the academic community; coord eqpt deliveries, assembly, inventory, troubleshooting & maintenance; develop curriculum for, & teach, a range of micro-related courses, particularly related to IBM PC; define & document procedures; asst w/ newsletter; res info & write short doc for users on various micro-related topics; QUALIFICATIONS: Bachelor's degree and/or equiv exp; approx 2 yrs evaluation res exp incl needs assessment, design, implementation, analysis & reporting; familiarity w/ quant & qual tech; approx 2 yrs computing exp in academic environ, using mainframe & various micros; exp w/ micro commu/file transfer & text proc software; mainframe exp incl use of text editor/formatter, data base sys, statistical programs; knowl of Stanford acad comp needs & of Humanities applic; excel written & oral commu skills; exp in writing procedures, etc.; C06; $1854-2312.

19167-JB (JCC:6412) SCI & ENGR ASSOC II: Work on the development & maintenance of linear accelerator & associated free electron laser experiments; design & oversee construction & implementation of part of the accelerator, cooling sys, control & measurement subsys & instruments; design some of the accelerator vacuum & mechanical sys; become familiar w/ the operation of the linac; QUALIFICATIONS: must demonstrate a broad spectrum of knowl & interest in analog & digital circuitry as well as vacuum & accelerator technologies.; C99; $2113-OPEN.

29449-LL (JCC:1964) UNIV MANAGER I: Mgmt of the Admissions Offc staff & procedures when the Dir is out of the offc (8-10 wks/yr); initiation, implementation & evaluation & oversight of programs & projs for minority recruiting; initial evaluation of one-half (2,500) of the applications to the program; interviews of candidates or prospective applicants to prov info about the program; professional representation of the School to various publics; supvn of an interna'l applicant academic expert & oversight of the academic evaluation of all interna'l candidates; supvn of a sec/receptionist; QUALIFICATIONS: prior managerial exp; ability to relate well to professional school applicants; strong commu & interpersonal skills; MBA or other approp master's degree; prior exp in a univ setting in admissions; familiarity w/ MBA programs; exp in working w/ minority group applicants strongly preferred.; C07; $2113-2724.

21693-AW (JCC:2270) FIN/MGMT ANALYST III: Respon for developing fiscal programs of O&M which amount to about $16 million for both cost ctrs & the Univ Operating Budget; full respon for budget prep, data collection, problem solving analysis; the formulation & evaluation of alternate solutions; the prep of periodic or special reports whether manual or data processing; capable of supvn & directing the work of 2 people in Service Ctr Acctg group; interfaces w/ other financial areas of the Univ; interprets their requirements, develops a plan of action for O&M & gives direction to other O&M mgrs on

Bargaining Unit

39483-TC (JCC:5644) LIFE SCI TECH II: TMS Unit; handling & restraining of mice, admin of medications, tumor implantation & collection of blood; a variety of immunological tech required incl cell separations, immunofluorescent staining, radioactive labelling of cells, cellular cytology assays & radioimmunoassays; maintenance of continuous cell lines & tissue culture tech; working knowl of immunology for prep of protocols, & analysis of experimental data; QUALIFICATIONS: some lab exp nec particularly in area of immunology & biological sci; knowl of immunology highly desirable; an animal model to verify modification of disease by interferons & monoclonal antibodies will be studied; good judgment & explicit lab notebooks are critically important.; A24; $ 8.65.

32124-TC (JCC:5652) LIFE SCI TECH III: TMS Unit; certified X-ray Technologist to work in radiology res labs; may be requested to work an occasional night or wkend; procedures are mostly animal related; computerized Tomography, digital imaging, as well as routine radiograph are employed in res labs; willing to perform all aspects of lab work; QUALIFICATIONS: CT exp as well as some spec procedure (angio) exp strongly desired; grad of an approved A.R.R.T. program; A.R.R.T. registered; have Calif License.; A30; $ 9.97.

94713-JM (JCC:6696) PR S&E TECH MECH TMS Unit; assemble klystron guns for production & R&D; coat cathodes; outgas gun parts & assemblies; sinter cathodes; operate hydrogen & vacuum furnaces & induction heaters; maintain vacuum sys & eqpt needed in gun production; braze, spot weld, heliarc weld & solder; QUALIFICATIONS: AA degree or equiv; several yrs exp working in clean room environ; must have solid knowl of operating principles & use of helium leak detectors, RF induction heaters, brazing furnaces & vacuum pumps; familiar w/ all phases of klystron production brazing soldering, heliarc & spot welding, outgassing, ceramic spraying, sintering.; A39; $2148. APPLY AT SLAC

39119-JB (JCC:8606) BUILDING SYSTEMS TECH: TMS Unit; 8:00-4:30; Under min supervision of a shop suprvr performs HVAC; pneumatic & elec control instrumentation system work in the design, installation, maint, operation, monitoring & balancing of equipt & controls of complex building systems; maint records of operations such as pressures, temps, flows & service functions performed; periodically test, adjust & calibrate pneumatic, electric & elect controls; maint, inspect, diagnose & make repairs to steam, water, refrigerant & air dist systems; QUALIFICATIONS: 2 yrs control system app, installation, calibration & operation; certifiable training & education in control theory inc electronic controls & computer automated systems; completion of a recognized air cond apprentice program/at least 6yrs exp in total bldg syst maint & repair, 1yr of exp must include maint & repair of central multizone a/c systems; A37; $11.80.

Nonexempt

31172-PM (JCC:1755) LIBRARY SPEC II: Fixed term, 6/1/83-5/31/84; performs duties in Catalog Dept; processes monographs on-line, incl searches MARC & RLG files, compares book to bibliograph record, transfers matched bibliographic records to on-line acquisitions records; prepares authorities incl: prepares name headings by searching SUL card catalog, LC name authorities microfilm edition or on-line source & types authority card, series headings prepared by searching card catalog LC monographic series printed catalogs & creates authority record for SUL card catalog; files in SUL card catalog; keeps daily production statistics; QUALIFICATIONS: typ 40; work w/ good judgment based on good understanding of processing policies; prev exp w/ RLIN II or other automated sys; prev lib exp, preferably in technical processing operations; high degree of accuracy in typing; ability to lift heavy catalog trays (approx 15 lbs.); reading knowl of at least one non-English Western European lang; contact: Bob Johnson, Green Lib, Room 223 (497-3152).; B12; $1310-1373.

31174-PM (JCC:1755) LIBRARY SPEC II: 50%, 8-12 noon; some evening & wkend work; performs duties in the Physics Library; respon for opening the Lib, for all set-up procedures & for staffing the serv desk 8-12; answers info'l, directional & reference questions using printed & automated sources, incl RLIN II; maintain & compiles circulation statistics for annual report & for SUL sampling statistics; in charge of the reserve shelves; prep overdue notifications & deals w/ patron appeals regarding bills, problems, etc; QUALIFICATIONS: typ 40; require prev lib exp; ability to commu well & work w/ people; typing skills; ablity to use RLIN or other automated sys; sci bkground; knowl of SUL resources & programs desirable; contact: Bob Johnson, Green Lib, Room 223 (497-3152).; B12; $655-687.

33504-PM (JCC:1755) LIBRARY SPEC II: Searching on RLIN & in other bibliographic tools for cataloging records; inputting records, as revised by catalogers, into RLIN; initiate & follow-up on FASTCAT & TEMPCAT procedures for titles w/out acceptable records; maintaining files & documentation; revising filing in main catalog, & filing, unrevised, into dept files; training new staff; QUALIFICATIONS: typ 45; ability to exercise judgment & initiative in relation to complex tasks; accuracy & attention to detail; ability to set work prior that meets the needs of dept; prev cataloging exp desirable, esp w/ automated sys; good typing & filing skills; RLIN exp desirable; contact: Dick Miller, 497-6401.; B12; $1310-1373.

31176-PM (JCC:1763) LIBRARY SPEC III: Performs duties in Serials Dept; supv day-to-day operations of Continuations/Maintenance Unit of Serials Records Div; receiving & claiming serials mat'ls & processing invoices for serials mat'ls; maintains corresp pursuant to completion of reception/claims & invoice-processing tasks; supv 3 Lib Specialists; supv & performs manual & on-line claiming of missed issues, defective issues & lapsed subscriptions; prov bkup to Head, Serials Records Div; QUALIFICATIONS: typ 45; require prev tech processing exp, prev supvry exp, demonstrated ability to commu effectively, both orally & in writing; demonstrated clerical & organizational skills; ability to learn RLIN II or other automated sys; prev exp in serials records work desirable; contact: Bob Johnson, Green Library, Room 223 (497-3152).; B14; $1440-1514.

31175-PM (JCC:1771) LIBRARY SPEC IV: Within the guidelines of established policies & procedures & subject to close review until these are learned, performs the following duties in Swain Lib of Chemistry & Chemical Eng: Oversees day-to-day operations of the lib, including acquisitions, catalog maint, circulation, course reserves & serials, responsible for the lib in the librarian's absence; suprvs 1.75 lib specs; provides reference services in the chemical sciences using the printed & online ref tools (RLIN, DIALOG, SPIRES); QUALIFICATIONS: Previous lib exp; public service exp & suprv exp; know of/or exp in the sciences (pref in chemistry); prev automated systems or RLIN exp; know of German; type 40; contact Bob Johnson, Green Lib, Room 223 (7-3152).; B16; $1593-1671.

39454-PM (JCC:2078) ADMIN ASST I (N): Assist Business Mgr of Dept of Family, Community & Preventive Medicine in the admin of all common serv of the Dept; manage all research grants & operating Budget; prep budget reqs, handle details of monitoring & reporting process, financial analyses & forecasting; handle all purchasing of scientific eqpt; personnel admin for faculty, exempt & non-exempt staff; prep, interpret & apply all policies & procedures for the smooth running of the Dept; QUALIFICATIONS: exp in Univ/Hospital admin procedures & policies; res grants & contracts admin exp, preferably at Stanford; exp in budgeting & forecasting; demonstrated supvry ability; proven interpersonal capabilities & commu effectiveness; typing nec to handle confidential mat'l; send appl/resume to Cindy Spain, HRP Bldg., Room 105C.; B16; $1593-1671.

36386-BP (JCC:2202) ACCOUNTING ASST II: Prov tech support for univ capital eqpt inventory control sys; asst in maintaining the sys in current status thru use of WYLBUR text editing via on-line computer terminal & related software sys currently under development; respon to inquiries regarding govt & Univ inventory procedures, schedules, forms use, etc; maintain univ property mgmt files; screen purchase orders for all capital eqpt purchases; asst in daily screening & approval Purchase Reqs & Capital Eqpt Inventory forms; prov assistance & guidance to student help; QUALIFICATIONS: light typing; use of electronic calculator required; accuracy & demonstrated ability to perform detailed acctg functions; good oral & written commu skills required; send appl/resume to M. Willis, 200 Encina Hall.; B12; $1310-1373.

31504-PM (JCC:2438) OFFICE ASST TRNEE: Respon for the maintenance of the Alumni Files; files must be comprehensive, complete & accurate; code various Alumni transactions on coding sheets in a legible manner; batch coding sheets for submission to data entry; review edits for errors & correct as required; file info cards alphabetically; answer inquiries fr Univ offcs, alumni & friends regarding info contained in file; interpret Univ policy relative to confidentiality of info contained in file; QUALIFICATIONS: typ 45; neat & legible handwriting; knowl of English alphabet; knowl of basic offc procedures; handle phone calls in a professional manner; willing to interchange job assignments; send appl/resume to Liz Trujillo 301 Encina Hall.; B00; $1078.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, June 7 in Room 270, Tresidder Union.

The sessions are open to all new employees without preregistration.

26641-BP (JCC:2454) OFFICE ASST II: Prov data entry for computer documentation; asst in production work on doc, & act as bkup for graphic artist; act as interface w/ print shops, delivering camera-ready copy to Word Graphics, picking up completed jobs, & delivering various doc to campus depts as needed; maintain master & online files; asst CIT instructors w/ courses, incl bursting, trimming, & stacking handouts, passing out course mat'ls at first sessions of classes; QUALIFICATIONS: typ 40; requires good genl offc skills & solid command of English lang; able to work on several projs simultaneously; knowl of & exp w/ WYLBUR text editing & SCRIPT text formatting sys required; SPIRES knowl & exp in the use of 3800 printer desirable; knowl of typesetting, printing, photography, & photo layout tech desirable; requires good commu & arithmetic skills; contact: CIT-Human Resources Offc, Pine Hall, Room 175, 497-9656.; B09; $1130-1189.

39283-BP (JCC:2454) OFFICE ASST II: 50%, 10-12, 1-3 preferred; serv as receptionist in the Dept of Residential Education; answers phones; opens & sorts mail; answers genl questions; scheduls appts; assts in the process of assigning students to housing; typ corresp, reports, forms, etc; maintains a variety of files requiring a knowl of the subj & purpose of each file; checks, updates & maintains lists & rosters; operates various offc machines; accepts rent & housing deposits; assts in petty cash & program records, etc; QUALIFICATIONS: ability to understand & explain complex housing sys & to enforce Univ policies; ability to work w/ diverse groups of people; work w/ numerical detail accurately & quickly; accuracy & thoroughness in written & oral commu; typ 45; send appl/resume to Chris Griffith, Escondido Village Office.; B09; $565-595.

30456-PM (JCC:2462) OFFICE ASST III: 50%; prov clerical assistance to the sec of a large research group consisting of 2 faculty members as well as several visitors, postdocs & grad students; typing drafts of manuscripts & ltrs; work on word processor, xeroxing, filing & genl reception duties; maintain offc supplies; lib searches; carry out errands, etc; QUALIFICATIONS: typ 50 tech typing exp or willingness to learn; knowl of computers & word processing eqpt desired; excel organizational skills required; ability to work independently & set own prior; send appl/resume to Dena Polyhronakis, Dept of Physics, Varian 108.; B11; $623-655.

39280-BP (JCC:2470) OFFICE ASST IV: 50%; help develop, organize, publicize & evaluate a variety of edu, social & cultural programs in the village; asst in neighborhood coordinator selection process; asst in planning & implementing the orientation for new residents; implement workshops/info sessions on program organization; serv as liaison w/ other Univ offcs; asst in prep of Village Handbook & the Village Express; prep & distribute minutes fr neighborhood coordinator mtgs; serv as receptionist, sec & coordinator in Village Ctr; select, train & supv the volunteer staff; act as a resource/referral person for residents; edit & typ corresp, rprts & Univ forms, etc; QUALIFICATIOINS: typ 45; successful exp in developing & implementing programs, initiating projs, working w/ groups of college students & faculty of ethnic bkgrounds; promoting events & encouraging participation; commu effectively both orally & in writing; send resume/appl to Patricia Brandt, Escondido Village Office.; B14; $720-757.

895-BP (JCC:2554) SECRETARY II: Secretary to faculty members at new Center for the Study of Language & Info; type correspondence, manuscripts & reports; prepare Univ forms; answer phones; make appointments & travel arrangements; run errands among Univ depts; use computer/word processing system for text-editing; additional responsibilities as

Permit for hazardous wastes facility drafted by Health Services Dept.

The Department of Health Services, Hazardous Waste Management Branch, has drafted a Hazardous Waste Facility Permit for the following facility:

Quarry Road and Campus Drive, Stanford University, Stanford, Calif. 94305.

The permit will authorize this facility to store and/or treat hazardous wastes under specific conditions to assure safe operation of the facilities.

This notice hereby invites comments before final issuance of these permits. Anyone wishing to submit comments should do so by either: 1) submitting written comments within the next 45 days to the address listed below, or 2) submitting verbal comments during a public hearing, to be held at 9 a.m. Tuesday, June 14, at the State Department of Health Services, 2151 Berkeley Way, Room 136, Berkeley.

All comments will be taken into consideration in preparing the final permit. All comments will be addressed in writing in the Administrative Record and available to the general public.

The draft permit and application form, operation plan, and supplements submitted as required are available for public review at the Berkeley Regional Office, Hazardous Waste Management Branch, 2151 Berkeley Way, Berkeley, Calif. 94704, between the hours of 8 a.m. and 5 p.m., Monday through Friday. The office phone number is (415) 540-2043. Written comments should also be sent to this address. The contact person is Blake Spears, permit coordinator.

Description of Facility

The facility operations involve consolidation and storage of hazardous wastes prior to transfer to a recycling facility or to a disposal site. Wastes will be those generated by research labs, teaching labs, maintenance procedures, and various other sources. All wastes will be stored in containers.

Types and Quantities of Wastes

The facility will handle all types of hazardous wastes except biohazards, radioactives, or explosives. The general categories of wastes and the rate capacity of the respective storage areas are:

Storage Area	Rated Storage Capacity (gal.)
Oxidizers	90
Poisons Irritants Toxics	90
Reactives	90
Corrosives	90
Flammables Combustibles	2,000

The facility is prohibited from handling the following types of wastes: a) forbidden and Class A explosives as defined in Section 173.51 and 173.53, Title 49, CFR; and b) any hazardous waste not listed in the approved operation plan.

Explanation of Draft Permit Conditions

The application, operation plan, and supplementary documents have been reviewed and found to be complete.

All conditions and terms of the permit are required under Division 20, California Health and Safety Code Chapter 6.5 and Title 22, Chapter 30, California Administrative Code.

The General Conditions, Section III, contain requirements which provide for:

a. Item 1—list of acceptable wastes
b. Item 2—list of prohibited wastes
c. Items 3, 4, 5—safe operation of the facility
d. Items 6 and 18—recordkeeping and reporting
e. Item 7—waste analysis plan
f. Item 8—security
g. Item 9—inspections
h. Item 10—personnel training plans
i. Item 11—management of ignitable, reactive or imcompatible wastes
j. Item 12—location standards
k. Items 13, 14—equipment requirements
l. Item 15—required aisle space
m. Items 16, 17—contingency plans
n. Item 19—closure plans
o. Item 20—financial responsibility.

The Storage of Wastes, Section IV, contains specific requirements for storage.

Warning about excessive consulting

continued from page 1

a wise and timely action," Hastorf and Lieberman observed.

Five of the 60 faculty surveyed said they had acted both as consultants and as departmental liaison for companies involved in industrial affiliate programs with the University. No problems or improprieties were uncovered in these cases, however.

The internal audit was designed to remind faculty of their University obligations under present consulting policies, Hastorf and Lieberman said.

In March, 1978 the University reimbursed about $128,000 to the federal government from unrestricted funds after a random sample survey showed excessive consulting by those engaged in government-sponsored research.

At that time, University officials warned that any future instances of excessive consulting could lead to the recovery of funds directly from the individuals involved.

"The faculty should reread the policy on consulting activities so they're aware of its content, particularly if anything appears that might be of concern," Lieberman suggested.

He emphasized the need to inform department heads or deans in advance if there were plans to average consulting time over more than one academic quarter or to employ graduate students outside the University.

By chance, Lieberman himself was among those included in the survey. Results were published in the June 1 issue of *Campus Report*, the University's weekly newspaper for faculty and staff members.

Jobs/continued from page 24

Center expands; QUALIFICATIONS: Type 60; good sec skills; well organized; exp w/computers or word-processors desirable; willingness to take on new responsibilities as position develops; Send app/resume to Joyce Firstenberger, Ventura 16.; B11; $1246-1310.

31941-PM (JCC:2554) SECRETARY II: Genl sec duties for Dir of Class Agents, Reunion Giving, & Student Development Program; frequent interactions w/ other staff members & w/ student & alumni volunteers; asst w/ telephone; preparing copy & coordinating an annual series of mailings to some 60,000 alumni; QUALIFICATIONS: excel commu skills; reliability & accuracy essential; prior word processing exp desirable (Lexitron sys); typ 55-60; editorial skills; ability to compose corresp for review; contact: Liz Trujillo, 301 Encina Hall.; B11; $1246-1310.

27144-PM (JCC:2554) SECRETARY II: Act as joint receptionist; answer phone; refer visitors & calls to approp person; busy office; need good judgment in making referrals; sort & route dept'l mail twice a day; prov sec'l serv for 4 anesthesia faculty, incl genl corresp, typ fr handwritten mat'ls, maintain files, transcribe med terminology fr dictating machine, prep mat'l for slides; key operator for Xerox copying machine; respon for Sony recorders for genl dept'l use & on-call beepers; QUALFICIATIONS: typ 55; willing & able to work well w/ other secs in a close environ; important for work to be accurate, neat & well organized; able to handle emergency situations, i.e. cardiac arrests; contact: Adena Goodart, Med Ctr S-236, 497-7555.; B11; $1246-1310.

Economist Schultze dismisses 'myths' about America's competitive edge

Economist Charles L. Schultze charged that many of the arguments supporting the creation of a new industrial policy for the United States are not valid and urged caution in adopting any new policy.

Schultze, who was chairman of the Council of Economic Advisers under President Carter, was keynote speaker at a conference celebrating the 10th anniversary of the Stanford Business School's Public Management Program on Saturday, May 7.

Schultze is Distinguished Professor of Research at the school.

He said advocates of a new industrial policy "subscribe to the idea that in the last 10 years the U.S. has been deindustrializing and is continuing to do so. There has been an absolute decline in heavy manufacturing and a sharp decline in the share of U.S. output going to manufacturing."

There is also belief, he said, that management and labor are not capable of making the transition to modern high technology without assistance; that the U.S. is losing its competitive edge in the world because of a lack of leadership; and that other countries, most notably Japan, have highly successful industrial policies in which "government select the winners in the technological race, building them up with heavy subsidies, while maintaining a core of traditional heavy industries."

Charging that such beliefs are myths and that a policy based on them would fail, Schultze said that in the 1970s, U.S. industrial performance was equal to or superior to virtually all other industrialized nations. He cited statistics to demonstrate his point:

* Employment rose by 26 percent, compared with 12 percent in Japan and minus two percent in Germany.

* The level of manufacturing output in the U.S. was equal to or better than any nation except Japan.

* Manufacturing employment rose by five percent in the U.S. and was unchanged in Japan.

* Real value of U.S. exports doubled in the 1970s.

"Where the U.S. did fall down was in two major industries: basic metals, particularly iron and steel, and automobiles—two industries with basic, long-term structural problems," said Schultze.

He said no country in the world had economic growth in the 1970s equal to that of the 1960s.

Rental housing

HOUSING AVAILABLE

□ **Regularly avail:** 1 to 3BR furn & unfurn apts & twnhses & 3BR/2BA hses in Menlo Pk. & Palo Alto in good nghbrhds. Close to campus. No fee. $595 to $1200/mo. Call Shirley, 856-6049.

□ **June '83 to June '84:** Hse in Mt. View, 3BR/1BA, kitchen w/appl., patio, gar., yd w/ dog run. New carpet & maint. 7 mi. to Stanf. Req. 1st & last mo. rent & 1 yr. lease. Call Mrs. Schatzki 494-6135.

□ **Beg. July 1, 6 mos. lease:** Apt. to SHARE. Seek female staff or grad. studnt for 2BR/2BA apt w/recent Stanf. grad, female. 2.5 mi. to Stanf., 3 pools, sauna; on Alma nr. E. Meadow in Palo Alto. $350/mo. incl. water, garb. Call Risa Forister, 497-2021, day.

□ **Beg. July '83 to beg. Apr. '84 (flex):** Fully furn hse, 3BR/2BA, AEK, W/D, Steinway, 2 studies, frpl, pool, fenced yd. Nr. Med. Ctr, bike to campus. $1500/mo. (nego) incl. pool serv, grdnr. Call 497-1348, day; 325-4533 (lv. message), 322-9866, eve.

□ **Beg. June 10:** Palo Alto, old town; furn. 2BR/2BA apt suite to SHARE w/grad student or other Stanf male. Quiet, conv. to Stanf. & dwntwn. Pool, lndry, stor. for bike, encl. prkng. $385/mo. incl. util. Call Dan Stephan, 324-1552, 859-2185, wkdays.

□ **Beg. June 1, '83:** One unfurn. BR avail. in 3BR Menlo Pk hse. Rest of hse furn, W/D. Seek female nonsmoker. Close to Stanf, dwntwn Menlo Pk. $216.67/mo. Call Denise or Aria, 324-0174, eve.

□ **June to Sept. '83:** Summer rent; TAHOE; modified A-frame chalet, 2BR + loft/1½BA, AEK, DR, LR w/frpl., W/D, cable TV, deck. Nr lake, tennis, casinos. No pets or sublet. $600/wk, $1100/2 wks, $1750/mo. Call Marsha (415) 563-3156.

□ **Beg. July to beg. Sept:** OXFORD, Eng. Centrally sit. hse, 4BR/3BA, lovely garden, gar. Call 857-9384.

□ **Mid-June to end Aug. '83:** Portola Valley, 3BR rustic hse in woods, fully furn, piano, W/D. $525/mo. + util. + care of pets. Call 497-3486, day; 851-1986.

□ **NOW:** Ski cabin, So. Lake Tahoe, 2BR, frpl, color TV, phone. Adj. Nat'l Forest, walk to lake, Tahoe Keys. $120/wknd, $200/wk (5 days). Call Janine, 497-2501, day; (408) 739-3141, eve.

□ **Aug. 19:** Luxury 1BR furn. campus apt. Lrg. closets & windows. Priv. patio. $875/mo. incl all util. Call Shirley, 856-6049.

□ **July 3 to Aug. 5 (flex):** Lovely campus hse, 2BR/2BA, LR w/piano, DR, study, AEK, closed porch, patio, grden. $650 incl. grdnr, water, garb. for neat tenant caring for cat. Call 497-4359, morn; 857-0657.

□ **June '83 to June '84 (flex):** Lrg. unfurn hse in Ladera, 3 mi. to Stanf. 5BR/3BA, AEK, 3 frpls., FR, lrg. deck. $2000/mo. Call (415) 854-0281.

□ **Fall Qtr:** Lovely campus hse, fully equipped. Grdnr, pool & clean. serv. Solar pool. Nonsmokers, no pets. $1270/o. Call 857-1497.

□ **NOW:** Tahoe-Donner hse, 4BR/3BA, hot tub, deck overlooking Nat'l Forest. Hiking, tennis, golf, Donner Lake access. $450/wk, $200/wknd. Call 324-8559.

□ **June 11 to July 19:** Fully furn hse in old Palo Alto. 5BR/2½BA, mdrn ktchn, fenced yd, game rm (sep. from hse), housekeeper. $1000 (nego). 1 mi. to campus. Call Vickie, 327-5339.

□ **Beg. July 15 (flex):** Furn hse mid-twn Palo Alto, 3BR/2BA, quiet off-st. loc., nr elem. sch. Nonsmokers, pets nego. Lease 1 or 2 yrs. $1000/mo. Call eves (408) 735-1441.

□ **Aug. '83 to July '84 (nego):** Paris apt., quiet loc., nr Forum-Pompidou. 2-level on top flrs; 1BR/1BA, LR, study, DR, AEK, W/D. Fully furn. in rstored 18th c. bldg. $700/mo. Call (415) 864-5011.

□ Mid-June through summer or longer: Half of 2BR furn. hse. near campus. Pref. quiet nonsmoker. Reduced rent during summer in return for feeding cats while owner is on vacation. Pat Black, 497-2558 or 327-1858.

Lively Arts 1983-84 season to offer variety of concerts for all tastes

The Lively Arts at Stanford will present 30 artists and ensembles in 37 performances during the 1983-84 concert season, according to Vicky Holt, director of Stanford's University Events and Services.

"This will be our 14th season and we have made arrangements with many of our artists to provide special programming for our audiences," she said.

Highlights include: the Wednesday Chamber Series featuring works by 20th Century composers; the Kalichstein/Laredo/Robinson Trio giving three concerts in honor of Brahms' 150th Anniversary; the Guarneri String Quartet performing with clarinetist David Shifrin the Brahms' "Clarinet Quintet"; pianist Peter Serkin performing the last six Beethoven piano sonatas; a chamber ensemble series; the Intimate P.D.Q. Bach; and jazz pianist Claude Bolling, who is making his first U.S. tour.

There will be 15 chamber music recitals, 11 solo recitals, six dance performances, one lecture, and five special concerts. The performances have been divided into seven series and five special events.

"Because of the strong interest in chamber music amongst our subscribers, we will present four chamber series," Holt said.

Chamber music

The *Chamber Ensemble Series* includes the Paillard Chamber Orchestra (Oct. 14); I Solisti di Zagreb (Feb. 8); the King's Singers (March 10); the Musicians of Swanne Alley (March 11); and the Philip Jones Brass Ensemble (April 8).

The *Sunday Chamber Series* includes the Guarneri String Quartet performing the Brahms Clarinet Quintet with clarinetist David Shifrin (Nov. 13); the Bartok Quartet in a program of Haydn, Bartok, and Beethoven (Feb. 5); the Borodin Trio joined by clarinetist James Campbell, violist Jerry Horner, and violinist Mimi Zweig in a program of Prokofiev, Mozart and Shostakovich (Feb. 26); the Philip Jones Ensemble (April 8); and Elly Ameling (April 15).

The *Wednesday Chamber Series* includes the Concord Quartet performing Noam Sheriff's String Quartet (1982) (Oct. 26); the Guarneri String Quartet performing Witold Lutoslawski's String Quartet (1964) (Nov. 16); Music from Marlboro in a program of Haydn, Kreisler, and Schumann (Feb. 1); the Emerson String Quartet in a program of Beethoven, Dvorak and Maurice Wright (Feb. 22); the Fitzwilliam String Quartet playing Shostakovich's Quartet No. 8 (April 4); and the Kronos Quartet (May 2).

Brahms' anniversary

The *Brahms' 150th Anniversary* Series with the Kalichstein/Laredo/Robinson Trio will present three concerts: Brahms and His Archenemy (Nov. 2), Brahms and His Friends (Nov. 4), and Brahms and His Idol (Nov. 6).

The *Piano Series* will feature Peter Serkin performing the last six Beethoven sonatas (Jan. 13 and 15); Stephen Bishop-Kovacevich (Feb. 12); and Cecile Licad (April 29).

Lutenist Julian Bream (Nov. 7), cellist Carter Brey (Jan. 20), violinist Ani Kavafian (April 18), and trumpeter Stephen Burns (April 27) will be included in the *Solo Series*.

The *Dance Series* will include four performances by the Pilobolus Dance Theater (Nov. 31, Dec. 1, 2, and 3) (subscribers may choose one); the Ririe Woodbury Dance Company (Jan. 27); and the Margaret Jenkins Dance Company (May 4).

There are five special concerts, including jazz pianist Claude Bolling on his first American tour (Oct. 16), the Intimate P.D.Q. Bach (Oct. 31), author Maya Angelou (Jan. 12), jazz vocalist Susannah McCorkle (Feb. 4), and Mime Musica (March 17).

Subscription prices range from $34.50 to $73, with student series priced from $25.50 to $55.

"As was the case last year, we expect many of our events to sell out on subscription, so we encourage people to take advantage of this opportunity and order their series early," Holt said.

For more information and a free brochure call the Lively Arts Office, 497-2551.

Fallen Leaf Lake singles weekend

"On Being Single," a long weekend June 9-12 at Fallen Leaf Lake sponsored by the Stanford Singles Club, still has openings for men who would enjoy the opportunity to discuss with about 75 other men and women the joys and dilemmas of being single.

This is the eighth annual such weekend sponsored by the group. Leaders will be Rochelle Myers, M.A., Tom Trent, M.A., and Evie Delunas, Ph.D.

On the agenda for discussion are such topics as "Sex—They Changed the Rules Since I Played the Game"; "Making Life Itself a Work of Art"; and "Why Can't They be Reasonable—Do It My Way?"

Free afternoons may be filled with tennis, hiking, volleyball, bridge, or backgammon—or just loafing. Also on the agenda are sumptuous meals, evening lectures, singing, dancing, and relaxing.

Since the first On Being Single weekend, the Stanford Singles has grown into a club of more than 600 men and women, including many Stanford faculty and staff. The monthly calendar includes events in the Bay Area and elsewhere.

For more information on the weekened or the club, call Linda Lohse at 851-7350 or write P.O. Box 5815, Stanford, Calif. 94305.

Come play jazz Wednesday nights

The Stanford Jazz Band, under the direction of Stanford senior Jose Bowen, will host a Wednesday night reading band during Summer Session. All interested musicians are asked to attend the first meeting on Wednesday, June 22, at 7 p.m. in Annex B-1 behind the Knoll.

Sponsored by the Department of Music, the summer band will meet every Wednesday night from 7-9 p.m. to read through old and new tunes from the Stanford Jazz Band Book. Everyone is welcome and no auditions are required.

For more information, call Jose Bowen: 327-6248.

'Sarah in the Studio' by Sue Gussow

Djerassi artist Sue Ferguson Gussow shows work at Museum beginning June 7

An exhibition of paintings and pastels by Sue Ferguson Gussow, Pamela Djerassi visiting artist at Stanford University, opens Tuesday, June 7, in the Stanford Museum.

A figurative painter, Gussow is a professor at the Cooper Union in New York City, and has served on the faculties of Columbia University, New York University, and Parson's School of Design.

Her work has been exhibited at the Museum of Modern Art in New York, at the Brooklyn Museum, and elsewhere in the U.S., Europe, and Japan. She was represented in "Graphics USA" at the Hermitage Museum in Leningrad.

Her paintings and drawings are included in numerous public and private collections, among them, the Seattle Art Museum, the Philadelphia Free Library, the Dallas Museum, the New Orleans Museum, and the CBS Building in New York. Gussow's work is discussed fully in *Twenty Figure Painters*, published by Watson-Guptil.

The exhibition in the Stanford Museum's Contemporary Gallery closes August 14. The Stanford Museum is open

Sue Ferguson Gussow

to the public Tuesday through Friday from 10 a.m. to 5 p.m.; Saturday and Sunday from 1 to 5 p.m. It is closed Mondays. Admission is free.

Football season tickets for faculty and staff are still available

Don't miss out! 1983 Stanford football season tickets are still on sale, but are going quickly.

This year Athletics offers a variety of ticket plans for faculty-staff: regular reserved seats, a new "First-Time Season Special," family plan seats and economic group rates.

For more information call (415) 497-1021 locally or call toll free (800) BEAT CAL. Visa and Mastercard are welcome.

"Don't Walk," a painting by Boris Ilyin

Ilyin paintings shown at I-Center

Recent oil, acrylic, and watercolor paintings by Russian-American artist Boris Ilyin will be on view at Stanford's International Center June 3-30.

The versatility of Ilyin's technique in several media and the variety of his subject matter are striking. He ranges from painstakingly sharp focus to loose washes or impasto, and from brilliant color to a severely subdued palette in his work.

He paints sympathetically whimsical studies of people or peeling Roman villas or the dry and lonesome northern California hills. Gradually the viewer can discern the spirit that pervades his work—an expectation that one must come upon the truth, as it were, from behind: that an empty hill cut by deer trails should be studied intently for its secret, that laundry hanging over a classical Italian doorway encapsulates the human condition.

Ilyin's work has been exhibited in San Francisco and throughout the U.S. and is in many collections here and in Great Britain and France. He will be honored at a reception at the International Center from 5-7 p.m. Friday, June 10.

Born in Russia at the time of the Revolution, Ilyin came to the U.S. with his parents when he was five. He attended San Francisco schools and graduated from UC-Berkeley in International Relations.

During World War II he served in the European Theater and just before the German surrender was assigned to General Eisenhower's headquarters as a Russian linguist signal officer. Some of his experiences of this period were used in a novel, *Green Boundary*, which Ilyin wrote just after the war while studying at Stanford for his M.A. Here he also taught at the Creative Writing Center under Wallace E. Stegner.

Ilyin's interest in writing was interrupted by international events in the 1950s. He spent several years in intelligence service and served in the U.S. Foreign Service both in Washington, D.C. and in Europe. His interest in painting, however, continued without pause after the age of seven when he began studying with Peter Ilyin, a relative and a noted San Francisco portrait painter. During university studies and the war and throughout his years of foreign service, in such scattered locations as Joplin, Mo., Fort Benning, Ga., and Falls Church, Vir., and at countless places in Germany, France, Switzerland, and Italy, the artist painted whenever a paintbox and a few hours were available. Retiring in 1969 to San Rafael, Calif., he has at last been able to give painting his full attention.

Amsterdam Werktheatre topic of lecture

Shireen Strooker, famous actress and director, will discuss her work with the world-famous Amsterdam Werktheatre Friday, June 3, at 1:30 p.m. in Rm. 205, backhall of Memorial Auditorium.

The Werktheatre is one of Europe's leading experimental theatre companies, specializing in improvisational techniques and social drama. Much of their work is developed from the actors and is not bound to a pre-existing script.

The company, which has lived collectively for the past 10 years, performs in every conceivable venue—from leading theatres in Europe to hallways in hospitals, from the streets to factories and assembly lines.

The company has made several films which have received critical acclaim, including the Prix d'Italia for *In for Treatment* in 1982. Part of Strooker's presentation will include film clips from the company's work.

Since coming to the U.S. last fall, Strooker has been on the faculty of the Theatre Department at UC-Berkeley, where she has worked on several performance pieces.

Her lecture-discussion will be in English.

S.F. Suite Story unique fundraiser

Four of San Francisco's landmark hotels will offer the public a rare look at their exclusive luxury suites on Thursday, June 23.

The St. Francis, the Mark Hopkins, the Fairmont, and the Hyatt Regency will tell the "Suite Story of San Francisco" as an unusual fund-raising event for the Committee for Art at Stanford.

Rooms which have sheltered presidents, royalty, prelates, and stars will be on view for a total cost of $15 in advance ($20 on the day of the tour if tickets are still available). Ticket price includes refreshments and transportation between hotels. Send check to: Committee for Art at Stanford, Stanford Museum of Art.

For further information, call 497-2997.

Help Center helps cope with divorce

The Stanford Help Center has planned a noontime workshop called "Why Can't I Get Over It—Coping With Divorce" for Wednesday, June 15, at Galvez House.

Licensed clinical social workers Sue Thompson and Kay Martin will be guest speakers, discussing normative phases in the separation/divorce process, children's emotional responses, social pressures, and how to recover.

To reserve a place in the workshop call the Help Center, 497-4577, by Monday, June 13. Participants may park at Angell Field and go to the back entrance of Galvez House.

All Help Center workshops, seminars, support groups, lectures, and counseling sessions are free to employees of the University, Medical Center, SLAC, and Children's Hospital and their immediate families.

Youth orchestral summer workshops

The El Camino Youth Symphony Association will sponsor a series of music workshops in July on the Stanford campus.

The workshops, under the direction of ECYS music directors Prof. Arthur Barnes and Sara Salsbury, are open to all students of orchestral instruments from beginning to advanced levels.

Classes offered include group instruction in technique for beginners, theory, ensemble playing, chamber music, and a repertory orchestra.

For details on dates, times, and registration fees call the orchestra manager at (415) 493-3946.

Tresidder exhibits class of 1983 art

Stanford University's Senior Class Art Show is on display now through June 15 in the upper lobby at Tresidder and in the Coffee House.

Ten talented seniors reveal their creative talents through a variety of art forms: oil paintings on canvas, ink drawings, photographs, sculptures, and comic strips. Some works are for sale.

The public is invited to a special reception from 4 to 6 p.m. Friday, June 10, in the Tresidder upper lobby.

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., June 1, to cover the week of Mon., June 6, through Sun., June 12. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

TUESDAY, JUNE 7

Center for East Asian Studies Colloquium: Prof. Wang Yuquan, a Lace Scholar affiliated with the Institute of History, Chinese Academy of Social Sciences, will speak on Ming history. 4:15 p.m. Room 238, Lou Henry Hoover Bldg.

FRIDAY, JUNE 10

Psychiatry & Clinical Faculty Association: "A Fate Worse than Death: The Fear of Changing," by James Bugental Ph.D. An existential-humanistic perspective on the process of change in psychotherapy. 8 p.m. Fairchild Aud.

SATURDAY, JUNE 11

University Public Worship, Baccalaureate: Speaker: The Rev. David H.C. Read. 9:30 p.m. Inner Quad.

Calendar

VISITORS FROM OTHER COUNTRIES

June 6: Group of 15 from Latin America— "Domestic Considerations on Foreign Policy" study group. Tufts-Fletcher School of Diplomacy.
Mr. Andreas Unterberger: managing editor. *Die Presse*. Vienna.
Mr. Julio Columbi Neto, Planning and Control of State Enterprises (SEST) ministry of planning. Brasilia. Brasil.
June 7: Ms. Barbro Berg, development officer. National Board of Universities in Sweden.
Mr. A. W. Findlay, deputy registrar. Macquaire University. Australia.
June 8: Mr. Suman Dubey, managing editor. *India Today*. New Delhi.
Mr. Kess Lunshof, chief parliamentary editor. *De Telegraaf*. The Hague. Netherlands.

CAMPUS REPORT

Volume XV, Number 36 | A publication for Stanford University faculty & staff | June 8, 1983

Spring has been a long time coming, but a sure sign of it is a Stanford class meeting under a tree instead of under a roof. Above Prof. Bob Sinclair, materials science engineering, conducts a class—with all students paying strict attention, of course—on a comfortable patch of lawn.

Commencement advice: Come early, and bring your ticket

Come early and bring your ticket is the advice for those planning to attend Stanford's 92nd commencement at 10 a.m. Sunday in Frost Amphitheater.

Featured speaker will be Secretary of State George Shultz, on leave as professor in the Stanford Graduate School of Business. He will deliver a foreign policy address, Stanford Department officials have advised.

A coalition of groups opposed to Reagan administration foreign and human rights policies plan a memorial service on the fields outside Frost, starting at 8:30 a.m. Featured speaker will be Robert McAfee Brown, former Stanford professor of religion.

The protest groups include the Stanford Central American Action Network, the Stanford Disarmament Lobby, the Committee on Justice in the Middle East, the Coalition Against Apartheid, and a coalition of Third World Groups. Organizers have stressed they do not intend to disrupt Shultz's speech.

A record-breaking crowd of 15,000 is expected to fill Frost to the brim. Admission is by ticket only. About 2,800 graduates are expected to attend, an all-time high. About 500 faculty are expected to

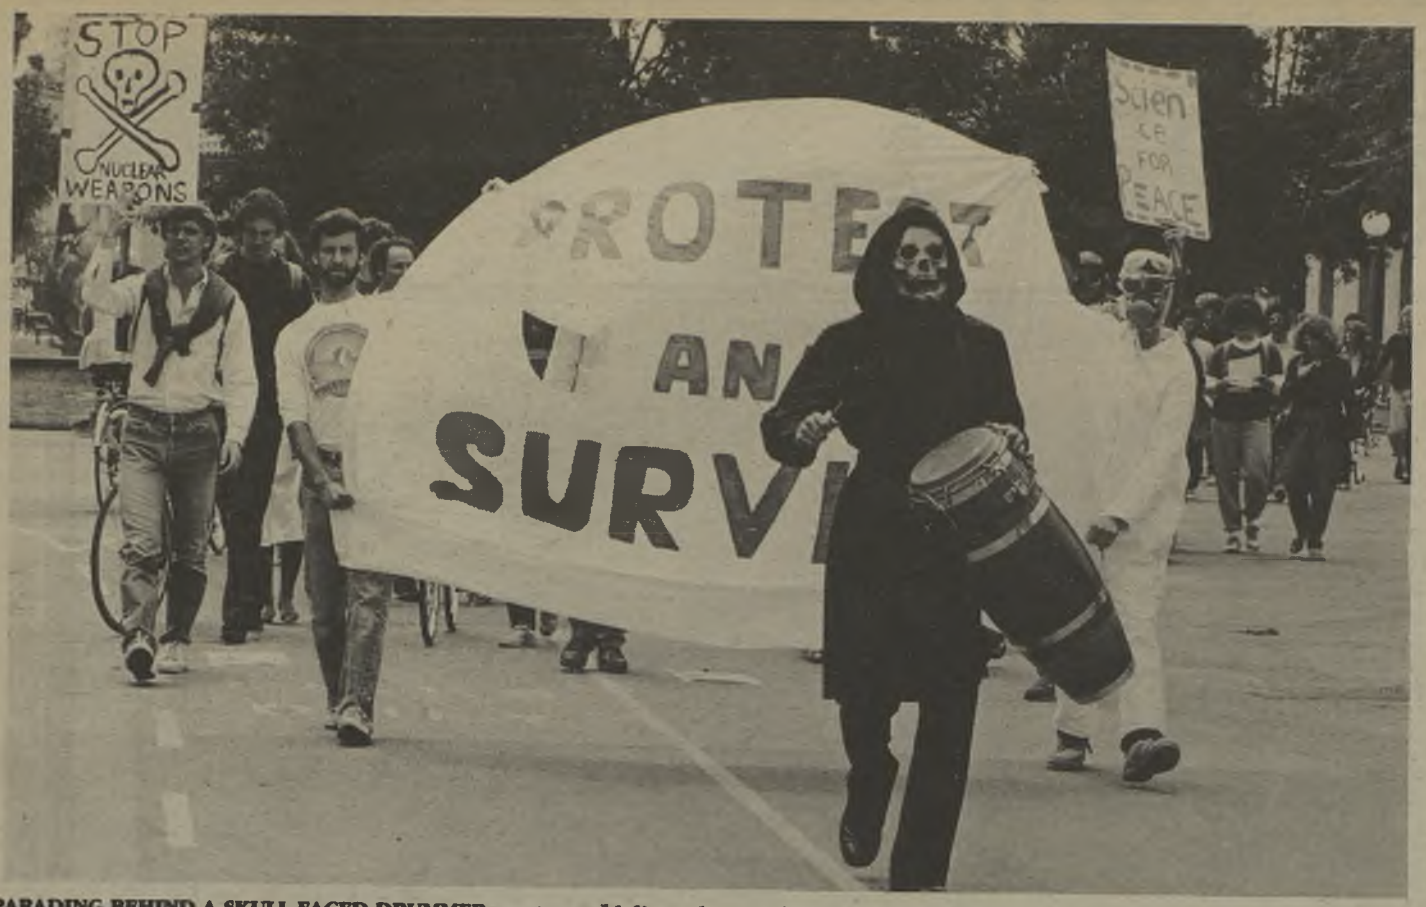
Faculty Senate looks at reapportionment



Formation of a 12-member committee to consider reapportionment of the Stanford Faculty Senate will be discussed at the Senate's last meeting of the 1982-83 year Thursday, June 9.

The primary task of the proposed Ad Hoc Committee on Senate Representation would be to recommend the total number of voting representatives, their distribution among major constituencies, and methods by which the Senate should be reapportioned every five years.

As recommended by the Faculty Committee on Committees, the new group would include 12 voting members, one from each of the current electoral units in the Senate. Academic Secretary Clara Bush would serve ex-officio, without vote.

Formed in 1968, the Senate includes 35 voting members, plus the president, provost, deans of the seven schools, vice provosts responsible for overseeing undergraduate and graduate education, and the academic secretary.

The Committee on Committees recommends that the ad hoc group report its recommendations on reapportionment to the Senate no later than Nov. 10 and the remainder of its recommendations, if any, by Jan. 26, 1984.

PARADING BEHIND A SKULL-FACED DRUMMER, protesters delivered more than 100 "death warrants" to the President's Office at Stanford Wednesday, June 1, opposing proposed weapons-related research at the Synchrotron Radiation Laboratory.

Rhode named Yale fellow

Associate Prof. Deborah L. Rhode of the Stanford Law School has been elected a fellow of the Yale Corporation, the governing body of Yale University.

Rhode earned both her undergraduate and law degrees at Yale, which she entered in 1970, the year after coeducation was introduced at the formerly all-male institution.

She came to Stanford in 1979 after a year as clerk to Justice Thurgood Marshall of the United States Supreme Court.

Rhode's chief research interests are legal ethics and constitutional law, on which she has published several articles.

She was elected by a mail ballot of Yale alumni to the seat previously held by Bayless Manning, dean of Stanford Law School from 1964 to 1971.

Rhode, whose term of office runs for six years, will be the first member of the Yale Corporation to have been a female undergraduate at the university—"a perspective," she says, "I believe should be represented."

While at Yale, she served as president of the varsity debate association, played women's varsity tennis, and was elected to Phi Beta Kappa. She graduated in 1974 *suma cum laude* with distinction in political science.

She also excelled in law school, where she edited the *Yale Law Journal* and directed the moot court board, as well as working as an intern in a poverty law office.

At Stanford, Rhode teaches courses in contracts, sex discrimination, and professional responsibility. She also serves on the board of directors of the Stanford Public Interest Law Foundation (SPILF).

She is in addition a cooperating attorney for the American Civil Liberties Union in San Francisco.

Rhode is married to a Yale classmate, Ralph C. Cavanagh, who is an attorney for the Natural Resources Defense Council in San Francisco.

Bob Street named vice provost of computing, info systems

Prof. Robert Street, civil engineering, has been appointed vice provost for academic computing and information systems on a half-time basis, effective July 1, Stanford Provost Albert Hastorf has announced.

Street will be responsible for overseeing and planning all aspects of academic computing, including both instructional and research needs. He will recommend the resources needed, means for funding, and organizational structures for classroom computing, unsponsored and sponsored research computing, and word processing for faculty and students.

Key responsibilities of his office will include determining configurations needed for hardware, software, and support services, as well as networking needed for these functions.

Important coordinating jobs will include planning related to campus-wide cable TV systems, telecommunications, and library automation.

Street's office will be in Building 10, the President's and Provost's Office. His organization will include the Low Overhead Time-Sharing Facility, directed by Prof. Ralph Gorin; the Network Development Division under William Yundt; and the Office of Instruction and Research Information Systems (IRIS), directed by Michael Carter.

Street will continue his research on numerical simulation of turbulence in fluid flows and will teach one class in the Department of Civil Engineering.

Street currently serves as associate dean for research in the School of Engineering, a position he has held since 1971, and as professor of fluid mechanics and applied mathematics in the Department of Civil Engineering, since 1972.

Except for three years as an officer in the Navy's Civil Engineer Corps (1957-60), he has been at Stanford continuously since 1952. He received his Master of Science in civil engineering (with no Bachelor of Science) in 1957, followed by a Ph.D. in 1963.

While rising from assistant to full professor, he also has served as department chair, acting dean of engineering, and acting vice provost for research in the University.

Hayakawa picks Hoover as repository

Former Senator S. 1. Hayakawa has selected the Hoover Institution at Stanford University as the repository for his papers, Institution Director W. Glenn Campbell announced Tuesday, May 31.

The S. 1. Hayakawa Collection totals over 300,000 documents and covers his career as the U.S. Senator from California, 1977-1983, and as a nationally acclaimed educator and semanticist.

His papers will provide future scholars with primary source material on many public issues, especially those in which he took a special interest, such as the environment, agriculture, nutrition, African affairs, East Asian and Pacific affairs, education, and the future of small business.

Campbell commented: "I am particularly pleased that Dr. Hayakawa has decided to deposit his papers at the Hoover Institution. They will join those of other distinguished Californians who have served their country in elected office, including Presidents Herbert Hoover and Ronald Reagan."

Gutenberg bus twice daily; $2.25 fee

The results of the Gutenberg Express survey and expressions of interest from the campus community indicate strong support for continuing the Gutenberg Express service between the Stanford and UC-Berkeley libraries, even with some sort of fee structure.

Since that March survey, various schedules and fee structures have been reviewed toward meeting the objectives of transporting library materials between the two libraries and of providing users of the respective libraries a source of transportation.

A revised Gutenberg Express service starting July 1 will include expanding the capacity of the vehicle from an 11-passenger van to a 32-passenger bus and limiting the service to two round trips per day follows below.

The charge for this service will be $2.25 for each one-way trip and will be on a cash basis. Because of the expanded capacity of the bus, reservations for daily trips will not be necessary after June 30.

For additional information about this service, please contact Joe Jezukewicz, Stanford University Libraries (7-2018).

Albrecht elected

Jack Albrecht, assistant director of facilities and services, has been elected to the Executive Committee of the Western Association of College and University Business Officers for the 1983-84 fiscal year. He has been a member and chairman of several of the organization's committees during the past 12 years.

Mystery of sharp drop in world productivity rate

by Donald Stokes

During the last 10 years there has been a dramatic drop in the rate of productivity growth all over the world, including Germany, Japan, and the Communist countries.

Nobody knows for sure why it has occurred.

Charles L. Schultze, distinguished visiting professor of research at Stanford's Graduate School of Business, drew attention to this in a campus interview.

Schultze served as chairman of the Council of Economic Advisers under President Carter from 1977 to 1980. He is a senior fellow at Brookings Institution.

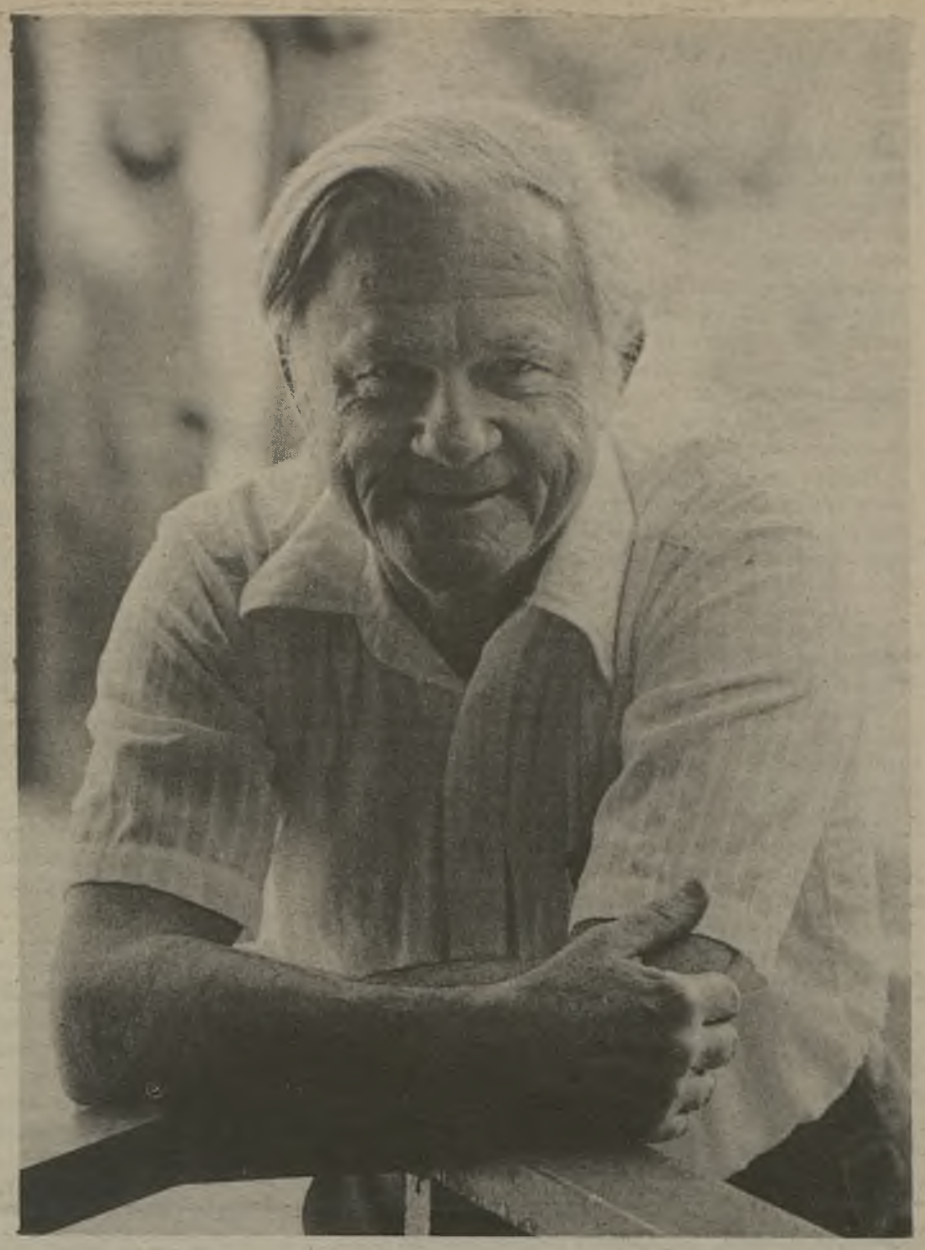
Schultze, a scrappy feisty man, ran over the whole scene of economic problems in response to a series of questions.

"We have long-term problems for which I don't have any panaceas," he said. "One of the difficulties with politics is that candidates try to come up with magic solutions. Usually they do more harm to the patient than the malady.

"One of our biggest long-term problems is productivity growth, the growth of output per person. This is true not only for the U.S. but all over the world.

"There has been a slowdown in productivity growth not only in the free world but apparently in the Communist countries as well. It is true for countries such as Germany and Japan.

"Actually, Japanese productivity growth has come down more sharply than most others, though it did start off from a much higher base than most other countries. Their productivity in the 1960s grew at about eight percent a year, while more recently it has come down to three percent.



"In my judgment, the more an economist knows about the problem, the less certain he is why it has happened. We know some of the factors, but an important part of it is a mystery.

"That is one of the problems with Reaganomics—they promise to have a cure for lowered productivity. But there are no quick or sure solutions. We can work away at it, do a number of things with real but modest results.

"There are questions of investment incentives, a long-term policy on science education, support for basic research and development, getting the government's heavy hand out of areas where it is interfering too much, without at the same time abandoning those things which have to be done.

"None of this can be done overnight. They have to be worked at over the long term.

"Once we have gotten the recession behind us, gotten more people back to work, the long-run problem is a return to growth in living standards, which in turn depends on an increase in productivity."

In my judgment, the more an economist knows about the problem, the less certain he is why it has happened. We know some of the factors, but an important part of it is a mystery.

—Charles L. Schultze

If Schultze were President Reagan's adviser, what advice would he give today?

"The first necessity is to enact now a substantial reduction in the budget deficit, *not* so much to take effect this year but to become effective principally in 1985 and later years.

"Second, for the Federal Reserve Board to be flexible in its approach. If the Congress enacts credible measures to cut the budget deficit, the Fed should carefully but actively promote the lower interest rates which will then be consistent with noninflationary growth.

"Then there must be a readiness to reduce the speed of the defense buildup, and to compromise on increased taxes for 1985 and beyond.

"These are all necessary in order to promote a sustained economic recovery.

"There are some things we should *not* do. I am a little worried that we may fall into the trap of thinking that we have to imitate the Japanese and institute what might be called 'an industrial policy' for the United States, with the Reconstruction Finance Corporation to protect declining heavy industries and to subsidize newer high-tech industries.

"If unemployment stays as high as I think it will, there is going to be temptation to seize on such a policy as the answer to our problems.

"I hope we don't do that because it is not the sort of thing we could do well. The Japanese do some of it, but it is not the main reason for the success of the Japanese, in any case. The Japanese succeeded because they invested about 30 to 35 percent of their national income, and they had a marvellous system of labor-management relations. It was not because their government was so good at picking winners."

The U.S. invests only about 18 percent of its output, while Europe invests over 20 and the Japanese 35 percent. Is reinvestment the key to better performance?

"The total savings rate in the U.S. has not changed very much during the last 100 years—that is if you include both business and private saving. It would be helpful in the long run, but not right now during the beginning of recovery, to have an increase in saving.

"But how do you do it? Real interest rates to savers are already higher now than they have been for a long time, and some of it is tax-free."

Perhaps the American psyche leans more to living on credit rather than to saving?

"Probably what would be of most use is something that is politically impossible. That is not so much to give still further rewards to savers, but instead to remove the present tax subsidies for consumer borrowing.

"We allow people to deduct from their tax returns the interest payments on consumer instalment loans, mortgages, and other forms of borrowing. That doesn't make much sense.

"My guess is that if you could get over the political difficulty of repealing or reducing the deductions, then additional saving would be encouraged. But there is no current prospect of that happening."

Defense procurement will leap 26 percent this year to $83 billion and to $147 billion in 1986. Isn't there a danger of this causing inflation or diversion from investment in core industries?

"If you take the smallest realistic proposal floating around for defense spending increases, which I think is that of the House Democrats, they suggest a four percent inflation-adjusted increase a year. Contrast that with the Reagan proposals—there you have the likely upper and lower bounds.

"If you trace out the results of those two different paths to 1988, the difference between those two would then be about one percent of GNP. That in itself is not going to cause inflation. The real problem is that what is small in the context of the economy as a whole is very big in the context of the defense industries.

"They will be pushed so hard that we shall see a lot of cost over-runs, inefficiences and bottlenecks in those industries. I don't think this will spill over and cause inflation generally but it could mean significant cost over-runs. This in turn would mean more expensive weapons, paying for which would crowd out of the defense budget a lot of less dramatic items which nevertheless are quite important to military strength."

Will the stronger dollar we've had for the last two years drain off enormous sums because of our dearer exports? In tourism alone Europe expects

continued on next page

Schultze. . .

continued from page 3

to receive record sums from U.S. tourists this year—Britain alone thinks it will receive two billion dollars in 1983.

"The tendency certainly is for a strong dollar to make it harder to sell our goods abroad. A strengthening dollar helps pull down inflation (lower import prices) but also promotes imports and penalizes U.S. exports. We are beginning to feel these effects now. That is one of the reasons why the recession has proved so stubborn.

"It is one, but only one, of the reasons why the American steel and auto industries are in bad shape.

"Having said that, we have to realize that the pressures are mounting. They should be resisted strongly. If governments yield, the consequences for future trade and productivity growth could be seriously impaired."

You have stressed the importance of lowering the budget deficit, particularly for 1985 and 1986. What is the best way to do that?

"It will have to come from lower outlays for arms and by tax increases. Civilian programs have already been sharply cut. Some of the entitlement programs might perhaps be shaved further, but I doubt if that is at all likely in the near term.

"What we need is a firmly enacted tax increase that takes effect in 1985 and 1986. With the economy just beginning to recover we don't want a tax increase to take effect now. But as the economy strengthens in subsequent years the budget deficit will be too big.

"It is important to enact, this year, a future tax increase so that the financial markets know the future is being taken care of. The markets need to know right now what the road ahead will be.

"At the moment everybody knows in a broad sense what has to be done, but there is little agreement on how to do it. There seems to be an impasse."

You are in favor of an easier money policy?

"The Federal Reserve Board eased money policy about eight months ago. The main requirement for the next year or two is that they be flexible, and not stick to rigid adherence to so-called monetarist principles that look only on the speed with which the money supply grows.

"If actions are taken to cut the budget deficit, the Fed should be willing to do what is necessary to finance a moderately good recovery with real interest rates coming down some.

"A combination of reductions in out-year budget deficits and such flexibility on the part of the Fed is what we need."

"The strong dollar also means that other countries, in order to protect their own industries, have had to keep their own interest rates higher than they wanted, and this makes their recessions longer than they had expected.

"Our excessively high interest rates and the other factors that caused the overvalued dollar harmed everybody."

On the opposite side of the coin, the cheap yen of the Japanese continues to cut into basic American industries. Latest to go to the wall is Caterpillar, which is fighting a duel to the death with the Japanese.

"The Japanese have just the opposite problem to us. The Japanese save a tremendous amount, and now there is not enough private investments to absorb that saving. The Japanese need to run a larger budget deficit to offset that 'excess' saving. Because they won't, two things happen; their export surplus tends to swell and their own economic growth slows down.

"We and the Japanese ought to look in a mirror and do the opposite of what we are doing. We ought to cut our prospective budget deficits, while the Japanese ought to increase theirs.

"The results would help reduce protectionist pressures all over the world.

"So you can legitimately criticize the U.S. for having a budget policy that ensures huge deficits in the future. But the Japanese are not running a large enough deficit."

We and the Japanese ought to look in a mirror and each do the opposite of what we are doing. We (Americans) ought to cut our prospective budget deficits, while the Japanese ought to increase theirs. The results would help to reduce protectionist pressures all over the world.

—Charles L. Schultze

How did the international bankers get themselves into this mess, with the huge loans to Third World countries that can never be repaid?

"I am no defender of theirs. They made mistakes. But in some ways they take a bad rap. It really started when OPEC took in billions they were not spending, partly taking it out of the pockets of the Third World.

"They put the money in the banks, who did what banks do, they loaned it out to countries which needed it, among other things to pay for the dearer oil.

"If we had not had a worldwide recession, and if U.S. interest rates had not risen so high, we wouldn't have seen such a big problem, except in the cases of Mexico, Nigeria, and a few other oil exporters. Those were the two factors that precipitated the crisis.

"In any world recession, exports of raw materials get hit particularly hard, so this hit all the debtor nations where it hurt.

"Yes, there were some bad loans made, and the ones to Mexico probably came under that heading. Some banks did show poor judgment, but in my view, if we're going to point fingers, they should also be pointed at the government policies which led to interest rates that were higher than necessary.

"I think the huge debts of the Third World can be restructured without any significant country going into default. There will be problems, perhaps some big ones, but I do not foresee any default by an important country."

The Senate Banking Committee has voted without dissent to pump another eight billion into the International Monetary Fund, a sum that would cause roars of protest if it were taken away, from Social Security. This $8 billion is really covering the losses of the private bankers who made the loans. Isn't it unfair for the U.S. taxpayer to subsidize private banks when so many public services are being drastically slashed?

"The alternative is to put a considerable part of the world in a terribly serious economic and political squeeze. Without I.M.F. assistance, both in cash and in helping to restructure private loans the debtor nations would have to squeeze their resources down to the point where there is immense hardship and probably revolution. Not only that but they would shut off imports, and so do great damage to U.S. industry, which depends to a great deal on Third World markets.

"You may say 'Let the bankers go bust.' Well, the bankers have your money, so you may go bust, too.

"We do need to be careful to couple assistance with requirements for sane economic policies on the part of debtor nations. And we ought to try to preserve incentives for banks to be prudent in the future. The 'bail-out' shouldn't turn into reward.

"But there is really no practical alternative to helping those debtor nations. If we don't we shall cripple our own export industries and bring on revolutionary conditions in many areas."

What may outrage the man in the street is that his tax dollars go to bail out a major U.S. bank that pays no income taxes, is saddled with $5 billion of weak foreign loans, but nevertheless has just come up with $400 million to buy up another bank that is also saddled with huge amounts of dubious foreign debts.

"Somebody had to re-lend the money flowing from OPEC. It could have been done by governments, and some more government guidelines would probably have been a good thing. But for the U.S. Government to do it itself—well, you know how that would have worked.

"What were the options? To put the money under the mattress? That would have been terrible. Have government do it all? Decisions by govrnment on loan quality have not given us much cause for confidence. Third, to do what we did, let the bankers who normally deal with this sort of thing conduct their business.

"It led to some mistakes, to some excesses, to some bad loans.

"In an imperfect world you often have to choose among imperfect solutions."

Much depends on whether the price of oil will stabilize or fall further. What do you foresee? Returning prosperity may cause a rise in the price of oil?

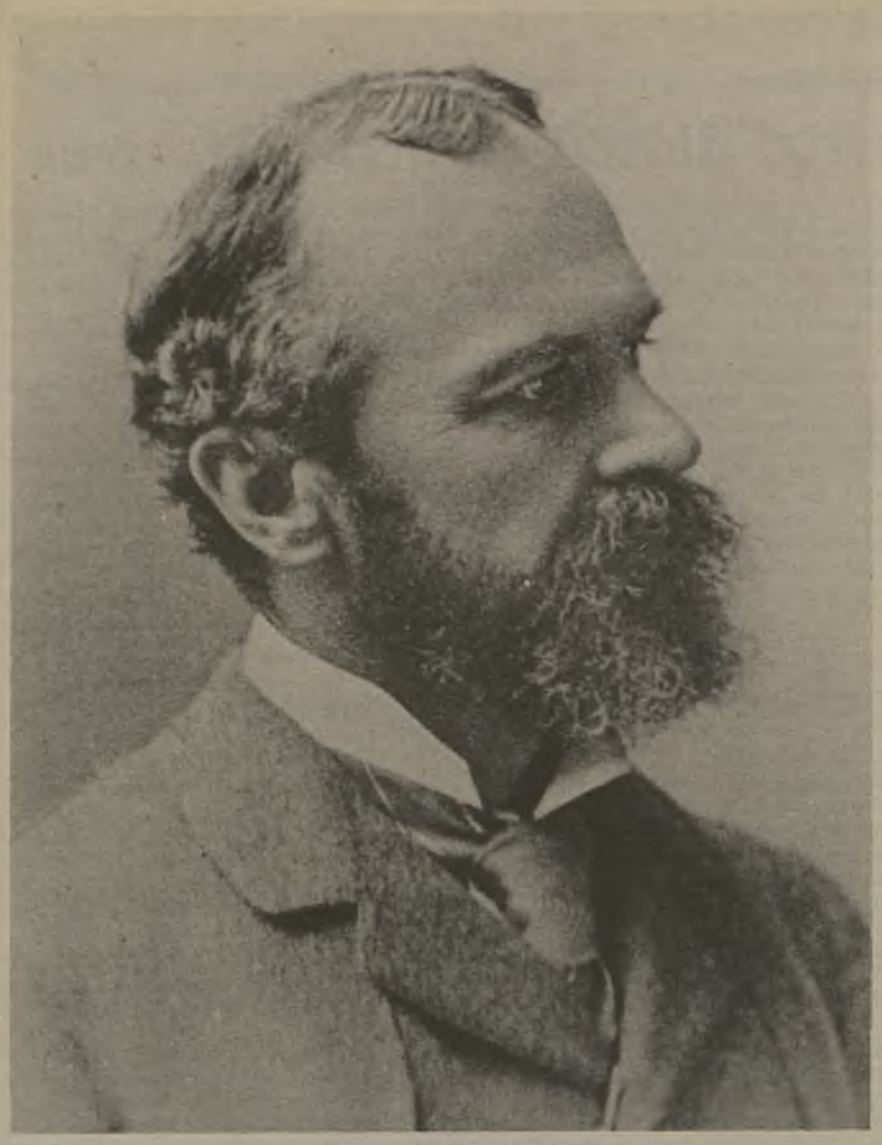
"Even if economic conditions improve in the world I don't think oil prices will rise in the way some people think.

"We and the rest of the industrial world now use a lot less oil, relative to GNP, than used to be the case. Consumption will increase but not in the way it used to. If I had to guess I would say that the price of oil is likely to stay stable for a while, and is more likely to fall a bit than to rise. But I want to stress the uncertainty of my forecast in this area.

"If we look farther ahead, say to the 1990s, that may be a different matter, but I don't think there is much of a chance in the near term for a big resurgence of oil prices—barring a new political upheaval in the Persian Gulf.

"One of the major factors in the oil situation during the last 12 years has been the growth of non-OPEC oil. It used to be that OPEC was the dominant producer. Today it produces less than half of the world's oil exports. We have seen production come on stream from the North Sea, Mexico, the North Slope, and so on."

There seems to be covert protectionism spreading among the nations—is that going to hold back world recovery?



"When you consider how long the recession has lasted and how many people are unemployed, it is really remarkable that moves toward protectionism have been so limited.

"In the O.E.C.D. countries today there are between 33 and 34 million people out of work. In view of this it is surprising how little protectionism has gained.

"If you had told me eight or nine years ago that nations would be dealing with unemployment on the present scale—with France and Germany facing up to eight to 10 percent out of work—I would have expected protectionism to be far more of a political concern.

"The same applies to this country, where unemployment is worse than it has ever been since the Depression 50 years ago.

"I think we all deserve a little bit of self-congratulation that additional protectionism has been kept to such low proportions.

The faculty are young and vigorous (students about 1,500 in number). No one is rich, life is ultra simple, all the essential higher needs are provided for (good music, for example, on an abundant scale). In short the place is a sort of utopian socialistic community such as visionaries have dreamed of.

—William James on the Stanford of 1906

Stanford letters of William James revealed after 77 years

by Donald Stokes

Newly discovered letters written 67 years ago by William James, the famous philosopher-psychologist, give fresh insights into his frail health, his views on Stanford, and his experiences during the 1906 earthquake.

They reveal that he was relieved by the closing ot the University following the quake, because he feared that his health would not have permitted him to fulfill his contract to lecture for the remaining two months of his engagement.

He was lyrical in his praise of Stanford, which he described as "a kind of utopian socialistic community such as visionaries have dreamed of." He forecast that Stanford would grow richer year by year "and possibly will be the richest university in the world."

James came to Stanford at the age of 64, when he was world-famous for his work in philosophy and in psychology, though he detested being referred to as a psychologist.

He accepted an invitation from Stanford's first president, David Starr Jordan, to lecture during the academic year 1905-6. He was then an eminent member of the Harvard faculty, and came to Stanford as what would now be termed a visiting professor of philosophy.

The letters which have just come to light are those which James wrote while at Stanford, and were addressed to a Prof. Ferrari in Rome, who had for a good many years been translating James' works into Italian. Though the two men had never met they had built up a friendship.

The letters were discovered by Frank Low-Beer, of Vancouver, British Columbia; he had received them earlier from an acquaintance in Rome. Low-Beer mailed them to Prof. John D. Goheen, Stanford ombudsman and professor emeritus of philosophy. Low-Beer was formerly a student of Goheen's.

On Jan. 30, 1906, just six weeks before the great earthquake struck northern California, James wrote to Ferrari:

"I received your letter of the 20th of December 10 days ago but have been too busy to answer it until today. I have been here three weeks, and am to stay until June, if my health holds out, lecturing on the elements of philosophy to an audience of 450 very earnest students three times a week. An interesting task artistically, but not an easy one. Nature and climate here are south Italian.

"The little university, founded in 1884 by a millionaire of California and his wife, and endowed with all their fortune, in memory of their dead son, is beautiful and convenient in every material way, and will grow richer year by year (having enormous possessions in land, which is gradually coming into the market) and possibly will eventually be the richest university in the world.

"The faculty are young and vigorous (students about 1,500 in number). No one is rich, life is ultra simple, all the essential higher needs are provided for (good music, for example, on an abundant scale). In short the place is a sort of utopian socialistic community such as visionaries have dreamed of.

"The only drawback is the great historic vacuum characteristic of our new states, absolute silence before 50 years ago, and a certain social insipidity owing to the fact that we are all *novi homines* together. Ah! You owe a great deal in Italy to your wondrous past, always with you in echo. . . . "

James' mention of his health refers to the fact that he had for several years been suffering from heart trouble and other maladies. For this and other reasons he had turned down dozens of lecture offers and profered appointments from universities all over the world.

His emphasis in his letters on the good climate in California suggests this may have been one reason for his acceptance of the offer from Stanford. A stronger reason is probably the friendship he had formed with Stanford's President Jordan.

James had regularly undergone a treatment which today seems bizarre. He had received injections of the lymph glands of goats, and he was convinced that they had done him much good.

The 1906 earthquake on April 16 caused extensive damage to Stanford. James wrote to Ferrari a week later, on April 23:

"Between Vesuvian eruptions and Californian earthquakes, there seems hardly room on the earth for people who wish to lead a quiet, undistracted life. My wife and I have suffered no harm and *very* little material loss, but the University of which I wrote you is damaged badly, and has had to stop work and let the students go home, a month earlier than the natural end of the semester.

"I am glad, for I am very tired cerebrally, and my wife's presence is needed at home. We can probably find 'transportation' in a week, but there is no money, banks are closed and, as for poor San Francisco, it is practically wiped off the map. A better city will grow up on the spot.

"This University is not crippled pecuniarily—most of the ruined parts are more ornamental and need not be rebuilt for an indefinite time. The working parts will be ready again in the autumn. I hope that Vesuvius has not ruined or killed anyone dear to you.

In your letter of March 28 you ask for information how such places as Stanford 'poussent.' It is not a *town*—but a town of 10,000 inhabitants has grown up in 10 years at its gates, a mile away. You will probably find in Munsterberg's book *Die Amerikaner* (or in translation *The Americans*) some

Letters to the editor

Thomas Grey responds to 'hysterical diatribes' from Hoover

Editor, *Campus Report*:

Hoover Fellow Edwin Harwood writes both offensively and ignorantly in his contribution to the current Hoover controversy (*Campus Report*, June 1).

Mr. Harwood says that Ron Rebholz is insincere in criticizing Hoover because Prof. Rebholz signed a brief in 1971 which argued that for the University to dismiss Bruce Franklin would violate academic freedom. Mr. Harwood characterizes this position as "so patently ludicrous as to suggest a *prima facie* case for assuming that (the signers') motives in backing Franklin were primarily partisan. . . .

I don't know or care what Ron Rebholz's motives were then or are now, just as I don't know or care whether Prof. Juilland's elegant and cogent advocacy is motivated by abstract devotion to academic freedom, or by some low and secret lust to have a coven of right-wing scholars working busily nearby. Both of them probably have mixed motives, as seems usual in such matters with members of our species.

What is both offensive and ignorant is for Mr. Harwood to say that the position taken in the 1971 brief was so "patently ludicrous" as in itself to cast doubt on the motives of its signers. I didn't sign the brief, because I disagreed with some of it, but I did agree with its central claim that the charges against Franklin couldn't be sustained consistent with the First Amendment, and I said so in an appended statement.

Recall a little history, which now seems from a time very long ago, if not from a galaxy far away. Franklin was fired for three speeches he gave on campus. In the most damning of them, he told a crowd of students that the University Computation Center should be "shut down," and the students thereafter broke into it and damaged it.

There was a good argument, a persuasive one to me as a constitutional lawyer, that his words were ambiguous between a call for imminent unlawful trespass and a call for a lawful boycott or strike, tactics that had been discussed in immediately preceding meetings with Franklin present. I thought First Amendment values required resolving such an ambiguity in favor of free speech. The Advisory Board thought that Franklin had intended to get the students to break into the Center, or if he hadn't so intended, at least he had created too great a risk of their so interpreting him.

After the Board's decision came out, there was a Law School panel at which I and two colleagues, Franklin's lawyer, and Prof. Alan Dershowitz of Harvard, debated whether the judgment was consistent with free speech law or not. Two thought it was; three thought it was not. No one thought that either position was "patently ludicrous." The A.C.L.U. brought suit on Franklin's behalf, and the case is still kicking around the courts.

With respect to Franklin's two other speeches, the Board found illegal incitement rather than constitutionally protected advocacy only by a divided vote. Among the dissenters in both cases was a biologist named Kennedy. If he still suffers from a penchant for taking "patently ludicrous positions" to mask leftist partisanship, then Hoover is in big trouble.

For what is it worth, I can add that my colleague, John Kaplan, a signer of the Juilland petition in the Hoover controversy, also signed an A.C.L.U. brief in 1971 that supported some of Franklin's arguments. But he was young and foolish then.

I didn't like Franklin or his politics, and I remember thinking that the University would probably be better off if he were not around, despite his vitality and undoubted talent. I am coming to have similar thoughts about the Hoover Institution as I read more and more of the hysterical diatribes the present controversy is evoking from within its walls.

Thomas C. Grey
Professor of Law

Sponsored researchers have their due

Editor, *Campus Report*:

The *Campus Report* having devoted a full page to President Kennedy's position paper concerning indirect costs and the NIH, may I once again add just a few more paragraphs?

President Kennedy says, "Because (these) costs are *indirect*, they naturally arouse some suspicion in members of Congress and others who encounter them for the first time." Is it possible that members of Congress, and others in Washington who encounter these costs for the N-th time, might also be a little suspicious because the University itself does *not* explicitly impose these same indirect costs on its own money—only on government money?

President Kennedy further asks: "Why, after all this history, are there now questions about indirect costs?" Well, again, maybe this has something to do with the University's own apparent unwillingness to explicitly recognize the reality of indirect costs in its own budgeting, through an explicit overhead recovery on its own funding sources.

As a long-term member of the Stanford community, I do explicitly support the reality of indirect costs; the probable fairness and accuracy of the University's indirect cost rate; and the validity of all of the arguments that the president raises in this recent position paper. But, if President Kennedy also wants those faculty members on campus who are engaged in sponsored research to feel that we are being treated with visible fairness and equity, the University is going to have to go to a system in which *everyone* on campus explicitly and visibly pays for indirect costs—*not* just we sponsored researchers.

account of Stanford as well as of our other academic life in America. The U.S. are on the whole in a healthy condition as far as the higher institutions go. I know of no authentic general account in print. . . . "

The opening reference in the letter above to "Vesuvian eruptions" clearly refers to the major eruptions which occurred in Ferrari's Italy from Mount Vesuvius; they continued all through 1906 and caused serious damage.

James had written an earlier letter on Feb. 1, 1906, to his brother Henry James, who had for many years been recognized as a leading novelist, resident in London. This letter has been published in *The Letters of William James* (Atlantic Monthly Press) edited by his son Henry.

Though the two James brothers were deeply fond of each other, William had often been less than fulsome in his praise of Henry's novels. Some researchers, who include Prof. Tom Moser of Stanford's English Department, speculate that Henry may have felt it necessary to put the Atlantic Ocean between him and his brother in order to develop individually, away from the shadow of his eminent brother.

The Feb. 1 letter gives some point to this theory: "BELOVED H.,—Verily 't is long since I have written to thee, but I have had many and mighty things to do, and lately many business letters to write, so I came not at it. Your last was your delightful reply to my remarks about your 'third manner,' wherein you said that you would consider your bald head dishonored if you ever came to pleasing *me* by what you wrote, so shocking was my taste.

"Well! only write *for* me, and leave the question of pleasing open. I have to admit that in *The Golden Bowl* and *The Wings of the Dove*, you have succeeded in getting there after a fashion, in spite of the perversity of the method and its *longness*, which I am not the only one to deplore.

"But enough! let me tell you of my own fortunes! . . . have now given nine lectures to 300 enrolled students and about 150 visitors, partly colleagues. I take great pains, prepare a printed syllabus, very fully; and really feel for the first time in my life, as if I were lecturing *well*. High time, after 30 years of practice!

"It earns me $5,000, if I can keep it up till May 27th; but apart from that I think it is a bad way of expending energy. I ought to be writing my everlastingly postponed book, which this job again absolutely adjourns. I can't write a line of it while doing this other thing. (A propos to which, I got a telegram from Eliot this a.m., asking if I would be Harvard Professor for the first half of next year at the University of Berlin. I had no difficulty in declining that, but I shall probably not decline *Paris*, if they offer it to me year after next.)

"I am expecting Alice to arrive in a fortnight. I have got a very decent little second story, just enough for the two of us, or rather amply enough, sunny, good fireplace, bathroom, little kitchen, etc., on one of the three residential streets of the University land, and with a boardinghouse for meals just opposite, we shall have a sort of honeymoon picnic time. . . .

"You've seen this wonderful spot, so I needn't describe it. It is really a miracle; and so simple the life and so benign the elements, that for a young ambitious professor who wishes to leave his mark on Pacific civilization while it is most plastic, or for *anyone* who wants to teach and work under the most perfect conditions for eight or nine months, and *who is able to get to the East, or Europe, for the remaining three* I can't imagine anything finer.

"It is Utopian. Perfection of weather. Cold nights, though above freezing. Fire pleasant until 1 o'clock a.m., then unpleasant. In short, the 'simple life' with all the essential higher elements thrown in as communal possessions. The drawback is of course, the great surrounding human vacuum—the historic silence fairly rings in your ears when you listen—and the social insipidity. I'm glad I came, and with God's blessing I may pull through. . . . Keep well. Your loving, W.J."

Although William James wrote the monumental *The Principles of Psychology* and several other works on psychology, the center of his interests were religion and philosophy. Toward the end of his life (he died in 1910) he became irritated by being referred to as a psychologist.

In one of the last of the newly-discovered letters, written at sea aboard the ship *Saxonia* on Oct. 7, 1908, he explained the final focus of his interests. " . . . Of late I have become exclusively occupied with metaphysics, and to some extent with sociology, to say nothing of health and the salvation of my soul (?) in case my body gives out, and all that psychology belongs so much to a past epoch of my life, that I feel out of connection with it, and nothing occurs to me in the way of a message to your Italian compatriots." (Ferrari had asked him to write a preface, and Ferrari was himself a psychiatrist.)

The letters now discovered are to be placed in the permanent archives of Stanford University.

Reservoir of public confidence in institutions runs low

Americans show "disturbing signs of deep and serious discontent" with their social system, two veteran analysts of public opinion believe.

Prof. Seymour Martin Lipset of Stanford and William Schneider, resident fellow at the American Enterprise Institute, tell why in a new book on *The Confidence Gap: Business, Labor, and Government in the Public Mind* (the Free Press 434 pp., cloth).

"The U.S. enters the 1980s with a lower reserve of confidence in the ability of its leaders" to deal with social, economic, and political problems than at any time in this century, they declare.

As a result of strains experienced in the past 15 years "our institutional structure is less resilient than in the past.

"Should the 1980s be characterized by a major crisis, the outcome could very well be substantial support for movements seeking to change the system in a fundamental way.

"Serious setbacks in the economy or in foreign policy, accompanied by a failure of leadership, would raise greater risks of loss of legitimacy now than at any time in this century."

Concentration of power

While Americans still believe in the legitimacy and vitality of the American system "what bothers the public is the apparent growth of concentrations of power and the cynical, self-interested abuse of power by government, businesses, and labor leaders," they declare.

Confidence in major companies remains higher in the U.S. than in nine European countries and Japan. And the overall level of confidence in U.S. institutions last year was higher than any other country surveyed except Ireland. Britain, Denmark, Spain, West Germany, Belgium, Holland, France, Japan, and Italy followed, in that order.

"One reason why most Americans still feel positive about the country is that, despite all the troubles the country has gone through, the overwhelming majority say things have gone well for them in their lifetime and they are doing better than their parents did," Lipset and Schneider observe.

But by the fall of 1982, with unemployment above 10 percent, confidence in the leaders of 10 major institutions had reached the lowest level ever recorded in any U.S. survey.

"Confidence in institutions seems to be more a social than a personal judgment," they explain.

"Recent research has found strong and direct links between political cynicism and exposure to negative information in the media."

Problems are real

But the problems facing the country are real—not solely or primarily the result of the way media handle news or the result of a series of inadequate presidents.

"There is simply less for the country to feel confident about," they note. The power and influence of the U.S. has declined since Vietnam. Unemployment, inflation, and slow economic growth have become apparent to the public.

Despite strongly felt complaints about government waste, "the desire for the government to intervene in beneficient ways" has not diminished, they note. While more skilled and intelligent leadership is necessary to restore confidence in government, these may not be enough.

News media, especially broadcasters, have found "bad news" is more effective in competing for public attention. Politicians may foster defeatest views as a form of self-justification.

If ideological polarization of the two major political parties continues, they will be less and less likely to find areas of consensus, agree on solutions, or even accept each other's apparent successes.

From 1966 to 1981 "the people running organized labor" averaged the lowest confidence rating of any institutional leaders. Only 15 percent of the public expressed "a great deal of confidence" in labor leaders, on the average.

Labor union membership as a proportion of the nonfarm workforce has dropped from 35 percent in 1954 to 21 percent in 1980. Where unions won 59 percent of NLRB elections in 1960, now they win only 45 percent.

While labor gets more credit than business for supporting socially progressive causes, "opinion polls suggest that unions should do moreto police their internal operations and to reduce the widespread impression that corruption and lack of democracy characterized their internal governance," they add.

Between 1966 and 1981, confidence in business leaders fell faster than the leaders of any other major institution. "Business is perceived to be motivated exclusively by considerations of self-interest," the researchers note. The public also does not like the concentration of power through ownership and concentration of economic resources.

Attack on business

The spearhead of the attack on business today comes not from labor but from "the New Politics liberal left, the intelligentsia, and affluent college-educated professionals who are basically critical of the materialistic emphasis in society, which they see fostered by business," they observed.

The public prefers "checks and balances" and small-scale institutions to curb potential abuses of power. "Institutionalized conflict, regulation, labor-management strife and hamstrung government" are favored, even though these may raise cost, inhibit effective action, and retard economic growth.

"The invidious sentiments expressed about large organizations reflect a general anti-elitist, anti-power ideology much more than a sense of personal maltreatment," Lipset and Schneider declare.

Our institutional structure is less resilient than in the past.—Seymour Martin Lipset and William Schneider

"The experiences of the late 1960s and early 1970s—an unpopular war, social unheaval, racial polarization, and scandal in high places—served to confirm and intensify the fear that people 'running things' were abusing the public trusts....

"It is the self-interested quality of labor, business, and the government and the fact that they represent visible concentrations of power that turn public opinion against them.

"The institutions that consistently do best in the confidence ratings are those most clearly identified as altruistic: science, medicine, education, the military and religion.

"Professionals in these fields are not highly regarded simply because of their expertise; lawyers, after all, are experts, but they tend to be rated relatively low....

Seymour Martin Lipset

They appear to be willing to sacrifice their own interests for the well being of others as (as people) whose financial reward is incidental to the true motivation of their work.

"Most Americans continue to feel positively about the basic character of the country's political and business institutions, while entertaining serious doubts about their performance."

Lipset is the Caroline S.G. Munro professor of political science and sociology and a senior fellow at the Hoover Institution. He is president of the American Political Science Association.

Jobsite accidents cost $8.9 billion annually, study shows

Jobsite accidents cost $8.9 billion annually in industrial, utility, and commercial construction, according to a study by the Stanford Department of Civil Engineering for the Business Roundtable.

This total, which includes both direct and indirect costs, amounts to 6.5 percent of the $137 billion spent on this kind of construction (in 1979 dollars).

Reasonable reductions in the frequency and severity of accidents could lower this loss by as much as $2.75 billion annually, the study indicates.

How such savings can be achieved will be discussed at a conference on "Cost Effectiveness Through Safety Management" at Stanford June 28. Sponsored by Stanford's Construction Institute and the Western Council of Construction Consumers, the conference is intended for owners, construction contractors and subcontractors, and others interested in reducing accident costs.

The conference registration fee is $75, including lunch. Reservations should be made by June 13 to assure space. Further information may be obtained by calling the Construction Institute at the University (415) 497-3923.

Personnel update

Group life insurance information sent

Participants in the new Group Life Insurance plan will soon receive information packets, according to Jeannie Thomas, manager of benefits and records.

There are two separate communications. One is being sent to all faculty and staff who have enrolled in the new plan.

This contains a Summary Plan Description describing the major features of the plan and a Certificate of Insurance detailing the plan's provisions in more technical terms. Also included is a copy of the individual's completed enrollment form which should be attached to the certificate and kept with other important legal documents.

A second communication is being sent to those eligible faculty and staff who have not completed the enrollment process and, therefore, have been enrolled automatically in the "free" $5,000 coverage.

This contains a Summary Plan Description, a Certificate of Insurance, and a blank enrollment form. Faculty and staff receiving this communication are asked to complete the beneficiary designation section of the form to insure that the appropriate person will receive the benefit from this plan if the faculty or staff member dies while coverage is in effect.

Anyone who has not received a mailing by June 10 should contact the Office of Benefits and Records at 7-1776 or 7-1777. Employees at SLAC should contact the SLAC Benefits Office at 2357.

Foundation president's concern:

Teaching hospitals may lose social relevance

Academic medical centers are going to get smaller and their hospitals less socially relevant in terms of the poor and inner-city needs, Dr. David E. Rogers, president of the Robert Wood Johnson Foundation, predicted here Saturday.

University hospitals, in an effort to survive, will examine services that produce deficits and try to eliminate them, and expand those services that pay well, Rogers predicted.

He cited a recent Urban Institute analysis suggesting that the first to get the ax will be services for the poor—among them home care, family planning, rehabilitation and social services. Next on the hit list would be burn care units, neonatal intensive care units, and out-patient departments with community orientation.

Such cutbacks would affect the poor severely, he added, because although academic medical centers and their hospitals make up only 5.6 percent of the nation's hospitals, they deliver a disproportionate share of 47.2 percent of charity care.

Rogers discussed the gloomy future as well as the challenges facing academic medical centers at the annual meeting of the Stanford Medical Alumni Association. The Princeton, N.J. based Robert Wood Johnson Foundation is one of the largest in the nation, interested in improving health care in the United States.

"We will see progressive shrinkage in the size of basic science departments and top heavy clinical faculties," Rogers said. Faculty clinicians will be recruited largely for their abilities to attract patients with problems which result in high fees and good hospital reimbursement rather than teaching or research skills.

While 20 to 30 major academic medical centers, including Stanford, will be able to continue—even expand—their biomedical research capabilities, Rogers said, most others will shrink progressively. The latter will become increasingly training institutions for doctors, more reminiscent of pre-Flexnerian days, with less and less resemblance to other university graduate programs, and more tenuous university ties.

"It seems to me clearly evident that the nation is at present unwilling to pay the full costs of all the research," he said.

In addition, because of the oversupply of physicians and the high costs of care created in part by high technology and overspecialization—government at all levels, and the public, will demonstrate a progressive unwillingness to pay all of the costs to sustain those features which distinguish the academic medical center, like medical education, residency training, research and scholarly pursuits.

"In an effort to stay afloat, many academic medical centers will begin to expand all high technology areas—open heart surgery units, pathology laboratories, intensive care units, CT scanners and radiotherapy units," he said. "These generate respectable revenues.

"They will create or spin off or unbundle potential profit-making enterprises, or establish satellite clinics or affiliations with smaller hospitals and HMOs and other health delivery plans to ensure an adequate flow of patients. They may get involved in the construction of facilities for fee-for-service ambulatory care, preventive health services, or health spas.

"Faculty and hospital board meetings will increasingly resemble the annual stockholder meetings of multi-national corporations."

Rogers said "it would be a dreadful mistake if academic medical centers became just another profit-making institution."

"The most compelling long-term justification for their existence lies in their championing of certain values," he said. "Like the churches, they have been at their best when they have served as important, powerful spokesmen for good science and the humanistic values which characterize a caring responsible society."

Until happier days return, Rogers suggested that academic medical centers should turn the spotlight on their unique social purpose—the training of young men and women to be the doctors of tomorrow.

"In the rush for bigness, medical students have almost been forgotten," he said. "More attention to the care and feeding of medical students should be given, more rewards to faculty for paying attention to them, more concern for their attitudes toward science, for the values they acquire, and the ways they approach the care of the sick.

"Despite the costs, academic centers should stoutly maintain their traditional mission of caring for the less fortunate. Over time this will compel public support.

"If academic centers abandon this mission, I'm afraid they will become simply another indistinguishable part of our profit oriented society and the medical profession, the doctors we turn out, and society, will be the poorer for it."

"Reestablish the commitment to make the health professions in general mirror the social, racial and cultural makeup of our society," Rogers admonished. "We made a good start but we are faltering."

Rogers said academic centers should also seriously address the problem of the oversupply of tertiary care oriented superspecialists.

These young, elegantly-trained superspecialists are populating well-financed suburban hospitals and taking paying patients away, he said. Academic centers are now far less referral institutions than in times past.

"It is killing you," he told the audience. "The crying need is for more generalist physicians."

—Spyros Andreopoulos

Rogers addressed the annual meeting of the Stanford Medical Alumni Association.

David Rogers

Profile of the troubled academic med center

The difficulties facing academic medical centers:

- **problems posed by their unique interface with the public.** Not only the educators of all U.S. trained doctors, and generators of most of the new biomedical knowledge, academic centers have carried disproportionate responsibilities for delivering medical care to the poor.
- **problems posed by their locations.** More than one-quarter of the major academic medical centers reside in the inner city centers of some of the most troubled, financially stressed, large cities. The loss of services, people, and private physicians has added to their woes. Stanford is spared of this particular problem.
- **problems posed by their size.** Although their growth has been prompted by new research ventures and clinical responsibilities, it has thrust these institutions into the world of big business. Their governance, stemming from university traditions, has left them poorly equipped to deal with the complex arena into which they have been propelled.
- **problems posed by the enthusiastic and uncontrolled training of subspecialists rather than generalist physicians.** Thanks to their own training programs, academic medical centers are far less referral institutions than in times past, and they must try harder to get patients needed for their programs.
- **problems posed by the failure of government and private medicine to fix responsibilities for the equitable delivery of medical care.** This has led to governmental pressures on academic medicine to take on a whole series of new tasks like operating central city emergency services, neighborhood health centers, drug abuse programs, family planning and the like, rather than having these tasks shared by medicine as a whole.

Blood Center to screen donors for possibility of AIDS

All blood donated to the Stanford University Blood Center will be screened starting July 1 for an abnormality frequently associated with AIDS, the center's medical director said Friday.

AIDS, short for Acquired Immune Deficiency Syndrome, is a deadly family of immune disorders whose elimination was billed last week as the "No. 1 priority" of the U.S. Public Health Service.

Dr. Edgar Engleman, assistant professor of pathology and medicine and medical director of the blood center, said the screening test was made possible by equipment and high technology already used in research at the center, and will raise the cost of each blood product by only $6, to a total of up to $64.50 per product.

Based on a pilot study of 200 patients, Engleman estimates that between one and two percent of Stanford's 18,000 blood donors will be excluded on the basis of the screening. Not all the donors thus excluded have AIDS, Engleman emphasized. In fact,the majority may be completely healthy, because the screening method is not perfect. "But it's the best method available," he said.

Although several methods of screening blood have been discussed nationally, none—so far—have been selective enough to screen out only those donors with AIDS.

Precious resource

"Most of the proposed screening methods would eliminate between 15 and 50 percent of the donors, and only a tiny fraction of those actually have AIDS," Engleman said. "Blood is such a precious resource that we need to be fairly certain that our screening process is highly selective to make screening worthwhile."

Engleman said the testing was begun as a precaution, not because there have been any known cases of AIDS in Stanford blood recipients. The blood center already has begun other precautions, such as asking potential donors from groups at high risk for contracting AIDS not to donate blood. Such high risk groups of potential donors include homosexual men who are active with multiple partners, intravenous drug abusers, and Haitian immigrants.

The test Stanford will use examines infection-fighting white blood cells called "T-cells" that drop to abnormally low concentrations in the blood of about 95 percent of all AIDS victims. Such patients also experience a dramatic change in the ratio of two subgroups of the cells called "helper T-cells" and "suppressor T-cells." Healthy donors have more helper T-cells than suppressor cells but, for an unknown reason, that ratio is reversed in AIDS patients, Engleman said.

Using monoclonal antibodies—specially manufactured proteins—and a space-age research tool called a fluorescence activated cell sorter (FACS), Engleman and his colleagues can detect the subtle clues in the blood of donors who may have contracted AIDS without realizing it.

The technique has been used in the past to confirm AIDS diagnosis, but its cost of between $150 and $200 per test made it impractical as a screening tool. By simplifying the test and increasing the volume of tests in each batch, Stanford can reduce the cost to the $6 level, he said.

Although the technology is available to other blood banks, few have the equipment or expertise to make their own monoclonal antibodies, said Engleman, who sees Stanford's upcoming screening program as an interim tool to be used until researchers can develop a simpler and cheaper test that is just as effective.

"As soon as a better test comes along, we'll be willing to use it," he said. "In the meantime we're using existing technology to try to prevent the spread of AIDS."

—Deborah Franklin

Pianist, neurobiologist and geneticist chide society. . .

Imbued with the music of a hundred rehearsals, a concert pianist approaches the stage. He has memorized hundreds of thousands of notes, *felt* them at the deepest level of understanding and is ready to touch the soul of the listener with passion, whimsy or pathos. As he touches the keys, the audience, the concert hall disappear from his consciousness. He becomes the music, and the music plays itself, pulsing, undulating to a rhythm that swells from within. Then the block comes.

"The performer makes some type of mistake, often undetectable, sometimes inaudible," said Lorin Hollander. "At times he can take it in stride and go on as though nothing has happened. But other times, panic sets in." The critical judge, the mythical listener who is all knowing and all powerful, arises from the performer's powerful imagination, blocking any further creativity.

Such blocks to creativity can arise and be just as destructive to "performers" in any field, said Hollander, who suffered his first block of stagefright at age eleven, when he played his first concert at Carnegie Hall.

At a meeting of Stanford Medical School alumni Saturday, Hollander shared the stage with Nobel laureates David Hubel and Joshua Lederberg as the three peeled apart the anatomy of creativity.

Though their fields are disparate—Hubel a neurobiologist, Lederberg a geneticist, and Hollander a concert pianist—all are teachers, eager to identify the roots of creativity so that they can nurture it in their students.

"We have a problem," Hollander said. "We are not nurturing creativity in children. Indeed, it seems that in our educational system, the creative process of children is being destroyed."

"I think boredom is important," Hubel said. "Giving students a chance to get bored enough to think up problems may be critical. If there's one thing important to creativity, it's being saturated in a problem most of the time, most of the day," said Hubel.

He pleaded for letting creative people immerse themselves in uninterrupted time to think. Creativity needn't decline as one gets older, Hubel suggested, "but it takes a certain amount of stubborness against the outside world."

In the years since his Nobel award winning work deciphering the genetic tricks of bacteria, Lederberg, who left Stanford in 1977 to become president of Rockefeller University, has spent part of his time researching the biographies of scientific discoveries and the people who make them.

The work has been "interesting, but not enlightening," Lederberg said. Even keeping detailed lab notebooks of his own group's work in hopes of chronicling the leaps of creative insight that marked a major reversal in a theory or dogma, proved unfruitful.

"In a few moments of discourse, the whole frame of discussion changed so much that we couldn't write it down five minutes later," he said.

Lederberg cited a question taken from a college entrance exam as the kind of trap that trips up the creative student. Though the test givers were seeking a single "obvious" definition for the word "nucleotide," any student who looked a layer deeper into the definition, could have realized that all of the options given might be considered correct.

"I suggest that we have a world full of special traps like this for the special and creative student," Lederberg said. "There's a penalty for thinking."

Instead, Lederberg cited his own experience as a 22-year-old graduate student as an ideal form of learning.

After two years of medical school, Lederberg did graduate work at Yale University that challenged the age-old dogma that bacteria have a very limited genetic make-up, and reproduce simply by dividing—without the help of a mate.

By mixing two different colored strains of bacteria together and growing the hybrids in a culture dish, Lederberg made a radical discovery.

Months later, he found himself at a gathering of expert geneticists, where he could meet each criticism and challenge to his theory head on, without waiting for the delays of debate in the medical literature.

"Imagine a 22-year-old coming up and saying, 'Look you guys, you haven't been noticing all these years—bacteria do have sex!' "

Such a willingness to challenge dogma, though necessary to creative solutions, is easily squelched in today's elite universities, he said.

"Our institutions today probably do a very good job as filters, making sure that we get the best and the brightest students. But I'm not so sure that we do a very good job as nurturers."

Hollander cited a Moslem mystic who wrote, "Look not for the devil in the desert, but in the over-critical teacher." Early criticism is often internalized and projected back much bigger than life, he said. Like a snail in its shell, a child withdraws at early criticism and the scars can remain into adulthood.

Far from eliminating grades and criticism, Hubel and Lederberg—who admitted to earning "poor C's" in some graduate courses—agreed that criticism should be fair and tempered with praise.

"We don't want to eliminate the game, but let the child see what the game is," said Hollander. "Life gives grades, but let's let the kids learn the relative importance of grades."

An education in the arts can permit the freedom of expression, said Hollander, that can help an adult or child face down the critic within himself, to permit creativity to bud and flower.

—Deborah Franklin

"We are not nurturing creativity in children. Indeed, it seems that in our educational system, the creative process of children is being destroyed."

—Lorin Hollander

SUH modernization: spri

Stanford University Hospital is embarking on a comprehensive modernization designed to meet the ever-increasing demands for the most up-to-date technological facility within an environment of warmth and comfort. The goals of the modernization are to provide adequate space for the necessary patient care and support services, and to upgrade facilities to meet the needs required of a leading teaching institution.

Many people—medical staff, professional and administrative staff of the hospital, and consultants—are participating in the extensive planning of the modernization area by area. The plans and justification for the project were recently submitted to state and local agencies in a Certificate of Need application. They will be reviewing the documents during the coming months.

Because of the size and complexity of the project, the Medical Center developed this report to keep readers informed about its status and progress. Future issues will discuss more details, and describe the impact of these plans on patients, physicians, staff and the community. We hope this will begin to answer some of your questions.

What is the hospital modernization project?

The project is both renovation and new construction.

It is designed to take place in three stages, beginning with completion of the Phase I building, an addition at the north end of the hospital that was opened in 1978 but left partially unfinished.

New construction will be the next step, stage two, adding a four-story 349,000 square foot building which will include a diagnostic and treatment wing and eight new nursing units. The new contruction will be located immediately adjacent to the present hospital building and include a connecting atrium.

The number of licensed beds (663) will remain the same, except for the addition of six neonatal intensive care beds. Construction of the new nursing units will allow the hospital to use several more beds than can be used now. More patients will be accommodated as the number of functional beds is increased from 633 at present to 669. The number of adult medical/surgical beds available at the main center (excluding Hoover Pavilion) is expected to increase by about 110 beds.

The new nursing units will include more private rooms, better facilities for examination and treatment of patients, and quiet areas for family and physician consultation.

The new construction will include a surgical suite with 20 new operating rooms. The present 14 operating rooms will be closed and the space renovated for other needs. Clinical laboratory functions now in 15 different locations will be centralized in one area. A centralized materials management area will be developed, and the heliport moved from Welch Road to the roof of the new diagnostic and treatment wing.

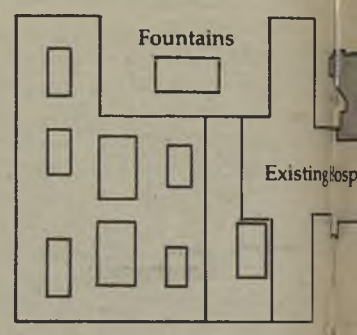
In stage three, nursing units in the original building will be improved and some of the two-bed rooms will be modified to private rooms. Other areas in the original building, such as Labor and Delivery, will be remodeled and expanded.

Why is the modernization needed?

Stanford University Hospital is at present seriously constrained by lack of space and flexibility. It was designed almost 30 years ago, before the dramatic improvements in medical services.

Biomedical research in both basic and clinical areas, and revolutionary improvements in technology have brought more effective treatments in areas such as intensive care, neonatal care, cardiovascular surgery, chemotherapy, radiation therapy and immunology. These changes have brought to the hospital greater numbers of patients with serious and complex medical problems. The great need is for modern technological facilities designed to accommodate their care.

As both a university hospital and a community hospital, Stanford provides a broad range of services that have made it world renowned. However, a 1973 facilities assessment study pointed out that the hospital was underdesigned for the new services it was providing, and operating at that time at 50 percent over maximum reasonable capacity. The hospital has, for example, only about half the square footage per bed found in an average modern university teaching hospital.



A 1976 building project designed to alleviate some functional deficiencies was left partially unfinished when financing was not adequate and building codes changed. Those areas need to be finished to meet present state agency and accreditation requirements.

How will the plans for the New Children's Hospital at Stanford affect the modernization program?

Stanford University Hospital and Children's Hospital at Stanford agreed in 1982 to consolidate the pediatric facilities of these institutions, which are now located about a mile apart and separated by a major thoroughfare. Comprehensive pediatric care will be centralized in the New Children's Hospital at Stanford which will be built adjacent to the new construction planned at Stanford Hospital. The new facility will better provide a distinctly child and family oriented environment.

The New Children's Hospital Board will select an architect and develop plans for the new hospital separately from the Stanford Hospital modernization. Separate public review and approvals will be sought.

The new facility will consolidate the 60 beds of Children's and the 44 pediatric beds of Stanford Hospital and will provide a full range of

Building for

Annual Report highlights medical center's exciting new directions

New construction to modernize Stanford Hospital, a new comprehensive children's medical center, improved clinic services, and a major program in molecular and genetic medicine are part of the "Building for the Future" theme of Stanford University Medical Center's 1983 Annual Report.

"The school, hospital, and clinics are all engaged in new, well-articulated programs," writes vice president for medical affairs Dr. Lawrence Crowley.

Building for the future is not limited to brick and mortar, he adds. It includes stronger relations with the community, new ties with Children's Hospital, and academic and service-related programs as well as mechanisms for change.

Such mechanisms are essential at a time when external factors are affecting the way academic medical centers will be shaped, organized and managed.

How Stanford Hospital, the faculty practice and the medical school will balance their efforts and the direction they will take are the subject of study by a long-range planning group, Crowley notes. The issues are how to attract and retain the necessary patient populations in the hospital and clinics, "how to maintain our position as a major research center in the basic and clinical sciences, and how to best educate tomorrow's leaders in medicine."

Stanford is completing a $14 million Cardiovascular Research Building, and a $6.5 million modernization program of its outpatient clinics, the base of the faculty's medical practice. It will begin a $125 million modernization of its hospital to serve the needs of patients and their physicians more effectively. (*See related report.*)

The project will be done in phases and construction will begin as soon as state and local agencies approve the plans. They include a new diagnostic and treatment wing, surgical suites and eight new nursing units. Eventually space in the present hospital will be modernized as functions move to the new building.

In addition, the School of Medicine contemplates the development of a major program and building for molecular and genetic medicine, and a center for nuclear magnetic resonance to explore the analytic and diagnostic potential of the technique.

"Building for the future, however, does not necessarily mean becoming bigger," Crowley cautions. "We hope that our building program will make us more effective, better consolidated, economical to manage. If we can become a more compact, efficient unit I'm convinced that the Center will also become more stimulating intellectually and better positioned to provide medical and scientific leadership for many decades ahead."

The report includes interviews with Dr. Dominick Purpura, dean of the school of medicine; Sheldon King, executive vice president and director of the hospital; and Donald Tower, executive director of the university clinics and faculty practice program.

All three, according to Crowley, are strong academically-oriented executives who have been here long enough to get a feel of the place and to make plans for their own areas of responsibility.

According to the report, both hospital and Stanford clinics have made major improvements in billing procedures, traditionally problem areas for patients.

The problem wasn't as simple as it seems, however. In the clinics alone, the report notes, it involves 40,000 patient accounts, with 250,000 insurance forms, 300,000 bills to patients, and 2,000,000 individual charges processed annually.

The clinics have also instituted a patient relations program, decentralized and simpler patient registration system and procedures to analyze operating and administrative costs.

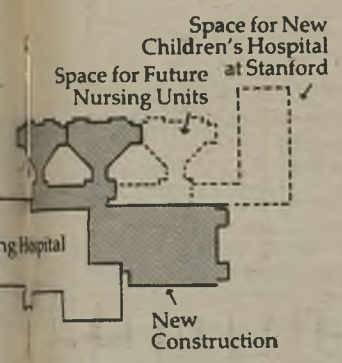
Lawrence Crowley

The goal, concludes the report, is "making the Stanford clinics competitive with other group practices in terms of service."

Copies of the Annual Report are available from the Office of Medical Development, 780 Welch Road, telephone 497-7305. —Spyros Andreopoulos

ing 1983 progress report

ambulatory care clinics. Both hospitals share a common medical staff, whose members serve on the Stanford medical faculty.



The Stanford modernization plans have been designed to continue to accommodate the pediatric service needs, such as operating rooms and diagnostic facilities.

What will happen to Hoover Pavilion?

The hospital modernization is the first step of a Medical Center long-range plan which envisions consolidation of several patient care sites at the main center.

When completed, the modernization project will allow the closing of approximately 90 beds at Hoover Pavilion, a 50-year-old, 189-bed facility located about one mile from the main center. The long-range plan calls for moving all patient care services from Hoover to the main center. Construction of four more nursing units in addition to those planned in the present modernization project would be necessary to consolidate the Hoover care entirely in the main center.

Consolidating patient care will help the hospital avoid duplication of high cost and high technology equipment, and also avoid unnecessary patient transport and potential disruption of care.

for the Future

What will the modernization do to hospital room rates?

Debt service on the project is expected to total about $47 per patient day, considerably less than similar projects of other major university hospitals. However, the hospital has recognized and planned for the need to modernize and replace its facilities, and these plans have been incorporated in the current rate structure. Through 1991, the hospital expects to keep its rate increases on the average less than one percent above its rate of increase in operating costs.

Cost increases, which reflect inflation and increased intensity of services, are expected to average about eight and a half percent per year, while rate increases are expected to average slightly over nine percent a year through 1991. Therefore, patients will not incur any significant increase in charges as a result of the modernization.

What will the project cost?

Cost estimates are $79.2 million for construction or $114 million with equipment, architects' and contingency fees included. The hospital will invest $55.9 million from funds on hand and earned during the course of the project which are reserved for capital improvements. Donations are expected to provide a total of $15 million of that amount. The balance of the project costs will be provided by a tax-exempt bond issue in 1984.

Why not just remodel the present building?

Intensive studies have concluded that the proposed project is the most cost effective and affordable solution to the hospital's needs. The 1959 building is a concrete structure that complied with the building codes and needs of the mid-fifties. Remodeling capabilities have been limited by changes in building codes that increased seismic safety standards.

Although the original building will be remodeled and updated for some services, it cannot be adequately modified to meet the future needs of critically ill patients. New space is the only way to alleviate many of the space problems of the present and also allow greater flexibility for meeting future needs.

The completion of the unfinished addition, with modest remodeling of some areas, would address only a minor portion of the present needs. It would not upgrade the 1959 facility and would provide no possibility to plan for or accommodate the future.

What is the timetable for the project?

State and local approvals of the modernization require a lengthy review process. Following these approvals, the first stage of the project completing the Phase I building, is expected to begin in May 1984. Construction of the new diagnostic and treatment facility and the nursing units is planned to begin later in 1984 and be completed by the end of 1986. Then space vacated in the original building would be renovated, work that is expected to continue into 1988.

What's happening with the project right now?

On March 30 Stanford Hospital filed a Certificate of Need application with the Office of Statewide Health Planning and Development in Sacramento and with the Santa Clara County Health Systems Agency in San Jose. The 400-page document includes financial feasibility studies, space plans, and extensive documentation of need for the project. The agencies will review those documents during the next several months.

Initial work is under way to prepare an Environmenal Impact Report which will be submitted to the City of Palo Alto later this year.

The NBBJ Group, an architectural and planning firm, is developing the project plans. The firm of Morse/Diesel, Inc. has responsibility for construction management. These planners, working with groups of hospital administrative staff, nurses and physicians, recently completed the schematic designs. A report on the schematics and a firm construction budget will be made to the Stanford University Board of Trustees in June.

Next: **How will these plans meet our needs for the future? What will happen to parking? Will there be more private rooms for patients?**

Copies of this Progress Report are available from the Medical Center Office of Communications, Stanford, California 94305; or call 497-6911.

WEDNESDAY, JUNE 8

Div. of Surgical Pathology conference: "EM Diagnosis of Tumors"—Dr. Richard Kempson. 8 a.m., L201.

SUH Auxiliary meeting: for members interested in participating in the tour docent program to begin in September. 10 a.m., Fairchild Auditorium Lobby. For further information, call Linda Northway at 497-6389.

Dept. of Clinical Social Work and the American Cancer Society: "I Can Cope," a program for cancer patients and their families. 5:30 to 7:30 p.m., TF-122c. To register, call 497-5091.

Hematology Support Group: Meeting for patients with leukemia, myeloma, hemophilia and other hematological diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

THURSDAY, JUNE 9

Dept. of Dermatology lecture: "Arachidonate Metabolites: Role in Inflammatory Disorders and Psoriasis"—Dr. Malcolm Greaves (Institute of Dermatology, London, England.) 8 a.m., R136.

Dept. of Psychiatry grand rounds: "Facing Nuclear War: Our Responsibility as Physicians"—Dr. Gary Lapid (president, Mid-Peninsula chapter, Physicians for Social Responsibility). 7 p.m., Fairchild Auditorium.

Dept. of Medicine grand rounds: "NMR"—Dr. Alexander Margulis (chairman, dept. of radiology, UCSF). 8:30 a.m., Fairchild Auditorium.

FRIDAY, JUNE 10

Second video showing of "The Hypocritic Oaf." Sponsored by Office of Public Events. 3:30 p.m., Fairchild Auditorium.

Dept. of Pediatrics grand rounds: "Contraception in Teenagers"—Dr. Iris Litt. Case presentation by Dr. Mary vander Velde, intern in pediatrics. 8 a.m., M106.

Dept. of Psychiatry and Behavioral Sciences: "A Fate Worse Than Death: The Fear of Changing"—Dr. James Bugental. 8 p.m., Fairchild Auditorium.

Div. of Child Psychiatry grand rounds: "What Ever Happened to. . .Followup of Clinical Presentations 1982-1983"—Dr. Charles Zeanah et al. 11 a.m. to 12:15 p.m., Faber Auditorium, CHAS.

Dept. of Gynecology and Obstetrics grand rounds: "The Role of Hypoxic Cell Radiosensitizers in Gynecologic Cancer"—Dr. Samuel Ballon. 8 a.m., A336.

SUNDAY, JUNE 12

Medical School Convocation Ceremony: 2 p.m., Alumni Green. The public is welcome.

TUESDAY, JUNE 14

Dept. of Medical Microbiology seminar: "Mechanism of a Synthetic Immuno-Regulator in Augmenting Phagocyte Microbicidal Action"—Dr. Christine Morrison (Loyola). 11 a.m., D300.

WEDNESDAY, JUNE 15

Div. of Orthopedic Surgery C. Howard Hatcher Memorial Visiting Professorship lecture: "Sublaminar Wiring as an Adjunct to Scoliosis Surgery"—Dr. John Hall (professor of orthopedic surgery at Harvard, and president of Boston Children's Medical Center medical staff). 8 a.m., M114.

JUNE 15 through JUNE 17

Departments of Pediatrics, Obstetrics, and Dietetics: "Nutritional Care of High Risk Obstetrical Patient and High Risk Infant." 7:30 a.m. to 8 p.m., Fairchild Auditorium. For further information, call 497-5711.

SATURDAY, JUNE 18

Dept. of Medicine Appreciation Day for Referring Physicians. 7 a.m. to 5 p.m., M classrooms, medical school. For further information, call 497-5453.

JUNE 20 through JUNE 23

Dept. of Pharmacology Second International Symposium on the Biochemical Basis of Drug Action. To be held at Fairchild Auditorium. A fee will be charged. For further information or to register, call 497-6834.

SATURDAY, JUNE 25

Eating Disorders Conference: sponsored by the Dept. of Psychiatry and Behavioral Sciences. A one-day conference to inform parents and the community about modern treatments for obesity, bulimia, and anorexia nervosa. The public is invited, and a fee is charged. 9:30 a.m. to 4 p.m., M104. For further information or to register, call 497-7871.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Trevor Clay

British leader to give nursing talk

Nursing administration invites Stanford registered nurses to the third distinguished lecture series dinner featuring Trevor Clay, June 16 at the Stanford Faculty Club.

Clay, who will speak on "Emerging: Visions of the Future," is general secretary of the Royal College of Nursing, United Kingdom. He is internationally known as a leader of nurses.

Besides his post at the Royal College of Nursing, Clay's professional experience has included nursing and administrative positions at the Camden and Islington Area Health Authority, the North London Group Hospital Management Committee, Whittington Hospital, the North West Metropolitan Regional Hospital Board, Guy's Hospital, and the psychiatric unit at Queen Elizabeth II Hospital in Hertfordshire.

He received his training at the George Eliot Hospital, the Bethlem Royal and Maudsley Hospital, and Brunel University. His professional activities in Great Britain have included membership on the Staff Side of Nurses and Midwives Whitley Council and its Negotiating Committee, the National Staff Committee for Nurses and Midwives, and the Council of National Representatives, International Council of Nurses.

In addition to various articles in nursing journals, Clay has published a thesis in England on "The Workings of the Nursing and Midwifery Advisory Committees in the National Health Service since 1974."

Clay will visit and consult with several groups at SUH prior to his June 16 address.

The distinguished lecture series was conceived as a way for nursing administration at Stanford to honor staff nurses for professional excellence. Previous speakers have included Jo Eleanor Elliot (1982) and Barbara Nichols (1980).

This year's event will begin at 6 p.m. with no host cocktails, and dinner will be at 7. A $5 donation is requested. For further information or registration forms, call Betty Bland at 497-5181.

Med School musical shown one more time

Don't miss your chance!

The final video showing of "The Hypocritic Oaf," the Stanford medical student/faculty musical, will take place 3:30 p.m. Friday, June 10, in Fairchild Auditorium. The screening is free of charge, and the public is invited.

...News Notes...

Spotlight on...

Dr. Robert Glaser, *president of the Henry J. Kaiser Family Foundation and Stanford consulting professor of medicine, has received the University of California at San Francisco's medal "for outstanding contributions to health education, community health care and public service."*

University officials specifically commended Glaser, one of five Bay Area men and women to receive the medal, for his leadership in establishing several UCSF programs, including the Joint Program in Bioethics, which has spawned the new division of medical ethics there.

In his Kaiser Foundation post, Glaser has supported research at UCSF on the Medi-Cal program, on changes in medical care costs, and on the application of psychiatry and behavioral sciences to other areas of medicine.

Glaser served as dean of Stanford Medical School and vice president for medical affairs from 1965 to 1970, and as acting university president in 1968.

You should know...

The **Hospital billing system for outpatients** *has changed, announced Suzanne Cameron, assistant director of hospital finance. As of June 1, SUH is sending bills for outpatient services directly to patients, who will then be responsible for filing claims with their private insurance companies. The policy also affects the medical benefits of most hospital employees.*

The change has been made to align SUH's outpatient billing system with that of the Faculty Practice Program. Cameron noted that this procedure is standard among area community hospitals and clinics as well.

Some outpatient services will **not** *be affected by this change, however. SUH will continue to bill Medicare, Medi-Cal, California Children's Services, Blue Cross, industrial compensation claims, health maintenance organizations (such as Kaiser and TakeCare), and services for housestaff and their families.*

In addition, the hospital will still bill insurance companies for emergency room visits, outpatient surgery, dermatology day care, and kidney dialysis.

Cameron noted that bills now include instructions on submitting claims to insurance companies. A patient communications representative is also available to answer questions Monday through Friday from 10 a.m. to 3 p.m., at 497-5621.

Payment to SUH is due within 30 days of billing.

* * * *

The **Lane Medical Library** *is participating in the trial of a computer system which makes the full text of a number of biomedical journals available on-line. The system is developed by Elsevier Science Publishers and Bibliographic Retrieval Services.*

The biomedical research journal IRCS Medical Science is now available simultaneously on-line and in paper form. All articles from January 1982 to the present are now in the base, and 1981 is being added. Tables are also mounted on-line in this database.

In addition, a large primary database is being developed which will consist of the full text of 12 of Elsevier's top biomedical journals. This is the first full-text database in biomedicine. Journals are being incorporated continuously in this base, and an initial file of *Biochimica Et Biophysica Acta* and *Brain Research* is being made available to the university and industrial test sites. Material will be added to this file regularly each month.

The system provides that users will be able to search these bases without any formal training. The documentation and computer prompts are sufficient for users to access these files directly and set up and carry out their own searches immediately.

The trial period at Lane will last through July. Passwords and instructions can be issued to users who want to try out the databases themselves, or librarians can conduct searches for them. Participation may have to be limited. Those interested should call Gloria Linder, at 497-6831.

Charles Barnett in 1974

Barnett dies of heart attack

Dr. Charles Barnett, emeritus professor of medicine, died at SUH of cardiac arrest Sunday, June 5, following hospitalization for a longstanding heart condition. He was 79.

A nationally recognized authority on venereal disease, Barnett was director of the general medical clinic for many years after Stanford Medical School moved to Palo Alto from San Francisco. As part of his faculty role for nearly 30 years before the move, Barnett directed the syphilis clinic.

From his 1969 retirement until about two years ago, Barnett served part-time in the outpatient medical clinic.

After receiving his A.B. from Stanford in 1923, Barnett went on to earn his M.D. from Harvard Medical School. He joined the Stanford faculty in 1927. Born in Santa Rosa, he lived until his death on the peninsula.

No funeral services were planned.

Convocation Sunday

This year's Medical School Convocation will take place 2 p.m., Sunday, June 12, at Alumni Green outside the Fairchild Auditorium. Dr. Allen Barbour, associate University ombudsman at the medical school, will be the speaker.

Open to all, the ceremony will include the 1983 faculty awards presentations. It will be preceded by a light luncheon, from 12:30 to 1:30 p.m., for those graduating medical school students, family members and faculty who have received tickets in advance.

Acclaimed surgeon is Hatcher Memorial Visiting Professor

John Hall

An internationally-known orthopedic surgeon is this year's C. Howard Hatcher Memorial Visiting Professor, announced Dr. Eugene Bleck, head of SUH's orthopedic surgery division.

This year's visiting professor, Dr. John Hall, is professor of orthopedic surgery at Harvard Medical School and president of Boston Children's Medical Center medical staff. "His major contributions have been in the field of scoliosis surgery, and in children's orthopedics," Bleck said.

"He is also highly regarded as one of the most gifted teachers in orthopedic surgery."

Hall is scheduled to be at Stanford from June 12-15. During that time, he will attend rounds and presentations by orthopedic residents at Stanford and the affiliated hospitals.

Hall will give a lecture on "Sublaminar Wiring as an Adjunct to Scoliosis Surgery," at 8 a.m. June 15 in room M114. Later that day, he will be one of the disputants for the division's four graduating residents' thesis presentations. The presentations are scheduled to be held 1 p.m. at Faber Auditorium, Children's Hospital at Stanford.

The professorship will culminate that evening with a traditional banquet by invitation at the College of Notre Dame.

Established in 1973 as the C. Howard Hatcher Visiting Professorship, it was renamed earlier this year following Hatcher's death in December 1982.

Hatcher was professor of surgery emeritus and former chief of the Medical School's division of orthopedic surgery. He was internationally known for his research of bone diseases, especially tumors of the bone.

Social class power struggles may intensify in communes

by Joel Shurkin

What happens if you take 20 college students, put them into an isolated area, assign them to social classes—lower, middle, and elite—and turn them loose for a long weekend?

Power struggles.

What happens if they decide they will not accept the class structure and form an egalitarian communal society?

The power struggles get worse and a nascent dictator arises.

The exercise is part of Prof. Philip Zimbardo's class on mind control (Psychology 199), which instructs students on the various ways people can influence each other by playing the power game.

The results could be important for educators, Zimbardo said. They show just how unprepared smart college students (and probably most intellectuals) are to cope with strong emotions.

The weekend is part of a "power laboratory," run by the Stanford Psychology Department. Six psychologists and anthropologists helped.

Power labs

Greg White, a former Stanford student, now a psychologist at the Veterans Administration Hospital in Palo Alto, said the power labs originated in the late 1960s when minority groups, generally disenfranchised from power, tried to learn how to attain positions of power. At the same time, those in the elite needed to learn what it was like to be powerless.

The same need to understand power was felt within management of corporations, where those with the most power had radically different understandings of how the company operated than everyone else.

The rise of cults in the 1970s also contributed to the need to understand the uses of power, White said.

"Book learning can take you just so far," he explained.

Twenty students from Zimbardo's class, chosen at random but screened to make sure they were appropriate for the study and that there was a male-female balance, were sent to the youth hostel at Pigeon Point, north of Santa Cruz, for four days. They were joined by two students from UC-Santa Cruz. They were divided into three social classes, each with prerogatives and responsibilities.

A staff of about six from the laboratory went with them to observe.

"The staff had to deal with problems of power and organization," White said.

The experiment began on a Thursday morning with the arrival of the Elites, each of whom thought they were going to be lower class because they were called in first. The exception was a UC student, Allen (not his real name), who would play a crucial role in what happened. Allen had read about similar experiments and guessed that the first group would be the Elites.

Elites meet

Allen immediately assumed a leadership role. At a meeting of the Elites, they voted that all power must be exerted by the group as a whole and decisions must be unanimous. Allen also urged them to have a policy of open communications, and that no decision should be made without the concurrence of the group affected. These rules were accepted and proved to be crucial to the experiment.

The Middles soon arrived. They were ordered to take off their shoes, sign a release form, were searched and required to turn over all their belongings to the Elites. The Lowers came, were subjected to the same indignities, and were then told they would sleep outside the hostel buildings.

They constructed a tent "Reaganville" while the Middles and Elites ate spaghetti dinner inside. Rain threatened.

Class distinctions

The arrangement broke down because the Elites had violated their own rules by unilaterally bridging the gap between them and the Middles. The staff broke up the dinner.

Word got out that if the Elites did not maintain the class distinctions, new Elites would be elected and the old ones would lose their privileges. Not true.

"We thought the Elites had become Middles by turning us into the Elites, by telling everyone that 1) the staff was really making everything happen, 2) if there is anything wrong it was the staff's fault," and 3) "the staff would do horrible things if they decided to abolish the staff system—none of which we ever said to them," White noted later.

"From early on it was very clear that the Elites were quite uncomfortable being Elites, particularly with Allen sticking to his principles," White said.

A meeting ensued, going well into the morning. Allen moderated. The group discussed whether to abolish the class tiers or to rotate the classes. It was decided to keep the present system for a day.

The Middles and Elites decided the Lowers could sleep inside because of the possibility of rain. The Lowers decided to sleep outside rather than accept favors.

By the next afternoon tensions were building, particularly among the Middles. They began to see themselves squeezed from the top and bottom. They were below the Elites but had no real power over the Lowers. They began to believe the Elites and Lowers were in collusion against them.

At one point they threw the Lowers off their best couch and offered it to the Elites, hoping to win favor and to demonstrate superiority over the Lowers.

The weekend project was selected: building a giant sand castle on the beach.

Revolt brews

By 4:30 p.m. Friday, the Lowers and the Middles were in revolt. The Elites, too, were unhappy. Many, like Allen, were bristling over the class distinctions which ran against their egalitarian principles.

The Elites voted to propose a commune. The Lowers and Middles were thus denied their revolution (there was nothing to revolt against), and tensions increased.

After a quiet dinner, with all sharing the facilities, a small meeting with representatives of the old classes was held.

There was a problem: not all of the students were in favor of the cooperative, and not all of them were willing to keep playing along with the majority. An argument broke out over how the cooperative could build the sand castle.

Abolishing the class distinctions still worried many, particularly the fear that the staff would reinstate the classes and dump the old Elites. The meeting bristled.

"Watch them," warned an Elite, "there's a gleam in their eye. . .they're going to try something. . .we do have to supply their food you know. . . ."

'It's strange,' said a Lower, 'but personally I feel more controlled by the anthropologists than by the Elites or the Middle Class.'

"I heard that if something happened to the Elites, that a coin would be flipped, and all the classes would be switched. . .that's what Allen said," a Lower warned.

"That's just Allen's opinion—that's not official rules."

"It's strange," said a Lower, "but personally—I don't know how the other Lower class people feel, but I feel more controlled by the anthropologists than by the Elites, or by the middle class."

"Absolutely, yeah," said a Middle.

"The rules seem to be a way of making sure that there are distinctions. . .the rules are making more of the distinctions than we are," said another Middle.

The meeting was marked by accusations of "power tripping." Allen, who had strongly supported the collectivity, was slowly emerging as the group leader. He would later say it was unintentional, but it caused considerable friction.

The next morning the new collective played some beach games and tried to "relate" to each other.

There was another long meeting that night with a review of what happened.

By Sunday morning, with the experiment coming to an end, emotions were still high. In part it was the friction caused by the class system, in part it was the friction caused by the collectivity. The air finally cleared as the group dispersed Sunday afternoon.

Hostilities emerge

Later, members of the various classes described their feelings. Many of the Elites felt a responsibility to the staff to keep the experiment going. They were also afraid they might be replaced as Elites.

Allen said he wrestled with his conscience about the class system and concluded it wouldn't work. He was surprised to find that the collective didn't work either.

"Hostilities came out of nowhere," said another Elite, "for reasons not clear."

The Middles expressed the most tension.

"It was clear to us that the Lowers would be gunning for everything we had," one said. "We felt we had a lot to lose."

"When the Lowers moved in we felt the distance," said another. "Every person in the group wanted something and what they wanted was everything we had."

They found themselves in the position of trying to boost the power of the Elite so they could increase their power.

"It's amazing how fast we came together as a group," said another.

The class distinctions remained even after the collective was formed, said a Middle.

The Lowers said they were forced immediately into an adversary position and tried to use techniques taught in the class to fight back. They came up with the suggestion the roles be rotated knowing that it would be rejected. But it allowed them to obtain other concessions from the Elites and Middles.

Part of their frustration, however, was that they won what they could win the first night and there was "nothing left to beat up on them for."

"It got very intense," said a Lower, "very personal."

Some dissension broke out within the group between those who wanted to "be nice" and those who wanted to resist.

After the commune was formed "it really got interesting," one Lower said. "Individuals' unconstrained behavior came out—people who were really powerful came out."

Some expressed a real hatred for the Middles.

"I'd rather not have social mobility than be with some of them," said one candidly.

One serious problem was the people who refused to play the role and elected not to do what the group voted to do.

"Power was coming at me from directions I didn't expect," said one student, "and all the tricks worked. That scared me!"

The vote for the collective was another example of power games. The students

continued on next page

Zimbardo. . .

continued from page 13

discovered that one powerful technique was to appeal to "a widely held belief with intensity," making the proposal "almost irresistable."

"How can you argue with collectivity?"

The students assumed that after the commune was formed all would be equal, but they found that natural leaders, like Allen, emerged and that the games of power politics got worse, not better. Knowing the techniques made manipulation easier, but did not offer very much protection.

"All the things we saw out there are here (in the real world), but we didn't notice them," said one student.

What happened is almost a textbook case in power, White said.

The students had trouble understanding how you get bad effects out of good people. They tend to think in terms of malignant people producing bad ends, which did not happen here.

Allen was not malignant. The bad end was the product of predictable group dynamics, White said.

When they formed the collective the "fantasy" was that they could all be equal, he said. "That's never happened; there are always power differences that emerge, individuals that emerge, groups that emerge that are more powerful.

"In order to have everybody equal you would have to have absolutely everybody agreeing at all times on what their individual needs were as well as on their perceptions of what the external environment of the group was like."

When differences began to emerge—when individuals dropped out of the collective, the students were left with the problem of explaining why the egalitarian society failed.

They believed people like Allen, with leadership and charisma, influenced the group to accepting leadership. White said the researchers believe that is only part of the story. The rest is the dynamics of the group.

"If a group has problems that it can't solve, that are really very emotionally trying, groups usually go into one of three kinds of clusters of emotions: they begin to feel dependent and they want a benign leader, or they begin to feel a little paranoid and they want a fighter, or they go into a kind of Utopia, which is one way of thinking about the collective. . . ."

In the Utopia state you get "a cult figure who promises a promised land."

It explains the influence of Allen; he rose to a leadership position not just because of his own power, but because the group needed someone like him to lead them. Confronted with the failure of their Utopia, he received the blame.

C-AAA suggests how language proficiency should be noted

Committee on Academic Appraisal and Achievement
Official Transcript Notation Certifying Foreign Language Proficiency

C-AAA recommends that the notation, "proficiency in (language)," appear on the official transcripts of students whose level of achievement is found, by procedures established by the language departments in consultation with the Associate Dean of Humanities and Sciences for Undergraduate Programs, to be roughly equivalent to knowledge an excellent student can be expected to demonstrate late in the third quarter of the third year of study in that language.

Background

On May 14, 1981, the Senate of the Academic Council established a language requirement for baccalaureate degrees and approved in principle efforts to encourage student study of languages beyond the level of the requirement. Since that time representatives of the language departments and the Associate Dean of Humanities and Sciences for Undergraduate Programs have been considering what level of achievement might represent a "proficiency" worthy of recognition and what means might be established to evaluate that achievement. C-AAA is persuaded that the level described and the methods outlined (below) are suitable for the purpose endorsed by the Senate.

Committee on Academic Appraisal and Achievement, 1982-83

Michael Bratman, associate professor of philosophy
William Durham, assistant professor of anthropology and human biology
C. Therese Ford, junior, individually designed
John G. Gurley, professor of economics
Carolyn Lougee, associate dean of humanities and sciences of undergraduate programs (*ex officio*)
Sally Mahoney, associate provost and registrar (*ex officio*)
Gilbert Masters, adjunct professor of civil engineering
Susan K. Matisoff, associate professor of Asian languages, chairman
Irwin Remson, professor of applied earth sciences and geology
Michael Resnick, senior, human biology
David Youmans, sophomore, undeclared
Thomas Moser, professor of English

Proficiency in a Foreign Language
The Transcript Notation Incentive

Method of Demonstration. A student will demonstrate "proficiency" in a foreign language on a written and oral examination administered yearly by the competent department.

Level. "Proficiency" is understood to be roughly equivalent to knowledge an excellent student can be expected to demonstrate late in the third quarter of his-her third year of study in that language at Stanford.

Recognition. Achievement of this "proficiency" will be duly recorded on students' transcripts.

Availability.

a) *Languages.* The opportunity to demonstrate proficiency will be available only in languages for which the competent department elects to offer the requisite examination. Normally these will be the languages in which a third year of instruction is regularly offered at Stanford. Currently, the languages in which the examination is available are: Chinese, French, German, Greek (ancient), Hebrew, Italian, Japanese, Latin, Russian, Spanish.

b) *Students.* The opportunity to demonstrate proficiency in a foreign language will be available to all students regardless of major, personal language background, or previous formal study.

Procedures.

Chinese or Japanese.

To receive certification a student will be expected to speak, read, and write Chinese or Japanese at a level normally associated with more than three years of well-assimilated training as measured by a proficiency test designed by the department.

On the written part of the examination, the student will be examined on ability to read, write, and translate.

The student will also be subjected to a 30-minute oral examination administered by two faculty members of the department.

In accord with the general sentiment expressed by the foreign language programs here at Stanford, we envision the typical winner of the honor as an outstanding student who has completed the third year of language training, the minimum requirement in language for our undergraduate majors.

French.

In order to receive advanced language proficiency certification, students will be expected to demonstrate:

1) An ability to extract meaning from written and oral sources without vocabulary aids (dictionary or glossary). Minimum proficiency level in this area: a score of 780 on the College Board French Listening-Reading Exam. (CEEB Form TPL).

2) An ability to synthesize and anticipate with regard to the grammar, syntax, and vocabulary of the language. This integrative skill to be tested by: a) A Stanford-normed "cloze" procedure—80 percentile minimum score. b) A prose translation at a level of difficulty comparable to that found in the French press (e.g., *Le Monde*).

3) An ability to exhibit sustained expression of ideas, both orally and in writing. These skills to be tested by: a) Oral interview (15-20 minutes), based on a pre-established format to include: summarizing succinctly a book, a movie, or an event, or supporting an opinion. b) Written sample (one to one-and-one-half pages) displaying organization, varied vocabulary, appropriate use of idiomatic expression, some sense of style, in addition to reasonably correct grammar.

German.

To receive a certificate of advanced language proficiency, students must pass the *Kleine deutsche Sprachdiplom*, developed jointly by the University of Munich (Lehrstuhl Deutschals Fremdsprache) and the Goethe Institute, Munich. The exam tests a broad spectrum of language skills:

1) Speaking freely on a topic selected from several given to the student 30 minutes in advance,

2) Reading aloud a) a prepared text, b) an unprepared text,

3) Translating a passage from English into German,

4) Dictation of a German text,

5) Explanation, in German, of a given text,

6) Grammatical analysis,

7) Questions on several books assigned several weeks in advance,

8) A short composition.

The test is administered by a member of the German Studies Department and an outside examiner from the Goethe Institute in San Francisco.

Greek (ancient) or Latin.

In order to receive advanced language proficiency certification, students will be expected to demonstrate by departmental examination:

1) Familiarity with some of the writing of at least six ancient authors in the original language.

2) Ability to translate fluently from these authors, and from other easy authors.

3) Ability to translate accurately, with use of dictionary if necessary, from authors of greater difficulty.

4) Ability to identify the commoner verse meters, to scan verse in these meters with facility, and to read verse aloud with attention to the meter.

Hebrew.

Proficiency in Hebrew is demonstrated by:

1) The ability to comprehend advanced short stories and news stories from papers such as *Maaviv* (with translations of extremely unfamiliar words provided).

2) The ability to express one's ideas correctly and fluently in written prose.

3) The ability to use a number of difficult grammatical structures correctly.

4) The ability to translate correctly syntactically sophisticated passages.

5) The ability to engage in conversation with relative correctness and fluency at an advanced level.

Italian.

In order to receive advanced language proficiency certification, students will be expected to demonstrate:

1) An ability to understand written and oral material without vocabulary aids.

2) Knowledge of grammar and syntax to be tested by means of a prose translation selected from contemporary writers (Calvino, Moravia, Ginzburg, Sciascia, Pavese, etc.).

3) An ability to express ideas, both orally and in writing, to be tested in the following manner:

a) Oral interview (15-20 minutes), based on a pre-established format to include summarizing succinctly a book, a movie, or an event, or supporting an opinion.

b) Written sample (one to one-and-one-half pages) displaying organization, varied vocabulary, appropriate use of idiomatic expression, some sense of style, in addition to reasonably correct grammar.

Russian.

"Proficiency" in Russian involves:

1) The ability to read belletristic and journalistic prose of moderate difficulty with only occasional recourse to a dictionary,

2) The ability to write essays on a familiar topic without recourse to a dictionary or reference grammar,

3) The ability to speak and answer questions on familiar topics fluently and correctly.

"Proficiency" will be deemed to have been achieved by any student who passes the written and oral proficiency exam to be administered by the Department once a year during the final three weeks of the spring quarter.

Spanish.

In order to receive advanced language proficiency certification, students will be expected to demonstrate:

1) An ability to extract meaning from written and oral sources without vocabulary aids (dictionary or glossary). Minimum proficiency level in this area: a score of 780 on the College Board Spanish Listening-Reading Exam (CEEB Form TPL).

2) An ability to synthesize and anticipate with regard to the grammar, syntax, and vocabulary of the language. This integrative skill to be tested by: a) A Stanford-normed "cloze" procedure—80 percentile minimum score. b) A prose translation at a level of difficulty comparable to that found in the Spanish press (e.g., *La prensa, Excelsior, El pais*).

3) An ability to exhibit sustained expression of ideas, both orally and in writing. These skills to be tested by: a) Oral interview (15-20 minutes), based on a pre-established format to include: summarizing succinctly a book, a movie, or an event, or supporting an opinion. b) Written sample (one to one-and-one-half pages) displaying organization, varied vocabulary, appropriate use of idiomatic expression, some sense of style, in addition to reasonably correct grammar.

Cloze procedure involves deleting every nth word (e.g., 5th, 7th, 8th, or 9th, etc.) from a suitable text and asking students to reconstitute the text in accordance with the contextual (i.e., grammatical, syntactical, lexical) dictates of the passage.

Teenagers are getting their own niche in law—Mnookin

America is slowly evolving a "law of adolescence," says Prof. Robert Mnookin of the Stanford Law School.

Teenagers are beginning to be viewed differently than younger children in abortion and child custody cases, for example.

The U.S. Supreme Court recently held that a Missouri statute was unconstitutional because it provided for a parental veto of an abortion decision made by a teenager who was pregnant, he notes.

Some states give great legal weight to the preferences of those 14 and over in deciding which parent obtains child custody after divorce.

Many states already allow young people to consent to treatment for venereal disease and to secure birth control devices.

A few states have lowered the age for medical consent from 18 to 14 or 15.

While both the "kiddie libber" and the "child saver" each "sings of children's rights, their songs are very different (and). . .the lyrics of both often strike me as garbled," he observes.

"Kiddie libbers" basically want to make children responsible for more decisions, while "child savers" favor greater government intervention in the family.

"In many critical areas, what is best for an individual child or for children in general is usually indeterminate or speculative. It is not demonstrable by scientific proof, but is instead fundamentally a matter of values," Mnookin adds.

Primary responsibility

Admitting his own preference "for the family to have primary responsibility for child rearing," he suggests more public attention should be focused on how power and responsibility for children are allocated—who decides custody, for example, or determines that a child should be institutionalized.

Because of the values involved, and the lack of social consensus regarding them, there are no simple or pat answers to questions of how power and responsibility for children should be allocated.

"Like cigarettes, there are some easy generalizations that may be habit forming but that may be hazardous to public policy," he warns. He suggests stamping a cautionary warning on four propositions, but not prohibiting their use:

1. Legally imposed age requirements should be rejected because age and maturity or competence are imperfectly correlated.

"Some 15-year-olds would be better informed voters than any 40-year olds," Mnookin notes. "Some 13-year-olds would be better drivers than many 19-year olds."

But allowing individual determination of who is qualified must give some person a great deal of discretion to determine competence or maturity. And there are no litmus tests for these qualities, which means the power to make these decisions can be abused and raise profound questions about unequal treatment and cost.

Age-based lines are plainly preferable for voter qualification, Mnookin believes. "We also should be wary of wholesale elimination of age-based lines concerning medical consent. Perhaps the lines should be lowered." Otherwise enormous uncertainty could result, with doctors, judges and others given too much power to make individual determinations.

2. Whenever a parent has a potential conflict of interest with a child, the parent should no longer be permitted to decide on behalf of the child.

"It is certainly true that parents sometimes expose their children to risks and may occasionally seek or withold medical treatment for reasons of their own, apart from any benefits to the child," he acknowledges.

"But my own hunch is that a careful examination of alternative decision-makers may, in many contexts suggest that the parents are more appropriate decision-makers than some disinterested third party—a judge or a professional, like a doctor.

"A doctor must be prepared and willing to offer parents guidance. But in most circumstances it is the parents, not the professional—much less the judge-who must live with and be responsible for the child on a day-to-day basis after the decision is made.

Moreover, parents will often bring to the decision intimate knowledge about the child and the family's values that an outsider may not have.

"Apart from extreme situations, where a decision will abrogate the parent-child relationship entirely or the child's health is put in serious jeopardy, I'm loath to reject parental prerogative simply because of a potential conflict of interest, especially when the child's interest is indeterminate or speculative.

3. When a young person is competent to perform a task, the youth should be given the legal right to decide without parental interference.

"A 16-year-old may certainly be competent to drive a car, date, and engage in sexual intercourse," Mnookin notes. "But should a 16-year-old have the legal right to go to court and enjoin her disapproving, perhaps overprotective parents from prohibiting her from seeing her 18-year-old boy friend?

"Most teenagers are still economically and socially dependent on their parents, and many of us still view the family as the basic social unit.

"Law suits are a very crude and disruptive method of settling disputes.

"Perhaps young persons should have greater legal power to escape parental domination by leaving home. But I find very problematic and inconsistent the liberator's notion that the law should make parents economically responsible for their children after relinquishing all power to discipline them. . . . Under California law, when a young person gives legal consent for their own medical treatment, parents are not legally liable to pay for the treatment.

4. Whenever the law as written might be criminally applied to punish behavior that many believe to be morally blameless, the law must be formally amended.

"Existing homicide statutes, if blindly applied, would subject parents and doctors to manslaughter charges in situations where they chose a course of action or inaction directed at deliberately allowing an infant to die."

While some favor drafting a euthanasia law to cover such cases, in the absence of broad social consensus on the appropriate circumstances, "the legal principle that human life is worthy of protection should remain the primary standard," Mnookin believes.

"To argue that euthanasia is at times morally unobjectionable is not to say that we must legalize it. To legalize it might well allow too many uses, too many mistakes.

"We should avoid the easy proposition that because something is morally justifiable, it must necessarily become an order of law."

Mnookin was one of several faculty speakers May 14, at the Stanford Alumni Association's 51st annual campus conference.

Law suits are a very crude and disruptive method of settling disputes.

It's harder to teach in class than to be physician-Shulman

Classroom teaching is more difficult than being a physician, says a Stanford expert who's studied how professionals work in both these fields.

The toughest tasks experts face are managing complexity and making decisions under uncertain, unpredictable conditions, says Prof. Lee S. Shulman of the School of Education.

The physician trying to diagnose an individual patient has less complexity to manage than the teacher at "ground zero" facing 22 to 40 young people, he contends.

Shulman has worked with others trying to discover the "rules" experts use to manage uncertainty, so these can be taught to young professionals.

While medical textbooks urge young doctors to keep an open mind before making any diagnosis, research now has shown repeatedly that the best practicing physicians start generating a series of possible diagnoses in the first 30 seconds with a patient.

Asked to "think out loud" as they watch videotapes of their own encounters with "programmed patients"— paid actors, trained to simulate symptoms—doctors typically report having two or three working hypotheses in the first half minute.

In two years of controlled studies, "we never could find a doctor who performed the way the textbooks suggested," Shulman says.

It can be very difficult for skilled practitioners to teach neophytes. With few exceptions, "the very best coaches in baseball are not themselves great batters or pitchers," Shulman observes.

Research with physicians showed strong diagnostic skills were very "domain specific"—a doctor who was first rate in hematology might not do very well in gastrointestinal diagnosis, for example.

National board exams were "changed radically" as a result of this finding, Shulman notes. A much larger number of diagnostic problems was included to cover the various domains.

With support from the National Fund for Medical Education, Prof. Roy Mafly of the Stanford School of Medicine now is working on a program where medical students can sit at computer terminals and rapidly generate hypotheses in response to patient information.

Since gathering all the information about a patient usually is impossible, doctors erect a mental framework, organized by hypothesis, and see what fits. "Most of the time it works, and makes for beautiful diagnosis," Shulman says. But when it doesn't, the results "lose all meaning."

Those who think classroom teaching is simply "telling and testing" seriously underestimate the complexities involved, Shulman says.

At the elementary level, teachers are expected to cover "every aspect of Western civilization mandated by the school board" except physical education, which is left to a specialist.

While secondary school teachers may specialize, they may find themselves required to teach subjects far afield from their college major, spending 50 minutes a day with five different classes.

Studying everyday classroom activity can enhance effective teaching, he notes. "Classrooms are economies of 'turns,' of who gets called by the teacher." Here there are three competing theories: 1) calling on volunteers with raised hands; 2) striking at random, "the commando theory of guerilla pedagogy;" and 3) following in complete order, alphabetically or by seat location.

While most teachers believe the third choice is terrible, it's by far the best for improving first-grade reading achievement, Shulman said. It doesn't favor the active few, and minimizes the fear associated with "commando" tactics.

What happens "inside a turn"—between the time a question is asked and a response given—makes a difference in teaching. The normal time lapse is nine-tenths of a second.

When this is extended to as much as four seconds, "a pedagogical eternity," students may give a more sophisticated response to complex questions.

Teaching involves a constant tradeoff between planning and spontaneous reaction.

Where physicians often confront the chaos of the emergency room and hard decisions about the dying, teachers face "a more subtle and insidious stress," especially when "someone's mind is dying slowly in front of you," he observes.

"When teaching is taken as seriously as the doctor's domain of expertise, and when teachers get respect as well as tangible rewards, then we may find the next generation gets a good education. The talent is out there."

Staff employment opportunities

Exempt

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

42502-LL (JCC:5588) LIFE SCI RES ASST I: Production, purification & safety testing of monoclonal antibodies for clinical trials; immunofluorescence cell staining & analysis using a fluorescence activated cell sorter; & monitoring of patient responses to therapy using FACS analysis & ELISA assays; QUALIFICATIONS: handling of small lab animals & radioisotopes required; familiar w/ tissue culture, incl hybridoma production; column chromatography; gel electrophoresis; radioimmune & ELISA assays; requires independence, organization, literature review & development of new experimental techniques; BS or equiv exp; work exp in microbiology, biochemistry, immunology, cell biology or related fields; computing exp helpful.; C05; $1670-2086.

21693-AW (JCC:2270) FIN/MGMT ANALYST III: Respon for developing fiscal programs of O&M which amount to about $16 million for both cost ctrs & the Univ Operating Budget; full respon for budget prep, data collection, problem solving analysis; the formulation & evaluation of alternate solutions; the prep of periodic or special reports whether manual or data processing; capable of supvn & directing the work of 2 people in Service Ctr Acctg group; interfaces w/ other financial areas of the Univ; interprets their requirements, develops a plan of action for O&M & gives direction to other O&M mgrs on implementing such plans; maintain files; attends wkly mtgs of mgrs; participates in O&M policy decisions; prep monthly, quarterly & annual reports; QUALIFICATIONS: BA or BS in Acctg or Business Admin preferable; MBA desired but not required; exp w/ ADP applications w/ special emphasis on Hewlett-Packard hardware & software.; C08; $2464-3139.

31430-TC (JCC:5940) CLINICS STAFF NURSE IV: 50%; Flexible schedule; works under the direction of the Nurse Manager to provide nursing care in the Oncology Day Care Center; includes the administration of intravenous chemotherapy to oncology patients. Assists physicians with exams; QUALIFICATIONS: Must have the ability to work in a high pressure position w/many simultaneous demands being made upon the employee; must have at least 2 yrs applicable exp; must have venipuncture exp; must have valid Calif nursing license.; K04; $1030.50-1114.50.

27293-VW (JCC:1954) UNIVERSITY OFFICER IV: Dir of SLAC & Professor; planning, coordinating & administering the program of SLAC as part of Stanford Univ; also serv as a professor on SLAC faculty; QUALIFICATIONS: extensive & widely recognized exp as a practicing scientist in the field of elementary particle physics; admin exp & knowl of government relations desirable.; N11; $4166-OPEN.

Nonexempt

28284-BP (JCC:2562) SECRETARY III: Sec to Prof in Electrical Engrg; admin res contracts; budget prep, monitoring & projection of spending on contracts & assignment of expenditures between contracts; computer & typewriter prep of tech reports & manuscripts involving high degree of skill in editing & formatting of text will be required after an initial training period (typesetting sys are SCRIBE, TEX); receive & screen call & visitors; sort mail; compose original ltrs, memo, etc for supvr's signature; implement a filing & record-keeping sys; prep time sheets for employees; purchase supplies; QUALIFICATIONS: typ 60; prev exp w/ computer word processing sys desirable; editorial skill & writing ability essential; knowl of tech terminology; knowl of Univ policies & regulations; send appl/resume to Beverly Yates, AEL 107.; B14; $1440-1514.

44387-BP (JCC:2454) OFFICE ASST II: Referral source of genl Univ & Registrar's Offc info for students, faculty, staff & the public both in person & by phone; accurately interpret & answer a wide variety of questions; confirm registration & degrees of current & former students w/ knowl of Privacy Regulations so that approp info is given; actively involved w/ student registration & distribution of student Spouse Cards; input info to computer sys; access student info using Registrar's Offc computer sys; maintain Visiting Scholar info & update dept'l memos using word processing sys; QUALIFICATIONS: typ 35; strong verbal commu skills & ability to work effectively w/ people in a positive, courteous, & tactful manner; accuracy in high volume & detailed work; willingness to learn computer sys; send appl/resume to Diane Shankle, Old Union, Rm 137.; B09; $1130-1189.

40576-PM (JCC:2462) OFFICE ASST III: 50%; Have full responsibility for maint approx 30 budget statements & financial reporting to the investigators involved on a monthly basis; act as back-up for person responsible for purchase requisitioning, travel reimbursements, & hourly payroll; reconcile salary & supply expenditures to monthly expenditure statements; require solving problems w/ old requisitions & check the invoicing for accuracy; acquire knowledge of rules & regulations governing contracts, grants, & Univ procedures; QUALIFICATIONS: Bookkeeping exp needed; knowledge of Univ rules & regulations helpful; computer skills also helpful as we have just acquired an Apple computer; Send resume to Dick Davis, Room S-236 Medical Ctr.; B11; $623-655.

27183-LL (JCC:6810) SOC SCI RES ASST I: 8-5 except 2 days 12-8pm; entering data fr pro-coded forms into computer; editing entered data, data retrieval & simple analysis using standard statistical routines; treadmill & bicycle testing incl application of electrodes, monitoring & recording of electrocardiogram & blood pressure & recording of these data; drawing of blood samples; personal & telephone contact w/ patients to assure timely return & completeness of responses to questionnaires & compliance to home exercise training program; involved some evening telephone calling; QUALIFICATIONS: exp in exercise test monitoring is mandatory; exp w/ computer entry & retrieval highly desirable.; B12; $1310-1373.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, June 14 in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

29478-PM (JCC:2462) OFFICE ASST III: Student Affairs Offc Assistant; prov clerical support to 2 major GSB offices; the Public Mgmt Program, 50%; Mellon Grant 25%; Student Affairs 25%; organize & maintain career files for PMP & assist students w/ their use; maintain & update PMP alumni addresses & jobs info on rolodex & computer; organize Student Affairs files & asst w/ maintenance of GSB sch'l-wide calendar; telephone/Receptionist coverage; prov typing, photocopying & mat'ls distribution, etc; QUALIFICATIONS: typ 60-65; ability to handle confidential info & sensitive situations w/ discretion & tact; excel interpersonal skills & phone manner for dealing w/ students, staff, faculty & the public; strong typing & sec'l skills; incl knowl of MUSE & 1022 Programs on the Digital VT100 computer, or willingness to learn; send appl/resume to Susan Gould, Rm 10, GSB, 415 497-2101.; B11; $1246-1310.

SLAC

95528-JM (JCC:2562) SECRETARY III: Perform a wide range of sec'l & admin duties as follows: typ ltrs; maintain file sys; screen mail; support in connection w/ special lab committee mtgs; record data on word processor; typ tech mat'l using physics terminology; schedule appts & mtgs; make travel arrangements; asst in carry out daily respon; QUALIFICATIONS: several yrs applicable exp; typ 50-60; knowl of spelling, grammar & punctuation; familiarity and/or some exposure in use of word processor; ability to do tech typing or willingness to learn; exp w/ dictaphone & shorthand helpful have excel admin/organizational skills; good interactive skills.; B14; $1440-1514. APPLY AT SLAC

94212-JM (JCC:5108) PROGR SCIENTIFIC II: Operate VAX computer for online data logging, working w/ assistance; mgmt of large data base, most is on tape; construct & run computer programs using data base; interpret output fr programs w/ minimal input fr supervising physicist; supv data aide; QUALIFICATIONS: MS or equiv; physics training; knowl of physics programming (FORTRAN); particle physics training useful.; C06; $1854-2312. APPLY AT SLAC

94259-JM (JCC:8880) Electronic Engr (Microwave): Participate in design, development, modification & evaluation of components for highly stable rf sys; develop strip line circuits & amplfiers up to micromave frequencies; develop phase, amplitude & beam monitor sys for proj; initiate preliminary design approaches & parameters; set up & carry out experimental tests on rf accelerator sys, evaluate results & upgrade sys; QUALIFICATIONS: MS in EE or Applied Physics or equiv; several yrs exp in development & implementation of rf sys, solid state circuits, microwave measurements, phase-locked loops & feedback techniques, digital design techniques & high speed analog signal processing electronics; supvry ability; able to commu both orally & in writing.; C99; $2800-3600. APPLY AT SLAC

91950-JM (JCC:8880) Engrg Physicist: Asst physicists & engrs in design, fabrication, testing & maintenance of particle detector components, such as contributing to all aspects of electronic data acquisitions sys for new end-cap calorimeters of Mark II; preamplication, analog-to-digital conversion, calibration, noise-suppression; QUALIFICATIONS: BA/BS or equiv; several yrs hands-on exp w/ mechanical & electronic properties of particle detector apparatus such as tracking chambers, calorimeters, scintillators, etc; microprocessor applications incl programming; familiarity w/ CAMAC sys; ability to work independently in a intense environment.; C99; $2400-3000. APPLY AT SLAC

Bargaining Unit

31177-LL (JCC:1728) PORTAL MONITOR: 50%; TMS Unit; work schedule varies; perform duties in Meyer Memorial Lib; occupies Portal Monitor Booth at lobby entrance during assigned hrs & examines patrons' briefcases & bookbags, etc to determine that lib mat'ls are properly charge out; enforce lib regulations; transfer turnstile count of patrons to a tally sheet each hr of the day; collects other statistics as approp; answers patrons' questions; open & close bldg as scheduled; other duties as assigned; QUALIFICATIONS: prev public serv exp; punctuality & dependability; atten to detail; ability to perform repetitious tasks for extended periods & maintain accuracy; some college and/or lib exp; contact: Bob Johnson, Green Lib, Room 223 (497-3152).; A09; $6.08.

Hospital

Please submit all applications/resumes to the Hospital Personnel Department to the attention of Celia Corchado, 770 Welch Rd., Suite 100.

Radiation Research Nurse: 8-hr-a-wk position for staff nurse III or IV assisting w/ investigational drug study in dept of radiation therapy; this individual will work under direction & supvn of physician in dept of radiation therapy and a full time research nurse; duties involve administering IV radiosensitizer (phase I, investigational drugs) to outpts, collecting multiple blood & urine samples, monitoring patients for side effects related to drug and/or XRT, and minimal data collection; this individual should enjoy working independently & have flexible time sched; previous exper in med oncology and/or radiation therapy preferred; relief recurring as 2-3 days a wk could be needed when vacations occur; contact Carol Van Riper, 7-5055, or Joann Halsey, 7-6368.

Dawes new SFCU head; election coming

Charles Dawes has been appointed president of the Stanford Federal Credit Union by the Board of Directors.

Formerly a federal examiner with the National Credit Union Administration, Dawes has nine years experience in the credit union industry. He earned an MBA from Southern Illinois University in 1972.

Dawes will meet with members of the credit union at its annual meeting, set for 7:30 p.m. Thursday, June 16, in Tresidder Union 270-271.

Results of the board of director elections, conducted between Monday, June 13, and Thursday, June 16, will be announced at the meeting and presentations will be made by the Board, by the supervisory committee, and by the credit union management.

Members may vote at any branch office.

Five candidates, all incumbents, are running for slots on the board. They are: Maurine Buma, associate controller and accounting officer Stanford; Karl Hartmann, staff counsel, Capital Preservation Fund; Dick Olden, chief financial officer, Capital Preservation Fund; and Frank (Bud) Ratts, director of management and financial planning at Stanford; and Linnea Marenco, executive assistant to the director of CIT at Stanford. Marenco recently was elected board chairman.

Other board members, whose terms are continuing, are Terry Denley, manager of information services in the Office of Development, Stanford, and Floyd Grolle, biotechnolgoy research associate in the Office of Technology Licensing, also at Stanford.

The Stanford Federal Credit Union serves 35,000 members and has assets in excess of $40 million. Membership is open to most employees (and their relatives) of companies located on land owned and administered by the Board of Trustees of Stanford.

Four receive Newcombe fellowships

Four Stanford graduate students in the humanities have received Charlotte W. Newcombe doctoral dissertation fellowships for 1983, the Woodrow Wilson National Fellowship Foundation has announced.

Recipients, their field and dissertation topic are:

Jenny Franchot, American literature, "Roads to Rome: Catholicism in Ante-Bellum America;"

Patricia Klindienst Joplin, modern thought and literature, "Art and Resistance: Authority and Violence in the Work of Virginia Woolf;"

William Beattie Smith, political science, "British Government in Northern Ireland: A Study in Conflict Management;" and

John Louis Tofanelli, English, "The Opened Heart: The Act of Confession in the Novels of Dickens and Eliot."

Each will receive a $7,500 stipend plus dependency allowances. They are among 46 winners for the only dissertation awards in the humanities or social sciences offered in a national competition.

The dissertations concern the ethical and religious values by which individuals and societies determine the right course of action.

Franchot is a 1975 UC-Berkeley graduate who received a CBS bicentennial award for research in Colonial American literature.

Joplin is a 1973 graduate of Hampshire College and received her M.A. in English at Boston University in 1977. She was a University fellow there and received a Whiting dissertation fellowship at Stanford.

Smith graduated in 1971 from the University of Sussex. Former private secretary to Lord Melchett, minister of state, Northern Ireland Office, he received a Fulbright award in 1979 and 1980 and an American Political Science Association British politics group dissertation fellowship in 1982.

Tofanelli graduated from Saint Mary's College in 1978, where he received both the De La Salle award and the Brother Leo Meehan award for outstanding achievement in the liberal arts and English, respectively.

Contracts and grants

Following is a selected list of government and nongovernment contracts and grants of $200,000 and over, received for the months of February and March:

FEDERAL

New Contracts

Daniel B. DeBra, Thomas O. Binford, and Lambertus Hesselink, aeronautics and astronautics, "Ultra Precision Machining," $350,000 from the Department of the Navy for 1 year.

Contracts—Amendments

C-W Francis Everitt, Daniel B. DeBra, and William M. Fairbank, W. W. Hansen Laboratories, "General Relativity Experiment," $279,999 from NASA for 3 months.

Robert A. Huggins, materials science and engineering, "New Battery Materials," $300,439 from the Department of Energy for 11 months.

Thomas Kailath, Stanford Electronics Laboratories, "Signal Estimation, Scattering Theory and Interpolation in One and Two Dimensions," $210,001 from the Department of the Army for 2 years.

Stephen J. Kline, Joel H. Ferziger, Robert J. Moffat, James P. Johnston, and Brian J. Cantwell, mechanical engineering, "Theoretical and Empirical Studies of the Basic Structure and Properties of Turbulent Shear Flows Including Separated Flows and Effects of Wall Curvature," $245,100 from the Department of the Air Force for 2 years.

Robert J. Madix, chemical engineering, "Molecular Beam Studies of the Dynamics and Kinetics of Heterogeneous Reactions on Single Crystal Surfaces," $310,000 from the Department of Energy for 3 years.

Joseph Oliger, computer science, "Computing Methods for the Approximate Solution of Time Dependent Problems," $335,187 from the Department of the Navy for 32 months.

William C. Fowkes, family, community, and preventive medicine, "Stanford-Area Health Education," $315,561 from the University of California (Health Resources Administration) for 1 year.

William A. Tiller, materials science and engineering, "Fabrication and Properties of Multilayer Structures," $423,951 from the Department of Defense for 2 years.

New Grants

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Position available in rental listings

The service is seeking a second person to help with listings which appear weekly in *Campus Report*. Simple bookkeeping, typing and telephoning skills are required.

The job pays $6 an hour, and when shared, needs a time commitment of five to seven hours weekly. Most of this is Wednesday through Friday, plus being available at a phone certain days of the week.

If you are a campus resident interested in such a partnership, please write SCHOA Rental Housing, Box 7772, Stanford, Calif. 94305.

CIT solicits ideas for two forums on SUNet's schedule for next fall

SUNet, Stanford's computer and video communications network, will be the subject of two open forums early in autumn quarter.

The first session (5:30-6:30 p.m., Oct. 12) will explain in nontechnical terms the basic capabilities of SUNet and its relationship to Stanford's new telephone system and Palo Alto's planned cable TV system.

The second session (5:30-7 p.m., Oct. 13) will begin with a short status report on SUNet development and prototype operations.

The rest of the time will be devoted to open discussion of planned and potential uses of SUNet.

In addition to linking computers, SUNet is being designed to accommodate experimentation with new video services such as teleconferencing, transmission of prerecorded classroom materials, and reception of public service broadcasts such as congressional sessions, etc.

SUNet will support both delivery to and origination of video programming from any central campus building. Together with the other University resources such as the Instructional Television Network and the newly-built video studio in the Communications Department, it will create opportunities for innovation in instruction and research.

We solicit your ideas and will use them to help shape SUNet development. If there are specific issues you would like covered in the forums, please contact Jean Siegman, ext. 7-1683.

Both forums will be held in Skilling Auditorium.

Gates to Frost will close at 10 a.m.

continued from page 1

march in the colorful procession.

Individual tickets will be checked and taken at the Amphitheater gates, which will remain open only from 8:30 to 10 a.m., when the main ceremony starts.

Frost will be secured, starting Tuesday. Signs carried by demonstrators will be permitted so long as they do not obstruct the view of others and are not on sticks.

An estimated 4,500 degrees will be conferred by President Donald Kennedy, who also will address the class. Following the Frost ceremonies, diplomas will be handed out in 37 separate locations across campus. Total attendance is estimated at 19,000, an all-time high.

The Rev. David H. C. Read of the Madison Avenue Presbyterian Church, will deliver the baccalaureate sermon at 9:30 a.m. Saturday, June 11, on the Inner Quadrangle.

Dedication of the Senior Class plaque will follow at 10:45 a.m. Speakers at Class Day luncheon in the Bowman Alumni House Grove will include President Kennedy, Alumni Association Director William Stone, Admissions Dean Fred Hargadon, and Profs. Eleanor Prosser, drama and English, Gil Masters, civil engineering, and William Durham, anthropology.

This year's class presidents are Joe Del Hierro, Mary Ruckelshaus, Katy Dore, and Kevin O'Beirne.

The president's reception for graduates, faculty, and alumni will start at 3:30 p.m. Saturday at the President's House, 623 Mirada.

History senior wins Sudler Prize

James Riley, a senior in history and a member of the graduate class in creative writing, has been chosen as the first Stanford recipient of the Louis Sudler Prize in the Arts.

He will receive $1,000 and will be flown to New York for a symposium in the arts to be held at the Yale Club in early June.

The Sudler Prize will be given each year to the most accomplished and promising undergraduate in one of the fine or performing arts: music, art, drama, or creative writing. Prizes will be awarded at 14 colleges and universities, among them, besides Stanford, are Yale, Harvard, Princeton, Dartmouth, MIT, Chicago, Duke, and Purdue.

Louis Sudler, who has endowed the prize, is chairman emeritus of the Chicago Symphony Orchestra, and is founder and honorary chairman of Sudler Company, a Chicago real estate firm. A musician of note, Sudler had appeared as a soloist with leading symphony orchestras, and from 1960 to 1974 was host and founder of the Peabody Award winning television program, "Artist's Showcase."

Riley, a native of Pasadena, is a history major with a long held interest in writing. Upon completion of his sophomore year at Stanford he dropped out for a year to sell real estate and to write; upon his return, he enrolled in a number of undergraduate writing courses and in his senior year was admitted to the graduate workshop in creative writing. After graduation, Riley will attend the Writer's Workshop at the University of Iowa.

Winner of film prizes

Winners of screenwriting and film production fellowships for 1983-84 in the Department of Communication have been announced by Prof. Julian Blaustein.

The Nicholl Fellows in screenwriting will be Jay Stapleton, Jeff Swab, and Kris Tomooka. The fellowships are funded by a gift from the late Don Nicholl and Mrs. Nicholl.

The Louis B. Mayer Fellows in film production, funded by the Louis B. Mayer Foundation, will be Marshall Eisen, Devon Miller, and Dan Woodard.

Radiological peril

All interested members of the Stanford community are invited to attend the meeting of the Administrative Panel on Radiological Hazards Control (APRH) at 2:30 p.m. Tuesday, June 14, in Tresidder Room 132.

Questions or comments should be directed to Health Physics, 497-3201.

Humanities Center move

The Humanities Center has moved into Mariposa House, behind Kresge Auditorium.

The remainder of its offices in nearby Rogers House will not be ready until later this summer.

Return those library books

Green Library material charged out to faculty and staff due Spring 1983 must be returned or renewed by June 30, 1983. Prompt response will reduce library costs of mailing overdue notices.

Questions or concerns should be directed to Mary Sevilla, Loan Division, Green Library, 497-1493.

Eliot Cohen is third Simon Schuster scholar

Eliot Cohen, a second-year student in the Stanford Writing Program, has been chosen as the third Gulf and Western-Simon and Schuster Scholar.

He will receive $6,000 support money during the 1983-84 school year and, upon receiving his degree, will be offered an entry-level editorial position with the publishing firm of Simon and Schuster in New York.

The Gulf and Western-Simon and Schuster Scholarship is awarded to three students a year at universities located on the East and West Coasts. The participating universities are: Columbia University, School of Arts; Stanford University, School of Humanities and Sciences Graduate Program in Creative Writing; and Tufts University, College of Arts and Science.

Prof. John L'Heureux, director of the Stanford Writing Program, said, "The Simon and Schuster scholarships foster the very healthiest kind of relationship between academia and the world of business. Publishing money assists young writers in completing their graduate educations; those writers, armed with their new degrees, then work within the publishing industry. This is an exciting, innovative, and handsome example of corporate charity."

Cohen is a native of New York City. He received his B.A. in ancient history in 1977 from Yale University and wrote for three years for the *Yale Daily News*. After graduation he worked for the U.S. International Communication Agency in Washington, D.C., and was assigned to Dar es Salaam, Tanzania, for one year as a foreign service information officer.

Children's Dance offers variety of summer courses

Children's Dance at Stanford enters its fourth year of operation with a summer session scheduled for June 20 to July 28 in Roble Dance Studios.

The six-week program features classes for boys and girls ages 3 to 13. Classes meet Monday through Thursday afternoons between 4 and 6 p.m.

Class offerings include a "Workshop in Dance and Micro-Computers," "Dancing Out-of-Doors," "Rhythms and Movement" for three to five-year-olds, and "Movement and Music" for six to eight-year-olds.

The "Workshop in Dance and Micro-Computers" for children ages six to 13 involves one hour of choreography in the dance studio, followed by an hour in Stanford's Micro-Computer Lab.

The "Dancing Out-of-Doors" class will improvise and choreograph in a variety of environments on Roble grounds.

For further information and registration call instructors Elizabeth Larkam and Diana Lindsay at 497-4254. Children's Dance at Stanford is sponsored by Stanford Dance Division under the auspices of the Department of Athletics, Physical Education, and Recreation.

STARTS sponsors summer classes for all dance levels

Student Arts at Stanford sponsors a six-week Summer Dance Workshop with instructors Lisa Burnett and Elizabeth Larkam.

The Workshop features classes in ballet, modern dance, floor-barre—alignment, and early morning dance-exercise.

Classes are scheduled for early mornings, late afternoons, and evenings, Monday through Thursday, June 20 through July 28, in Roble Dance Studios.

Dancers of all levels of experience from Stanford and neighboring communities are invited to participate. Workshop fees range from $3 to $4 per class based upon the number of classes taken per week.

For further information and registration call Lisa Burnett at 854-4163, or Elizabeth Larkam at 497-4254.

Trips, adventures offered by SOAR at Tresidder

Stanford Outdoor Adventures and Recreation (SOAR) at Tresidder Union has in store all kinds of trips and programs to keep campus people busy through the summer months. Like the U.S. Marines, participants will be able to play on land, on water, or in the air.

Summer programs, beginning this month, include backpacking, whitewater rafting, and flying, as well as trips to Yosemite, New Brighton Beach, and Big Basin State Park.

Classes will be available in horseback riding, kayaking, bike maintenance, and rock climbing.

Call 497-4316 for information on these and other exciting events sponsored by SOAR.

Tom Coster

David Baker

Tom Coster, David Baker to give first two STARTS 'Speaking Jazz' lectures

Tom Coster, pianist for Santana, will speak on "Ivory Expedition, Multi-Keyboard Applications and Approaches to Improvisation and Modern Chord Voicings" at 7:30 p.m. Wednesday, June 22, in the Tresidder Lounge. Admission is $3.

Coster has recently released an album entitled "Ivory Expedition," a richly textured, cohesive work, on Fantasy records. He is also a columnist for *Keyboard* Magazine.

David Baker, internationally renowned educator, composer, performer, and author of more than 60 books on jazz will speak at 7:30 p.m. Thursday, June 23, in the Tresidder Lounge. Admission is $3.

Baker, currently chairman of the Jazz Department of the Indiana University School of Music, will talk about "New Directions in Jazz Since 1959."

These lectures are the first in a series of 10 Speaking Jazz lectures sponsored by STARTS and the Stanford Jazz Workshop. Other speakers include composer Bobby Hutcherson, guitarist Bruce Forman, and sax player Stan Getz. Full series tickets are $25, available at the STARTS office.

UNICEF concerts next weekend

Stanford's Department of Music will host the 21st annual UNICEF Youth Concerts at 2 p.m. Saturday and Sunday, June 18 and 19, in Dinkelspiel Auditorium.

The two concerts will feature solos and ensembles by talented young musicians aged six-18 chosen from over 300 auditioners. The panel of judges includes professors from San Jose State University, Stanford, the San Francisco Conservatory of Music, and Bay Area music teachers.

Admission is $3 for adults and $2 for children and seniors at the door. All proceeds benefit UNICEF, the United Nations Children's Emergency Fund.

For more information, please phone 365-1681.

'60 Minutes' show on Mosher Sunday

Producers of the CBS-TV program "60 Minutes" have advised Stanford that they plan to broadcast a major segment on Steven Mosher Sunday, June 12. The program may be seen locally on Channel 5, starting at 7 p.m.

A graduate student in anthropology, Mosher was dismissed by an 11-0 vote of the department faculty Feb. 24 for "illegal and seriously unethical conduct" in China that "endangered his research subjects."

Mosher has blamed his expulsion on a popular press article he wrote on forced abortions late in pregnancy in China and on "slanderous" allegations by his former wife.

Mosher has filed a grievance with Dean Norman Wessells of the School of Humanities and Sciences, who has named three persons to review the case.

The panel includes Profs. Gordon Wright, history; Ernest Hilgard, psychology; and Ward H. Goodenough, University of Pennsylvania anthropologist. Wessells has requested a report from them by June 30.

Ph.D.orals

MONDAY, JUNE 13

Rafael Mantilla-Montalvo, electrical engineering, 9 a.m., Durand 450.

Summer jazz workshop to feature Stan Gertz, Richie Cole, master classes

Stan Getz, Richie Cole, and an all-star faculty will lead masterclasses and jazz clinics this summer at the 11th annual Stanford Jazz Workshop, sponsored by the Department of Music and Tresidder Memorial Union.

Week-long, full-time instrumental and vocal jazz programs offer a unique and outstanding educational opportunity to adult and student jazz players, while concerts and the "Speaking Jazz" lecture series are open to anyone with interest in jazz.

June 20-July 21: Jazz Summer XI (Mon-Tues-Thurs evenings). Theory, improvisation and small combo playing with Jim Nadel. Also "Speaking Jazz" lecture series.

July 24-30: Bay Area Jazz Week featuring Richie Cole. Between appearances at festivals in Europe and Japan, the talented and versatile alto saxophonist will highlight this week at Stanford with a faculty including Mark Levine, Eddie Moore, Mel Martin, Cal Lewiston, Dick Hindman, Bruce Forman, and others.

July 31-August 6: Stan Getz Jazz Week. Stan will bring Jim McNeely (piano), Victor Lewis (drums), and Marc Johnson (bass). Getz's career spans four decades and his distinctive sound can be heard on over 150 albums.

The Jazz Workshop includes improvisation, small combo playing, masterclasses, individual instruction, big band sight reading, clinicians for each instrumental family, public performances and jam sessions, and evening faculty concerts.

The Workshop accepts all instruments, junior and senior high school, adult, and advanced students. Room and board are available; commuters are welcome.

For information call (415) 752-1370 or write: Stanford Jazz Workshop, Box 6508, Stanford, Calif. 94305. Jim Nadel is director.

Coping with divorce workshop slated

The Help Center workshop on coping with divorce, "Why Can't I Get Over It," slated for noon to 1:30 p.m. Wednesday, June 15, still has room for a few more participants.

Items for discussion are the normal phases in the separation-divorce process, children's emotional responses, social pressures, and how to recover.

Guest speakers are Sue Thompson and Kay Martin, licensed clinical social workers.

Call 497-4577 to reserve a-place by Monday, June 13. The Help Center is in the rear of Galvez House; parking is at Angell Field.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., June 8, to cover the week of Mon., June 20, through Sun., June 26. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

TUESDAY, JUNE 14

Tower Talks Presents: "Solidarity between East & West," by Christine Sadowski, National Fellow. 3:30 p.m. Lou Henry Hoover Bldg., Hoover Tower.

EXHIBITS

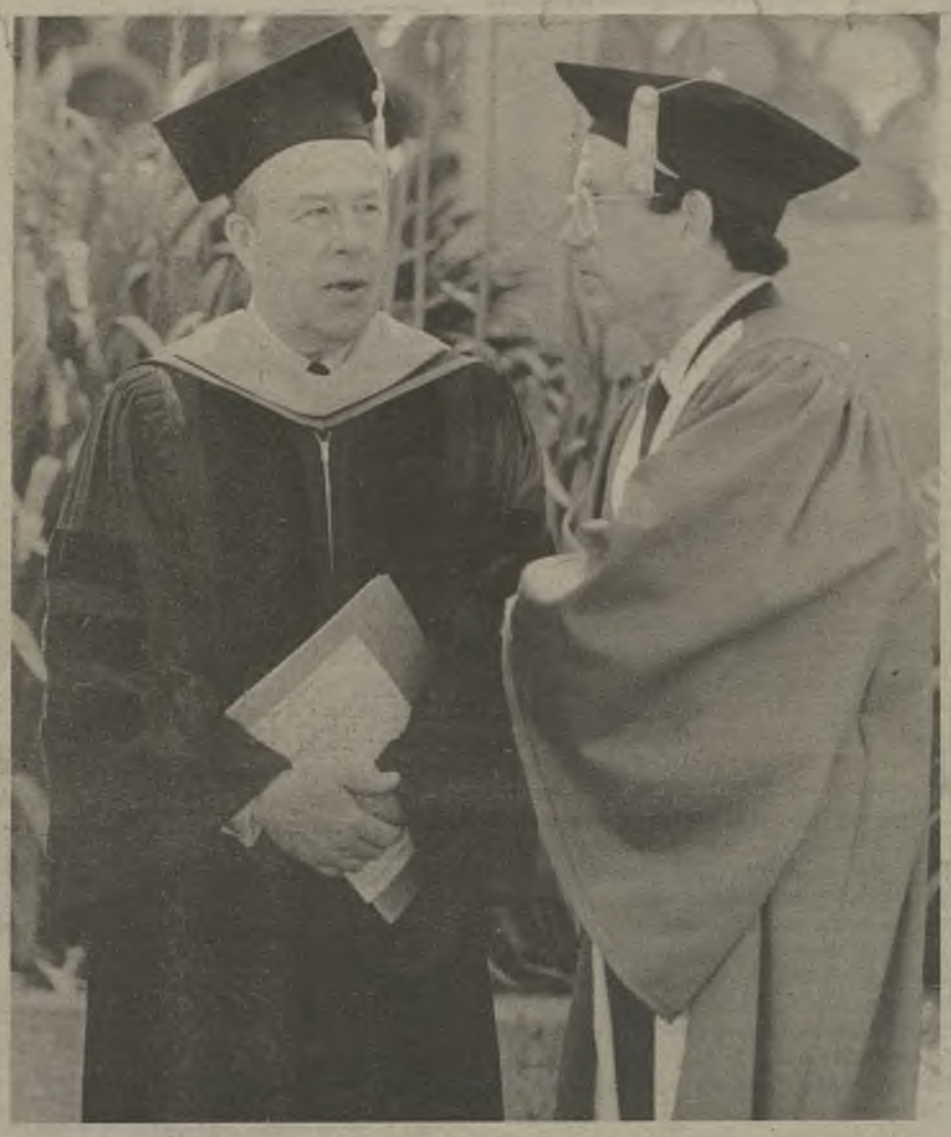
Early Lithography: 1803-1830. Museum, Miedel Room. April 12 - June 19.

Chicanos in California: Organization, Politics & People. An exhibition selected from the Chicano Manuscipt Collection, Dept. of Special Collections. 8 a.m.- 5 p.m. Louis Lurie Rotunda, Green Library. April 25 - June 30.

Stanford Senior Class Art Show. 7 a.m. to 11 p.m. Tresidder Coffee House and Upper Lobby. May 1 - June 15.

Master of Fine Arts Exhibition. Tues.-Fri.: 10 to 5 p.m.; Sat. & Sun. 1 to 5 p.m. Stanford Art Gallery (next to Cummings Art Bldg.). May 17 - June 14.

The Stanford Quadrangles: Design & Construction. An exhibition of materials relating to the early planning development and construction of the university; compiled from the resources of the University Archives. Second floor gallery, Green Library. May 23July 28.



Arthur Schnitzler 1862-1931, Documentary Photo Exhibition. Cecil H. Green Library, West Wing Corridor. May 23June 30.

Boris Ilyin, exhibition of recent oil, acrylic, & watercolor paintings. Reception, Friday, June 10, 5-7 p.m. Bechtel International Center. June 3 - June 30.

Graphic Artists Work. The work of Tresidder's Marketing Dept. staff - see the process involved in creative advertising as well as cartoons and graphic design work. Upper Lobby and Coffee House Galleries of Tresidder Union. June 16 - July 3.

CAMPUS REPORT

Volume XV, Number 37 | A publication for Stanford University faculty & staff | June 15, 1983

George Shultz and Donald Kennedy wait outside Frost Amphitheater — Ed Souza photo

Record crowd in Frost

Standing ovation for Shultz — but the quote wasn't his

Returning to his home campus, Prof. George Shultz, on leave from Stanford as Secretary of State, drew a standing ovation from 2,800 graduates Sunday, June 12, when he said "a nuclear war cannot be won, and must never be fought."

Only when the graduates returned to their seats did Shultz add the kicker: "That's a quote from Ronald Reagan."

Scattered laughter, applause and a few boos ensued.

Bathed in sunshine, sage advice, and champagne, the 92nd annual commencement drew a record crowd of more than 15,000—the most since former President Herbert Hoover spoke at the 1935 commencement in Stanford Stadium.

A large, balloon-buoyed banner, "Congrats '83—Stop U.S. Intervention in Central America" floated high above Shultz. Scores of students, several faculty, and the Rev. Robert Hamerton-Kelly, dean of the chapel, wore orange sashes with the words "Respect Human Rights."

Smoothly adapting his text, Shultz was applauded when he said: "Considering how few democracies there are in this world, what we have in common with our allies is therefore something precious: systems of constitutional, representative government; systems of law that guarantee basic political and civil rights and freedom; respect for human rights; open economic systems that give free rein to individual talent and initiative."

Nine television crews were among an estimated 50 press covering his foreign policy address. About 150 persons joined in a peaceful protest outside Frost prior to the ceremony. Speakers included former Stanford religion Prof. Robert McAfee Brown.

While Shultz was donning his academic robes in the Little Theater, petitions signed by more than 2,000 persons opposing U.S. policy were presented to Doug Bryson of the State Department by Andrew Bennett, a graduating senior who helped organize the protest.

In his prepared remarks, Shultz warned that protectionist policies could hinder global economic recovery.

"New efforts of trade liberalization would be especially beneficial to the developing countries," he said. "In 1980, their export earnings of $580 billion amounted to 17 times their net receipts from foreign aid.

"The unprecedented expansion of Soviet power over the past two decades cannot be ignored or rationalized away. Any President, any Administration, would be forced to respond.

"Surely the burden of proof is on those who would undo the present military balance, or alter it, or conduct risky experiments with unilateral concessions without genuinely reducing the levels of arma-

Smokeless information can't solve all problems—Kennedy

President Donald Kennedy of Stanford Sunday, June 12, urged graduating seniors to devote a portion of their lives to public service.

In remarks prepared for the University's 92nd commencement, Kennedy said "our passion for the entrepreneurial chase should not blind us to some fundamentals.

"We must take care of the agricultural and industrial basics. We must govern ourselves. We must teach the children.

"Despite what we are told by the best-selling corporate futurists, we cannot live in some Mandevillian beehive run entirely on smokeless information, in which half the inhabitants are venture capitalists and the other half software designers."

While economic constraint "makes everyone more cautious about occupational risk-taking," Kennedy said, "a decade's worth of unwise political rhetoric about Big Government and the Bureaucracy has congealed into a generalized mistrust of the public sector."

Former commissioner of the Food and Drug Administration, Kennedy noted that morale in federal agencies has been "sapped by constant criticism, especially from those campaigning for national office in hope that they might run those very agencies.

"Both the vulnerability and the resilience of morale in the civil service were poignantly illustrated by the way in which the disenchantment at the Environmental Protection Agency turned to hope when

Read attacks atheist fundamentalism

"People are tired of living within the narrow frontiers of a secularist philosophy and a technological society," the Rev. David H.C. Read of the Madison Avenue Presbyterian Church of New York said Saturday, June 11, at Stanford.

Delivering the baccalaureate sermon to about 3,500 graduates, their families and friends, Read said whatever career is beckoning you at this moment—science, law, literature, public service, diplomacy, business, teaching, art—you will find people who are searching for. . .that dimension which gives meaning, purpose, and some measure of hope and joy" in life.

Read criticized the "new atheist fundamentalism" which would rule out all forms of religion. A year ago, one professor condemned the awarding of a Nobel Prize in literature to Isaac Singer on the sole ground that he believed in the supernatural.

Read said others "keep their religion on a back burner. . .for future use in time of emergency," a kind of "fox-hole religion."

"But it is not only the unbelievers and the half-believers who have pushed religion into a corner as a specialized interest," he added.

"Thousands of devout church members today speak and act as though their God was a private possession confined to the area of their prayers and worship, and isolated from their business, their profession, their recreations, their political opinions....

"Others let their religion intrude into public affairs, but their God hardly seems to be the God who requires us 'to do justly, and love mercy, and walk humbly' with Him. He's the kind of God who can be let into, or kept out of our public schools by vote of Congress, a God who apparently doesn't exist in countries called 'Godless':

"I sometimes have wondered if God
Doesn't find it exceedingly odd
That the Moral Majority
Should have the authority
To control Him at home and abroad.

"Your predecessors who boasted about being the 'Now' generation were apt to reject anything that smacked of tradition, to despise their religious roots, and to welcome any cult that was born yesterday.

"I believe that you realize that religion is not one of those subjects where the new is always better than the old.

"In astrophysics, the latest authority makes the older obsolete, but that doesn't hold for ethics or religion. Plato and Kant are not made obsolete by the latest ethical school in Oxford or Heidelberg. Augustine and Luther are not made obsolete by the latest messianic cult or televangelist.

"The best place to begin a new search for religious truth is the tradition in which you were born."

Bob Beyers receives the Cuthbertson award from President Donald Kennedy

Chuck Painter photo

Cuthbertson award given Bob Beyers

Robert W. Beyers, director of News and Publications Service, was named recipient of the Kenneth M. Cuthbertson award for exceptional service to the University at Stanford's 92nd annual commencement exercises Sunday, June 12.

Interrupted in his work as the University's chief journalist covering commencement, Beyers was summoned to the podium by President Donald Kennedy, who cited him for "the reliability and stubbornly independent candor with which he represents Stanford to the external media."

Kennedy also praised him for the "humanity, energy, and scrupulous sense of fairness he applies to the proprietorship of this University's publications, to the leadership of his own staff, and to the coverage of various news events at which his presence has become campus legend."

Word of his selection for the honor had been kept from Beyers.

In addition to his role as liaison with the press, Beyers serves as "publisher" of *Campus Report*, Stanford's weekly faculty-staff newspaper, and the *Stanford Observer*, a newspaper mailed seven times a year to 140,000 alumni, parents of students, and friends of the University. He also oversees the University's in-house graphic design service.

He once wrote that his "main satisfaction comes from writing several hundred news releases yearly, trying to attract attention to new ideas of all kinds nationally." His goal is to write an average of two substantive stories a day, while managing a department of 25 employees.

"You can't treat Bob as an ordinary person—he's a force of nature," said his former boss Robert M. Rosenzweig, who resigned in February as vice-president for public affairs to become president of the American Association of Universities.

"We talk glibly sometimes about irreplaceable people. Bob is as close to being an irreplaceable person as I have ever seen in any organization," Rosenzweig added.

Robert Freelen, appointed in May to replace Rosenzweig, said Beyers' "reputation as the nation's leading practitioner of university press relations is justly deserved. His dedication to reporting the facts, even when embarrassing to the institution, has enabled Stanford to develop and maintain a high level of credibility."

Beyers has served as a consultant to colleges and foundations about public relations, always advocating "telling the truth, even when it hurts."

Since 1975 he has served as a trustee of Editorial Projects in Education, publisher in Washington, D.C., of the newspaper *Education Week*. He was a staff member of the 1965 White House Conference on Education and during summer of 1964 served as volunteer coordinator of all media and police relations on the Mississippi Summer Project, a civil rights program.

Beyers' son Robby, a Ph.D. candidate in materials science at Stanford, who was active in the conspiracy to keep news of the award from his father, arranged for an "early Father's Day" visit by the other two Beyers children, Bill and Amy, who both live in the East.

"Trying to keep the guy who has all the information from finding out is pretty tough," he observed.

Vincenti, Supton, Zuckerman, Haynes given highest honor for undergraduate education

Dinkelspiel award winners
Walter Vincenti
Alice Supton
Mary Haynes
Seth Zuckerman

A pioneer in supersonic aerodynamics, a staff member of the Dean of Student Affairs office, a former editor of the *Stanford Daily*, and a student active in black service organizations received the 1983 Lloyd W. Dinkelspiel awards for outstanding service to undergraduate education at Stanford's 92nd commencement exercises Sunday, June 12.

The recipients are engineering Prof. Walter G. Vincenti; assistant dean of residential education, Alice L. Supton, and seniors Seth A. Zuckerman and Mary L. Haynes.

Each received a personalized citation by President Donald Kennedy, himself a Dinkelspiel winner in 1976.

Vincenti was honored for "a devotion to students and a skill as a teacher so extraordinary that he is called saint by some, moving spirit by others, and teacher's teacher by his colleagues."

A professor of aeronautics and astronautics since 1957, Vincenti has also taught in the Values, Technology, and Society program since 1971 and served as program chairman for several years. In addition, Vincenti served as associate dean of undergraduate studies, from 1980 to 1982.

Prior to joining the faculty, he was chief of a group of scientists who built a wind-tunnel at Ames Research Center in Mountain View to study how airplanes could travel at the speed of sound.

Supton, in addition to her residential education duties, is active in the Center for Research on Women. She was honored for "her role in bringing different elements of the Stanford community together, in unexpected but welcome ways, so as to enrich them all—using a level of energy and creativity that no reasonable person could expect."

Kennedy also acknowledged her "for the determination, discipline, and devotion she brings to each task—whether designing a dormitory or fashioning a seminar program.

Zuckerman, who designed his own major in energy studies, was honored for "his distinguished contributions to the voice of this campus, through his editorship of the *Stanford Daily* and his bold initiative in establishing an alternative student newspaper, the *Independent*."

Kennedy also noted that Zuckerman "has contrived to blend serious academic purposes and accomplishments of his own with the education and enlightenment of others, through service as an engineering advising associate and a sought-after teaching assistant in chemical engineering and human biology.

In addition to his other projects, Zuckerman also was responsible for creating an undergraduate special course, "The Energy Controversy."
He served as editor of the student newspaper in spring 1981.

Haynes, who received a degree in communication Sunday, was cited "for a commendable four-year record of leadership." Kennedy noted she exercises "that special kind of leadership that inspires the participation of others, drawing new talents into key roles and ensuring the continuity of voluntary service."

She has worked with organizations serving black undergraduates on projects ranging from orientation to media and the arts, and mental health and residences.

As resident assistant at Mirrielees, a student dormitory, she employed "creativity, productivity, and good cheer in equal portions to create a sense of community under challenging circumstances," Kennedy said.

Walter Gores awards for excellent teaching conferred on Guerard, Durham, and Steyer

Gores award winners Albert Guerard, William Durham, and James Steyer.

Stanford presented its highest teaching recognition on Sunday, June 12, to an English professor and author, a MacArthur Foundation fellowship winner, and a teaching assistant in political science. The 1983 Walter J. Gores awards for excellence in teaching were given at Stanford's 92nd commencement exercises to Albert J. Guerard, professor of English; William Durham, assistant professor of anthropology; and James P. Steyer, teaching assistant in political science.

The three were presented personalized certificates by Provost Albert Hastorf.

Guerard, holder of an endowed chair named in honor of his late father, Albert Leon Guerard, was cited "for decades of inspired and inspiring teaching at all levels: from freshman seminars through undergraduate courses and graduate seminars to the direction of dissertations in literature as well as fiction writing."

A nationally recognized literary critic, Guerard is author of *The Touch of Time: Myth, Memory and the Self*. He also wrote *The Triumph of the Novel* and several other books and edited *Mirror and Mirage: Fiction by Nineteen*.

Guerard taught at Harvard for 23 years, during which time he wrote five novels and four critical books. In 1961 he returned to Stanford, where he was reared and where he earned his bachelor's degree. His father taught literature at Stanford from 1907 to 1913 and 1925 to 1946.

Himself a student of the late Yvor Winters, Guerard has taught such distinguished writers as John Hawkes, Jonathan Kozol, and John Updike.

In the mid '60s, with support from other faculty members, Guerard introduced a new interdisciplinary Ph.D. program in Modern Thought and Literature.

Hastorf paid tribute to Guerard for "the passion for letters which kindles the sacred fire of a great teacher; and for the word and example which make him a creative presence at Stanford."

Durham, a leading researcher in biological anthropology and recipient last January of a $176,000 MacArthur Foundation fellowship, was cited by Hastorf for "his skill in revealing the nature of scholarship by the introduction of his own research and experience in the classroom, and for his successful efforts in training the teaching assistants and developing their teaching effectiveness." Hastorf called him a "superb teacher: clear, sparkling, and innovative."

Durham, who believes "genetics and culture have coevolved in a very interdependent fashion," currently is writing a book about his theory of "coevolution." His theory is that there is a dynamic relationship between human culture and human genetics: one alters the other and is, in turn, altered itself.

Durham attended Stanford as an undergraduate, then earned his Ph.D. at Michigan. He joined the faculty of Stanford's Anthropology Department in 1977.

In the mid-'70s Durham researched his Ph.D. dissertation in the then-little known country of El Salvador. The work was published by Stanford Press in 1979 under the title *Scarcity and Survival in Central America*.

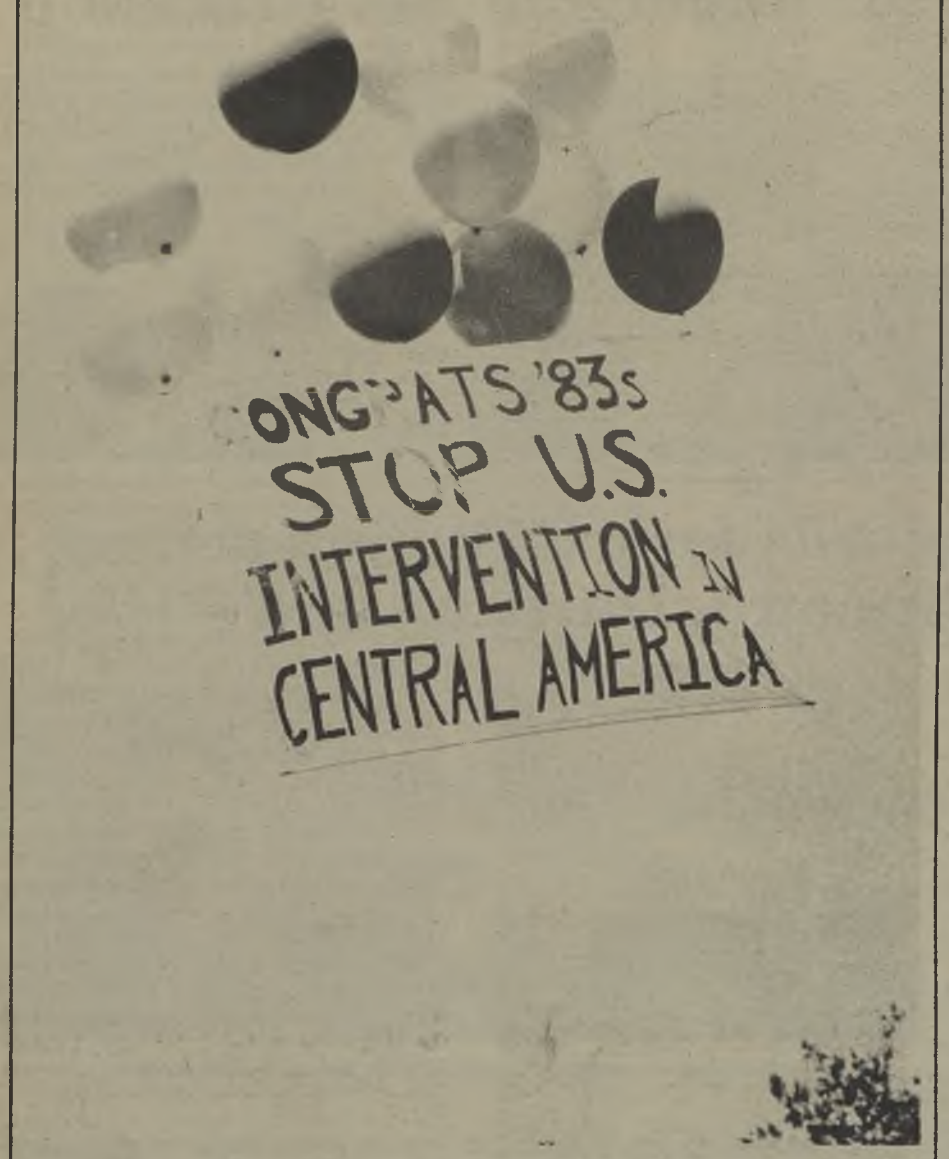
This is the second time Durham has received a prestigious honor at commencement: in 1971, as an undergraduate, he was named recipient of a Dinkelspiel award for outstanding service to undergraduate education.

Steyer, a law student from New York City, was honored "for his extraordinary effectiveness as a teaching assistant in a number of political science courses, for demonstrating a friendly and caring attitude while demanding that his students think critically, and for his ability to relate his own outside activities as well as other students' activities to the class material."

Active in the area of rape education and rape prevention, Steyer was named a co-recipient of a Dean's Student Service Award last month. This spring Steyer was also involved in organizing student petitions calling for a study of ties between Hoover Institution and the University. He also has been busy setting up a legal clinic in East Palo Alto.

Gurley: Lenin's forecast coming true

Marxist scholar John G. Gurley, professor of economics at Stanford, told an audience of newly initiated members of Phi Beta Kappa June 10 that Lenin's forecast of doomed capitalism was coming true.



"Lenin's prophecy was of a turbulent, violent, and unplanned world," said Gurley, "a world of violence and revolution. Many people think that describes the 20th century very well, considering the depressions, the inflation, the unemployment, the wars among capitalist powers—which Marxists claim generated World Wars I and II.

"Socialism now comprises about one-third of the world's land and population. Lenin's opinion was that the fires of revolution would work in from the underdeveloped countries till they consumed the advanced capitalist countries.

"This has been a century of capitalist wars, the reduction of capitalism and the expansion of socialism."

Gurley said that his own personal role model in life was the actor-singer-lawyer Paul Robeson, who linked the two worlds of Marxism and intellectualism. Robeson had gained great intellectual honors, including election to Phi Beta Kappa and had also collected 12 varsity letters."

The ceremony was the 80th consecutive initiation into Phi Beta Kappa at Stanford. Most of the 183 new members initiated by the president of the Stanford chapter, Assoc. Prof. Susan A. Stephens, were seniors, and 49 were women.

Inventive students find a newer and better way to make their message known PAINTER PHOTO

J.E. Wallace Sterling presents the Sterling Award to Megan Ann Chesnut

Megan Ann Chesnut gets Sterling award for leadership—from Wally

Megan Ann Chesnut, a psychology major from Chappaqua, N.Y., has been named the fifth recipient of the J.E. Wallace Sterling Award, given annually to a Stanford senior who has displayed outstanding leadership potential.

The award, presented at the Class Day luncheon Saturday, June 11, by Chancellor Sterling, is the Stanford Alumni Association's highest honor for a student.

The honoree has been staff coordinator at Roble Hall this year, was a resident assistant as a junior, and is president of Pi Beta Phi sorority.

Currently a social worker at the Palo Alto Nursing Center, she has a wide background of experience with the developmentally impaired, much of it as a volunteer. She has also directed and choreographed, danced, and acted in campus dramatic and musical productions.

The citation mentions the "wholeheartedness of her commitment to others and the energy and infectious enthusiasm that are the trademarks of her life and work" as well as "the unwavering quality and substance of her contributions to the residence program, to music and drama at Stanford, to departmental research, to counseling and tutoring, to physical therapy and human services."

Recipients of the Sterling Award receive a plaque and a life membership in the Alumni Association.

Burk, Klarman lead Law School class; Coif elects 16

Stanford Law School presented diplomas to 158 members of the Class of 1983 in an awards ceremony held June 12 in Kresge Auditorium, following university commencement exercises.

John Hart Ely, dean of the Law School, welcomed the School's 90th graduating class and more than 750 relatives and friends.

Bernard A. Burk of Encino, Calif., was named the Nathan Abbott scholar, for the highest cumulative grade point average in the class.

Michael J. Klarman of Baltimore, Md., received the Urban A. Sontheimer prize for the second highest cumulative grade point average.

Sixteen members of the class were elected to the Order of the Coif, the national law honor society for the encouragement of scholarship and advancement of ethical standards in the legal profession.

Membership in the Order is extended to third-year students ranking at the top of the class academically and considered worthy of the distinction. The Stanford chapter was established in 1912.

New members are Bernard Alan Burk, Encino, Calif.; David Lambert Furth, Los Angeles, Calif.; Samuel Michael Hurwitz, Hamden, Conn.; William Gerald Roche, Atlanta, Ga.; Michael Joseph Klarman, Baltimore, Md.; Kirk Murray Veis, Scobey, Mont.; Cynthia McGaw Moore, Cheektowaga, N.Y.; Mark B. Seidenfeld, Queens Village, N.Y.; Dana Leigh Gross, Woodbury, N.Y.; David James Shaffer, Enon, Ohio; Vincent Michael Waldman, Tulsa, Okla.; John David Guinasso, Portland, Ore.; Robert B. Hawk, Dallas, Texas; John Steven Gordon, Houston, Texas; Thomas Martin Hagler, Arlington, Va.; and Robert Axel Olson, McLean, Va.

Class President Stephane Atencio of San Antonio, Texas, presented the 1983 John Bingham Hurlbut award for excellence in teaching to Prof. Paul L. Goldstein. Goldstein, a member of the Stanford faculty since 1975, is an expert in property law. In a brief address, he urged members of the graduating class to hold on to their individuality despite the inevitable career pressures they will encounter.

Several members of the class have been recognized for outstanding achievements during their three years at the Law School.

David I. Schiller of Brocton, N.Y., received the Frank Baker Belcher award for the best academic work in evidence.

Margaret A. Niles of Portland, Ore., received the Carl Mason Franklin prize, awarded annually for the most outstanding paper in international law. She also was author of the outstanding student note published in the *Stanford Law Review* during 1982-83.

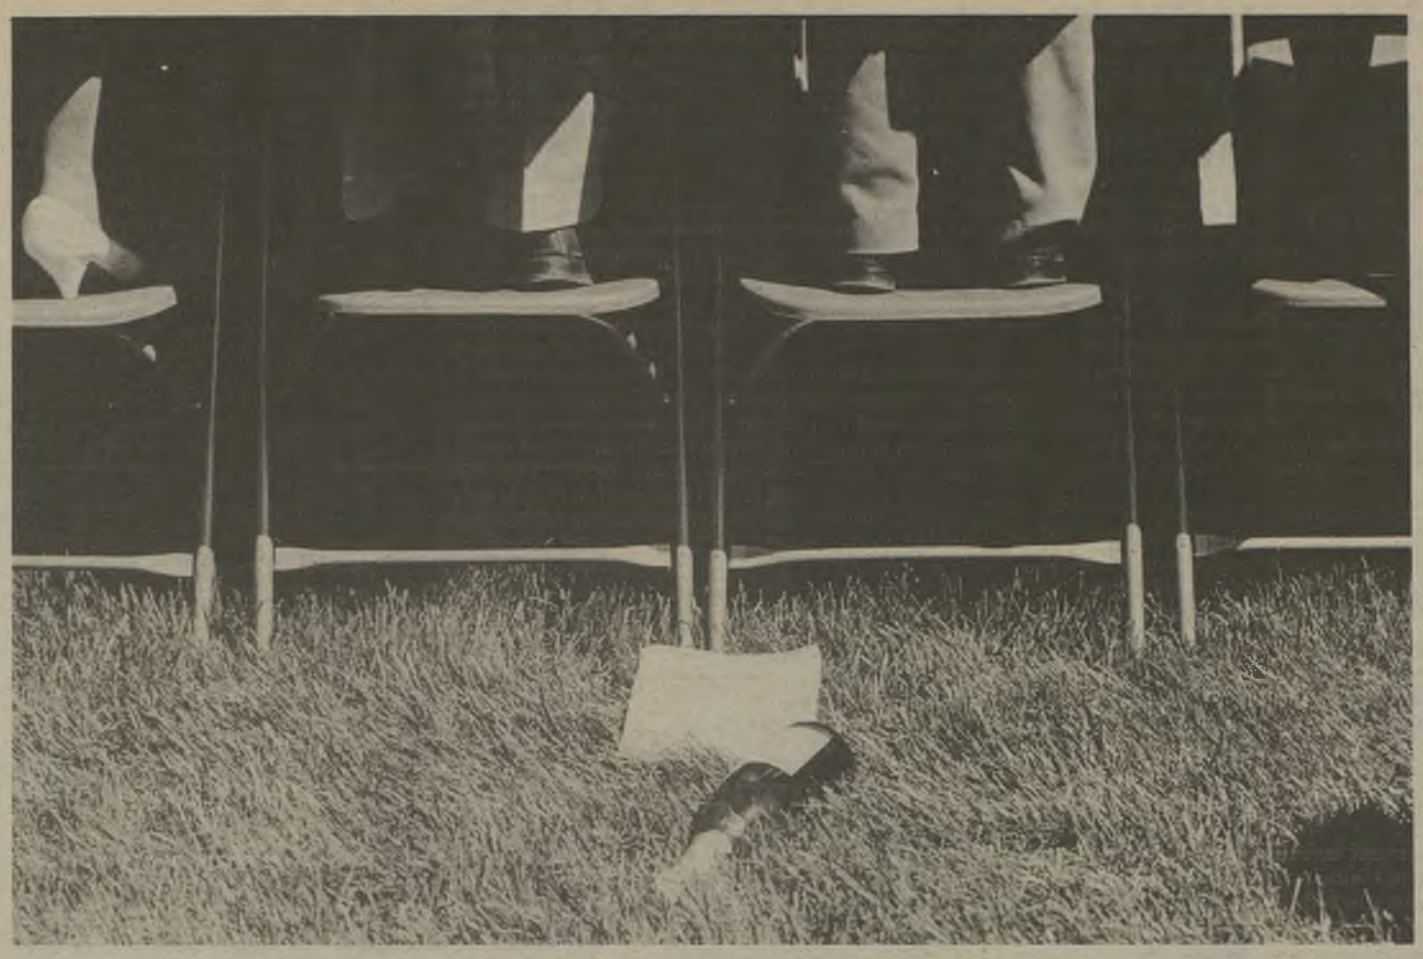
Eva Marie Carney of San Francisco and Michael J. Gennaco of Glendale, Ariz., received the Faerie Mallory Engle prize, awarded to the finalists of the School's client counseling competition.

Palma J. Strand of Ashland, Wash., received the 1983 Olaus and Adolph Murie award for the most thoughtful written work in environmental law; the 1982 award went to J. Christopher Grace of McLean, Va.

Sharon L. Reich of West Lafayette, Ind., was presented with the award for outstanding editorial contributions to the *Stanford Law Review*.

Cynthia M. Moore of Cheektowaga, N.Y., received the award for outstanding service to the *Stanford Law Review*.

The R. Hunter Summers trial practice award, presented by officers of Serjeants at Law for outstanding student performances in trials conducted during the year, went to Robert M. Bohl of Topeka, Kan.; Joseph E. Bringman of Elmhurst, N.Y.; John S. Gordon of Houston, Texas; James E. Henderson of Winowa, Minn.; Samuel M. Hurwitz of Hamden, Conn.; Dennis P. McLaughlin of Tucson, Ariz.; and Gail MacQuesten of Alamo, Calif.

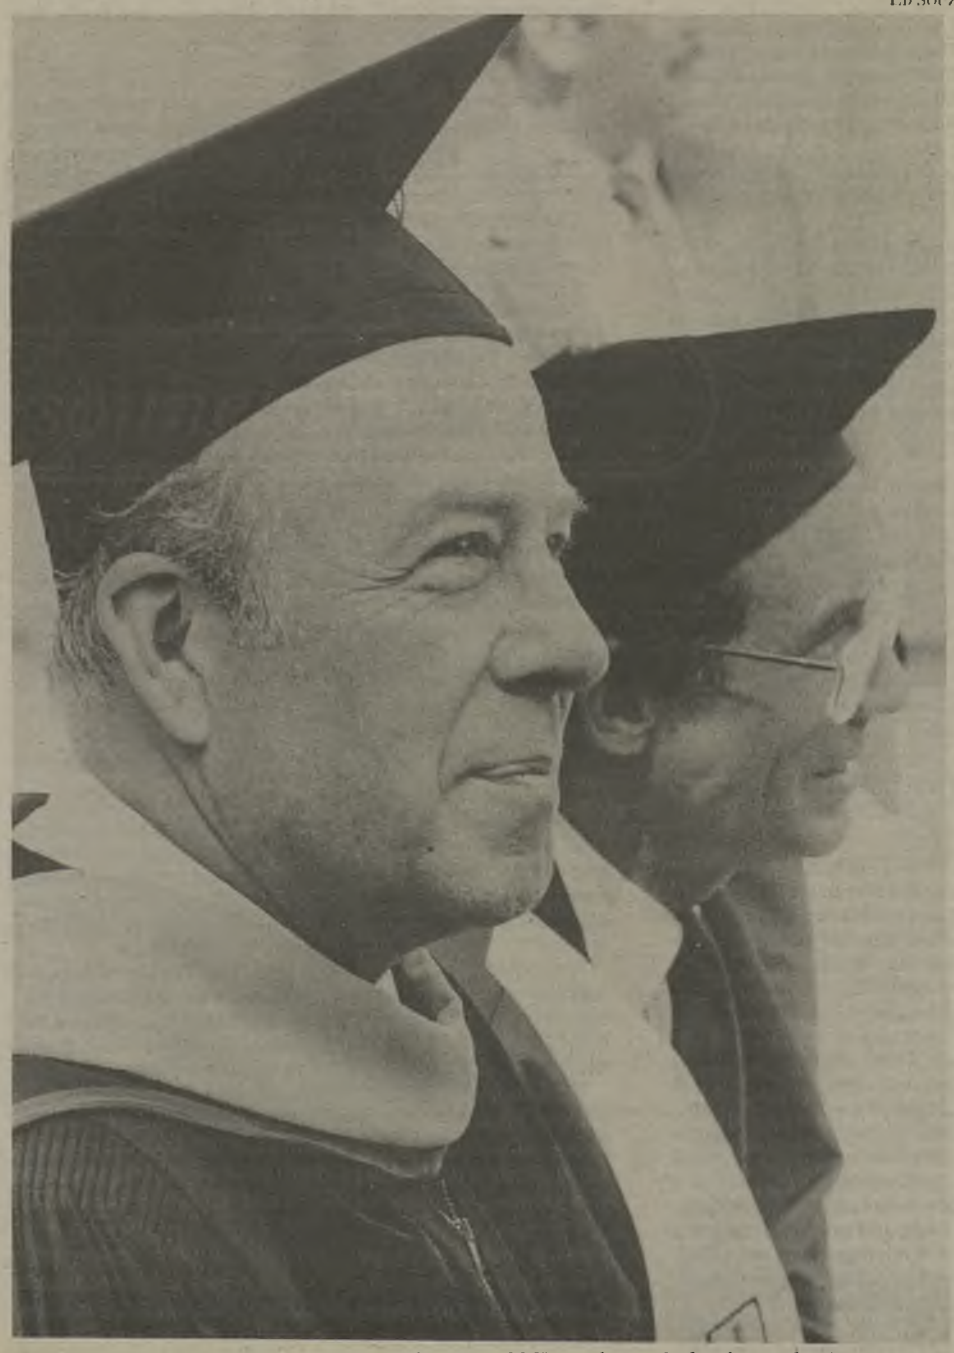


A string quartet played while graduates and their families celebrated at a champagne reception held in Crocker garden following the ceremony.

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.
Published by the Stanford University News Service. Patricia J. Black, editor; Karen Marman, design assistant; Debbie Jeppson, production assistant; Charles Painter and Ed Souza, photographers; Medical news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.



Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

Champagne bottle and Commencement program are forgotten as students watch the approaching academic procession

ments on both sides.

"On the basis of strength, the cohesion of our alliances, and a clear view of our own obejctives, we must never be afraid to negotiate.

"This is our attitude to arms control. As NATO decided in December 1979, for example, we intend to modernize our intermediate-range nuclear forces in Europe to counter the Soviet deployment of over 1,000 nuclear warheads on their new intermediate-range missiles (SS-20s). But we are also willing to eliminate this entire category of nuclear weapons from the face of the earth; and we are prepared, as an interim step, to reduce these forces to any equal, verifiable level.

"If negotiations do not succeed, however, we must be prepared to deploy at the end of this year as decided in 1979. The Soviet Union has no higher priority goal at the moment than to intimidate NATO into cancelling its deployments unilaterally, thereby leaving the Soviet Union with its massive monopoly of new missiles and warheads already in place.

"Democracies are sometimes slow to awaken to their challenges. But once they are aroused, no force on earth is more powerful than free peoples working together with clear purpose and determination."

EE Department honors Angell, Bacon, Cloutier

Three Stanford electrical engineering faculty and staff members received outstanding service awards from their department during its special commencement ceremony Sunday, June 13.

In the fourth annual presentation of the awards, those honored each received a certificate of appreciation and a check for $1,000. They are:

Prof. James B. Angell: For outstanding service as director of graduate admissions and financial aids for the Department of Electrical Engineering, carrying out this responsibility with highest standards, excellent judgment, absolute integrity, and infinite patience and dedication. By systematically applying highest criteria to the selection of outstanding students for admission to our department, he has played a major role in creating the excellence of which we are so proud.

Dr. David C. Bacon: For extraordinary contributions and outstanding service as associate director for the Stanford Electronics Laboratory and as research coordinator for the School of Engineering. In these capacities he has handled complex and frustrating problems in research management, in personnel, and in research funding with sensitivity, competence, responsibility, and good humor. With his guidance, an academic research establishment of almost unrivaled power has been built and continues to run smoothly.

Mary Cloutier: For extended service of the highest professional quality, as both secretary and administrative assistant to the Department, the Solid State Laboratory during a period of extraordinary growth, and the executive committee of the Center for Integrated Systems during especially critical stages of policy development and fundraising.

Kennedy. . .

continued from page 1

the eleventh-hour restoration of trusted leadership offered those career employees the return of their self-respect."

In an obvious reference to the featured speaker, Secretary of State George Shultz, Kennedy said "there are abundant illustrations of the cost of public service—some of them are visible even at this commencement.

"For experienced men and women who have something valuable to contribute to their government, it is not easy to give up the comfort, the financial advantage, and the personal freedom that private life provides.

"No one, in short, needs to go into one of the visible, high-pressure government jobs; the reward has traditionally been a sense of fulfilled obligation and a measure of respect for one's fellow citizens—not immunity from criticism, mind you, but decent, humane respect.

"If that is allowed to disappear, we may some day wake up to discover that public life at the top has become such a psychic hazard that only the insensitive will undertake it."

Former president of the Bechtel Corporation, Shultz is now on leave as a professor in the Stanford Graduate School of Business and has a home on campus. In his absence, demonstrators opposed to U.S. policy in Central America have staged peaceful protests on the street in front of his residence.

'We cannot find security in arms alone,' Shultz declares

Following is George Shultz Commencement text:

"Commencement" says that something new is about to begin, just as something else ends. Don't worry about it too much—you can still have fun in the real world. And if someone tells you it means a sharp transition from the world of learning to the world of work, don't believe it. The transition is more apparent than real.

The week before last, for example, I happened to meet with an extraordinary American, our Ambassador to the Federal Republic of Germany, Arthur Burns. He's full of information and ideas about Germany, the Atlantic Alliance, the American economy, and dozens of other subjects. He's lively and well and full of the future. He's 79 years old. He has been taking German lessons over the past 18 months. He's never stopped learning.

The message is that this habit of learning is a habit that will sustain you throughout your life.

An old saw has it that experience itself is the best teacher. I can mention this now that you have already paid your Stanford tuition. But the old saw is only a half-truth. Just as scientists say that luck is something that comes to the prepared, experience teaches only those capable of grasping its meaning.

So, make use of the gifts Stanford has given you: the habits of careful observation, of an analytical ordering of what you see, of living with ambiguity and waiting for the evidence before reaching conclusions—the quality of mind that enables you truly to learn from experience.

The Challenge to the Democracies

Societies, too, must learn and remember, if they are to maintain their vitality and confront the future.

In recent weeks, much of my time has been devoted to this country's relations with our closest friends and allies, the great democratic nations of the Atlantic Community and Japan. A month ago, I attended a meeting in Paris of the Organization for Economic Cooperation and Development (OECD), the descendant of the international agency that, 35 years ago, administered the Marshall Plan. Two weeks ago, I joined President Reagan in Williamsburg at the Economic Summit with leaders of our major industrial partners. And this past Thursday and Friday, in Paris, I took part in the semi-annual meeting of Foreign Ministers of the North Atlantic Alliance.

As Dean Acheson said about the Alliance, this unity "is not an improvisation. It is a statement of the facts and lessons of history."

When the Atlantic Alliance was founded in 1949, the allies showed they had learned a lesson from the period before World War II—when the democracies had lacked the will to come together in the face of danger, when they had tried to evade their responsibility of maintaining their strength and permitted a dangerous imbalance of power to develop. Eventually, they were forced to respond, but it was at a cost of millions of lives that might have been spared had they taken bold but prudent action beforehand. When the Altantic Alliance was formed, the purpose was to prevent war by ensuring that the cohesion, strength, and collective will of the democracies would never again be doubted by any adversary.

The Alliance has succeeded in preventing war. Indeed, since its formation, the only use of military force on the Continent of Europe has been by the Soviet Union against its own "allies." But experience has also taught that the unity of the free nations is central to the achievement of any of our goals: peace, freedom, security, prosperity.

I want to say a few words now about how the democracies, learning from the "facts and lessons of history," are responding today to a new set of challenges—in the realms of political affairs, economics, and security.

Political and Moral Unity

The first lesson is that what the democracies have in common is of overriding importance to us and to others throughout the world. Our common heritage gives us a common responsibility.

American students graduating today have many worries, I am sure. You must be anxious about your careers and your future. Yet, there is one category of worries that I daresay you do not have. You are not concerned that the threat of imprisonment or torture hangs over you if you say or write or do the "wrong" thing. You have no fear of the policeman's midnight knock on the door. Considering how few democracies there are in this world, what we have in common with our allies is therefore something precious: systems of constitutional, representative government; systems of law that guarantee basic political and civil rights and freedoms; respect for human rights; open economic systems that give free rein to individual talent and initiative.

Most alliances in history have not lasted. The fact that the democracies have been held together by ties of political, economic, and security cooperation form more than three decades, through many profound changes in international conditions, is proof, I believe, that our unity of shared values and common purpose is something special. At the same time, the grim lesson of history should warn us that even this

George Shultz

great coalition will not survive without conscious effort and political commitment. Those statesmen who were "present at the creation" in the immediate postwar period showed enormous vision and courage. In a new era in history, it is up to all of us to summon the same vision and courage to assure that it survives and flourishes.

Therefore, it is of enormous importance that our moral unity is today being so effectively translated into political unity.

It is important that old divisions within the Alliance are narrowing, as shown by the fact that the Ministerial meeting I just attended was held in Paris for the first time in 17 years. It is important that the Alliance is attractive enough for new countries to want to join—the original 12 now number 16. It is important that the 24 industrial democracies grouped in the OECD have worked out a framework for a consensus on the difficult issues of East-West trade, based on a thoughtful analysis of the balance of interests in economic relations with Communist systems.

Outside of the formal Alliance framework, British, French, and Italian soldiers now stand alongside our Marines protecting Beirut. Our Atlantic allies, Japan, and other countries around the world are supporting our efforts to promote the withdrawal of all external forces from Lebanon. Britain, France, West Germany, Canada, and the United States are working together as a "contact group" to help reach a negotiated arrangement for the independence of Namibia. And all the diverse Williamsburg Summit partners—including Japan—joined in an impressive joint statement on security and arms control.

Thus, for all our occasional squabbles, the democratic nations have not forgotten the paramount importance of the values and interests we have in common.

Our Common Prosperity

In the economic dimension as well, experience teaches that cooperation is essential. We now live in an interdependent world in which each country's well-being, primarily its own responsibility, is nevertheless affected powerfully by the health of the global economy, for which the industrial democracies bear a special responsibility.

In the 1970s, the plagues of recession, oil shocks, and inflation spread across national boundaries. The impact was not only economic but political. There was great concern that these ills would weaken not only Western economies but the cohesion of Western societies. If democratic governments proved unable to deal effectively with their economic problems, societies would be under continuing strain, social divisions would be aggravated, and we might have faced a demoralizing crisis of democracy. Increasing resort to protectionism, choking off world trade and compounding the recession, could have undermined relations between allies. These political divisions, as well as budgetary pressures, threatened to weaken the common defense.

The free nations had learned however, from the experience of the 1930s, when the failure of cooperation gave birth to widespread protectionism, which deepened the Great Depression.

This time, the free nations began the practice of holding yearly Economic Summits and intensified their cooperation in many other forums, multilateral and bilateral.

As the Williamsburg Declaration testifies: "The recession has put our societies through a severe test, but they have proved resilient." Rather than economic stagnation, we are seeing the impressive capacity of open economies to regain their vitality. Growth with low inflation has resumed in the United States, Japan, West Germany, Britain and other countries which together account for about three-quarters of the production of the industrialized world. If we have truly wrung inflation out of our system, and if we all maintain discipline in our national policies, the world could be headed for a long period of sustained noninflationary growth. Those are big "ifs," I know, but our experience should tell us that the job can be done and that we will be much better off as we do it.

It is essential that we resist protectionism, which could hinder this recovery. The Williamsburg Summit partners candidly acknowledged to each other that every country's record is spotty on this score. But they committed themselves "to halt protectionism, and as recovery proceeds to reverse it by dismantling trade barriers." New efforts of trade liberalization would be especially beneficial to the developing countries: In 1980, their export earnings of $580 billion amounted to 17 times their net receipts from foreign aid.

For all our temporary setbacks, the free economies have brought about since 1945 an era of growth and prosperity unprecedented in history. On the Eastern side of the divided continent of Europe, economic problems are systemic. Inefficiencies are built-in; innovation is inhibited; effective economic reforms are excluded because they would weaken the grip of centralized Soviet political control. In contrast, our economic difficulties are largely problems of self-discipline, of better management of fiscal and monetary policy to permit the inherent vitality of the free economic system to show its power. The weakness of Soviet-style economies is structural. We have reason for confidence, for our economic future is in our own hands

Collective Security

Unfortunately, the Soviet system is very proficient in another sphere: the accumulation of military power. Therefore, security must remain a priority area of cooperation.

If the values and interests we have in common are truly precious to us, then we have a duty to defend them.

The Summit partners at Williamsburg made very clear that they have learned this lesson. Let me read to you from their joint declaration:

"As leaders of our seven countries, it is our first duty to defend the freedom and justice on which our democracies are based. To this end, we shall maintain sufficient military strength to deter any attack, to counter any threat and to ensure the peace. . . . The security of our countries is indivisible and must be approached on a global basis. . . . We have a vision of a world in which the shadow of war has been lifted from all mankind, and we are determined to pursue that vision."

Importantly so, but in an age of nuclear weapons, maintaining collective security is no easy task. "A nuclear war cannot be won, and must never be fought." That's a quote from Ronald Reagan. Our challenge is really two-fold: We must both defend freedom and preserve the peace. We must seek to advance those moral values to which this nation and its allies are deeply committed. And we must do so in a nuclear age in which a global war would thoroughly destroy those values. As the President pointed out in Los Angeles on March 31, our task is "one of the most complex moral challenges ever faced by any generation."

We and our allies have agreed for decades on a two-fold strategy for meeting this challenge. First, we are committed to ensuring the military balance, modernizing our forces, and maintaining vigilance. Second, we are prepared for and committed to constructive dialogue with our adversaries, to address the sources of tension, resolve political conflicts, and reduce the burden and danger of armaments.

We cannot find security in arms alone. We are willing to negotiate differences—but we cannot do so effectively if we are weak, or if the Soviet Union believes it can achieve its objectives without any compromise. Therefore, both these tracks—strength, and diplomacy—are essential.

Unfortunately, the democratic nations have tended to neglect their defense responsibilities. Some serious problems have resulted and are now coming home to roost. They underlie many of the current controversies. In the 1970s, the trauma of Vietnam caused the United States to reduce its armed forces and reduce real defense spending, at the same time that the Soviet Union, in the wake of the Cuban missile crisis, was embarked on a relentless buildup in all categories of military power, strategic, conventional, and naval.

Once the United States lost its unquestioned strategic

Kennedy to grads: Consider public service part of career

Following are President Donald Kennedy's Commencement address:

My opening text for this last lesson is supplied by the line from this year's Gaieties: "I think perhaps it's time I explained what's going on here."

What's going on is that you are in the very act of graduating from Stanford, and it is now my privilege to address you for the last time in your present status. So we have reached that point in these proceedings at which, by ancient custom, we examine together the timeless question "Is There Life After Stanford?"

Since there are obviously alumni, there must be life after Stanford. I will say a few words about that in a moment. But first, there is something else; it is called the Awful Awakening. I refer to the realization that life *off* the farm, although ripe for discovery, contains some problems.

During the Awful Awakening, you will be envied and misunderstood. These are your crosses to bear. Perhaps they will be easier for you if I briefly acquaint you with each.

Envy you must remember, is notable especially for its occasional irony. A typical example will help you identify it. Susie, a member of your high school class, was rejected by Dean Fred in the Spring of 1979, when you were accepted. Subsequently, you have learned (through the assiduous efforts of others who know you both, but know her better) that she was elected to Phi Beta Kappa at Princeton in her junior year, made all-Ivy in soccer, and has just been accepted to Stanford Law School. That's not the worst. Her mother—who is a good friend of your mother's, turns out to be your seatmate on a long transcontinental flight. As she settles in beside you, she begins the conversation. "Isn't it too bad that Susie is coming to Stanford just as you're leaving, dear. Do tell me about your plans."

Misunderstanding can be even more immediately depressing than envy. Your Stanford penchant for abbreviation, so easily understood and accepted here, will only draw blank stares elsewhere; Wide Libe is not used in Cambridge. And only the Stanford interns in our nation's capital will understand that by Mem George you mean the Washington Monument.

You will, furthermore, have to accustom yourselves to a belief that this university resides in a middle-sized suburb of Fairfield County, Connecticut—or, perhaps worse, to a view that *correctly* places it in California but believes that it is in Southern California. You may recall that when you were freshmen my predecessor learned about the effect of distance on perspective the hard way, in the headlines: "New York Foundation Post to Head of Coast School."

And finally, I would warn you sternly that you cannot expect anyone to understand what it means when, in a difficult moment of frustration at some injustice, you give the Stanford gesture for confusion, personal ineptitude, and total loss of control. . .

These experiences of the Awful Awakening are unpleasant to different degrees, but you will survive them; and once you have, you are fully prepared to engage with Life After Stanford. In trying to help you with this, I shall sound a bit avuncular, not to say preachy. Too bad; that's an inevitable part of this ritual. It just wouldn't be complete without farewell advice, so relax and try to enjoy it.

Last year, I approached my task by venturing some hopes about what the graduates had obtained from their time at Stanford. Here is a brief version of the list of qualities I gave them:

- Confidence in their own capacities of analysis;
- The desire to appreciate and seek a wide range of diverse traditions and values;
- A tolerance for ambiguity;
- A healthy suspicion of those convictions that emerge from commitments to a single value;
- A strong, but not incapacitating, skepticism about Certified Truth;
- Appreciation for the value of a sense of humor and last, but not least;
- A willingness not to be cool—to engage in headlong, risky commitments when they seem warranted.

This year, I chose instead to make some predictions and suggestions about what you may do with those capacities, beliefs, and qualities that you will take away from Stanford.

The first is that you are likely soon be occupied with a number of matters you didn't study at all. This may produce, at first, a sense of dismay; but I think you will then become acquainted with with an old piece of wisdom: that education is what takes over when training gives out. You will find much scope, even in unfamiliar circumstances, for the application of the capacity to communicate, the analytical style, and the foundations of liberal learning that you have gotten here. I hope you will come to trust those capacities and believe in them. More than that, I hope you will tell others about your successes, especially those who have yet to begin college. They need relief from the awful burden of believing they have to Prepare for Life even before Declaring a Major.

Second, I urge you not to regard this day as the end of one phase of your life and the beginning of another, entirely different phase. Your years in the university should open doors but not close any; it is an episode of learning but it will not encompass all, or even most, of the learning you will do. If it has worked it will have expanded both your appetite and your capacity for more. Indeed, the only thing I don't like about the symbolism of commencement is the metaphor it offers for the discontinuity between learning and life. I hope your life will be a symphony in some respects, but you won't, I assure you, live it in movements. Take from here the belief that the best that has happened to the life of your minds will happen over and over again—if only you will insist upon it.

There is a third hope, and I want to dwell on it at somewhat greater length. It is a wish that you will put some of the talent, energy, and training you possess into public service at some time in your lives. I offer that wish with the realization that these are not times in which that prospect has a great deal of natural appeal, even to an audience of thoughtful and compassionate people in the university that not so long ago led the nation in rate of volunteering for the Peace Corps. We might begin, in fact, by wondering briefly how we could ever have reached a point at which public service requires such special pleading.

There is, of course, the state of the economy. Constriction of opportunity makes everyone more cautious about occupational risk-taking. While I take that seriously, I do not think it begins to provide the whole explanation. Other things have happened. For example, a decade's worth of unwise political rhetoric about Big Government and the Bureaucracy has congealed into a generalized mistrust of the public sector. Morale in Federal agencies, about which I know a bit, has been sapped by constant criticism—especially from those campaigning for national office in the hope that they might run those very agencies. Both the vulnerability and the resilience of morale in the civil service were poignantly illustrated by the way in which disheartenment at the Environmental Protection Agency turned to hope when the eleventh-hour restoration of trusted leadership offered those career employees the return of their self-respect.

Second, there are abundant illustrations of the human cost of public service. For experienced men and women who have something valuable to contribute to their government, it is not easy to give up the comfort, the financial advantage, and the personal freedom that private life provides. No one, in short, needs to go into one of the visible, high-pressure government jobs; the reward has traditionally been a sense of fulfilled obligation and a measure of respect from one's fellow citizens—not immunity from criticism, mind you, but decent, humane respect. If that is allowed to disappear, we may some day wake up to discover that public life at the top has become such a psychic hazard that only the insensitive will undertake it.

A third source of difficulty, I am afraid, comes out of something that is actually rather good: our national rediscovery of entrepreneurship. It is distillate of some traditional pieces of our national character; individualism, independence of action, innovation. Our economic situation, and our visible need for productivity improvement, have heightened the emphasis on private initiative and on new ventures. But passion for the entreprenurial chase should not blind us to some fundamentals. We must take care of the agricultural and industrial basics. We must govern ourselves. We must teach the children. Despite what we are told by the best-selling Corporate Futurists, we cannot live in some Mandevillian beehive run entirely on smokeless information, in which half the inhabitants are venture capitalists and the other half software designers.

Entrepreneurship, we should remember, is but one side of the coin of American tradition. Obligation—public responsibility—is the other. The public sector has been through some difficult times, but its need for your support and your talents is only the greater because of that. Think of your own life, and consider how much poorer it would have been without the dedication of the best teacher you ever had, the most devoted leader in your community, the county agent, the city director of recreation—whatever public servants you have encountered in personally important ways. I find it quite inconceivable that you will decide, as a society, to allow those roles to be filled by whoever happens to fall into them. Yet unless we can manage to get some of you turned around, that is exactly what is going to happen. I am not naive enough to expect that any of you will change your life plan now; but I do hope that in the happiness of remembering this day, sometime in your future, what I have just said may contrive to touch your conscience gently.

Finally, I hope you will all find yourselves becoming advocates for what you have experienced here—becoming, that is, promoters and supporters of education at all levels. It is none too early for you to accept a remarkable fact: already our society's future depends upon those younger than yourselves. It is too late to do much about you, all I can do is stick a last word or two in your ear, and you're gone. But you can decide to use some of your own unusual educational background in the interest of improving the opportunities for those who will follow you. The quality of American education has never been more urgently in need of help from those in the best position to know how to help it—and they turn out, my friends, to be you.

Most especially, I hope that there will be joy and vigor and commitment in your lives, and happy memories of this place. Because I am a firm believer in the sentimental marking of significant moments I close this farewell with the best testimonial to such remembrance I know of. It was said thirty years ago to another senior class by Adlai Stevenson, but it is independent of time or locale:

> "Your days are short here; this is the last of your springs. And now in the serenity and quiet of this lovely place, touch the depths of truth, feel the hem of Heaven. You will go away with old, good friends. And don't forget when you leave why you came."

Adlai Stevenson, What I Think, Harper Brothers, 1954.

Shultz. . .

continued from page 6

superiority over the Soviet Union, NATO's defense—which relies on the commitment of American strategic power—became much more complicated. Yet NATO conventional forces continue to be inadequate. Ironically, NATO's success in keeping the peace in Europe for more than three decades leads some to take peace for granted and to forget the crucial role NATO has played in guaranteeing it.

The unprecedented expansion of Soviet power over the past two decades cannot be ignored or rationalized away. Any President, any Administrator, would be forced to respond. We have seen too often that an imbalance of power is an invitation to conflict. Therefore, this Administration, and our allies, are committed to maintenance of the military balance, in Europe and globally. Surely the burden of proof is on those who would undo the present military balance, or alter it, or conduct risky experiments with unilateral concessions without genuinely reducing the levels of armaments on both sides.

At the same time, experience teaches that a balance of power, though necessary, is not sufficient. Our strength is a means to an end; it is the secure foundation for our effort to build a safer, more peaceful, and more hopeful world. On the basis of strength, the cohesion of our alliances, and a clear view of our own objectives, we must never be afraid to negotiate.

This is our attitude to arms control. As NATO decided in December 1979, for example, we intend to modernize our intermediate-range nuclear forces in Europe to counter the Soviet deployment of over 1,000 nuclear warheads on their new intermediate-range missiles (SS-20s). But we are also willing to eliminate this entire category of nuclear weapons from the face of the earth; and we are prepared, as an interim step, to reduce these forces to any equal, verifiable level.

If negotiations do not succeed, however, we must be prepared to deploy at the end of this year as decided in 1979. The Soviet Union has no higher priority goal at the moment than to intimidate NATO into canceling its deployments unilaterally, thereby leaving the Soviet Union with its massive monopoly of new missiles and warheads already in place. As the Summit partners made unanimously clear at Williamsburg, the Alliance cannot, and will not, permit this to happen.

At Williamsburg and at NATO, we saw an impressive consensus on security and arms control. This is a firm ground for confidence that war will be deterred, that stability will be maintained, and tht we will have a chance at least to reach reliable agreements making the world that you inherit a safer place.

Facing the Future

The final lesson I want to leave you with is this: Experience teaches us that nothing is foreordained. Nations, like individuals, have choices to make. History is filled with many examples of nations and individuals that made the wrong choices; there are also many examples of foresight, wisdom, and courage.

Democracies are sometimes slow to awaken to their challenges. But once they are aroused, no force on earth is more powerful than free peoples working together with clear purpose and determination.

Therefore, I have confidence in the future. You new graduates, with your energy, talent, and creativity, represent the promise of that future. Few others are so fortunate. Few others have such a responsibility.

And now, my congratulations to you, to your parents, and to Stanford, and my very best wishes to all of you.

Read criticizes narrow frontiers of secularist philosophy

Following is the text of baccalaureate sermon by Rev. David H.C. Read:

He brought me forth also into a large place: he delivered me, because he delighted in me."—II Samuel 22:20; II Samuel 22:1-7; 17-20; Matthew 7:13-20.

Here comes the sermon. A dictionary I consulted offers as one definition of preaching: "To give earnest advice as on religious or moral subjects and the like, and to do this in an obtrusive or tedious way." I shall try to keep in mind that the author of that definition may have sat through, as a captive graduate, a sermon like that. Years ago when a colleague of mine, graduating from seminary, had the temerity to ask his homiletics professor what he should preach about, he got the answer: "About God and about 20 minutes"—and that's the rule I am following today. Anyone who dares to speak in the name of God needs the authority of the Bible and has no right to be tedious, for the biblical view of religion and the challenge to the mind and heart of the Word of the living God is the most exciting and enriching theme in the world.

What *is* the biblical view of religion? I offer you these words from a psalm: "He brought me forth into a large place." The religion of the Old and New Testaments is so large that it embraces the whole human experience from birth through death. It speaks of a God who is not a concept to be discussed by those who have a taste for this kind of thing, but a living God who lights up the universe with his presence, a God who is inconceivably great, great enough to rule the utmost limits of space and time, and great enough to be concerned personally with creatures like you and me. According to Isaiah: "Thus saith the high and lofty One who inhabiteth eternity, whose name is holy: I dwell in the high and holy place, with him also that is of a contrite and humble spirit. . . ." And, in the inspired imagination of Jesus not a sparrow falls to the ground unnoticed by the Lord of heaven and earth, and the very hairs of your head are numbered. This God of the Bible is not locked up in a church or temple. He is not chiefly concerned about our religious rituals but with every aspect of living—our careers, our business, our intellectual, mystical, artistic, and sexual activities, our laws, our political judgments, our search for justice, and our expression of love and compassion. To reckon with this God is to be brought out from the narrow world of an atheistic philosophy into a large place—so large, in fact, that the Bible has no special word for what we call "religion" at all.

It must occur to you that all this is far from the way in which we have come to think about religion today. In our world religion has become an option, an elective that you may choose if it happens to be one of your interests. It is an avocation—you might even say a hobby. As some are drawn to photography, to ballet, to stamp-collecting, or to computers, so others get into religion. We think we know the type: we can smell them a far off. The nice ones are affectionately tolerated; the obnoxious ones we avoid like the plague. A few weeks ago I read an obituary of a well-known newspaper editor. "Under his guidance," I read, "the paper stepped up its reporting on religion and other specialized subjects." Yes, that's how we think: religion is a specialized subject.

Some today go even farther. They don't think it is even a legitimate option, especially in an academic community. A letter to the press from a university professor about a year ago complained that a Nobel prize for literature should not have been awarded to Isaac Singer on the sole ground that he believed in the supernatural. So Dante, Shakespeare, Milton, Wordsworth, T.S. Eliot, Auden, Updike, and a thousand others would have been ineligible because of their peculiar religious aberration. This new atheist fundamentalism would rule them all out.

Then there are others who keep their religion on a back-burner. They know it's there, but it's for future use in a time of emergency. Once in the summer of 1940 (if you can imagine such an era), I was in an uncomfortable position as chaplain to a division of the British Army that had been surrounded by the panzers of General Rommel. It was two weeks after Dunkirk, and we were hoping for a minor evacuation of our own. The day before we were due to embark there was one of these peculiar lulls in the fighting and I decided to conduct a short service. As I finished a young officer came over and said to me: Thanks, padre, I always say there's nothing like a spot of religion in a tight corner." I'm not scoffing at what we call fox-hole religion, and the remark was genuine, but it did sum up the attitude of those for whom religion is for tight corners only. The religion of the Bible is not a religion of last but of first resort. "In the beginning God. . . ." "Whither shall I go from thy spirit? or whither shall I flee from thy presence? If I ascend up into heaven, thou art there: If I make my bed in hell, behold, thou art there. If I take the wings of the morning, and dwell in the uttermost part of the sea, even there shall thy hand lead me, and thy right hand shall hold me." I am Alpha and Omega, the beginning and the end, the first and the last."

Rev. David H.C. Read

But it is not only the unbelievers and the half-believers who have pushed religion into a corner as a specialized interest. Thousands of devout church members today speak and act as though their God was a private possession confined to the area of their prayers and worship and isolated from their business, their profession, their recreations, their political opinions. How often do you hear the phrase: "Let's keep religion out of this."

Others again let their religion intrude into public affairs, but their God hardly seems to be the God who requires us "to do justly, and love mercy, and walk humbly" with him. He's the kind of God who can be let into, or kept out of our public schools by vote of Congress, a God who apparently doesn't exist in countries called "godless."

"I sometimes have wondered if God
Doesn't find it exceedingly odd
That the Moral Majority
Should have the authority
To control him at home and abroad."

Let's forget about religion as a specialized subject. Whenever I heard the words: "Attend the church of your choice" I have a picture of religions spread out on a shelf like a selection of tobaccos. There's a brand sold in Scotland that's called "Presbyterian Mixture." I'm not here to commend Presbyterian mixture to you as a religion you might enjoy. If religion really matters it's not something you choose. If god really is then we don't choose him. He chooses us. That's what we mean by his revelation. He reveals himself to us all, and it is for us to respond. There is no special category of people to be called religious. What makes human beings unique is our capacity to wonder about the meaning of our lives. If you have ever wondered why you were born, if you have ever wondered what happens when you die, you are religious. If there ever was a time when the meaning of life and the nearness of death are real and compelling questions, whatever age we are, it is now.

So I am commending to you the thought of religion as a "large place." St. Paul, in a prayer, speaks of the "breadth and length and depth, and height, of the love of Christ." These are the dimensions of any true religion.

There is *breadth* in that large place. If Dr. Gallup is right by the end of this century there may well be an almost unprecendented wave of spirituality rolling across this nation. If this happens it will, I believe, be not only because we are living under the nuclear sword of Damocles, but because people are tired of living within the narrow frontiers of a secularist philosophy and a technological society and are groping for the dimension of the spiritual. The signs are there on every hand. Whatever career is beckoning you at this moment—science, law, literature, public service, diplomacy, business, teaching, art—you will find people who are searching for that larger place, that dimension which gives meaning, purpose, and some measure of hope and joy. Whatever your religious convictions may be now, I hope you will join them in that quest seeking a faith that is at home in that large place in the spirit of the apostle Paul who said; "I do not reckon myself to have got hold of it yet. All I can say is this: forgetting what is behind me, and reaching out for that which lies ahead, I press toward the goal to win the prize which is God's call to the life above." The broad religion is not the shallow one but one that includes "all this and heaven too."

Then it has *length*. Keep that in mind in your religious quest. For it suggests that in our search we are more likely to find the truth in a religion that has deep roots in the long history of the human race. Your predecessors who boasted about being the "Now" generation were apt to reject anything that smacked of tradition to despise their religious roots, and to welcome any cult that was born yesterday. I believe that you realize that religion is not one of these subjects where the new is always better than the old. In astrophysics the latest authority makes the older obsolete, but that doesn't hold for ethics or religion. Plato and Kant are not made obsolete by the latest ethical school in Oxford or Heidelberg. Augustine and Luther are not made obsolete by the latest messianic cult or televangelist. The best place to begin a new search for religious truth is the tradition in which you were born.

Then surely a satisfying religion has the dimension of *depth*. We are living in a society where everything tends to come in neat little packages, and where we are encouraged to believe that there is a "How-to" answer to every problem. So we are being offered religion packaged to suit our immediate needs. When, for instance, I hear the Christian Gospel presented as if it could magically provide us with all the answers to the conundrums of this mysterious universe, I feel like saying like Hamlet to his friend: "There are more things in heaven and earth, Horatio, than are dreamt of in your philosophy." But it is not only popular religion that lives in the shallows. Don't we miss the sound from the depths in philosophies that reject the dimension of the spiritual, and in novels, plays, movies that glorify the trivial and snigger at the holy?

That word brings me to the last dimension of the "large place:" *height*. "Praise to the holiest in the heights" wrote John Newman, "and in the depths be praise." It's time we rescued the word "holy" from its pietistic associations. The holy is that which is the quality of God and cannot be defined. The holy is the element of transcendence, what Rudolf Otto called the "mysterium tremendum et fascinans (the tremendous and fascinating mystery.") We meet it in the world of nature, in music, architecture, and all the arts. Let me give you this from literature—a meditation of Thomas Traherne:

> "You never enjoy the world aright, till the sea itself floweth in your veins, till you are clothed with the heavens, and crowned with the stars: and perceive yourself to be the sole heir of the whole world, and more than so, because men are in it who are every one sole heirs as well as you. Till you can sing and rejoice and delight in God, as misers do in gold, and kings in sceptres you never enjoy the world."

It is that enjoyment to which I invite you as you face the adventure that lies before you now. May God lead you through the narrow gate of dedication and decision into the breadth and depth and length and height of the large place to which he calls us all.

Robert McAfee Brown views the struggle for human rights

Following is a homily by Robert McAfee Brown, former Stanford professor, at Memorial Service for the Victims of Human Rights Violations Resulting from U.S. Foreign Policy—June 12, 1983.

Let us use El Salvador as an example. Since 1979, the government forces in El Salvador have murdered over 42,000 of their own citizens. The victims are almost randomly slaughtered. They are any persons who are suspected—no proof required—of being in opposition to the government, and that includes students, workers, farmers, women, children, the elderly. If you live in a certain area where "rebels" are thought to be present, you are likely to be rounded up, tortured, raped, shot, strangled, mutilated.

We are talking about ordinary people, most of them desperately poor. We are talking about priests, nuns, lay workers, who have been trying to help the poor with such subversive devices as food kitchens, schools, and hospitals. We are talking about an archbishop, Oscar Ernulfo Romero, who was gunned down in the very act of saying mass, because he had become a champion of the poor and oppressed. Not a single murderer has been brought to trial during the entire period. As a result of this random terror, one-fifth of the nation have become refugees—in the United States that would mean 40 million refugees either hiding within our boundaries or seeking political asylum abroad.

You would think that our government would be in the forefront of protesting such policies. You would think that our government would long since have stopped giving any support to such a government. You would think that our government would be welcoming refugees from such indiscriminate slaughter.

But you would be wrong. Every six months our government endorses the human rights policies of the government of El Salvador, continuing to send U.S. *military* aid so that it can maintain itself in power. We now have 55 military advisers helping the government keep control, and have declared that keeping the so-called "rebels" out of power is crucial, since the reason for the unrest in El Salvador is communist-inspired.

I think there is a fairly simple answer to that. It was given by one of the peasants who is opposing his government, who said, "The Russians didn't have to come over here to persuade me that I had been oppressed all my life. I know it every morning my children and I wake up hungry, or one of my friends is tortured and killed."

The truth is that not only in El Salvador, but in many other countries—Guatemala, Chile, the Philippines, Korea, South Africa—we are financing dictators and maintaining them in power. And the victims are ordinary people—the powerless, the hungry, the despairing. They are not just victims, they are victims *of our policies*.

It is a reason for deep anger. And it is a reason for deep sorrow. We have chosen today to acknowledge the sorrow.

It is sorrow first of all *for the victims*, victims of repressive regimes that are kept in power by American dollars, American military expertise, American guns and tanks, American complicity.

So in addition to sorrow for the victims, we feel sorrow also for *the role our government has played* in their oppression and death:

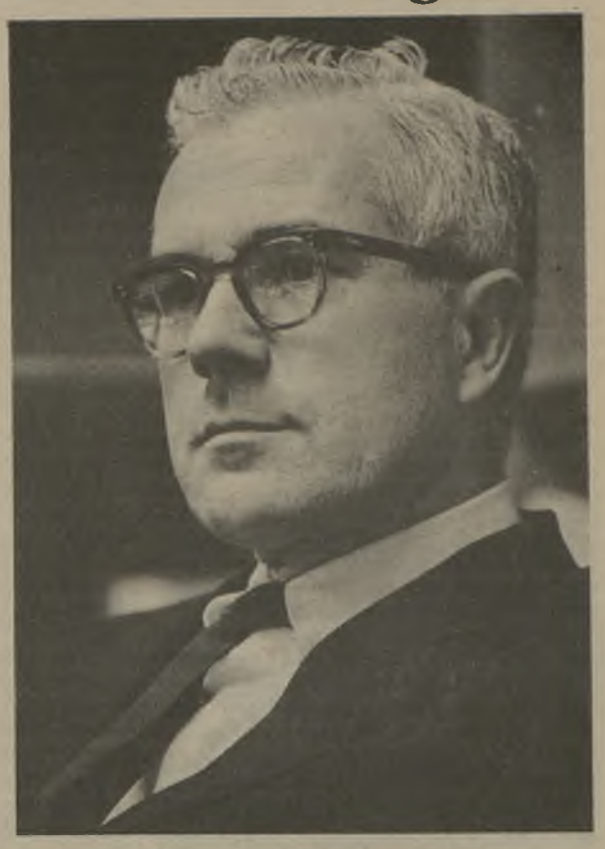
- Sorrow that rather than humanizing their policies, our leaders are now in the process of creating even tougher policies, in which a traditional hardliner like Thomas Enders is now perceived as too "soft," and as plans for a widespread American-inspired military offensive are refined;
- Sorrow that Vice-President Bush can go to the Philippines and hail General Marcos as a "champion of human rights," and President Reagan can go to Guatemala and claim Rios Montt as an ally in the human rights struggle;
- Sorrow that Ambassador Kirkpatrick can tell the world that the Catholic nuns and lay missionary murdered in El Salvador more or less got what they deserved;
- Sorrow that Secretary of State Shultz can admit to a Congressional committee that human rights in El Salvador need a lot of improvement and *still* agree to a six-month endorsement for more military aid;
- Sorrow that our State Department does not trust students on this very campus to hear both sides of the Chilean story, but denies a visa to the widow of Salvador Allende;
- Sorrow that rather than welcoming political refugees from El Salvador who seek asylum here, our Immigration Service, with the approval of the State Department, almost routinely ships them back to face danger and death if apprehended.

But in addition to sorrow for the victims and sorrow for our government's role in making them victims, we must also express *sorrow for ourselves*, since we too must shoulder blame. It would be too easy to say that the blood of the human rights violations stains only the hands of the President or the Secretary of State—no, it stains our hands as well, as long as we allow the present policies of our government to continue. So we must express sorrow for ourselves:

- Sorrow that we as a people have so far been unable to force major changes of policy upon our leaders;
- Sorrow that we do not give more support to those courageous members of Congress who are trying to force those changes;
- Sorrow that we have forgotten our own heritage, born of revolution, and deny its applicability to those today who seek deliverance from the shackles of tyranny;
- Sorrow that among peoples fighting today for their own freedom, the name of our nation symbolizes opposition to their deepest desires and most cherished dreams.

Where do we go with sorrow? We can be engulfed by it. We can be immobilized by it. We can be embittered by it. We can even be destroyed by it. But there is a different choice we must make. We must be *transformed* by it. Let me suggest, to conclude, some of the directions of that transformation:

1. Let us learn first from the victims themselves and those closest to them. If you live today among the victims in El Salvador, or South Africa, or the Philippines, or wherever, you find that they have an amazing and quite unexpected *hope*. They believe in the righteousness of their cause; they believe, nay, they know, that it will prevail, and that not even the power of the United States on the side of the tyrants will suffice to keep the tyrants in power forever.



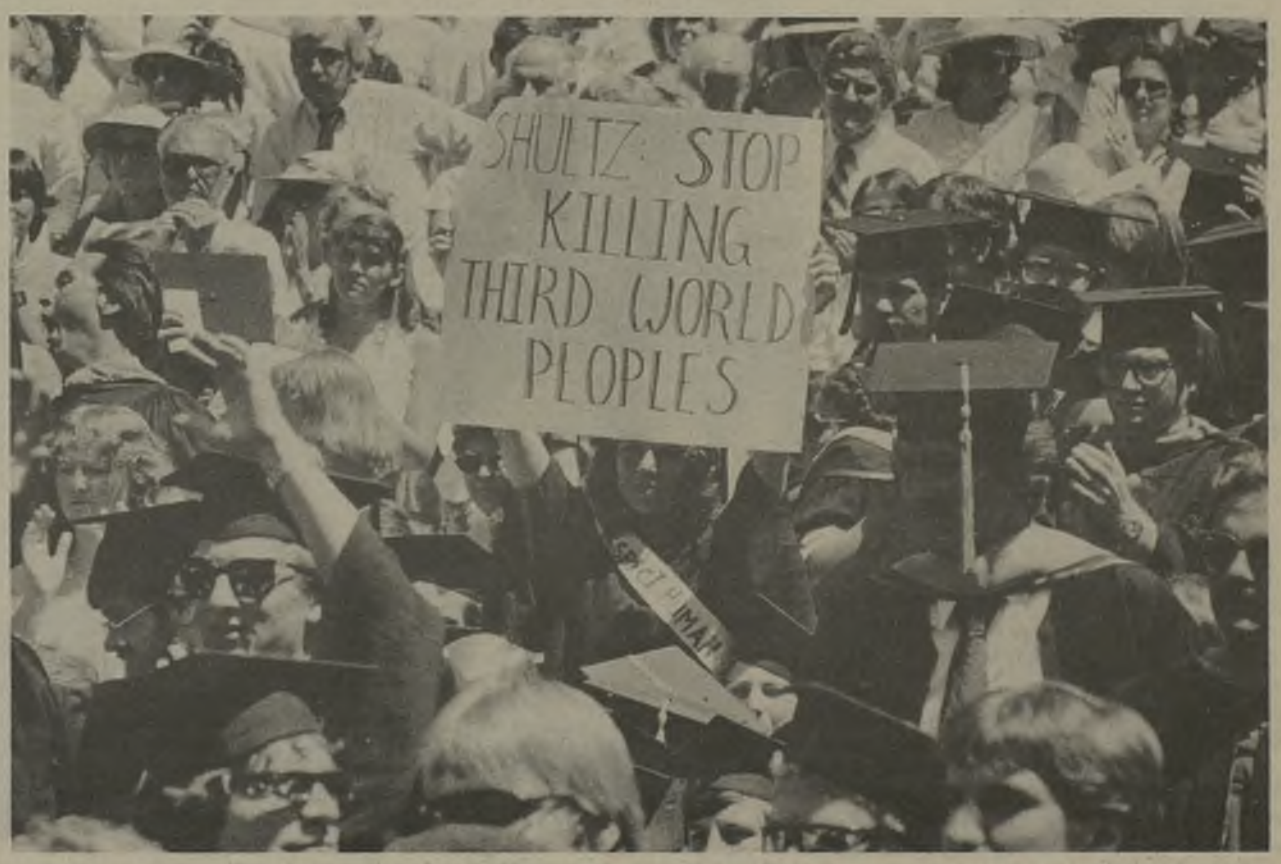
They see a vision of a better world for their own children that was unavailable to their own parents, and they are willing to struggle and suffer and even die for it. So while there is sorrow—who can fail to mourn any human death?—there is also hope. Let us allow that hope to rub off on us, and inspire us to keep the present policies of our government under constant challenge, so that the hope of others need not be so long deferred.

2. Let us embrace *the wider vision of human rights* to which the present victims are dedicated. For them the struggle is not just for the human right to protest, or to engage in public assembly without being gunned down—important as such rights are. No, for them human rights include the right to a job, the right to an education, the right to medical care, the right to shelter.

In our nation those are still privileges—you can have them if you can pay for them. But let us realize that those must be rights available to all, particularly to those who cannot afford to pay for them, whether they live in San Salvador or Managua or Manila—or East Palo Alto, for our foreign policy creates domestic victims as well.

3. And finally, let us find *a deeper rootage for our own hope*, so that we can struggle more effectively. In the Jewish story, there was a time of being oppressed by a ruthless tyrant called Pharaoh, a time of no hope. And in the Christian story, there was a time of being oppressed by a ruthless tyrant call Caesar (with local flunkies named Herod and Pilate) a time of no hope. In both stories, therefore, it seemed that sorrow had had the last word. But in both stories sorrow was not the last word.

In the Jewish story, the subversive word of the Lord came to Pharaoh, "Let my people go," and full of a faith that God was a liberator rather than an oppressor, the Israelites escaped from the bondage of fear and began their ongoing struggle for liberation.



Robert McAfee Brown

In the Christian story, the subversive word of the Lord came to Caesar through Jesus, that not even a political execution could destroy Jesus or his mission, and full of a faith that God was a liberator rather than an oppressor, the Christians escaped from the bondage of fear and began their ongoing struggle for liberation.

That ongoing struggle for liberation is being carried on today by the poor, the marginated, the "wretched of the earth." Along with Archbishop Romero, they and we can believe that God is an energizing power to bring freedom to the captives, liberation to the oppressed, and a day of great jubilation.

So we mourn, yes, for all those who have died. But we pledge, also, that their deaths will become for us a constant reminder that the killing must stop, and that we, who have given such aid to the killer, must exert our influence to change those policies that lead to death, and direct them toward those that enhance life. Amen.

Barbour addresses crowd at Medical School convocation

Allen Barbour

Physicians must understand and treat the complete person, and not be concerned only with a specific disease, in order to be effective in their role as healers, cautioned the keynote speaker at Stanford University School of Medicine's convocation ceremony Sunday, June 12.

"In medicine, we are students of the natural system known as human illness in which human elements play a major role. Unlike other scientists, however, we often ignore the most important causes in the very system we are supposed to be studying," said Dr. Allen Barbour, emeritus professor of clinical medicine and associate university ombudsman.

Physicians, he urged, must strive to understand the "human condition"—the underlying factors contributing to the patient's state of health—in addition to diagnosing the specific symptoms in order to determine the most effective treatment.

"The technology in medicine is the disease or medical model: every illness is reduced to a disordered part, labeled, and fixed," Barbour elaborated. "The result is that we rely almost exclusively on diagnoses and treatments to solve problems.

"Unfortunately, only about one-third of all our patients have illnesses that begin and remain mainly at the physical level and can be cured by technology. The other two-thirds have illnesses strongly charged with human problems, problems of living, problems of the human condition—what I call human illnesses."

Physicians must collaborate with the patient, and serve as healer, educator, and therapist, Barbour said. By relying only on technology to seek a cure, he said, physicians "inadvertently block the healing process, because when human elements are important in an illness, healing inevitably involves what the patient can and must do for him or herself."

It takes "some change in attitude, behavior, or a more positive solution to the problem than holding it all in just as it is and being sick."

Barbour pointed out that he does not discount the necessity of treating disease. "The treatment of disease is obviously the most important thing we do," he said. "But in many situations, what is most needed is our sensitivity to the human condition, and our confidence in the capacity of this person who is now our patient, to surmount the illness in any way possible. These provide the spark which fire the healing process."

Barbour spoke to the 91 graduates receiving their medical degrees, in addition to those receiving bachelor's degrees in basic medical sciences and medical microbiology; master's degrees in genetics, medical microbiology, medical sciences, physical therapy, and physiology; and doctorate degrees in biochemistry, cancer biology, hearing and speech sciences, medical microbiology, neurosciences, pharmacology, physiology, and structural biology.

Nineteen of the medical graduates plan to stay at Stanford for their internships. More than half plan to intern at university hospitals. About half the graduates were appointed to their first hospital choice through the internship matching process, while more than three-quarters of the graduating class received one of their top three hospital choices.

Malcolm Bagshaw

Bagshaw named Avery Professor

Dr. Malcolm Bagshaw, chairman of the department of radiology and leading authority on the use of radiation therapy for prostatic cancer, has been named the first holder of the Catharine and Howard Avery Professorship.

The Stanford University Board of Trustees approved the new endowed professorship and named Bagshaw the first recipient at its regular meeting Friday, June 10.

Bagshaw, who has served on the Stanford faculty since 1956, has played a key role in developing clinical uses of the medical linear accelerator, which has had

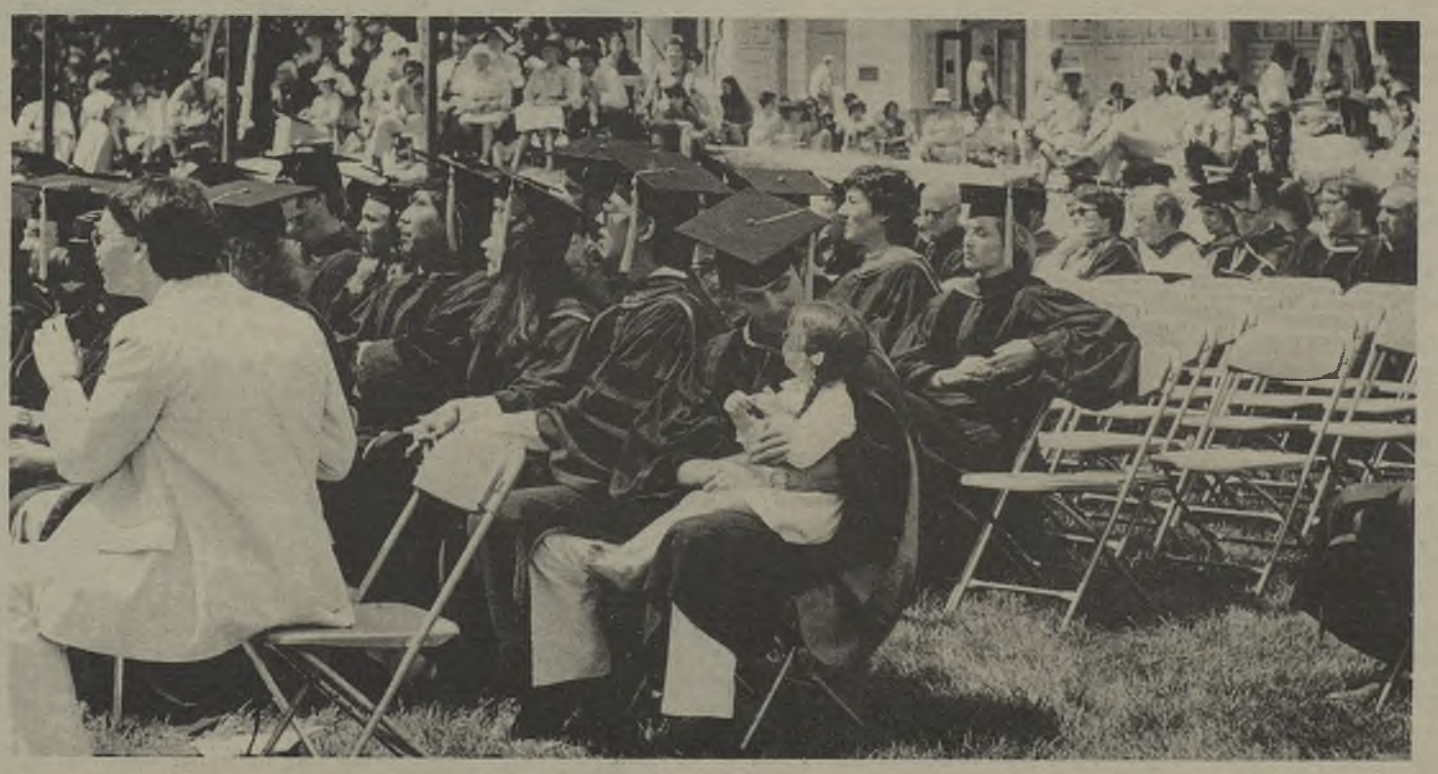
Faculty and students honored with special awards

Faculty and students alike were honored at the Medical School convocation ceremony Sunday, June 12.

The Henry J. Kaiser Family Foundation Award for Outstanding and Innovative Contributions to Medical Education was awarded to Drs. Ron Merrell, assistant professor of surgery, and David Stevenson, assistant professor of pediatrics.

Merrell had received the Henry J. Kaiser Award for Excellence in Teaching in 1982.



Four faculty members received the Henry J. Kaiser Foundation Award for Excellence in Teaching on Sunday. Drs. Peter Sargent, assistant professor of structural biology, and John Dolph, lecturer in structural biology, received the award for preclinical teaching. Drs. Charlotte Jacobs and Kelley Skeff, both assistant professors of medicine, received the award for clinical teaching.

Dr. Mark Perlroth, professor of clinical medicine, received the Arthur L. Bloomfield Award in Recognition of Excellence in the Teaching of Clinical Medicine. Perlroth heads up the housestaff program for the department of medicine also.

The Lucille Daniels Recognition Award for Outstanding Contribution to Physical Therapy at Stanford was presented to Dr. John Medeiros, acting director of the physical therapy program.

For the first time, seven graduating students were presented with Medical Student Research Honors Awards. They were Drs. Edward Robert Baer, Alan Michael Garber, Susan Jacobson, Amelia Genevieve Laws, Gary Steven Richardson, Audrey Christine Shafer, and Don Shigeo Yokoyama.

Dean Dominick Purpura presented a special award to graduating student Dr. Laura Jean Esserman for her contributions to the medical school play, *The Hypocritic Oaf*.

A FAMILY AFFAIR—As in the case of graduate Stephen Leibovic, who took time out to talk to his little niece (and favorite fan), the convocation ceremony was touched with many personal moments. *Convocation stories and photos by Shirley Kraus.*

NIH grant to help steer young M.D.s towards academia

A training grant renewal from the National Institutes of Health for approximately $900,000 over five years has been awarded to Dr. Eugene Robin, professor of medicine and physiology at Stanford University School of Medicine.

The grant, by encompassing some new features, will allow an expansion of the

Eugene Robin

pulmonary training program. Designed by Robin, who has overseen the program for several years, the new approach is hoped to attract more aspiring and fledgling M.D.s to the research labs.

"Many fewer young physicians are entering academia and biomedical research today than as recently as five years ago," Robin said, adding that this is observed particularly in clinical areas, and even more specifically in certain high-technology areas where there is now a substantial oversupply of clinicians.

The reasons for this phenomenon and how to overcome it have become the focus of much of Robin's attention.

"The progressive decline of M.D. academicians is a widely recognized, national problem," he said. "But it is particularly pertinent at a place like Stanford, which—with remarkable academic resources—is equipped to be in the forefront of research and teaching."

Moreover, he added, there is little need for Stanford to train pulmonary clinical specialists, of whom there is an abundance, and who are now needed "probably only on a replacement basis."

Until about five years ago, Robin said, 80 to 90 percent of young physicians trained in the pulmonary division under the now 21-year-old NIH grant went on to pursue careers in research. But of the latest group of trainees, only 30 percent went that route.

"The reasons are varied," he remarked. "There are changing values which view the independence of a clinician's life as happier than the stresses of an academic life. A career in research is very demanding. Economic factors probably play a role too."

The program revisions involve a two-pronged approach which recognizes that medical education must be flexible enough to meet new challenges as they arise.

First, the program will offer a new form of training to medical students—a marriage of their clinical and basic science preparation. "Under the conventional method, bench research is divorced from the student's clinical training," explained Robin. "We want to connect the two, to show the connections more clearly.

"Our students will be trained under the same circumstances in which they'll work in clinical departments," he added. The hope here, he said, is to make an impact on students while they're still at an early, formative stage in their training, before they become M.D.s.

"I'm not saying Stanford shouldn't emphasize the teaching of clinical medicine," said Robin. "However, we should be turning out students who are trained to think critically and know how to apply the best in medical science to patient care."

Two medical students, Mark Morin and Jesse Dodd, have already taken part in a trial of this approach, he said. The time spent in the training program is not a part of the regular studies leading to an M.D. degree, and is not eligible for credit towards the degree. However, these students have the opportunity to take a graduate degree, either M.S. or Ph.D., in physiology.

The second feature of Robin's plan involves young physicians who have finished their clinical training as pulmonary specialists, and who will be offered two years of further academic pursuit. "We've seen some people become interested at this stage, when they see that a purely clinical life is not enough to satisfy them," he said.

"The goal is to have 100 percent of the trainees under this program wind up in academic life. Of course with the medical students, this may not and need not be in the pulmonary field."

Robin said for the upcoming year there is still room for two medical students and three M.D.s under the new program.

The grant renewal, which takes effect July 1, also includes conventional training of pre- and postdoctoral Ph.D. candidates, and postdoctoral M.D.s without prior pulmonary training. The latter group will now also be offered research experience following clinical training in the pulmonary field.

"Hopefully, the more trainees we expose to the rewards of academia, the more will choose it as the base for their careers," Robin said.

Robin is acting chairman of the physiology department. The research basis of the training program involves the cellular pathophysiology of respiratory failure, and lung structure and function. Training is offered in molecular genetics and in heart-lung transplantation physiology, as well.

The intent is to meet the needs of trainees from many different backgrounds, by including contributions from Stanford faculty cellular physiologists, biochemists, pathologists, cardiovascular surgeons, clinical pharmacologists, infectious disease specialists, psychiatrists, and pulmonary disease specialists.

The training faculty, besides Robin, includes Drs. Lawrence Simon, James Theodore, Kay Ptashne, and Antonius Van Kessel.

"The idea is to use our new training program as a model for responding to a national problem," Robin concluded. "It may represent the type of innovative role that academic medical centers can assume in training the scientists of the future."

—Lisa Ames

AIDS victims susceptible to lethal form of toxoplasmosis

A common parasite that lingers harmlessly in humans has joined a list of maladies which turn deadly in persons suffering from Acquired Immune Deficiency Syndrome (AIDS), scientists say.

About 60 cases of acute toxoplasmic encephalitis, a potentially fatal brain disease, have been found to be caused by the parasite Toxoplasma gondii since July 1981, "and our research shows that this occurred in patients suffering from AIDS," said Dr. Benjamin Luft, a medical instructor at Stanford and a research scientist at the Research Institute at the Palo Alto Medical Foundation (PAMF).

Luft and two colleagues—Dr. Jack Remington, professor of infectious diseases at Stanford and director of the department of immunology and infectious diseases at PAMF; and Dr. Frances Conley, professor of neurosurgery at Stanford—published findings linking toxoplasmosis and AIDS in the April 9, 1983 *Lancet*, a British medical publication.

The article details 10 of the 60 cases of central nervous system toxoplasmosis (encephalitis) that have occurred throughout the United States and Western Europe. It focuses mainly on the linkage of toxoplasmosis to encephalitis and an "epidemic" increase in toxplasmic encephalitis in the past two years. Acquired immunodeficiency contributed to to the difficulty in making the toxoplasmosis diagnoses, the authors said.

Luft said in an interview this month that "there is extremely strong evidence that all of these patients suffered from AIDS."

Remington (left) and Luft discuss their findings on toxoplasmic encephalitis and AIDS.

photo courtesy PAMF.

About 1,500 cases of AIDS, which destroys the body's immune system, have been reported since the condition was identified in 1979. There is no known cure and about 75 percent of its victims have died within two years. Nine of the 10 patients cited in the *Lancet* article have died, Luft said.

Common AIDS killers include a form of pneumonia and rare cancers such as Kaposi's Sarcoma, in addition to other conditions such as the toxoplasmic encephalitis documented in the *Lancet* article.

AIDS has become widely known as an affliction of homosexuals and drug abusers, but it also is found among heterosexual, non-drug-user Haitians, hemophiliacs, and it has occurred among heterosexual Americans. Many authorities on infectious disease fear that AIDS could spread to the general population. Epidemiologists report that the number of cases is doubling about every six months.

Remington said the study of AIDS could help "lead us to an understanding of infectious agents that can cause cancer. The immune system is the key."

Most researchers now believe that AIDS is caused by some type of infection that causes the body's immune system to fail by drastically reducing the number of protective T-cells or lymphocytes in the blood. Then a second infection can move in with devastating results, Remington and Luft explained.

They believe that toxoplasmosis is one of those secondary infections. Laboratory studies and analysis of human blood tests have demonstrated that certain infections can disrupt the body's immune system, but no single infection has yet been identified as the trigger of AIDS.

Toxoplasmosis is present in about 50 percent of the U.S. population, Remington said, but the immune system keeps it dormant and under control in most healthy persons. It is spread through undercooked meats, unwashed vegetables, soil and cat feces. Symptoms are usually totally absent or are similar to a mild case of flu, he said.

The ailment usually becomes dangerous only when a woman becomes infected during pregnancy, risking transmission of the disease—and the likelihood of birth defects—on to the

Easing kids' fears about hospitals

Orthopedically handicapped children at Loma Vista Elementary School in Palo Alto listen raptly as play therapist Betty Lovelace describes what it's like to enter Stanford Hospital. Lovelace and her colleagues in pediatrics visit local schools, on request, with their unique hospital orientation slide show and demonstration. They also serve as special friends to children while they're hospitalized.

For a closer view of the recreation therapy program at SUH, look for a special feature by writer Shirley Kraus in an upcoming issue of **Campus Report.**

Five young Medical School scientists receive biomedical research grants

The genetics of immune diseases, oxygen boosters for the blood, and the ways certain chemicals are linked to cancer of the larynx are among the newly funded research topics to be explored by five young scientists at the Stanford University School of Medicine.

Each researcher was awarded a $5,000 allocation in May from the Biomedical Research Support Grant, provided twice each year by the National Institutes of Health, and administered by a Stanford faculty committee.

The grant is designed to help young scientists establish research programs in areas of basic and clinical research.

The five assistant professors awarded one-year grants are: Drs. Mark Davis (medical microbiology), Martin Hopp (otolaryngology/surgery), Susan Perrine (pediatrics), J.H. Pate Skene (neurobiology), and Michael Weinrich (neurology).

Davis will use his grant to explore the ways certain severe immune diseases present from birth may arise from a specific deletion in the genetic code of a developing embryo.

Scientists know that human illnesses such as severe combined immunodeficiency disease or Wiskott-Aldrich syndrome have a genetic component, but until now, no one has been able to determine exactly which genes are responsible for the illnesses, Davis said.

Hemoglobin F, a special variety of the oxygen carrying component of blood, is the research focus of **Perrine**. Normally, Hemoglobin F is produced primarily before birth, to be replaced by Hemoglobin A in the growing child and adult. Many diseases of the red blood cell, such as sickle cell anemia, might be ameliorated if Hemoglobin F production could be "switched on" again after birth, Perrine said.

She is investigating the way 5-Azacytidine, a drug used to fight cancer, coincidentally activates some genes that are normally suppressed, and leads to a boost in Hemoglobin F.

Hopp is using chemical tools to probe cells of the larynx in his efforts to better understand how a cancer-causing agent is activated inside the cell. Though larynx cancer is strongly correlated with heavy smoking and drinking habits and occupational exposure to certain hazards, the chemicals themselves are not carcinogenic, said Hopp, but must be broken down by enzymes in the cell to trigger cancer.

Susceptibility to larynx cancer in some individuals may be linked to elevated levels of such enzymes, said Hopp.

Weinrich is studying vestibulospinal reflexes in primates—the network of neurons that enable animals (and humans) to use information from the outside world to maintain posture and balance in a moving world.

Skene is investigating the genes that seem to regulate the growth and regeneration of some nerve cells.

Toxoplasmosis deadly in AIDS sufferers. . .

continued from page 11

unborn child. Toxoplasmosis also becomes dangerous when immunosuppressive drugs are given to persons, such as organ transplant or selected cancer patients.

Luft said the experience at Stanford and Palo Alto Medical Research Foundation has led to the following indications regarding the AIDS-toxoplasmosis link:

• Central nervous system toxoplasmosis can frequently be cured if it is pinpointed and proper drug treatment (with antibiotics) is conducted early. "This is tricky," said Remington, "because cortisone, often used for encephalitis treatment, is not effective and is even harmful when the condition is caused by toxoplasmosis. With the nationwide outbreak of AIDS, it is imperative that physicians be alert to this potential link and the appropriate treatment."

In addition, the symptoms can be quite varied, including such problems as chronic headaches, confusion or seizures. This variability underscores the need for physician alertness and the use of laboratory tests in diagnosis, Remington said.

• Luft said that before the most recent outbreaks, only about 10 cases of toxoplasmic encephalitis in adults had been reported in the past 40 years. (Those cases did not include medically immunosuppressed patients, he said.)

• The 60 patients represent a wide variety of lifestyles, indicating that the AIDS epidemic is not confined to select groups or caused by specific behavior patterns. Among the 10 persons reported in the *Lancet* article, only two had homosexual histories.

"This does *not* mean that the disease has already spread to the general population," said Remington. "What it does mean is that AIDS has the potential to affect a wide variety of persons."

Nevertheless, the link to the homosexual, Haitian, and drug-abuse communities appears valid. One patient described in the article, for example, was not identified with any of the three risk groups but had received a blood transfusion in Haiti following a motor vehicle accident.

• Evidence repeatedly points to the Haitian population as a center of the disease. "It appears," said Luft, "that the disease is endemic in that Caribbean nation. I'm not sure what the significance is except that it is an appropriate area to study the disease and look perhaps for causes—and this is being done."

—**Mike Goodkind**

Appreciation day

The fourth annual Appreciation Day for Referring Physicians is scheduled for June 18 at the Medical School.

Sponsored by the department of medicine, the program offers continuing education sessions focusing on new aspects of clinical practice and areas of tertiary care. About 150 physicians are expected to attend.

"This event affords us a special opportunity to thank our referring physicians and to become increasingly familiar with their needs," said Dr. Kenneth Melmon, chairman of the department.

Participation is by invitation only. The day will conclude with a wine and cheese reception for faculty and referring physicians.

Gonda awardee reflects on his long service to SUH

Today may be just Wednesday for most of us, but for Bill Ferguson, associate project manager in Operations and Maintenance, it is June 15, the day that marks his 24th year at Stanford University Hospital.

And Ferguson, or "Fergie" as his coworkers call him, has only the best things to say about his many years here. "I've enjoyed working at Stanford. As long as you do your work, you can stay as long as you want."

Ferguson "does his work" and then some.

As a project manager, he works with contractors hired to perform maintenance or building tasks in the hospital. And while he said the actual negotiations with contractors aren't difficult, when he begins a project he sometimes finds more than he'd bargained for.

"There are decisions to be made sometimes with the unknown—you could open a wall and find out you've got plumbing in there you didn't know about." Then he must quickly arrange for more preparations before the contractor's work can begin. Luckily, "I work closely enough with them so that if they *do* have to put in 'stand-by' time, they understand."

Ferguson has developed a reputation for this ability to work well with contractors, as well as the many electricians, plumbers and other maintenance and building professionals in the department. Earlier this month he received the Thomas A. Gonda award as Outstanding Hospital Employee of the Year at the 25th annual service awards banquet, in recognition of his quality work and professional rapport.

"It was a complete surprise," he said, pointing with bashful pride at the honorary plaque he was given.

Ron Just, director of operations and maintenance, was one of several people who nominated Ferguson for the award. He spoke of Ferguson's "thoroughness and resourcefulness. When something comes up, he doesn't complain, he *acts*." Just also noted his sense of commitment, exemplified by readiness to work extra hours.

He once came from his home in Burlingame on Thanksgiving to check the progress of a renovation project because, as Ferguson pointed out, modifications cannot always be done during regular business hours, particularly in a hospital environment.

Ferguson at the scene of the Hoover Pavilion Lobby, where he has just begun supervising renovation. photo by Ed Souza

"A hospital is not a place for an engineer to just sit in a boiler room waiting for a call to come in. You've got to really get out and hustle." ***—Bill Ferguson***

"When I'm on a project, no matter if it's the middle of the night, I'll come down. That's just part of my job. If something goes wrong, I'm here to correct it, and if there's a decision to be made, I make it," he explained.

Ferguson, who came to Stanford as an electrician from the Southern Pacific Company, has witnessed events in his 24 years here that have called for more than usual dedication.

In 1968 when the first heart transplant took place, he was instrumental in getting the necessary electrical power for the 150 reporters who attended the hospital's three weeks of press briefings after the landmark operation.

Then in 1971, an outside group staged a sit-in and took over the hospital administration office for four days after the firing of a black employee. The protesters caused extensive damage to the area when they fought back the riot squad who fired tear gas into the offices. "They turned hoses on and shot all the tear gas back at the riot squad. They absolutely demolished that place," Ferguson said.

His department, of course, was directly involved in the cleanup and renovation of the ruined offices. In that case, Ferguson said he didn't go home for three days.

When he does go home, though, he doesn't slow the pace. He works in his yard and does all his own home main-

Construction Corner

Research Animal Facility I:

According to a report from the University Facilities Project Office, construction of the Research Animal Facility I is scheduled to begin the last week of July or first week of August. Construction is expected to take approximately a year.

To minimize the impact of vibrations on the sensitive research operations within the Sherman Fairchild Research Building, a special consultant has been retained and particular directions have been given to the architect and the construction manager. Generally, all vibration-causing activities are to be scheduled before 1 p.m. Also, a bi-weekly schedule pertaining to vibration-causing construction will be developed by the contractor and furnished to those affected.

Between now and July another access road will be built from Campus Drive into the east side of the medical center parking lot; that is, Via Ortega is to be extended across Campus Drive into the parking lot. The reason for this is that the Jordan Way entrance will be blocked by the construction fence and eventually by RAF-I.

Some utility lines presently under the parking lot must be relocated before July. There will be scheduled utility shut-offs, and as much advance notice as possible will be given to those affected.

At the Hemodialysis Center there is no planned disruption of utilities, but the access ramp from the parking lot will have to be replaced before the present one is fenced in. This is being coordinated.

All construction traffic will go from Campus Drive, south. Except for this portion of Campus Drive, streets around the medical center should not be noticeably affected.

At Fairchild there will be no direct access from the parking lot to the auditorium or main entrance to the research building, but the ramp to the service entrance below grade will be maintained. Emergency exits from the auditorium will also be maintained. Deliveries of chairs, etc., for the auditorium can be accommodated along the south face of the medical school, and appropriate personnel are being informed.

Electrical Upgrade in Operating Room Suite:

Work is under way to provide additional electrical power to each of the main center's 14 operating rooms. In order to provide for the normal scheduling of cases, the contractor is performing the work during the night hours and on weekends.

Dave Dominguez, construction coordinator, and Wells Hoeltje, project manager, are overseeing the project.

Wood's lab—730 Welch Road:

Renovation of a laboratory area at 730 Welch Road has begun. The area will provide an office and lab for Dr. Peter Wood, deputy director of the Stanford Heart Disease Prevention Program. In addition, the renovation will make the building accessible to the handicapped.

The project was designed by Jennifer Wagstaff, Facilities architectural planner, and Erik Lund, project manager.

Medical Center Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, JUNE 15

Div. of Orthopedic Surgery C. Howard Hatcher Memorial Visiting Professorship lecture: "Sublaminar Wiring as an Adjunct to Scoliosis Surgery"—Dr. John Hall (professor of orthopedic surgery at Harvard, and president of Boston Children's Medical Center medical staff). 8 a.m., M114.

Div. of Hematology Wednesday noon conference: "The Hickman catheter: Problems and Perspectives"—Dr. Robert Carlson, oncology fellow. 12 noon, **S102**.

Dept. of Clinical Social Work and the American Cancer Society: "I Can Cope"—a program for cancer patients and their families. 5:30 to 7:30 p.m., TF-122c. To register, call 497-5091.

Hematology Support Group: A meeting for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

Medical Center Auxiliary Volunteer Orientation: 9:45 a.m., W001. For further information, call the Auxiliary office at 497-6636.

JUNE 15 through JUNE 17

Departments of Pediatrics, Obstetrics, and Dietetics: "Nutritional Care of High Risk Obstetrical Patient and High Risk Infant." 7:30 a.m. to 8 p.m., Fairchild Auditorium. For further information, call 497-5711. *Find details in this issue.*

THURSDAY, JUNE 16

Dept. of Medicine grand rounds: "Case Presentations in Hepatitis B—Prevention, Prophylaxis, and Treatment"—Dr. Gabriel Garcia. 8:30 a.m., Fairchild Auditorium.

FRIDAY, JUNE 17

Dept. of Gynecology and Obstetrics grand rounds: "Women's Health and Maternity Care in China"—Susan Leibel, R.N., C.N.M. (UCSF). 8 a.m., A336.

Dept. of Pediatrics grand rounds: "Hormones in Milk"—Dr. Otakar Koldovsky (professor of pediatrics and head of physiology, Perinatal and Nutritional Sciences, University of Arizona). 8 a.m., Fairchild Auditorium.

SATURDAY, JUNE 18

Dept. of Medicine Appreciation Day for Referring Physicians. 7 a.m. to 5 p.m., M classrooms, medical school. For further information, call 497-5453. *Find details in this issue.*

JUNE 20 through JUNE 22

"Small Beginnings"—an overview of nursing care in the Intensive Care Nursery. Sponsored by nursing staffs of ICN, extended care nursery and intermediate intensive care nursery. 9 a.m. to 5 p.m. each day, located outside the hospital cafeteria. *Find details in this issue.*

JUNE 20 through JUNE 23

Dept. of Pharmacology Second International Symposium on the Biochemical Basis of Drug Action. To be held at Fairchild Auditorium. A fee will be charged. For further information or to register, call 497-6834.

TUESDAY, JUNE 21

Depts. of Gynecology/Obstetrics and Psychiatry special conference: "Neuroendocrine and Psychological Perspective of Pregnancy." Speakers will include Drs. Paul Mascovich and Arthur Coleman. 11:30 a.m. to 1 p.m., M106.

WEDNESDAY, JUNE 22

Div. of Hematology Wednesday noon conference: topic to be announced. Speaker: Dr. Joseph Miletich (Washington University School of Medicine, St. Louis). 12 noon, **S102**.

SATURDAY, JUNE 25

Eating Disorders conference: sponsored by the Dept. of Psychiatry and Behavioral Sciences. A one-day conference to inform parents and the community about modern treatments for obesity, bulimia, and anorexia nervosa. The public is invited, and a fee is charged. 9:30 a.m. to 4 p.m., M104. For further information or to register, call 497-7871.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear.

Eugene Farber

Reminiscing at School reception

"I remember seeing patients in the dermatology clinic where we had four or five patients in an entire afternoon for six to 10 medical students," Dr. Eugene Farber said at the first annual Medical School reception for long-service employees, held June 2.

Farber, chairman of the department of dermatology, described the steady increase of patients over the years since the school's move from San Francisco. "They come from all over the world, including some from Salinas," he joked, remarking as well on many of the changes resulting from that growth.

The reception, which about 100 employees and their guests attended, commended those who have served the medical center for at least five years. Dr. Dominick Purpura, dean of the medical school, presented specially-designed certificates to those with 20 or more years of service.

Others honoring employees at the reception included Dr. Lawrence Crowley, vice president for medical affairs; David Mendelow, associate dean, administration; Donald Tower, executive director for the Faculty Practice Program; and Rosemary Hornby, manager of the Human Resources Group.

Feeding high-risk moms and babies

A conference on the nutritional care of high-risk obstetrical patients and high-risk infants is being held in Fairchild Auditorium and some M classrooms of Stanford Medical Center today through Friday, June 17.

The conference is oriented to nutritionists, nurses, obstetricians, pharmacists, neonatologists and other physicians who are involved in the care of these patients.

Both theoretical and practical points will be raised through the use of lectures, round tables, and workshops.

Sponsored by the departments of pediatrics, obstetrics and gynecology, and dietetics, the program will include such topics as "New and Future Issues in Perinatal Nutrition," "Severe Preeclampsia: The Highest Risk Pregnancy," "Specific Nutritional Deficiencies and Excesses; Impact on Pregnancy Course and Outcome," "Exercise During Pregnancy," "Ethical Dilemmas in Perinatology," "The Continuing Conundrum of Kernicterus," and many more.

The faculty includes many Stanford physicians and other professionals involved with these issues, as well as several knowledgeable guest speakers from around the country. The program directors are Dr. Philip Sunshine, professor of pediatrics and director of newborn nurseries at SUH; and Dr. John Kerner, Jr., director of pediatric gastroenterology.

A fee is charged, and continuing education credit is available. For further details on the conference and enrollment information, call 497-5711.

"Preemie" fair

"Small Beginnings" is the title of an information fair on the care of premature infants, to be held June 20-22, said Penny Rau, B.S.N., staff nurse in the neonatal intensive care nursery (ICN).

Nurses from the ICN, extended care nursery (previously called Romper Room), and the intermediate intensive care nursery will staff the event.

Also described will be adaptation of the nursery environment to meet the needs of the very tiny baby, new advances in eye care and surgical treatment of "preemies," and the process of helping parents assume an active role in their child's care.

The fair will run from 9 a.m. to 5 p.m. each day, and will be located outside the hospital cafeteria.

Building for the Future

HOSPITAL MODERNIZATION

A contract has been signed with the firm of Morse/Diesel Inc. for construction management services with the Hospital modernization.

Dr. Lawrence Crowley, vice president for medical affairs and SUH president, and Donald Piser, president of Morse/Diesel, signed the contract at a ceremony at SUH last week.

Construction costs for the modernization work are estimated at $66.5 million, which includes construction management services.

The design development phase of modernization planning began last week. During this stage of design, the 20 departments and services affected by remodeling and construction are working with architects to develop detailed large scale drawings of their new areas.

Department representatives and architects from The NBBJ Group are compiling detailed information about equipment needs also.

The design development phase is expected to be completed by fall. Then technical construction drawings will be prepared by the architects.

News Notes...News Notes...

Spotlight on. . .

Four medical center physicians were commended for special service by the Santa Clara County Medical Society recently.

Dr. Frederick Armstrong, *clinical professor of medicine, was honored for his "outstanding contribution to the medical society."*

Dr. James McCort, *clinical professor emeritus of radiology, was awarded for his "outstanding contribution in medical education," as was* **Dr. Donald Alcott,** *clinical professor emeritus of pathology.*

Dr. Rodney Beard, *professor emeritus of family, community and preventive medicine, received recognition for his "outstanding contribution to the community."*

* * * *

Dr. William Haskell, *clinical associate professor of medicine, was appointed president of the American College of Sports Medicine at that organization's annual meeting in Montreal last month.*

The College is a group of 10,500 scientists, physicians, educators and health professionals whose common interests involve treating sports injuries and defining exercise's role in improving human health.

* * * *

Karen Sortino, M.A., *director of the SUMC Friends of Psychiatry and Behavioral Sciences, led two special workshops on "Keys to Creative Volunteer Management" earlier this month.*

In the first workshop, sponsored by the Retired Senior Volunteer Program (RSVP) and the Volunteer Center of Palo Alto, Sortino instructed participants in motivating volunteers and developing creative leadership. Later she taught interviewing skills and offered suggestions on how to recognize and reward volunteers.

* * * *

The SUMC Signage Committee has hired **Leonard Kitts** *of Design Systems Group of Palo Alto to serve as consultant for its signage project. The project is intended to update and better coordinate directory signs within the medical center.*

The signage committee is chaired by Jeanne Kennedy, director of SUH community relations. Project manager for the renovation is Wells Hoeltje of Facilities.

Dr. Paul Basch, *associate professor of family, community and preventive medicine, has been chosen by the Committee on Scholarly Communication with the People's Republic of China to participate in the Distinguished Scholars Program.*

The Committee is supported by the National Academy of Sciences, the American Council of Learned Societies, and the Social Science Research Council.

Late this year, Basch will travel to Amoy University in Xiamen, Fujian Province. There he will work for two months at the Parasitology Research Laboratory with Professor C.C. Tang, an eminent Chinese parasitologist. Basch intends to investigate parasitic diseases of animals and humans, particularly schistosomiasis.

Basch was chosen as one of 16 senior American scholars of science, engineering, social sciences and humanities, from a field of 200 applicants. A total of 30 from the two countries will participate during 1983-84.

* * * *

Richard Rydell, *director of SUH management systems, has been elected to his third term as chairman of the Los Altos Hills Planning Commission.*

* * * *

Mike Goodkind *has been appointed news director in the Medical Center's office of communications effective June 1, announced director Spyros Andreopoulos.*

In his new capacity, Goodkind is responsible for the day-to-day news activities of the medical center. He coordinates news assignments, and acts as the spokesperson for SUMC.

The delegation of this responsibility was necessitated, Andreopoulos said, by his own recently expanded role as director of the Office of Communications.

With Stanford since May 1981, Goodkind will continue to edit the Medical Staff Update, *and assist Andreopoulos in development of the SUMC publications program.*

His professional experiences include work for newspapers in Vermont, Arizona, and California, and as a reporter for the Associated Press in Los Angeles from 1971 to 1979.

A graduate of Dartmouth, Goodkind has served in Africa with the Peace Corps, and with the Army in Vietnam.

You should know...

Annual Individual Benefits Statements *will be mailed to all hospital employees during the week of June 20. The statement explains each employee's benefit plan in detail and notes the cost of the various benefit programs to SUH and to employees.*

If you are an SUH employee and have not received your statement by July 18, or if you have any questions about your statement, call the benefits office at 497-5734.

* * * *

The Fleischmann Learning Resource Center *in the medical school has changed its hours for the summer months. As of June 14, the center is open Monday, Wednesday and Friday from 8 a.m. to 5 p.m., Tuesday and Thursday from 8 a.m. to 10 p.m., and Saturday noon to 6 p.m. (See next news note for another new feature of the LRC.)*

* * * *

The Learning Resource Center **(LRC)** *now has the* **computer system** *ASKME, an adaptation of Ohio State University's CASE. The programs are designed to teach medical history and physical examination information, as well as allow the user to "play" doctor to a "patient," for practice in diagnosing illness.*

The computer center in the LRC, room M200, also provides terminal access to the StanMed, Ohio State and Massachusetts General Hospital computer systems.

For more information see Anne Davis, LRC librarian.

* * * *

The Human Resources Group in the medical school has a file of applications from interested **summer clerical workers.** *If your department has such a need, call Catherine at 497-6295, or stop by the HRG office in M118 between 8 a.m. and 5 p.m.*

* * * *

Dr. Mary Southam of the behavioral medicine program reminds the community that a **weight-loss day camp for teenagers** *opens again this summer for two sessions, the first beginning June 20 and the second July 18.*

Young people aged 12-17 are eligible for the camp, which offers a chance to have fun while following a weight-loss program of dieting, exercise, and behavioral change techniques. Faculty will include members of the behavioral medicine program of the School of Medicine.

A fee is charged and space is limited. For further information, call Southam at 497-5065.

* * * *

The **Medical Board** *in May approved formation of a therapeutic pheresis committee recommended by the bylaws committee.*

The board in May also approved the policy for general nursing and heard annual reports from the care review/risk management department and the division of nuclear medicine.

Bagshaw. . .

continued from page 10

worldwide impact on the treatment of cancer. More recently, he has directed clinical studies of hyperthermia, the use of heat to destroy cancerous tumors.

He was also a pioneer in the treatment of localized human cancers with combinations of drugs and radiation, a now common procedure which was experimental only two decades ago.

He has authored or co-authored nearly 150 publications covering broad areas of cancer research and therapy.

Bagshaw has served as director of radiation therapy at Stanford since 1960 and was appointed chairman of the academic department in 1972. A 1950 graduate of Yale University School of Medicine, Bagshaw completed his radiology residency at the University of Michigan School of Medicine.

The Catharine and Howard Avery Professorship has been earmarked for a faculty member researching the causes, treatment and cure of cancer, an ailment Mrs. Avery had battled. In 1975 she established a fund for cancer research, which was augmented after her 1981 death to make the establishment of the professorship possible.

Mrs. Avery attended Mills College in Oakland and was a graduate of the University of Washington, Seattle.

Her husband, a resident of Mill Valley, is a 1932 graduate of Stanford.

As a Navy captain during World War II, Avery received several honors, including the Navy Cross, the Legion of Merit, and the Distingusihed Flying Cross. Later he held various command positions, including four years in the NATO headquarters in Paris as representative of the Supreme Allied Cammander-Atlantic.

In 1977, Avery established at Stanford the Douglas P. Avery Band Scholarship in memory of his son, who was killed in an aircraft accident in Munich while attending the University of Maryland, Munich Branch.

Ferguson. . .

continued from page 13

tenance, and being "the kind of person who likes to help people out," he also makes time to do the same for friends.

In addition to these pastimes, when he retires in 1985 he hopes to visit relatives back east with his wife and their pet dog, who is "the best traveler you've ever seen." They plan to continue their frequent trips to Reno, and he also wants to do more "abalone-ing" and salmon fishing.

For now, though, Ferguson works away, supervising his various remodeling and construction projects, and troubleshooting with characteristic calm.

He explains his philosophy about doing his job well very simply:

"A hospital is not a place for an engineer to just sit in a boiler room waiting for a call to come in," he said. "You've got to really get out and hustle."

Morley Safer of '60 Minutes' interviews Steven Mosher, Clifford Barnett

Following is an off-the-air transcript of the CBS 60 Minutes broadcast June 12, concerning the dismissal of Steven W. Mosher as a graduate student in anthropology. Produced by Joe Werschba, it features reporter Morley Safer and interviews with Mosher and Prof. Clifford Barnett, chairman of the Anthropology Department. Titled "The China Syndrome," it was introduced by Safer.

SAFER: "The China Syndrome" is about what the Chinese government will do when it is displeased—in this case with an American anthropologist from Stanford University, Steven Westley Mosher, to whom the Chinese took a dislike while he was doing field work in their country.

China threatened to cut off academic exchanges with Stanford unless the University fired Mosher. Stanford, which has extensive contacts with China, did what the Chinese wanted—expelled Mosher—but not, says the University, because of pressure from the Chinese government but because of what it called illegal and unethical activities by Steven Mosher.

But did Stanford, in fact, kow-tow to China? And, if it did, what does this do to the academic freedom of a great American university? You decide.

Steven Mosher, everyone agrees, was an excellent scholar with an unlimited future in Chinese studies, due to receive his Ph.D. from Stanford University.

In 1979 he was the first anthropology student to get into China in a new exchange program. He got around perhaps more than the Chinese liked.

Mosher speaks the language well. He was married to a Chinese woman from Hong Kong and worked in the village where her father was born.

Mosher found the people in his village to be warm and gregarious and truthful when they spoke to him in private. Communist Party officials knew of his activities and were highly suspicious.

What struck Mosher about his village was the devotion people had to children—a love that went beyond normal family ties because of China's birth control program.

Mosher was sympathetic to the need for China to control its population but found that the harsh rules of that program were being violated by even harsher rules.

MOSHER: Now in Chinese villages, parents are allowed only one child. And they are under government restrictions, they are under a quota system that only allows them to have that child when they have a quota.

If they happen to get pregnant, if they happen to conceive a child before they've been issued a quota, then abortion follows.

For example, the very large village that I was in had a population of 8,000 in 1981. The 1981 quota was seven. . . .

SAFER: Seven births?

MOSHER: Seven births in a year.

SAFER: Passes, in effect, to have a child.

MOSHER: Right. Those who were found to be pregnant and without a birth control quota were sent to the commune seat and they were held in dormitories there until they agreed to an abortion.

SAFER: How pregnant were these women?

MOSHER: Some of the women were as far along as nine months.

SAFER: Nine months?

MOSHER: I would say that perhaps two-thirds of the women were six months or more pregnant. The fetus was first injected with an agent that causes abortion. With that injection, the fetus took from 24 to 48 hours to die. Normally, that injection also caused the uterus to begin its contractions and that fetus would then be ejected. In some cases, that didn't happen, and so they had to go in and perform a cesarian.

I left at that point. I did not have the stomach to stay and watch that performed.

SAFER: Give us an idea of what these women said after what must have been a horrendous experience.

MOSHER: It was a horrendous experience. I think a lot of people in the West have the impression that Chinese don't bleed. That's totally false. These Chinese women reacted to forced abortions in the third trimester of pregnancy the same way that American women would.

SAFER: Is abortion in the seventh, eighth or ninth month legal in China?

MOSHER: No. According to China's own birth control regulation, abortions cannot be performed under duress. In other words, you cannot use coercion to obtain consent. And abortions are forbidden after the sixth month. So what I was seeing in rural China were widespread violations of China's own birth control regulations.

SAFER: Mosher wrote to Chinese officials about these violations but got no response. The Chinese government did suggest to her visiting American scholars that Mosher was a troublemaker, but gave them no details, just unsubstantiated allegations.

Almost a year after Mosher left China he made his findings public in an article written in a popular magazine in Taiwan, complete with evidence—color photographs of women about to be aborted in the last three months of pregnancy.

The Chinese government was outraged, both by the article and the fact that it had been published by its enemy, Taiwan.

American academics also were outraged that women's faces had not been blacked out as they are here. They were also upset that Mosher, going so public, might ruin things for other scholars wanting to work in China.

MOSHER: Chinese officials in Peking were demanding of visiting American academic delegations that I be punished. They made the explicit threat that if I were not in some way punished that the cultural exchange program would suffer, that American social scientists would no longer be welcome in China.

SAFER: You also wrote of infanticide. . . .

MOSHER: Recently, because of the tremendous pressure that the Chinese government is putting on the people, peasants very reluctantly have done away with female children in order, you see, to keep their quota open, in order to have another chance to have a son. And since in the countryside you must have sons if you are going to have a means of support in old age, female infanticide is reoccuring.

SAFER: So if the child is "lost" for whatever reason you can maintain your pass until you give birth to a healthy baby.

MOSHER: Right. And so many girl babies are, as you put it "lost."

SAFER: Mosher claims that all his subsequent troubles started with that article and led to his dismissal from the Stanford Ph. D. program.

MOSHER: If Peking had said nothing, I would have come back to the University, would have received the Ph. D., would have been accepted back into the academic fold, and would have been no problem.

SAFER: Not so, says Stanford. Mosher's troubles began almost the minute he hit China, and the article had nothing to do with it, says department chairman Clifford Barnett.

BARNETT: I don't believe there is any issue of academic freedom involved in this situation, unless you again subscribe to Mr. Mosher's statements, despite what is said in the report that his publication of the material on the Chinese birth control program was at issue.

There's no way in which that is an issue.

SAFER: If it wasn't the article that led to his dismissal, and it wasn't the displeasure of the Chinese government, why was Mosher expelled?

BARNETT: He was expelled for professional misconduct in the field and for illegal activity, illegal conduct, illegal and professional misconduct in the field.

SAFER: . . .They said unethical conduct.

BARNETT: That's right. And most of that conduct occurred before his publication of the birth control article. . . .

SAFER: You're saying you don't want to release the report because it's going to hurt innocent people. Mosher says the only innocent person to be hurt is Mosher. . . .

BARNETT: The other argument that he's built up is that we have acted to please the Chinese, that the only grounds that we have had to dismiss him are grounds that he published that article with regard to the excesses of the birth control program—and I might add, as a footnote that he was not the first person, in fact there are umpteen journalists who have reported on this going back to 1979 when the Baltimore Sun published material on this.

SAFER: Hold on a minute. Why were the Sinologists so up in arms for the poor fellow if it was all just old hat?

BARNETT: That's a very good question.

SAFER: Professor Barnett says he won't release the Mosher report because it would violate University regulations, but says it would be all right for Mosher to release it.

BARNETT: I feel that it would be injurious to other people. If I was subpoenaed to release that report, I would go to jail before I would release it.

SAFER: Mosher won't release it because he says it's slander, and he has no interest in spreading slander against himself.

MOSHER: They have now libelled me by saying I engaged in illegal and seriously unethical activities in China. But they still have not come forward and said precisely what those illegal and unethical activities are.

BARNETT: I would much prefer to see that report out and, if that was out, I don't think you and I would be talking today.

SAFER: You mean we would all be so convinced that Mosher was guilty as charged?

BARNETT: Yes, I think so.

SAFER: Well, give us a hint of what's in that report. . . .

(He won't) But there are hints. In November, 1981, six months after the Taiwan magazine article appeared, a Stanford investigating committee was asking the Chinese government for information on what Mosher was supposed to have done wrong the year before:

(Quotes from Stanford letter) "Much of the information we have received on these charges has been indirect and second-hand, consisting of reports made by American scholars of complaints made to them by Chinese officials."

Would you have acted at all had the Chinese government (not) written a very, very strong letter to this university saying "look, either punish this guy—not only punish him, we want to know precisely how he is punished because this is going to affect all future relationships that we have"

BARNETT: Here again, I don't know where you're taking information that you just relayed. We did not get a letter on this matter from the Chinese government until February, 1982. And we received that letter because the investigating committee had heard all kinds of rumors in this regard.

SAFER: That letter from the Chinese Academy of Social Sciences warned Stanford that exchange scholarships between China and the U.S. had been endangered by Mosher and that "we hope that Stanford University will deal with this matter severely and that our academy be informed as to its disposition."

The Chinese also laid out a bill of particulars against Mosher: that he travelled in an illegal van, that he had travelled to unauthorized places, that he had an unauthorized research assistant, that he tried to take old coins out of the country, and that he had published that abortion article in the Taiwan magazine—the same charges which Professor Barnett now says played no significant part in the dismissal of Mosher from Stanford's Ph.D. program.

Was that one of the things you considered, the so-called illegal van?

BARNETT: We considered that and, as a matter of fact, that was not considered a problem at all.

SAFER: Was the presence of a researcher?

BARNETT: That was a problem but that was not the reason for his termination.

SAFER: Was travelling in areas not precisely authorized to travel in?

BARNETT: That was a problem, but not the major one for his termination.

SAFER: Was the buying of 140 old coins?

ZBARNETT: No, that was completely discarded. 'Cause, among other things, of the Chinese statement themselves they also paid him back for it, which is hardly the kind of thing you would do. That was completely not at issue.

SAFER: Was there information, corroborated or otherwise, that he was an agent of the U.S. government?

BARNETT: No. I feel perfectly free to at least lay that aside, because I have heard that question come up now a number of times. I think in fairness to Mr. Mosher, as well as to ourselves, but particularly to him, particularly in this kind of situation, we feel very comfortable in saying that there isn't a word of that even discussed in the report.

SAFER: To complicate things, Mosher divorced his Chinese wife, and she later gave testimony against him.

One of the criticisms was that as you went into the village that was your former wife's family's village—your former wife being Hong Kong Chinese with roots back in this village—and that by reporting and the way you reported, you endangered that family. You endangered not just sources but sources very close to you.

MOSHER: Stanford has used that reason as an excuse to keep this whole investigation under wraps, to keep the final report confidential. That was a red herring. These rumors and allegations that Stanford gathered into the final report have been around now for two and a half years. Nothing untoward has happened in the village in that time. There have been no arrests, no persecutions, no people sent to labor camps.

SAFER: Do you know this?

MOSHER: I know that to be a fact. I go frequently to Hong Kong. There are many people in Hong Kong who visit rural China.

BARNETT: Well, I think there are two tragedies in this whole situation. One tragedy is of a brilliant student who's gone wrong, a student who's brilliant in the classroom, and has a real defect with regard to his behavior in doing research.

And the second tragedy is that the real suffering of, on humanitarian grounds, of women who indeed are undergoing forced abortions have gotten mixed up with what I consider to be the self-serving needs of an individual.

SAFER: Is the evidence against him evidence that, if this were a criminal trial, the evidence would stand up in court?

BARNETT: It's hard to say what a jury would do. All I can tell you is that, interestingly enough, there were 12 or 13 people—and, as you know, anthropologists are a very contentious, individualist bunch—and I think for the first time in a long time in my experience in this department, they voted unanimously. I don't know what that says. . . .

MOSHER: It says that academic freedom is a myth that is sustained by large universities who preach academic freedom, but when the crunch comes, when political pressure is on, sometimes behave in quite different ways.

SAFER: Whether or not it is an issue of academic freedom is an open question. Mosher has appealed to higher university officials to reconsider his expulsion. They've not yet come to a decision.

For the moment, Mosher is done for as an academic, but not as an authority on China. He has a book coming out in the fall on life in China, a book that will likely get more attention than it would have had the university not expelled him.

Rebholz: Hoover critics also favored rigorous education

Editor, *Campus Report*:

I was gratified by Prof. Thomas Gray's response (*Campus Report*, June 8) to Hoover Fellow Edwin Harwood's attack on the "sincerity" of my motives in criticizing the relationship of the Hoover Institution to the rest of Stanford University (*Campus Report*, June 1).

As a legal scholar with an accurate memory of the Franklin case, Prof. Grey puts to rest, I hope, Mr. Harwood's charge that arguments, by me and others, for Franklin's speeches being protected by the First Amendment were "patently ludicrous" and that my support of Franklin proves my partisan bias in questioning Hoover's role at Stanford.

On this aspect of Mr. Harwood's attack, I want only to add that I did not agree with Franklin's politics but that I do believe in free speech, and it was that belief which led me to sign the *Amicus Curiae* brief in defense of Franklin.

Contrary to Mr. Harwood's expectations, I believe in the free speech even of "A Ku Klux Klan adherent" or a "Nazi," users of "the most rabid and vicious demagoguerie" with whom Mr. Harwood compares Franklin. I remain a member of the A.C.L.U., which does defend the First Amendment rights of such groups as it has defended the rights of Franklin.

In the same spirit I would defend Mr. Harwood's right to attack me, even though the attack comes very close, I think, to the "nonmalicious slander" which Mr. Harwood identifies as one expression of "rabid and vicious demagoguerie."

Likewise I would defend the freedom of speech of every member of the Hoover Instution and of the Institution itself, which, as I argued in the Senate debate of May 26, does speak *as an institution* because the director and his immediate assistants use their power over appointments, the allocation of funds, and the publications program to create the Institution's image as a politically conservative think-tank and thereby encourage politicians and the media to seek out the *Institution's voice* on ideologically controversial issues.

The issue is not Hoover's freedom of speech; it is Hoover's "speech" as *an institutional component of Stanford University* to which I object because, in my view, no *institutional component* of the University should take partisan political stands. If Hoover's defenders would keep that distinction between individuals and institutions in mind, they would not invoke the analogue with Franklin to discredit their critics.

And, quite clearly, discrediting me as a critic is the purpose of Mr. Harwood's letter. It is just the most recent in a series of what Prof. Grey describes as "hysterical diatribes" uttered for the purpose of discrediting those who have asked for an inquiry into Hoover's relationship with the rest of Stanford:

Peter Duignan's "This is the same gang that was against the Vietnam War, supported the partisans in Nicaragua and now the rebels in El Salvador" (*San Francisco Sunday Examiner and Chronicle*, May 8;

The same Senior Fellow's "It is interesting that Hoover's most outspoken critics (Drekmeier, Carnoy, Levin, Rebholz, Roth, etc.) also supported the Maoist group led by Franklin when he rampaged around the campus intimidating and threatening conservatives and carrying on partisan political warfare" (*Campus Report*, May 11); and

Senior Fellows Peter Duignan's, Lewis Gann's, and Milorad Drachkovitch's "The reasons for the current attacks on Hoover appear to be the same ones that motivated earlier attacks, that is, greed, envy, and political partisanship. Liberal-Left faculty and students are intolerant of views that run counter to theirs and are unwilling to allow conservative view (sic) to be espoused in any significant or dynamic way" (*Campus Report*, May 18).

Such are the "restraint and forbearance" for which Glenn Campbell praises his "internationally renowned scholarly staff" during a "lengthy and difficult period of unwarranted attacks" (*Palo Alto Weekly*, June 1).

It is ironic that such defenders of Hoover should charge that they are the object of a witch-hunt. For me, personally, the most ironic of these attempts to discredit the critics of Hoover through the rhetorical strategy of "guilt by association" was that of my colleague, Alphonse Juilland: "These are the people who 15 years ago tried to rewrite academic programs and requirements along political lines in the name of relevance, of reconstituting the University" (*Campus Report*, May 25).

Prof. Juilland must know that I fought hard to retain the language requirement, which he rightly held dear, and to restore it recently, and that I fought equally hard to retain the old Western Civilization program and to institute the current requirement in the study of Western Culture.

People who are not a gang of Maoists and who believe in rigorous education can also, with sound motives, question the propriety of the Hoover Institution's role in Stanford University.

Harwood comments on liberal guilt, left-wing extremism

Reply to Professor Grey
By Edwin Harwood
National Fellow
Hoover Institution

In my June 1 *Campus Report* article, which argued that some faculty very probably signed the Hoover petition because of political bias, I claimed that it was patently ludicrous for faculty defenders of Bruce Franklin, a former professor discharged for incitement to violence, to claim that his conduct on campus in 1971 was the innocent expression of free speech. I argued that it was reasonable to assume that their support for him was motivated by political partisanship based on various statements they affirmed in their 1971 *Amicus Curiae* brief on his behalf.

There is other supporting evidence in that brief which I omitted to mention. On page five the signers express their sympathetic understanding for Franklin's "alleged" participation in the disruption of Henry Cabot Lodge's speech. Had Franklin been found to have behaved disruptively, his defenders assert, "the principles of Nuremberg apply as context and constitute profound mitigating legal and political precedents."

That the signers could see no distinction between a democratic society such as ours and Nazi Germany and, moreover, that they could imply that Ambassador Lodge belonged with other American leaders in the same class as Nazi war criminals *is* both patently ludicrous and a clear indication of their partisan sympathies for Franklin.

Let me explain. It was left-wing extremists who first promoted the idea that American involvement in Vietnam was comparable to the atrocities of the Nazi regime. Sadly, many liberals on campus came to accept this preposterous comparison. And they accepted other equally preposterous claims made by the exteme Left.

The intriguing question remains: why was balanced judgment thrown to the wind at Stanford and other universities during this period? How was it, for example, that well educated men and women, indeed, even professors of theology, could justify the terroristic violence of left-wing "liberators" operating both at home and abroad yet at the same time, and without noting the contradiction, fulminate against agents of law at home who would defend us from such violence as well as against foreign governments trying to protect themselves against left-wing terrorists? Why was *left-wing* murder and mayhem excused?

I offer this theory. It happened not because campus liberals necessarily shared the radicals' *ideology* root and branch. Rather, the radicals succeeded in inducing in them profound feelings of guilt about their own society.

The liberals' guilt over social injustice at home became the deep psychological pocket that the extremists of the Left were able to draw from. And if they didn't fall quickly into line, the radicals were adept at using psychological terror, achieved primarily by the imagery of violence (raised, clenched fists) but sometimes also by the real thing to enforce compliance. Thanks to the university community's psychological vulnerability, the new Unreason spread without opposition.

As reason fell victim to this onslaught, thanks to the failure of moral courage on campus, partisanship on behalf of Left extremists became legitimate.

Had the campus radicals of the late '60s to early '70s been antidemocrats of the Right rather than the Left, that psychological terrorizing would not have worked. To the contrary, right-wing terror would have galvanzied the campus community to expel and punish those coercively disrupting the university's functions. True, Franklin was eventually discharged but not without considerable agonizing and delay, and only after a climate of terror had not only taken hold on campus but threatened life as well as property.

And it's why, I contend, that such an *Amicus Curiae* brief as was written for a Left extremist like Franklin would never have been written for a (thankfully) hypothetical Nazi or Ku Klux Klan advocate on the faculty.

Nor is it plausible that a Nazi would have been referred to as an "effective teacher and able scholar." And do not forget: Franklin admired and advocated revolutionary *violence*. He described the bombing of the Senate Building in Washington as a "wonderful act." He called for a "people's war." I find nothing ambiguous about such language. And I believe that an English professor can be legitimately held accountable as one who should know the meaning of the words he is using.

Law Prof. Thomas Grey responded vigorously to my article. In his letter (*Campus Report*, June 8), he argues that there was nothing ludicrous at all in the position taken by Franklin's supporters.

Let me clarify my position. I argued that the position taken by his *faculty* supporters was patently ludicrous. I would never argue that it would be ludicrous for Franklin's own *attorney* or other supporters in the legal community to try to get the charges against him dismissed by claiming that he was merely exercising his right of free speech.

Attorneys are *obligated* to marshal any and all case precedents that will turn the tide of litigation in their favor, and to deftly hammer out a theory which, when fitted to the factual circumstances of the case, will vindicate their client. They can do this by astute reasoning from the accumulated case law, by emotional appeals to boards and juries, by conferences with the press in which they paint their client white and his accusers black and so forth. That's their job.

But this necessary partisanship of the advocate, who is a hired gun for his client, need not be adopted by the layman, and it certainly cannot be adopted by any judge or jury sitting on a case, whose duty it is to assess the legal reasoning of the *two* sides to a dispute, weigh the facts in dispute and finally arrive at a judgment in conformance with legal principle.

Most of Franklin's faculty defenders were barely conversant with the case law in the First Amendment area. Though the "freedom of speech" issue is raised in their *Amicus Curiae* brief, it is very spottily addressed from the standpoint of legal scholarship. Their "brief" is much more akin to a political polemic and it is one, moreover, that abounds in legal confusions. To cite just one, they state (p.7) that the Advisory Board "is asked to rule on charges concerning inchoate crimes—a category in which the lack of agreement on standards is notorious and in which such a Board is singularly unqualified to judge." What they say would be quite true if the Advisory Board had been sitting as a criminal court.

However, the Board never presumed to have the authority to pass judgment on whether Franklin's behavior was or was not in violation of the state's criminal code. And finding Franklin in violation of criminal statutes was never a legal prerequisite for passing judgment on his conduct as a university scholar and teacher in an administrative hearing. (This point was, indeed, conceded by the ACLU attorneys who drafted a genuine *Amicus Curiae* brief for Franklin, one whose legal reasoning on the First Amendment issue was both coherent and tied to case precedent even if debatable.)

If a university were not free to punish violations of unprofessional conduct on a faculty member's part through administrative proceedings without the individual first having been found in violation of some criminal statute, its ability to function effectively would be severely jeopardized. (This is one point on which Prof. Grey appears to agree with me. And it was a point on which he stated he (did) *not* see eye to eye with other signers of the faculty brief.)

But whether or not Franklin's faculty defenders clearly understood the First Amendment issue is beside the point. The important point is that they were under no moral obligation to come to Franklin's defense. To the contrary, as scholars concerned with academic freedom, they should have felt a strong moral obligation to defend their university and its reputation against the kind of attack a man like Franklin posed.

For Franklin's conduct—and one should examine the entire battery of testimony in this case—posed a clear threat to the most central values of a university, among them the values of tolerance for dissenting views and the expectation of civil behavior toward others holding differing views. It *was ludicrous*—and I won't mince my words here—that they should have viewed as "chilling" the university's efforts to punish and expel him when, to the contrary, it was his own behavior that was contributing to a chilling climate of terror on campus.

Prof. Grey argues that when Franklin told a crowd of students that the University Computation Center should be "shut down," a persuasive case could be made that his words were ambiguous between a call for "imminent unlawful trespass and a call for a lawful boycott or strike." In the context of other statements Franklin made, both on that and earlier occasions, any student would have been quite within his right senses to assume that Franklin meant the Center should be shut down with coercive violence. Reliable witnesses testified that Franklin called for a "people's war" against the "occupation army" on campus on that occasion.

On another occasion he advocated an "armed struggle" against the Board of Trustees and members of its class. On the night on which the Computer Center was damaged—and several students were injured—he had urged the students to do things that would bring more of the "occupation army" (police) to campus. What would bring more police on campus at night if not violence? He told the crowd that they should do whatever they wanted to do, and as late at night as

Senate report

Faculty Senate discusses weapons-related research, calls for more study

**TO THE MEMBERS OF THE
ACADEMIC COUNCIL
FIFTEENTH SENATE REPORT NO. 14
Summary of actions taken
by the Senate
June 9, 1983**

At its meeting of June 9, 1983, the Senate took the following actions:

1. On the recommendation of the Committee on Academic Appraisal and Achievement, the Senate, by unanimous voice vote, conferred bachelor's degrees on candidates who had met the various requirements for those degrees.

2. On the recommendation of the Committee on Graduate Studies, the Senate, by unanimous voice vote, conferred advanced degrees on candidates who had met the various requirements for those degrees.

3. On the recommendation of the Committee on Committees, the Senate, by unanimous voice vote, approved a charge to the new *Ad Hoc* Committee on Senate Representation.

4. On the recommendation of the Committee on Undergraduate Studies, the Senate, by unanimous voice vote, approved the list of changes to courses certified for distribution requirements.

5. On the recommendation of the Committee on Academic Appraisal and Achievement, the Senate, by unanimous voice vote, approved the official transcript notation certifying foreign language proficiency.

6. The Senate approved, by unanimous voice vote, the following motion:

The Senate receives with thanks the report of the Committee on Research, including the minority report, and instructs the Steering Committee of the next Senate to consider the results of this debate and to expedite the work of the next Senate in discussion and action on the issues brought forth at this meeting, including the framing of a new charge on this matter to the Committee on Research for discussion in the next Senate.

**MINUTES OF THE FIFTEENTH SENATE
OF THE ACADEMIC COUNCIL
June 9, 1983**

(Draft subject to approval by the Senate)

A meeting of the Fifteenth Senate of the Academic Council was held on Thursday, June 9, 1983, beginning at 3:18 p.m. in Room 190 of the School of Law with A. L. Fetter, Chair, presiding. Present were 37 representatives, 7 *ex officio* members, and a number of invited guests.

Approval of Minutes

The minutes of the meeting held on May 26, 1983 (SenD#2537) were approved as submitted.

Conferral of Degrees

Under the Action Calendar, the Senate, by unanimous voice vote,

1. Conferred bachelor's degrees on candidates recommended by the Committee on Academic Appraisal and Achievement in the Preliminary List (SenD#2527) and a Supplementary List (SenD#2528). In the same action, the Senate authorized C-AAA to make last minute changes up to the time of Commencement.

2. Conferred advanced degrees on candidates recommended by the Committee on Graduate Studies in the Preliminary List (SenD#2529) and a Supplementary List (SenD#2530). In the same action, the Senate authorized C-GS to make last minute changes up to the time of Commencement.

Report of the Steering Committee

In the report of the Steering Committee, A.L. Fetter, Chair, called attention to the President's reception following the Senate meeting for the members of both the Fifteenth and Sixteenth Senates. He then thanked the new Academic Secretary for her work and for learning fast during an eventful year. At the conclusion of his remarks, W. H. Northway, Jr. sought recognition to present to Chairman Fetter the traditional inscribed gavel to mark his year as Senate chair.

The text of Professor Northway's remarks was as follows:

Mr. Chairman:

On behalf of the Steering Committee and the Fifteenth Senate of the Academic Council, I would like to take this opportunity to thank you, Sandy Fetter, for your leadership during this year. Your calm, good-humored approach to the discussion of divisive issues, your sensitivity to the feelings of others and your knowledge of the interactions of the university community have created an atmosphere in the Senate which promoted reasoned dialogue.

This gavel, the traditional symbol of your office, is a token of our appreciation and thanks for your guidance this year.

Report of the Committee on Committees

A. Mellor, Chair, began the final report of the Committee on Committees by announcing that J. Gere, a member of CoC XV, had agreed to chair the new CoC for the Sixteeenth Senate.

She then introduced the last item of business to be reported from CoC XV, the draft charge for the Senate—mandated *Ad Hoc* Committee on Senate Representation (SenD#2534). There was no discussion of the charge. Chairman Fetter pointed out that the new CoC is expected to nominate the members to this committee, who will work over the summer and report to the Sixteenth Senate by November on recommendations regarding reapportionment and by late January on any other recommendations.

The Senate vote to approve the charge was unanimous.

Report of the President

President Kennedy, after thanking the Senate chair and his Senate colleagues for the encouraging year, spoke briefly in clarification of his comments made two weeks ago at SLAC when he met there with faculty and staff about their concerns over the SSRL project proposal. Some question has arisen concerning his reported statement there that a department or other University unit has the capacity to make its own research policies more stringent than those followed by the rest of the University. In clarification, the President commented that a department or other unit might do so, provided that such policies do not present any conflict with the University's overall policy on research. He reported that his qualifications about the practicality of such a position and the overall sense of the subsequent discussion were, unfortunately, not relayed in the newspaper report of that meeting.

In the question period for President Kennedy, R. Mozely reported that he had checked on the decision—making structure at SLAC after that meeting with the President and discovered that the faculty does not have the right to control the research decisions made there. The faculty are consulted by the director but the control at SLAC comes from the director.

Report of the Provost

Provost Hastorf announced that Robert Street, professor of Civil Engineering, had been appointed Vice-Provost for Academic Computing and Information Systems. He will be responsible for overseeing all instructional and research computing related to academic needs, including the networking needed for such functions.

The Provost next commented on a letter recently sent out by a national AAUP official announcing insurance protection for faculty sued by colleagues over issues related to tenure, salary, dismissal, etc. He pointed out that Stanford indemnifies its faculty engaging in good faith activities on such professional matters. Most other major universities do the same.

Interim Report on Alternatives to TIAA-CREF

In the final portion of his report, Provost Hastorf commented that of a series of ten proposals made by a recent *ad hoc* committee dealing with faculty benefits, the first two were to be implemented before the fall of 1983. Retirement funding alternatives in the future will include not only the TIAA-CREF option, but also a choice of three or four other company options. These alternatives are expected to become available to faculty by September 1.

J. Thomas, Manager of Benefits and Records, reported that negotiations are now in the final stages with three mutual fund firms and one other insurance company. Final details in written form are expected to be completed by next week and the names of the firms involved will be announced at that time. By Labor Day, faculty can expect to receive information on the options available. All four companies are experienced in this type of investment. The alternatives promise to provide improved investment performance and greater flexibility in the options available. Furthermore, communication from these firms will be more frequent and more specific than it has been from TIAA-CREF, enabling the individual to track the investment more effectively.

The Provost added that during the coming summer other recommendations from the *ad hoc* benefits committee will also be addressed, broadening the options even further. That report can be expected by October. He reminded the Senate that these matters are complex and expensive to explore and this impedes the pace at which such recommendations can be implemented. He also pointed out that work is going forward simultaneously on health benefit plans, which are extremely volatile now, in the hope that affordable health benefit plans can be provided in the future. This is the next important priority for all of us.

Finally, he commented on participation rates in TIAA-CREF. For young faculty, they are not high; they go up markedly as ages and salaries rise. For age 35 and up, rates are nearly 90 percent; for 45 and up, they approach the high 90s to 100 percent.

R. Rebholz inquired about the *ad hoc* committee's recommendation that the University make its contribution to retirement funds whether the individual faculty member contributes to the fund or does not. The Provost expressed some concern about the financial impact of such a policy, but deferred his considered response until the October report. President Kennedy pointed out that since those dollars would come from the same poor from which the University would increase its contributions generally, this would mean in effect that those willing to make their own contributions would be subsidizing those who are not.

In a question harking back to the May 26th report by Dean Wessells on the mean age of tenured faculty in Humanities and Sciences, B. Roth questioned again the generalization that brain function declines steadily with age. He cited research on psychometric test scores reported last year in *Nature* showing little or no decline for individual subjects through the 70s and into the 80s.

There followed several comments on the known effects of age on scores for various sub-tests measuring intelligence, on the significance of individual scores as oppposed to mean scores, and on the existence of an authentic debate in the neuroanatomical literature about cell loss.

C-US Report on Distribution Requirement Courses

P. Seaver, Chair of C-US, presented the year-end report on additions and deletions to the list of courses which will satisfy the distribution requirements in 1983-84.

K. Arrow commented on the large net increase in the number of courses approved and the very few deletions. The lists should be monitored so that the numbers don't go up, or do so only with good justification.

C. Lougee pointed out that a large number of the additions represent those courses approved for the Overseas Studies Program for 1983-84. These replace a similar number of courses for 1982-83 and thus are not truly additive. She also noted as a friendly amendment that under *Deletions* on the Addendum to SenD#2533, page 1, second line from the bottom, the words "or 106" should not be there. Computer Science 105 will no longer be taught, it is true, but the combination of Computer Science 101 and 106 will remain approved for the Area VIII distribution requirement in 1983-84.

There was further discussion about the status of the few deleted courses, all of which were withdrawn by departments because they were not to be taught in the immediate future. President Kennedy reiterated his concern that the list of courses had been too large and indiscriminate to begin with, and it continues to get larger. In his view, departments need to do some critical pruning so that the list can provide the students with intelligent guidance for fulfilling distribution requirements.

Registrar Mahoney commented that the longer the list, the

continued on next page

Senate. . .

continued from page 18

harder it becomes to monitor students' completion of the requirement. She also pointed out that these particular additions appear to have been made in areas where additions were needed: small population courses and non-Western Culture courses.

Vice-Provost Katchadourian pointed out that great pressure is exerted on C-US by departments and faculty to get courses approved. He expressed his belief that an arbitrary quota system is the only way to control the growth of the list. This would force departments to make critical choices internally. Perhaps the Senate should instruct C-US to explore the possibility of setting a ceiling on the number of courses proposed by a given department.

Chairman Fetter suggested that this would be an appropriate matter to consider when the C-US Annual Report comes before the Sixteenth Senate next fall. The Steering Committee might want to consider that possibility.

L. Ryan pointed out that cutting back would eliminate larger numbers of small enrollment courses and leave more students without that option. He also reminded the Senate that the demand for distribution requirement courses can put tremendous pressures on small departments with few graduate students.

When put to a vote, the C-US report on additions and deletions to courses certified for distribution requirements next year passed unanimously.

C-AAA Report on Transcript Notation Certifying Foreign Language Proficiency

S. Matisoff, Chair of C-AAA, presented the report on the transcript notation which the C-AAA recommended to certify foreign language proficiency. She called attention to the history of the proposal's development and indicated that C-AAA had unanimously found the level of competency, methods of testing, and notation for certifying proficiency all appropriate for the purpose earlier endorsed by the Senate.

K. Arrow commented on the lack of parallelism in the procedures specified for determining proficiency in the different languages. M. McCall reported that they had been devised independently for each language and were not intended to be parallel, but that they had been generally accepted as being roughly parallel in the level of competence tested. T. Pearkes pointed out by analogy that honors programs are similarly independenly determined by departments.

There being no further discussion, the vote was taken and the report was unanimously approved.

Preliminary Report on Weapons-related Research at Stanford

Vice-Provost G. Lieberman opened the presentation of the report from the Committee on Research in the absence of the committee's Chair, J. Meindl, who had been detained by a flight delay. He first pointed out that the report addressed two basic issues: 1) the Senate's request that C-Res study weapons-related research at Stanford, and 2) the SLAC community's concern about the impact of the proposed SSRL project on their freedom of choice. He proposed to present the two issues separately.

He reported that the committee had a lot of trouble with the Senate resolution because it found itself unable to define "weapons-related research" in any reasonable manner. The committee concluded that all research done at Stanford could conveivably have some military application.

Trying to respond to the Senate's request, however, the committee did review trends in the volume of research over the past 10 years, indicating dollar amounts by sponsors and also the calculated percentages of the total. A second study of the character of research was performed by a sub-group of the committee, which chose to examine 12 sponsored studies by title and sponsor. The sponsors for the 12 were DOD(8), NASA(2), and DOE(2). All the projects were found to be of high scientific quality; each could have potential defense applications but all offered a wide variety of non-military uses.

At this point, the presentation of the report was interrupted so that discussion could be opened on the part of the C-Res report responsive to the first issue, the Senate resolution asking C-Res to study the character and volume of weapons-related research at Stanford. (The minority report, it was pointed out, was not relevant to this issue.)

This first portion of the report was challenged as begging the question by not considering degrees of relatedness to weapons applications, as being labeled "preliminary" but indicating that no further action is planned, and as not addressing issues or reporting procedures to be followed as the resolution specifically instructed should be done.

B. Roth listed a number of issues which should be of institutional concern, among them departmental pockets of dependence on a single sponsor, problems of local expansion based on temporary funding which leaves a permanent residue, and the influence on student career patterns. There are many such questions which should be looked at.

He urged that the committee do what he had originally hoped they would do: give a preliminary report laying out the questions they would address, solicit advice from the Senate about the appropriateness of that range of issues, then indicate their proposed tactics for studying the problem—all of this before coming back with a final report of the findings.

G. Lieberman commented that many of the issues mentioned were interesting and might be worthy of study, but tying them to the question of weapons-related research in some unspecified sense seems inappropriate.

There was some further discussion about various degrees of research relatedness to weapons applications, with Vice-Provost Lieberman concluding that non-sponsored research was presumably not so related but that the sponsored research done at Stanford (all open research) would fall from 0-9 on a scale of 10 indicating relationship to weapons applications.

R. Mozley pointed out that SLAC physicists distinguish weapons research by the declared purpose of the proponent. If the purpose documented in the proposal is weapons research, the project is weapons research. The description of the project by the funding agency can also help to make the purpose of the project clear. For example, the SSRL proposal comes from a group at Livermore Laboratory titled *39GB Weapons Activities Research and Development.* Half of its $5 million will come from Livermore weapons research funds. Its original proponent describes it as " . . . the development and application of new diagnostics in nuclear testing. . . . " SLAC faculty have no difficulty accepting that this is weapons work. He concluded by supporting Roth's view that this portion of the C-Res report is not acceptable.

L. Rosenberg expressed the belief that the committee had misinterpreted the Senate's intent. It was not expected that weapons-related research would have no other application at all. The point was to use obvious and reasonable criteria (like sponsor, declared intent, etc.) to judge relatedness to weapons applications. There's no reason why the committee could not have responded to this request.

L. Moses pointed out that the language of the Senate resolution and the language of the C-Res report appear to be in conflict. That is, the Senate resolution seems to suggest that there may be grounds to study the matter, even the possibility that policy may need to be changed. The C-Res report seems to imply that if research projects meet the current requirements of the University's research policy, there are no grounds to study the matter. Moses also was inclined to agree that the committee had refused to take the problem.

R. Redfield expressed the view that the committee had trouble understanding what the Senate wanted; that it had tried to provide a helpful response and that it was willing to accept a clarification and try again.

President Kennedy agreed that the question was not put well in the resolution and the committee was asked to respond on short notice to a rather vague charge. He expressed the hope that the proponents of the resolution might refine the question further as had been done to some extent in this meeting (e.g., adding declared intent as a part of the defining mechanism). We ought to make it a first order of business in the next Senate to put the question better and to get the committee to look at it in the way that we instruct.

R. Rebholz disagreed with the claim that the question needs to be refined. For example, declaration of intent of proponent and sponsor seem too obvious criteria to need specification as defining mechanisms. The Senate was simply seeking information as a basis for further action or no further action.

G. Lieberman pointed out that if you take declared intent of sponsor as an automatic defining criterion, you find yourself in the dilemma of judging SLAC itself to be engaged in weapons-related research when the faculty there won't accept that view. Yet unless there is some simple criterion, classifying the 1,400 sponsored projects here is a very difficult, if not impossible, task.

W. Northway argued against sending the resolution back to the committee. It would make more sense, he felt, if the proponents of judging end-use as a criterion for accepting research projects would address that subject directly, i.e., would draft and defend such a proposal for the Senate's consideration. This would meet the issue squarely.

R. Mozley responded that unofficial groups have difficulty getting the information needed. Much of the data is not available. He objected strongly to the attempt to close the issue prematurely.

Northway insisted that the real issue is a desire to change the University's end-use research policy, and that more information won't help in writing a proposal that the policy be changed.

V. Fuchs asked how far one should be prepared to go in protesting the right of colleagues to do the research they wish to do, sponsored or not. An open, scholarly community has to be honored and protected as the most valuable aspect of the University.

J. Adams commented that there were several issues involved, all knotty ones, e.g., economic exposure, involuntary compliance, end-use. If the committee is asked to look at those issues, the Senate must send very specific directions, and legislative histories if available, to the committee.

S. Dornbusch expressed the view that end-use is a very weak criterion. Much basic research is sponsored by mission-oriented funding agencies, so judging end-use by sponsor is often misleading. Even so, there are varying degrees of closeness to military end-use. We do have the problem that research now is often carried out by interdependent research teams. He expressed the belief that the committee responded as best they could to the Senate's vagueness. The Senate should postpone discussion until the next Steering Committee can deal with the problem of sharpening the question and assisting the Senate to deal with it more effectively.

At this point, J. Meindl, Chair of C-Res, arrived from the airport and was briefed by G. Lieberman on the progress made in presenting and discussing the C-Res report so far. Meindl then focused on presenting the second portion of the report, dealing with SLAC faculty and staff concerns about involuntary contributions to weapons-related research. The majority of the committee members felt that these concerns arose because the individuals focused on one possible end-use of the project rather than on the basic research to be done. The SLAC researchers were responding to a proposal 85 percent of which dealt with basic applications of radiation to other fields of science (biology, astrophysics, chemistry, etc.) and 15 percent dealt with calibrating radiation detectors. These detectors can be used for a variety of purposes, e.g., to measure X-rays from an atomic weapons experiment, or to measure the rearrangement of atoms on the surface of a solid in understanding a basic chemical reaction in a bomb. The detector, like any calibration tool, can be used to further many very different purposes.

The committee rcognized the concern of the SLAC researchers and the issue they raised. The majority of the committee attributed the sense of conflict to a focus on possible detector end-use. This, however, wasn't a completely satisfying resolution of this consideration, even for the committee majority. Certainly it was not for the committee as a whole; obviously, it occasioned the minority report.

At the close of Meindl's presentation, Chairman Fetter deferred questions so that the Senate might first hear the minority report from C-Res, presented by Prof. E. Garwin of SLAC.

The minority report expressed the view that the committee focused almost exclusively on the undesirability of imposing end-use selection criteria on research, and did not adequately consider the issues of individual freedom and involuntary servitude raised by some of the SLAC faculty. It pointed out that 12 years ago when the Statement of Principles Concerning Research was adopted by the Senate, the trend toward collective research was not so evident as it is now.

Garwin reminded the Senate that the 1971 statement affirms the individual scholar's freedom to select the subject matter of his research. The stipulation against depending on end-use criteria applies to decisions made by the University as a body, as a collective. Indeed, that stipulation is followed explicitly in the 1971 statement by the following paragraph:

The above principles circumscribe the University's role with respect to University-connected research. They in no way diminish, and indeed **they reinforce, the individual researchers' personal responsibility to assure *that the* sources of funding *for his research,* and its perceived applications, are consistent with his own judgement and conscience *(emphasis Garwin's).***

The SLAC faculty feel that their freedom to follow those guidelines is being abrogated, not reinforced. Noncompliance implies failure to perform academic duties.

The dilemma has arisen from the particular situations associated with plural or collective research. It raises questions not adequately covered by the current research policy statement, questions which will become more common in the future given current trends toward collaborative research. He closed with a statement urging the Committee on Research to make a searching evaluation of these issues and trends in the coming academic year.

Asked why researchers at SLAC can't except themselves from a given project easily, Garwin cited the dilemma of one key researcher with a twenty-year involvement in one aspect of the research. His contribution is unique and there is no in-depth staffing for that work. His refusal to contribute to the PRT project would mean a failure to improve the effectiveness of the laboratory facility for all other projects as well. He would have to be replaced.

M. Bratman said that he found the minority report persuasive in pointing out that present policy clearly indicates two levels of treatment with respect to the end-use criterion: the University enjoined from using it for the allocation of scarce resources and the individual allowed, even encouraged, to consider it in making individual decisions. This creates a

continued on next page

Senate. . .

continued from page 19

real problem that deserves attention.

R. Mozley pointed out that SLAC was just beginning its work when the 1971 policy was formulated, and that the problems caused by intermingling the work of two large laboratories are not adequately treated under that 12-year-old policy. The question needs more study. He reiterated that the present policy makes no provisions for protecting the rights of faculty, staff, and graduate students in a unit doing collective research. He made it clear that the several SLAC representatives at the meeting were not the only ones concerned; the majority of the SLAC faculty consider this a serious problem not adequately addressed by the present policy.

There was some discussion about the difference between directly contributing to weapons-research as opposed to contributing to basic research in a field used by others for weapons applications. It is the direct involvement which is being protested by those at SLAC.

J. Roughgarden summarized his conclusions from the debate: that the degree to which a project is related to weapons research is an operational concept, and that there do not appear to be too many projects at SLAC narrowly focused on weapons research. He is very persuaded that there is a new development since the 1971 guidelines—a new question of the rights of the individual *vs.* the rights of small groups and of the institution as a whole. He spoke in support of further study, focused on the nature of collaborative research, which creates in effect a third level between the individual and the institution. That problem is not addressed by the current policy.

S. Dornbusch then proposed a motion that the Senate receive with thanks the report of the Committee on Research, and instruct the Steering Committee of the next Senate to go over the results of this debate and assist the next Senate in possible discussion and action on the issues brought forth at this meeting. There were several seconds to the motion.

K. Melmon remarked that the only persuasive evidence of involuntary servitude is that of the developing scientist who naively gets caught up in a protect and committed to it without fully understanding the implications of his or her early choice. It should be the Senate's aim to project the rights of such individuals. Full professors have a choice; the person in the process of developing a scientific background, once having made a commitment to an institution, does not have the same freedom.

President Kennedy suggested that faculty freedom of choice in a federally-funded contract laboratory might be somewhat more limited than in other environments. He also suggested a friendly modification to the eagerly-seconded Dornbusch motion—that the Steering Committee be asked to draft a resolution to bring to the Senate for discussion at an early meeting in the fall.

S. Dornbusch accepted the modification as in the spirit of the motion's intent.

L. Rosenberg asked if the motion included the minority report. Dornbusch responded that it did include the entire report, including the minority statement.

The question was called by unanimous vote.

The motion in final form read as follows:

The Senate receives with thanks the report of the Committee on Reseach, including the minority report, and instructs the Steering Committee of the next Senate to consider the results of this debate and to expedite the work of the next Senate in discussion and action on the issues brought forth at this meeting, including the framing of a new charge to the Committee on Research for discussion in the next Senate.

Put to a vote, the motion passed unanimously.

There being no unfinished business and no new business, Chairman Fetter pronounced the Fifteenth Senate adjourned *sine die*.

Weapons-related research; a student letter, minority report

The following letter was sent to President Donald Kennedy June 8 by Loren Rusk, graduate student in English.

I am writing to express my concern about the possibility of weapons research at SSRL. A Ph.D. candidate in the English Department, I care about the ideals and acts of this institution, as I am certain you do. I hope to do the University credit in the future, but that prospect is endangered by the proposed research, which would make me ashamed of the institution I come from.

You have said that end-use restrictions which may seem benign now could prove oppressive in the future. You must see that this is a special case. First, because the humanistic ethics you speak from signify nothing if they do not serve humanity, that being their *raison d'etre*. Second, because ethics assume that we have a future.

Nuclear war would put an end to consequences. Never in history have weapons been stockpiled on a large scale without being used. To allow weapons research at Stanford is clearly to participate in building the bombs.

Please re-examine your conscience and truly represent the community that you head. Fundraising, as I see it, comprises only part of your job, which is representation. In this case the money comes at too high a risk. I don't know how to stop nuclear war from happening, but I am sure than no neutral move is available to you. You can either add to the danger of annihilation, or you can join those of us who believe that the least we must do is not allow it to begin in our own back yard.

Minority Report of the Committee on Research presented to the Senate of the Academic Council on June 9, 1983, by Edward L. Garwin and supported by Sumner M. Kalman

Prof. Meindl has reported that the Committee on Research adopted by a vote of 7 to 2 a resolution stating that the Stanford Statement of Principles Concerning Research adopted by the Senate in December 1971, is adequate to handle the current SSRL-SLAC controversy concerning the "PRT proposal."

The minority view is that the committee focused almost exclusively on the undesirability of imposing end-use selection criteria on research, and did not strike an adequate balance in considering the issues of individual academic freedom and involuntary servitude raised by some of the SLAC faculty.

When the Statement of Principles Concerning Research (reproduced below with emphasis mine) was adopted 12 years ago, the trend toward collective faculty research was not so evident as it now is.

A. Statement of Principles Concerning Research

The following "Statement of Principles Concerning Research" was adopted by the Senate of the Academic Council on December 16, 1971:

The transmission of knowledge and conduct of scholarly inquiry are central and complementary functions of the University. They can be carried out effectively *only if scholars are guaranteed certain freedoms and accept corresponding responsibilities.* The Senate of the Academic Council of Stanford University hereby affirms the following principles concerning research:

The individual scholar should be free to select the subject matter of his research, to seek support from any source for his work, and to form his own findings and conclusions. These findings and conclusions should be available for scrutiny and criticism as required by the University's "Policy Guidelines on Secrecy in Research."

Research techniques should not violate established professional ethics pertaining to the health, safety, privacy, and other personal rights of human beings or to the infliction of injury or pain on animals.

The University should foster an environment conducive to research. Where, because of limited resources, *the University* cannot support all research demands, it *should allocate space, facilities, funds, and other resources for research programs based on the scholarly and educational merits of the proposed research, and not on speculations concerning the political or moral impropriety of the uses which might be made of its results.*

The above principles circumscribe the University's role with respect to University-connected research. They in no way diminish, and indeed *they reinforce, the individual researcher's personal responsibility to assure* that the *sources of funding* for his research, *and its perceived applications, are consistent with his own judgment and conscience.*

It is the view of a number of the SLAC faculty that their responsibility to assure that the sources of funding for their research and that its perceived applications be consistent with their individual judgments and consciences far from being reinforced (as in the last paragraph of the "Statement of Principles. . . ") has instead been abrogated.

The apparent remedy to what these faculty regard as "involuntary servitude" to a program expressly related to weapons research is to refuse to provide their services to aspects of SLAC which serve SSRL. Not only does this modify their freedom to select the subject matter of their research (in one case a 20-year-long interest), but might be construed as non-performance of academic duty, with possible disciplinary consequences.

This dilemma stems from the particular situations associated with plural research. For example, to what extent does a direct decision made not by a vote of the concerned faculty, but by the laboratory director (or principal investigator), bind individual faculty members?

If a researcher finds certain research personally repugnant, does he or she have an explicit right to refuse involvement, or does such action depend on the pressing requirements of the project, the good will of the director, or the interpretation of a policy written without deep consideration or understanding of the circumstances of plural research? How is "academic duty" defined for a faculty member engaged in cooperative research with other faculty in a laboratory or a large project under a Principal Investigator?

The discussion above indicates why Prof. Kalman and I believe that the current Statement of Principles Concerning Research is not adequate to handle the SLAC-SSRL controversy, and that the inadequacies of the Statement will become increasingly apparent with present research trends. We hope that the Committee on Research will make a searching evaluation of these issues and trends in the coming academic year.

Personnel update

Staff training on choices, changes

Staff Development will present two all-day pilot training sessions on "Choices and Changes: How to Improve Your Life" on Thursday and Friday, July 7 and 8.

Every day each person makes choices that affect their lives—some are positive, others negative.

The purpose of the new program is to help participants identify ways they may be limiting their effectiveness and make positive changes in their lives, both personally and professionally.

The course is especially useful for those who live and work in an environment where change is a constant consideration and who need the ability to make effective daily choices.

The pilot course will require a lot of participation. Not only will staff members leave with an action plan concerning a change they want to make, they will also be asked for feedback.

The two sessions, which will meet from 8:30 a.m. to 4:30 p.m., are limited to 20 participants each day. For enrollment call Bea Tracy at Staff Development, 497-0657.

Follow-up session on supervision set

A follow-up session for graduates of Staff Development courses in Fundamentals of Supervision and Supervisory Problem-Solving has been scheduled for 9 a.m. to noon Wednesday, July 6, in Room 204 CERAS Building.

Discussion will focus on what skills are working for participants and how to communicate with confidence. The leader will be David Wick, the new facilitator of the Fundamentals of Supervision course.

The follow-up sessions will be held about every two months on different subjects. Participants can expect to share their assessments of what was learned in the courses, to discuss what has worked and what has not, to exchange ideas about current supervisory concerns, and to learn new supervisory skills.

For information, call Staff Development, ext. 7-0659.

Foreign language proficiency to be shown on transcript

Future student transcripts at Stanford will note proficiency in foreign languages, the Faculty Senate decided unanimously June 9.

With minimum discussion, the Senate approved recommendations detailing how students could earn this notation.

To demonstrate proficiency in a foreign language, undergraduates should show achievement "roughly equivalent to knowledge an excellent student can be expected to demonstrate late in the third quarter of the third year of study."

The transcript notation was suggested as an incentive to encourage student study of language beyond the level of the requirement adopted by the Senate two years ago.

The procedures were developed by Prof. Carolyn Lougee, associate dean for undergraduate programs in the School of Humanities and Sciences, and representatives of several language departments. They were recommended to the Senate by the Committee on Academic Appraisal and Achievement.

The languages in which students may earn an official notation of proficiency include Chinese, Japanese, French, German, Greek, Latin, Hebrew, Italian, Russian, and Spanish.

Ph.D.orals

TUESDAY, JUNE 21

Fred E. Stanke, electrical engineering, "The Theory of Propagation of Elastic Waves in Polycrystalline Materials for Use in Nondestructive Evaluation," 3 p.m., Appled Physics 200.

THURSDAY JUNE 23

Carlos H. Muravchik, electrical engineering, "Identification of Moving Average Systems Using Feedback Ladder Algorithms," 10 a.m., Durand Bldg., Room 450.

Seven Days in the Life of the World were examined by (l to r) first row: Xioli Qin and Ying-huang Zhu, master's degree students in communication from the People's Republic of China; second row: junior Julie Jacobs, independent major; sophomore Ann Locke, economics and communication; master's degree student Barb Barbara Kelley; third row: master's degree student Jay Framson; Prof. Marian Lewenstein; Karen Dachey, master's degree student from England; professional journalism fellow Mola Olaniyan from Nigeria; back row: Daryn Kagan, sophomore in communication; Bryce McIntyre, doctoral student in communication; and John Hochheimer, doctoral student in communication.

Students, professionals view a week in the world's news

Mixing backgrounds on research projects is nothing new at Stanford University, but a recent media project in the Department of Communication went all the way: it mixed undergraduate with master candidates and doctoral students; it mixed American citizens with foreigners; and it mixed students with media professionals.

The project, "Seven Days in the Life of the World," was sponsored by the Associated Press Managing Editors Association. Prof. Marion Lewenstein, from the Department of Communication, and Robert Cochnar, deputy executive editor of the *San Jose Mercury News*, led the six-month long project which analyzed what "news" happened in the world during the week of Feb. 27 through March 5, and how American newspapers reported that news.

Among this week's news highlights: The Queen of England visited the U.S.; there were elections in Australia and West Germany; the Pope visited in South America; there were disturbances in Zimbabwe and India; and a ferry boat overturned in China, killing some 300 people.

Thirteen people pored over 25 wire and syndicate services that provided news from 225 foreign sources and compared how many of those stories were used in 32 newspapers from across the U.S. In addition, about 25 foreign newspapers were analyzed to see what news they carried that was not sent to the U.S. Over 6,000 stories were analyzed.

Some early findings: government and other media are the most frequently quoted sources in foreign news; American newspapers like to run human interest stories or accounts of terrorism and dissidence in other countries.

Swimming lessons to start Monday

Swimming lessons will be offered in two-week sessions at de Guerre Pools this summer, beginning Monday, June 20.

The program includes eight half-hour lessons Monday through Thursday during each session for anyone over the age of five years, beginners through advanced swimmers.

The cost is $35 per person for each of the four sessions. Full information is available at the guard office at de Guerre Pools or may be obtained from Skip Kenney, men's varsity swimming coach, at ext. 7-4416.

Summer recreation facility schedule

Encina Lockers and Showers: M-F, 7:30 a.m.-9 p.m.; Sat-Sun, 9 a.m.-6 p.m.

Roble Lockers and Showers, Weight Training Facilities: M-Th, 8 a.m.-10 p.m.; F 8 a.m.-7 p.m.; Sat-Sun, noon-5:30 p.m.

Angell Field: Open daily during daylight hours (inner field reserved, call 497-0505).

Taylor Field and IM Fields: Reserved only, call 497-0505.

Olympic Gamefield (starts at Angell Field) and **Perrier Parcourse** (starts near Roble Dorm): Open daily during daylight hours (complete body exercise).

Maples Pavilion: Closed.

Roble Pool (show ID and summer swim cards): M-F, noon-1 p.m. faculty-staff only; M and W, 2-6 p.m.; T and Th 3-6 p.m.; F, 1-6 p.m.; Sat-Sun: noon-5 p.m. Caps required. No children allowed (497-3277).

DeGuerre Pools (show ID and summer swim cards): M-F, noon-2 p.m. faculty, staff, student lap swim; 2-4:30 p.m. swim card holders; 4:30-6 p.m. lap swim only; Sat-Sun, noon-6 p.m. swim card holders (497-2210).

DeGuerre Courts (show ID): (Handball, racquetball, squash) Phone Reservations only 497-1588. Courts: M-Sat: 11 a.m.-7:15 p.m. Closed Sundays. May be closed periodically for maintenance.

Tennis Courts (show ID): Sign-up sheets for the next day's play are posted on each court bulletin board at the following times: Encina Courts, 8:30 a.m.; Roble Courts, 8:30 a.m.; Varsity Courts, 5:10 p.m. (Roble Courts are reserved M-F noon-1 p.m. for faculty-staff only.)

Encina Weight Room (show ID): M-F, 10 a.m.-2 p.m. and 4-8 p.m.; Sat-Sun, noon 5 p.m. (497-9993).

Encina Volleyball Courts: Daylight hours.

Roble Field: Check schedule at Roble Office (497-4895).

Roble Gym Floor (show ID): Recreational basketball only: MWF, 1-3 p.m.; TTh, 12-3 p.m.; recreational badminton only: F, 4:30-7 p.m. Open recreation: MW, 3-7 and 9-10 p.m.; TTh, 3-6 p.m. and 8-10 p.m.; F, 8 a.m.-noon and 3-4:30 p.m.; Sat, 2-5:30 p.m.; Sun, noon-5:30 p.m.

Roble activities rooms, #33 and #42 (show ID): Check schedule at Roble Office (497-4895).

Golf Course (show ID): Golfers must obtain starting times in person at the Pro Shop. For information, call 497-4334. T-F, First available starting times; Sat-Sun-Holidays, first available starting times after 11 a.m. Closed Mondays.

Golf Course Driving Range: M-F, 8:30 a.m. to one hour before dark; Sat-Sun-Holidays, 7 a.m. to one hour before dark.

Harwood responds to Grey's letter. . .

continued from page 17

possible. That's hardly the time for a peaceful boycott.

A man who maliciously yells "fire" in a crowded theater is not protected by the First Amendment just because he omitted to specifically instruct the audience on how they should trample one another to death. Most revolutionaries have enough low cunning to avoid giving the kinds of specific instructions to commit violence and mayhem that would ease the prosecutor's proof burden in a criminal court.

No legal machinery, even in a democracy like our own, can achieve perfect justice or guarantee a correct verdict every time. Verdicts that simple moral decency and common sense would dictate don't always get the nod from the bench. The fact is that the legal technicians, the client's partisan advocates, do on occasion win cases they ought not to just as, I'm sure, they must on occasion lose some that they should have won. In a democratic society we are obligated to live with the result. But we are under no obligation to conclude that a victory won for a client vindicates the claims of legal principle made by himself or his advocates.

In Franklin's administrative hearing, Franklin might conceivably have won on some technicality or other. That he didn't win is Stanford's good luck. But even if he had won, it would not necessarily have been a victory for "academic freedom" or "free speech" on campus. To the contrary, from all that we know about the climate of terror that Franklin helped to instigate, it could very well have been a grave tragedy. And, instead of just injuries and property damage, homicide might have followed in their train.

A final note. I wasn't in the least annoyed by the intemperate way in which Prof. Grey responded to my article. I was, however, much piqued by what he said in his closing paragraph.

He suggests that Stanford might be just as well off without Hoover as it probably is without Franklin. If Prof. Grey meant to imply that the conduct of myself and other Hoover Fellows is in any way comparable to Bruce Franklin's, then I want to register my profound disgust and dismay at a comparison that is not only patently ludicrous but highly offensive as well.

□ **NOW:** Summer rent. Alpine Meadows, Tahoe, 3BR/1½BA cabin, W/D, phone, sleeps 10. $180/wk. Call 493-4139, eve.

□ **June 11 for 1 yr:** 1BR furn apt., walk to Stanf/Med Ctr, shops, theaters, restaurants. Pool, jacuzzi, sauna, lndry. $550/mo. (415) 538-9444, early a.m., late p.m., (408) 335-3597.

□ **Regularly avail:** 1 & 2BR furn & unfurn apts. & twnhses, & 3BR/2BA hses in Palo Alto & Menlo Pk. in good nghbrhds. Close to campus. No fee. $595 to $1200/mo. Call Shirley, 856-6049.

□ **Beg. Aug. '83:** Crescent Pk, Palo Alto, 3BR/3BA, new ktchn, DR, fenced yd, piano, W/D, Mediterranean style hse. $1590/mo, incl. grdnr, water. Call COLLECT (602) 299-4499.

□ **NOW:** SHARE: Young single woman seeking M/F nonsmoker for 2BR/2BA lux. condo in Old Mill complex. AEK, secure bldg. Elevator, pool. Call Leslie, 948-6185, eve.

□ **Beg. Aug. 10:** Fully furn 1BR apt. in triplex. On Alma St. in Palo Alto. Priv. patio. $675/mo. Call 856-6049.

□ **Beg. June 16 (flex):** Unfurn. Palo Alto hse, 2BR/2BA, LR/DR w/brick frpl; FR can be 3rd BR. Yd, terrace, carport, wrkshed. Remodelled AEK ktchn, w/dw. $1150/mo incl grdnr. Call 856-6049.

□ **Beg. Sept. 1:** Palo Alto unfurn hse, 3BR/2BA, lrg. yd, patios, 2-car gar., frpl. 2 mi. to Stanf. $1200/mo. Call 856-6049.

□ **June 16:** Fully furn 2BR apt in 4-plex. 100 El Carmelo Ave., 2 mi. to Stanf. Coin lndry, yd., carport w/bike stor. $750/mo. Call 856-6049.

HOUSING NEEDED

□ **Beg. Aug. 1 (flex):** Responsible family of 4 willing to hsesit any time after beg. Aug. Local refs avail. Call COLLECT (202) 363-0558, Wash. DC.

□ **Sept. '83 to May '84:** Visit. prof. on sabbat. at Stanf. & spouse w/dog, seek furn. 2BR hse in P.A., Menlo Pk, Stanf. Nonsmokers. Call COLLECT (413) 367-2286 (home), (413) 545-0685 (work), Amherst, MA.

□ **Summer '83; 3 to 4 wks:** Seek hse w/pool on or nr campus. Local refs. Call J.M. Gallagher 981-6911 or (415) 751-3600, eve.

□ **Beg. Sept. '83 for 8-10 mos:** Visit prof from Israel with wife, children, 5 & 2, seeks hsng nr Stanf, Esc. Vill. Call 497-4786.

□ **Academic yr. '83-'84:** Visit fac. mbr & fam. seek furn 2-3BR apt. or hse. Call Ron Oaxaca, (602) 621-6224 or (602) 745-1796.

□ **Beg. Sept. 1, '83:** Prof. & wife seek 2BR apt or hse nr campus. Call Linda Heider, 497-4440, day.

□ **June 15 to Sept. 15 (flex):** Reliable missionary cpl on lv from Philippines seeks 1BR furn apt or will HOUSESIT. Call Lori, 324-5729, day; 321-0237, eve.

□ **Summer live-in:** French youth, 19, son of Visit. Prof. Berkeley, seeks summer live-in w/family in exchange for supervision of children over 6. Call Loftis, 325-7293 or Martinet, 549-2312.

□ **Aug. 15 (flex) for 1 yr:** Univ. of Ill. prof, wife, 2 well-behaved children, 14 & 16, seek 3BR, furn hse. Pref. nr Stanf. in Palo Alto sch. dist. Careful, considerate, nonsmokers, no pets. Local refs. Can pay $900 to $1100/mo. Call COLLECT (217) 351-9881.

□ **NOW:** Long term, hsesit or or work/rent exchange. Dr's wife w/local refs. Meticulous caretaker. Call 326-8880, Marjorie Pryor, or lv. message.

□ **July 16 to 31:** Reliable nonsmoking prof. & wife seek apt. or hse. Call (415) 922-4640, eve.

□ **Sept. '83 to Sept. '84:** Visit. prof. & wife wish to rent small furn. hse or 2BR apt. Pref. nr. Stanf. Call (415) 859-5105 or 326-0537.

□ **Beg. early July:** Stanf. staff mbr. wants studio for 2, Palo Alto area, w/College Terr. or dwntwn pref. Local refs. Call Donna, 497-3967, day.

□ **Mo. of Aug. '83:** French scientist seeks EXCHANGE for apt. in Paris. Furn, quiet st. 15th Arrondissment, Nr Institut Pasteur, Volontaires metro. Top flr, 6-flr. bldg (no elev). Dbl. LR, 1BR + xtra rm. Or will rent for $600/mo + $200 refundable dep. Call Dr. Brutlag, 497-6593 or write Dr. Maurice Hofnung, Institut Pasteur, UPMTG, 28 rue Dr. Roux, Paris, 75015, France. Call 1 306 19 19, X2156.

□ **Sept. 25 to Mar. 25, '84 (flex):** Visit. Canadian physician & wife seek 1BR or 2BR furn apt, small hse or HOUSESIT position. Prefer within 10 min to Stanf. Med Ctr. Refs. avail. Call (403) 432-3912, day; (403) 439-5135, eve.

□ **Aug. or Sept:** Female post-doc & dghtr, 12, seek quiet, inexpensive apt. or shared hse nr. campus. Write J. Carey, 805 W. Stoughton Ave., Urbana, IL 61801.

For $6 your brief housing ad will appear in two issues. Make the check out to SCHOA and send it with your ad to the Rental Housing Listing Service, P.O. Box 7772, Stanford, CA 94305. The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414.

Another of Rodin's burghers invites attention from passersby

CHUCK PAINTER PHOTO

Help wanted in rental listings

The service is seeking a second person to help with listings which appear weekly in *Campus Report*.

Simple bookkeeping, typing and telephoning skills are required.

The job pays $6 an hour, and when shared, needs a time commitment of five to seven hours weekly. Most of this is Wednesday through Friday, plus being available at a phone certain days of the week.

If you are a campus resident interested in such a partnership, please write SCHOA Rental Housing, Box 7772, Stanford, Calif. 94305. Or call Dorothy, 857-0414.

Summer bowling leagues to form at Tresidder soon

The Recreation Center in Tresidder Union will offer five summer bowling leagues beginning the week of June 20:

Mondays—Friendly Fours: Bowl on a four-person mixed team for 10 weeks. League starts June 20 and bowls at 6 p.m.

Tuesdays—Bowl for Lunch Bunch: Bowl with a partner at 12 noon. League starts June 21 and bowls for eight weeks.

Tuesdays—Mixed Trios: Bowl on a three-person mixed team at 7:30 p.m. starting June 21.

Wednesdays—Wednesday Fours: Bowl on a four-person mixed team, starting June 22. League starts at 7 p.m. and bowls for 10 weeks.

Thursdays—Stanford Hospital League: A four-person mixed team league from the hospital. Bowl at 5:30 p.m. for 12 weeks.

All of the leagues are handicap and include three games per week, except for the lunch league which bowls just two games each week. The cost is $3.30 per week plus an additional trophy fund.

Interested people should come to the organizational meeting for the league of your choice. You may sign up at the Recreation Center as a team or individually. For more information call 497-4316.

Join the joggers at Tresidder—free

The Tresidder Union Recreation Center invites students, faculty, staff, and visitors—beginners as well as runners of all abilities—to join the regular summer jogging program.

Morning runs begin at 7 a.m. Tuesdays and Thursdays, with afternoon runs scheduled for 4:30 p.m. Mondays and Wednesdays.

The runs, led by Stanford junior Chris Rodriguez, will last approximately one hour and will cover a variety of courses around the Stanford campus. Runners should meet at the entrance to Tresidder Recreation Center for each session.

There is no charge for any of the runs. For more information call the Recreation Center at 497-4311.

Vintage Brass Ensemble, l. to r.: Philip Zahorsky, Skip Wagner, Larry Osborne, David Burkhart, Steve Kohlbacher.

Vintage Bass Ensemble plays June 24

Stanford's Department of Music will present the Vintage Brass Ensemble in concert at 8 p.m. Friday, June 24, in Dinkelspiel Auditorium on the Stanford campus.

Founded in 1974, the brass quintet consists of David Burkhart and Skip Wagner, trumpets; Steve Kohlbacher and Philip Zahorsky, trombone; and Larry Osborne, horn.

They will perform *Rondeau from Premiere Suite* by Mouret, *Two Fantasias a 5* by Coperario, *Concerto* by Vivaldi-Bach, *Suite from the Music for the Royal Fireworks* by Handel and, after intermission, some contemporary works: *Scherzo for Brass Quintet* by Pilss, *Music for Brass Instruments* by Dahl, *A Tribute to Duke Ellington*, the Beatles' song *Penny Lane*, and *Star Wars* by John Williams.

Burkhart teaches trumpet at Stanford. Formerly principal trumpet with the Jerusalem Symphony and San Jose Symphony, he currently plays principal trumpet with the Oakland Symphony.

Wagner is a member of the San Francisco Ballet Orchestra and principal trumpet with the Midsummer Mozart and Cabrillo Festival Orchestras.

Osborne, formerly a member of the San Francisco Opera Orchestra, is currently a tenured member of the San Jose Symphony.

Kohlbacher toured world-wide and recorded with the Woody Herman Orchestra, and now freelances with the San Francisco Opera, Ballet, San Jose, and Oakland Symphony Orchestras. He also has a tenured position with the Santa Fe Opera Orchestra.

Zahorsky is bass trombonist with the San Jose Symphony Orchestra and has performed frequently with the San Francisco Symphony Orchestra. He is director of bands at Ohlone College.

Tickets for the June 24 concert are $4 general, $2 students and senior citizens, available at Tresidder Ticket Office (497-4317) and the door.

Group tennis lessons

Small group tennis lessons will again be offered to staff and-or their families on weekdays or evenings. Players are grouped by ability in these lessons taught by Dick Gould's staff.

Call 497-1160 on weekday mornings to receive detailed printed information and registration form.

Hutchings opens summer concerts

Pianist Virginia Hutchings will open the Stanford Music Department's Summer Session concert series at 8 p.m. Tuesday, June 21, in Dinkelspiel Auditorium. She will be a visiting assistant professor here from Stetson University for the Workshop on Baroque Music and Dance, June 20 to July 1.

Hutchings' June 21 concert will include Rondos in A minor and D Major by Mozart, Bach's *Partita No. 4 in D Major*, and *Sonata in E Major, op. 109* by Beethoven.

Hutchings holds a master's degree from Juilliard, where she studied with Rosina Lhevinne. She has received grants from the Martha Baird Rockefeller Fund and the Institute for International Education, and is winner of the Friday Morning Music Club National Piano Competition in Washington, D.C. and the Busoni International Piano Competition in Bolzano, Italy.

She has performed throughout the U.S. and Europe, including the Bar Harbor Festival in Maine, International Bach Society concerts at Lincoln Center, a *lieder* recital with Tatiana Troyanos in Paris, and radio and TV appearances in Italy and the U.S.

Hutchings made her New York debut at Alice Tully Hall in 1977, and soloed with the Atlanta Symphony under Robert Shaw in 1977.

Tickets for her June 21 concert are $4 general, $2 students and senior citizens, available at Tresidder Ticket Office (497-4317) and the door.

Jeanne Lee

Jeanne Lee to give free recital

Pianist Jeanne Lee, a graduate student in the Department of Music, will present a free evening of romantic music at 8 p.m. Saturday, June 25, in Tresidder Lounge.

Lee will perform Chopin's *Sonata No. 3*, selections from Schumann's *Waldscenen* (Forest Scenes), and *Sonata in B minor* by Liszt. She studies at Stanford with Naomi Sparrow.

Lee studied piano at Juilliard with Beveridge Webster for seven years and also received a degree in chemistry from Columbia University. She has soloed with Boston, Portland, and New England Symphony Orchestras and given solo recitals in Boston's Gardener Museum.

Lee is married to Stanford Ph.D. candidate in electrical engineering, Youm Huh.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., June 15, to cover the week of Mon., June 27, through Sun., July 3. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

WEDNESDAY, JUNE 22

Physicians for Social Responsibility: "In the Nuclear Shadow, What Can the Children Tell Us?" presented by Ian Thiermann, open to the public. 7:30 p.m. M-116, Medical School.

STARTS Speaking Jazz Lecture Series: "Ivory Expedition, Multi-Keyboard Applications and Approaches to Improvisation and Modern Chord Voicing," by Tom Coster, columnist for "Keyboard Magazine and currently touring with Santana. 7:30 p.m. Tresidder Union. $3 admission, $25 for 10 week series.

EXHIBITS

Chicanos in California: Organization, Politics & People. An exhibition selected from the Chicano Manuscipt Collection, Dept. of Special Collections. 8 a.m.- 5 p.m. . Louis Lurie Rotunda, Green Library. April 25 - June 30.

The Stanford Quadrangles: Design & Construction. An exhibition of materials relating to the early planning, development and construction of the university; compiled from the resources of the University Archives. Second floor gallery, Green Library. May 23-July 28.

Arthur Schnitzler 1862-1931, Documentary Photo Exhibition. Cecil H. Green Library, West Wing Corridor. May 23-June 30.

Boris Ilyin, exhibition of recent oil, acrylic, & watercolor paintings. Reception, Friday, June 10, 5-7 p.m. Bechtel International Center. June 3 - June 30.

"Propaganda Posters of Two Revolutions". Features over 40 posters from the Russian Revolutions and Civil War, 1917-1922, as well as the German Revolution of of 1918-1919 and the German elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover Memorial Exhibit Pavilion. June 8 - Aug. 31.

Graphic Artists Work. The work of Tresidder's Marketing Dept. staff - see the process involved in creative advertising as well as cartoons and graphic design work. Upper Lobby and Coffee House Galleries of Tresidder Union. June 16 - July 3.

CAMPUS REPORT

Volume XV, Number 38 | A publication for Stanford University faculty & staff | June 22, 1983

Senate discusses academic freedom in large-scale research

Stanford faculty will take a new look at how to reconcile the academic freedom of individual researchers with the requirements of large-scale research next fall.

The issue of "involuntary servitude" surfaced early this year when 15 faculty and 180 staff members at the Stanford Linear Accelerator Center made public their opposition to a weapons-related research proposal at the Stanford Synchrotron Radiation Laboratory.

No decision has yet been made on the proposal, which is unclassified.

SLAC provides the beams used by SSRL.

Attempts to block the research on the basis of its proposed end-use in nuclear weapons testing have been strongly opposed by Stanford President Donald Kennedy. His position was upheld in a 7-2 vote of the Committee on Research, which reaffirmed that research projects should be judged on scientific merit, not potential applications.

On Thursday, June 9, the Faculty Senate voted to receive the committee report. Simultaneously, the Senate instructed its Steering Committee to draft a new charge to the committee next fall, trying to focus issues raised by the SLAC protest more clearly.

"It's a truly thorny issue," SLAC Prof. Edward Garwin said after the Senate action. "I don't necessarily believe that a certain group of faculty should be able to 'veto' a certain research line." On the other hand, individual faculty should not be required to work on large projects which they find morally repugnant.

Graduate students also should have an opportunity to fully understand the nature of projects in which they are involved, he added. Where they can obtain statements to the funding agency from their principal investigator, they have been denied access by the agencies to work unit statements.

continued on page 13

Alternatives to TIAA—CREF will be available this fall

Stanford faculty should have three or four alternatives available to TIAA-CREF for retirement planning by September, Provost Albert Hastorf told the Faculty Senate June 9.

Jeannie Thomas, manager of benefits, said the University is now in "final negotiations" with three mutual funds and one insurance company.

Those eligible should receive detailed information by Labor Day, she added.

While disclosing no names, she said all four firms were accustomed to working with retirement plans and offered some "pleasant improvement" in investment performance and flexibility for individual planning.

They also are characterized by more frequent communication, in very clear language, with their customers, Thomas noted. The Teachers Insurance and Annuity Association and College Retirement Equities Fund have long dominated the college market.

The University currently requires a five percent contribution toward TIAA-CREF through voluntary salary reductions for employees to qualify for an additional 10 percent contribution to those plans by Stanford.

In a report issued a year ago, a task force headed by Prof. Kenneth Scott, law, recommended that the University offer three or four alternatives to TIAA-CREF and drop the matching contribution requirement.

Responding to Senate questions, Hastorf said participation in the present program is "not high" among those under age 35, but approaches 90 percent among those over 35 and is even higher among those over 45.

The task force report said nonparticipants included at least 50 percent of the assistant professors and 20 percent of associate professors.

While setting aside about 15 percent of

Down in the trenches, a new communications project starts

Stanford plans a $22 to $26 million modernization of its telephone and electronic communications systems on campus.

Replacement of the present telephone system will account for more than half the total, an estimated $12.5 to $14.5 million, including a new Telecommunications Building near the present Central Energy Facility.

Other elements in the Electronic Communications Media Project include the Stanford University Network (SUNet), currently projected at $3.5 to $5.5 million; a distribution system for the telephone, SUNet, and other communication system needs, estimated at $4.3 million; and an energy management and control system, projected at $1.6 million.

At their June 10 meeting, the Board of Trustees approved the $4.3 million distribution system, which will include nearly seven miles of trenching to accommodate nearly 57 miles of four-inch diameter conduit.

"The existing underground conduit system is extremely congested," a report to the trustees noted. "Many places on campus cannot support even current requirements for new underground cabling."

The expansion of underground conduit and manhole facilities will support voice, data, and video communications. By starting construction before the rainy season, parts of the system considered critical to SUNet can be built before winter.

The new telephone system is expected to result in significant savings in annual operating costs. "The current Centrex features and services are the poorest available on the market and among the most expensive," the report notes.

"Modern switching equipment will

Stephen Harris

Prof. Stephen E. Harris, electrical engineering and applied physics, has been named director of Ginzton Laboratories at Stanford for a three-year period, effective Sept. 1, Vice Provost Gerald Lieberman, dean of graduate studies and research, has announced.

He will succeed Prof. Anthony E. Siegman, electrical engineering and applied physics, who has served as director since 1978.

"Steve will have a hard act to follow, as Tony has proven himself to be a true academic statesman, representing the interests of not only Ginzton Labs, but of University-wide research policies and practices as well," Lieberman said.

Harris has an outstanding track record of research achievements including:

The first demodulation of frequency-modulated light;

The invention of FM laser;

The development of the first synthesis technique for birefringent optical filters;

The first observation of optical parametric spontaneous emission;

The operation of the first visible CW optical parametric oscillator;

The invention of the tunable acoustoptic filter;

The operation of the first electronically-tunable laser;

The invention and demonstration of generation of ultra-violet light by phase matched third harmonic generation in metallic vapors, and the use of this radiation to take the first hologram in the vacuum ultra violet.

His recent interests have been in the areas of selective laser-induced inelastic collisions, and in the development of new techniques for generating vacuum ultra violet and soft x-ray radiation.

Harris earned his Bachelor's degree from Rensselaer Polytechnic Institute, and his Master's and Ph.D. from Stanford, all in electrical engineering. He has been on the Stanford faculty since 1963 in electrical engineering and, since 1979, in applied physics.

He has received the Alfred Noble prize from the American Society of Civil Engineers, the Curtis McGraw Research Award of the American Society for Engineering Education, and the David Sarnoff Award of the Institute of Electronic Engineers.

Harris received a Guggenheim Fellowship in 1976, was elected to the National Academy of Engineering in 1977, and the National Academy of Sciences in 1981.

I appreciate Tony Siegman's many contributions as Ginzton's Director and welcome Steve Harris as Tony's successor.

Steven Chaffee

Prof. Steven Chaffee of the Stanford Department of Communication has been elected one of 16 fellows of the International Communication Association.

Emeritus Prof. Nathan Maccoby and Prof. Everett Rogers also are ICA fellows.

Besides Chaffee, those elected fellows this year were Dr. Randall Harrison of UC-San Francisco, an occasional lecturer in the Stanford Department of Communication, and Bradley Greenberg of Michigan State University, a postdoctoral fellow at the Stanford Institute for Communication Research in 1962-64. Chaffee is director of the Institute.

ICA is an academic association of some 2,200 members, most of them professors and scholars in fields such as mass communication, interpersonal communication, and organizational communication.

Fellows are elected primarily on the basis of scholarly contributions to the study of communication, and also on the basis of service to the Association. Maccoby was president of ICA in 1974-75, Rogers in 1980-81, and Chaffee in 1981-82. Election is by the Association's board of directors, upon recommendation of a committee composed of those who have already been elected Fellows.

ICA's convention next year will be held at the San Francisco Hilton May 24-28.

David Wick

David Wick, who was a management development specialist at Levi Strauss and Co. before coming to Stanford in January, is now facilitating the Fundamentals of Supervision course for Staff Development.

Wick has a B.A. in psychology from the University of Arizona, a master's degree in communication from San Jose State University, and did further graduate work in public service administration at the University of San Francisco.

He currently is vice-president of the Golden Gate chapter of the American Society for Training and Development and cofounder of its newest special interest group—Organization and Societal Transformation. The group is involved in understanding the functions of the brain in reaching an individual's highest potential, and how this affects organizations and groups.

Wick also has been for three years a cofacilitator with Dr. Jerry Jampolsky at the Center for Attitudinal Healing in Tiburon.

Valana Wells

Valana Wells, a Ph.D. student in Aeronautics and Astronautics at Stanford University, will receive one of the 1983-84 Zonta Amelia Earhart Fellowship Awards.

The $5,000 grant, offered annually to women qualified for graduate study in aerospace related science or engineering, memorializes Zonta International's famous member and air pioneer, Amelia Earhart, who disappeared over the Pacific Ocean in 1937.

Ms. Wells, of Mountain View, Calif. will use her third Amelia Earhart Fellowship to complete her Ph.D. thesis research on "Unsteady Effects of Propellers in Non-Uniform Flows." Her work is designed to provide a tool for the aerodynamic analysis of propellers behind wings and behind airplane bodies and-or tails (as in the Lear fan jet).

She has designed and begun to build an ultra light, personal recreational airplane with several Stanford colleagues which she sees as "a way to directly influence the efficiency and safety of general aviation aircraft." She expects to have a career which combines her enthusiasm for design with academic teaching.

Zonta International is the worldwide classified service organization of executive women in business and the professions. Since the establishment of the Awards in 1938, a total of 217 women from 32 countries have been named as Amelia Earhart Fellows.

Eleanor Worden

Eleanor Worden, assistant dean of admissions and financial aid for the School of Education, was honored by students on June 1, when they presented her with a plaque and a bouquet "in appreciation of her outstanding contribution to the students of the School of Education."

Joel Samoff

Prof. Joel Samoff received this year's School of Education excellence in teaching award.

Samoff is described by his students as "an extraordinarily dedicated teacher who is able to initiate a real dialogue between students and teacher; he respects students' opinions and views but pushes them to be critical and analytical; a tireless teacher, always available and helpful."

Samoff is a political scientist with special interests in the political economy of underdevelopment, primarily Africa. He has been with the School since 1980.

Mili Mosher

Mili Mosher is the Controller's Office's new assistant controller for expenditure operations, responsible for University expenditure departments, including Payroll and Accounts Payable.

For the past 12 years Mosher has been director of finance and administration at the Institute for Medical Research, Santa Clara Valley Medical Center, San Jose. She had previously worked as an accountant at the University of Oregon and at Des Moines General Hospital in Iowa.

Mosher has an MBA from the University of Santa Clara, and is a member of Beta Gamma Sigma, an honor society for outstanding students of finance. Her BA degree is from the University of Redlands.

Mosher set a milestone for women in 1980-82 by holding office as vice-president of the Association of Indpendent Research Institutions—the first woman officer in the history of the 25-year old national organization. She has also served on the board of directors of the University of Santa Clara MBA Alumni Association, and of the Children's Health Council.

Adolph Baller, a pianist for nearly 70 years, plays in his studio

Adolph Baller's hands survived crushing by Nazi jackboots

BY DONALD STOKES

Adolph Baller was an infant prodigy at the piano and today, nearly three-quarters of a century later, his hands still possess their magic.

He is teaching a dozen advanced students at Stanford, where he has been on the faculty for 20 years. He guides other pupils in his private studio at his Palo Alto home. His students include a number of noted musicians who are themselves concert pianists or music teachers. Some travel long distances to study under him.

For more than 30 years Baller has been a leading influence in the Peninsula world of music. He was a cofounder of the well-known Alma Trio, and was one of its mainstays for 40 years.

Baller is a cheerful, white-haired man of decided opinions, which he expresses with happy vehemence. Nearly 74 years old, he talks objectively of how musical genius can sometimes last into old age.

"Some musicians play better as they grow older. I heard Arthur Rubinstein play when he was 90, and he was incredible, far better than he had been when younger."

Baller's powerful hands, which have played as many as 300 concerts a year, were almost lost to the world in a ghastly scene during the eruption of Nazism. The precious fingers were deliberately stomped on by jackbooted Nazi thugs. Only a miracle of skillful and loving care saved the hands for the music-lovers of the world.

Baller was attacked by the thugs because he was a Jew. He was born in Brody, Galicia, at a period when that part of Poland was in the former Austro-Hungarian Empire.

When he was still a small child an uncle, who was a composer and singer, showed him how to read music. Within a short while he had gained a reputation as a prodigy on the piano.

At the age of eight he was taken to Vienna, where he studied music with a former student of Liszt. Within five years his powers had developed so remarkably that he performed as a soloist with the Vienna Philharmonic. His name became known throughout the world of European music. He gave recitals on tours all over the Continent.

When he was still in his 20s his name was included in those of the first rank in playing. Then came the foul tide of Nazism which spilled into Austria from Hitler's Reich.

In April 1938, soon after the Nazis had bullied their way into Austria, Baller was attacked by Nazi stormtroopers. They asked him if he was Jewish, and he said he was. They thrust him in an auto and proceeded to beat him up sadistically, pounding his face till his eyes swelled shut.

He was taken to a country estate, hauled into a room that was stained by blood on the floor and furniture. He was stripped, mercilessly clubbed and kicked. His kidneys were ruptured.

Worst of all, in Baller's frantic mind, he suffered the agony of his fingers, on which his artistry depended, being stomped by hobnailed boots, until the bones were broken. While they systematically beat him into unconsciousness, the thugs smoked cigarettes and stubbed them out on his skin.

They would probably have killed him, but they saw from his passport that he was a Polish citizen, and they may have feared international repercussions, or the anger of their own superiors. When they were sated the attackers dumped him in the basement and left him there for the night.

In the morning they stood over him again and forced him, with his broken hands, to clean their boots.

Only two hours later some other men he had not seen before came in and treated him with comparative respect. They used clumsy words to try to make him feel better: "This is war, and you have suffered some wounds of war."

He was released shortly after that, and taken back into the city. Later, he learned that his fiancee, Edith Strauss, had secured the help of the Polish Embassy, which made vigorous representations to the Nazi leaders. The resulting rapid inquiries soon revealed what had happened to the young man.

Baller was treated in a hospital, but even there the fear of the conquerers of Austria was so great that he was asked to report that his injuries had come from falling downstairs.

Baller is fervently grateful to the doctor who decided that the fingers should not be put into casts, as that would have made them permanently stiff. Instead, the doctor introduced a painstaking treatment by massage. Very slowly, as the broken bones healed, there was patient kneading of the damaged tendons and muscles.

His fiancee played an important role in the healing of the injured hands. She was at his side all the time, helping in the delicate work of recovery.

In retrospect, Baller does not think he was deeply worried whether his hands were ruined for playing; he had the confidence of youth. Both he and Edith were aghast, however, at the growing ugliness of the Nazi menace.

It was obvious that they had to try to escape from the looming danger. Jews were being hounded and abused, and many were rounded up for dispatch to destinations nobody could guess, but which the world was shocked to learn later. The ovens were being constructed with German efficiency in places like Auschwitz.

The chance fact that he had been born in a

Baller/ continued from page 3

foreign country may have saved Baller's life. As he had a Polish passport he was able, unlike most Austrian Jews, to leave the country. He and Edith escaped into Hungary where they were married. They managed to slip over another border, into Yugoslavia, then a pro-Western monarchy.

From here they secured passage by ship to the U.S., where they landed with hardly a penny between them. They found a refuge with relatives. Baller soon found a job with WQXR radio station New York City as a pianist—those were the days when major radio stations maintained orchestras.

He came to California in 1941 as guest of the famous young violinist Yehudi Menuhin, on the latter's Alma estate near Los Gatos. The two men formed a concert duo and toured together. They played far and near for the armed forces, including the Aleutians and the South Pacific.

Baller was named an Army colonel, as a precaution in case of his capture by the enemy.

In 1943 Baller joined with other musicians in trio playing, and this was the nucleus of what became the Alma Trio. The cellist was Gabor Rejto, Baller the pianist, and Roman Tothenberg the violinist. Later Andor Toth, today on the Stanford faculty, became a member of the Trio.

At the end of the war Baller received the devastating news that his entire family had been murdered by the Nazis. His mother, his two sisters, and his brother, together with an uncle, had been shot and shut into their house which was then burned to the ground over them.

Baller's voice dropped as he said, "They were burned alive." The pain was clear on his face.

"Like so many others I hoped that when the world war ended we would never again see human bestiality. But it is happening all over again."

For several years after the end of World War II Baller toured the world extensively playing to enthusiastic audiences. However, he found himself drawn increasingly to playing with the Alma Trio and he devoted himself to the group more and more. Eventually he played with the trio fulltime, and shared the growing praise for its smooth balanced playing and exquisite sound.

Baller has now been teaching music at Stanford for 20 years. He is impressed by the high quality of many of the pianists who have passed through his tutelage. "There are so many fine ones."

The last great composer was Gustav Mahler. The best composer of the 20th century was Bela Bartok. Except for the early compositions of Stravinsky, there has been very little since.

—Adolph Baller

At this time he has 12 advanced students in his Stanford class. Many of them perform in master's recitals. All of them speak warmly of their tutor.

"A wonderful man and a wonderful teacher," says doctoral student Nicholas Isaacs, who comes from England. "He is acutely sensitive to the qualities and needs of his students. When he plays you know immediately that you are in the presence of a master."

"He creates an atmosphere that makes you want to play for him," says doctoral student Kay Bedenbaugh, "there is a sense of sharing music."

The Ballers bought their Lowell Avenue home in 1950 when he decided to cut down on his touring schedule and concentrate more on teaching. He has two pianos in his studio, a Yamaha for practice and a Bosendorfer for performance.

He is so busy that very often the only time he can find to practice is after 10 p.m. when the last student has left. Then the magic hands play again.

He is strongly critical of modern music. "A Chinese philosopher once said, 'Show me the music of a country and I will show you its political situation.' When you try to listen to contemporary music. . . . He made a shrug of disgust.

"Think of the Brandenburg Concerto, which had been 'entertaining' music, think how much is conjured up by the waltzes of Strauss—then think of rock and roll." He grimaced as if in actual pain.

"Thousands of young people go to these gatherings, I can't call them concerts. They fight, they take drugs, they are like animals, sometimes people are injured, even killed. Nobody listens. There is just a great noise. The entertainers—I won't call them musicians—look like cannibals. So you have it. This is our 20th century."

He turned to avant-garde music. "Noise, chaos!! It has no future whatsoever."

He recalled how his teacher, the great European musician Hugo Kauder, once wrote scornfully of "modern" music, not modern in the sense of being typical, but as applied to music of a particular nature.

"Kauder wrote 'Nietzche was the first to recognize 50 years ago the sign of this time and to call it by its name: it is *nihilism*, that is, the highest values lose value. Where however there are no highest values which are generally believed in and honored, there are, in life as in art, no generally valid bonds, no generally acknowledged forms and formal principles.' "

Baller recalled another sad verdict by Kauder: " 'All this so-called "music life" for a long time now has been a mere dance of death. Yet I mean that in no way pessimistically; only that which vanishes anyway is dying, like the life of nature in winter, and it is now winter in spiritual life; but this too has in the darkness under the frozen surface its guardians and preservers of warmth and light.' "

Baller was asked whether he liked any music written in this century.

"The last great composer was Gustav Mahler. The best composer of the 20th century was Bela Bartok. Except for the early compositions of Stravinsky, there has been very little since."

What about electronic music?

"Absolute chaos. You cannot class it as music at all. As for other modern music Schoenberg was a worthy man, but his new system started off wrong and never went right. Today's self-styled composers actually look down on the masters of the past, because to justify what they are doing, they have to. This is a reflection of a sick society."

A look of surprise spread on his flexible features: "Sometimes I meet perfectly nice people who are engaged in this modern stuff. Why? It is utter lawlessness!

"Everything has to follow natural laws—in science, in people, and also in music. Must follow its own laws."

An interviewer suggested that there is not a large listening public for modern music, that even on campus it was difficult to draw audiences for those sorts of programs.

Baller shook his head: "That may be, but some of these modern composers are very well off, far more than many of us. They cater to the trendy."

His whole frame took part in remembered laughter: "There was a modern group that played a composition called 'Noise.' Can you imagine? It was so horrible that half the audience got up and left."

Supreme Court, other clerkships claimed by law grads

Two 1982 Stanford Law School graduates have been named to U.S. Supreme Court clerkships for 1983-84 and 33 members of the Law School Class of 1983 have been accepted at other judicial clerkships for the coming year.

Glen Nager of Houston, Texas, has been selected as a clerk for Justice Sandra Day O'Connor of the U.S. Supreme Court, while Anne Durand, of Albuquerque, N.M., will be a clerk for Justice Harry Blackmun.

U.S. Court of Appeals clerkships will be filled by 20 graduates in the Class of 1983:

Hugo Black III of Miami, Fla., for Hon. Patrick Higginbotham, 5th Circuit, Dallas, Texas; Nelson Cunningham of Panama, Republic of Panama, for Hon. James Hunter III, 3rd Circuit, Philadelphia, Pa; Stephen Easton of Thief River Falls, Minn., for Hon. Joseph Sneed, 9th Circuit, San Francisco, Calif.; Michael Gennaco of Glendale, Ariz., for the Hon. Thomas Tang, 9th Circuit, Phoenix, Ariz.; Robert Gordon of Chicago, Ill., for Hon. Walter Cummings, 7th Circuit, Chicago, Ill.; Robert Hawk of Dallas, Texas, for Hon. Irving Goldberg, 5th Circuit, Dallas, Texas; Mark Hersh of Skokie, Ill., for Hon. Joel Flaum, 7th Circuit, Chicago, Ill.

Walter Johnson of San Mateo, Calif., for Hon. Proctor Hug, Jr., 9th Circuit, Reno, Nev.; Walter Kamiat of New York, N. Y., for Hon. J. Skelly Wright, D.C. Circuit, Washington, D.C.; Michael Klarman of Baltimore, Md., for Hon. Ruth Ginsburg, D.C. Circuit, Washington, D.C.; Selene Mize of Portland, Ore., for the Hon. William Timbers, 2nd Circuit, New York; Robert Moore of Alameda, Calif., for Staff Attorney, 9th Circuit, San Francisco, Calif.; Margaret Niles of Portland, Ore., for Hon. Eugene Wright, 9th Circuit, Seattle, Wash.; Robert Olson of McLean, Va., for Hon. Anthony Kennedy, 9th Circuit, Sacramento, Calif.; Tony Phillips of San Francisco, Calif., for Hon. Ben C. Duniway, 9th Circuit, San Francisco, Calif.;

John Porter of Cincinnati, Ohio, for Hon. Proctor Hug, Jr., 9th Circuit, Reno, Nev.; Sharon Reich of West Lafayette, Ind., for Hon. Harlington Wood, Jr., 7th Circuit, Chicago, Ill.

Mark Seidenfeld of Queens Village, N.Y., for Hon. Patricia Wald, D.C. Circuit, Washington, D.C.; David Shaffer of Enon, Ohio, for Hon. Betty Fletcher, 9th Circuit, Seattle, Wash.; Vince Waldman of Tulsa, Okla., for Hon. John Minor Wisdom, 5th Circuit, New Orleans, La;

Those serving as clerks in U.S. District Courts include:

Bernard Burk of Encino, Calif., for the Hon. William Schwarzer, Northern District of California, San Francisco, Calif.; Barbara Gaal of Minneapolis, Minn., for the Hon. Robert Peckham, Northern District of California, San Francisco, Calif; John Gordon of Houston, Texas, for Hon. Richard Gadbois, Central District of California, Los Angeles, Calif.; Jonathan Hart of Merion, Pa., for Hon. Almeric Christian, Virgin Islands District, Virgin Islands; Robert Kent of Middletown, Ohio, for Hon. William Ingram, Northern District of California, San Francisco, Calif.; Seth. D. Linfield of Brooklyn, N.Y., for the Hon. Laurence D. Lydick, Central District of California, Los Angeles, Calif.; Cynthia More of Cheektowaga, New York, for the Hon. Louis Pollak, Eastern District of Pennyslvania, Pa.; Daniel Reicher of Syracuse, N.Y., for Hon. David Nelson, District Court of Massachusetts, Boston, Mass.; Valda Staton of Gary, Ind., for Hon. Frank Battisti, Northern District of Illinois, Chicago, Ill.

The following students have *State Court* clerkships for the 1983-84 term:

Eva Carney of San Francisco, Calif., for Hon. Robert Staniforth, 4th District, Court of Appeals, San Diego, Calif.; David Little of Boulder, Colo., for Hon. Joseph Quinn, Colorado Supreme Court, Denver, Colo.; James Steyer of New York, N.Y., for Hon. Allan Broussard, California Supreme Court, Sacramento, Calif.; Karen Wentzel of Eastchester, N.Y., has a Superior Court clerkship with the Superior Court of Santa Clara County, San Jose, Calif.

One member of the 1982 class accepted a *U.S. District* clerkship: Robert Riggs of Odenton, Md., for Hon. Stanley Weiger, Northern District of California, San Francisco, Calif.

Class of 1981 U.S. District Court Clerkship: Donald Donovan of East Meadow, N.Y., for Hon. Abraham Sofaer, Southern District of New York, N.Y.

Ratner seeks to enhance public appreciation of *The Musical Experience*

People with only an arm-chair or concert hall appreciation of music can tap more than 30 years' experience of Stanford Prof. Leonard Ratner in his new book, *The Musical Experience: Sound, Movement, and Arrival,* published in the Alumni Association's Portable Stanford series (155 p., paper).

Designed to let people "be friends with music," in the author's words, the book moves from general ideas of musical expression, to elements of its language, to great works of music art.

"I like to speak to laypeople about music and help illuminate their listening experience" says Ratner, who has given a number of seminars on Mozart and Beethoven to bankers and engineers visiting campus for Alumni Association summer workshops.

The book includes two inserted soundsheets: 33 rpm recordings of many musical examples from the book played by Stanford piano lecturer Josephine Gandolfi.

Ratner also received help from music lecturer Jonathan Berger, who produced many of the examples using Prof. Leland Smith's music typesetting computer program. Both Gandolfi and Berger were doctoral students of Ratner's.

Art works that accompany each chapter were chosen by Ratner's artist-wife, Ingeborg, to illustrate the various music topics.

Special approach

"I have developed a special approach to music listening," says Ratner. "The criteria of sound, movement, and arrival which encourage listeners to make their own evaluations, rather than be told what to think of the music. Music is like a wheel with spokes—no matter how elaborate it gets, it always proceeds from the basics—the center.

"One mark of the great composer is the ability to deal with the conventional in a unique way, to make the music come alive by giving it perspective. The conventional is the point of departure, the thing you push against in order to be unique. Beethoven is marvelous in the way he puts kinks into the conventional.

"Like a magnet attracts or orients iron filings, my book sets up points of reference for the listener. I focus on salient features of a piece: high or low sound, slow or quick movement, effects of arrival. Thus the listener can exercise personal discrimination and judgement from the very beginning."

Music 'arrives'

Ratner's term "arrival" is not a conventional one in music. He describes it in this way in the book: "Music moves toward goals. To be intelligible, music movement must arrive. . .

"In a composition, points of arrival form a chain that gives the piece structure. Each arrival (except, of course, the last) is also a point of departure, so the music moves forward with what might be called a pogo stick effect. How the points of arrival affect the music's movement depends on how final, how clear, and how emphatic they are."

To illustrate his points, Ratner refers to many of the great works by Bach, Bartok, Beethoven, Berlioz, Brahms, Tchaikovsky, Chopin, Liszt, Mendelssohn, Mozart, Schubert, Stravinsky and Wagner. Most of the examples are arranged so the reader can play them with ease at the piano.

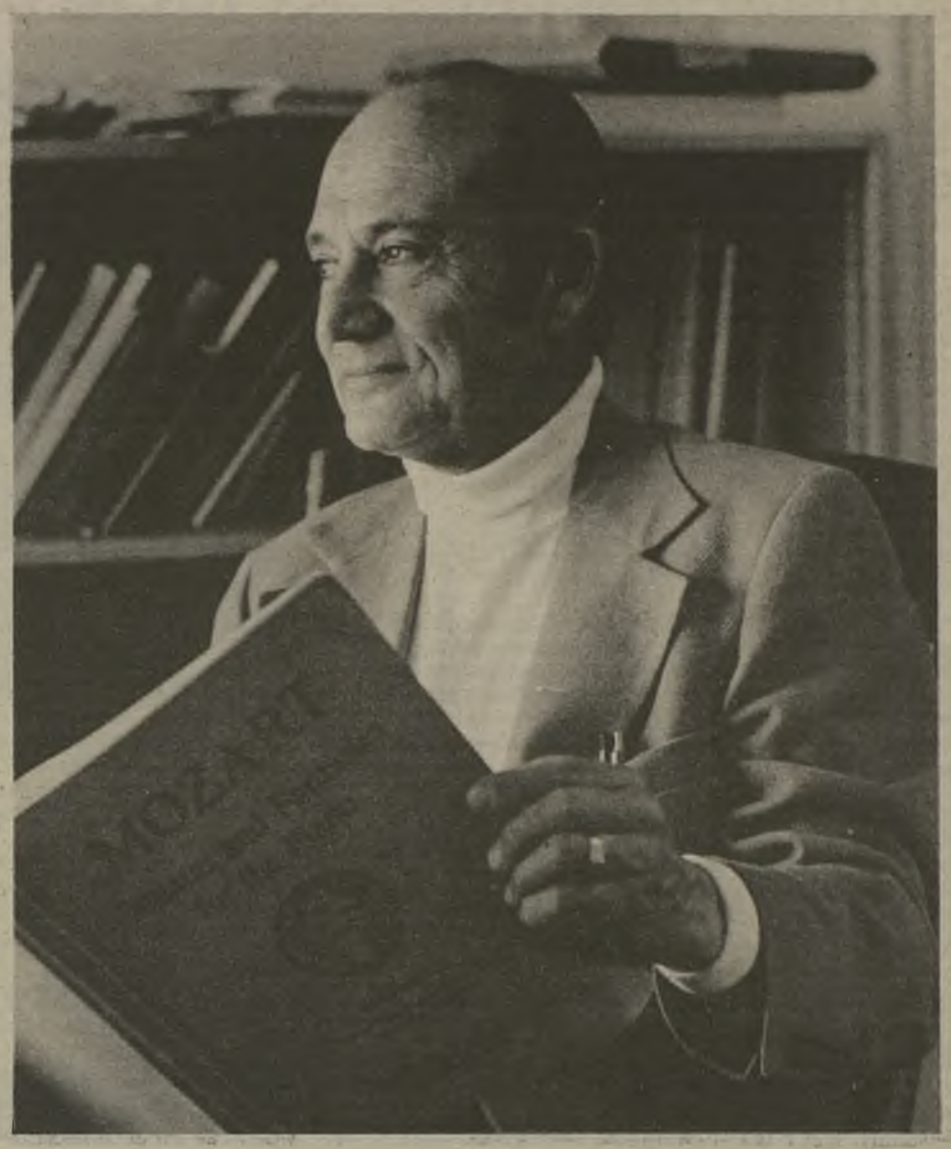
W.H. Freeman and Co. has published *The Musical Experience* for the commercial market. (The Portable Stanford series is published for subscribers only, who number about 10,000.)

John Boykin, associate editor at the Alumni Association, edited *The Musical Experience.*

"I couldn't have asked for a better author to work my first book," he says. "Prof. Ratner was cooperative, punctual, and he really cared. He was very interested in being sure we had the best possible book. If that meant rewriting, that's what we did, and the book is stronger as a result."

Boykin was chosen as editor because he majored in music at Fresno State. He describes *The Musical Experience* as "starting where the layperson starts—with the emotional reaction to music. Then it climbs inside the composer's workshop and studies the techniques the composer used to produce the effects you hear. It teaches someone who already enjoys music how to become a more perceptive listener."

Boykin background



The Portable Stanford series was started in 1972 to keep alumni up on happenings at Stanford. The books, usually three a year, are written by Stanford professors on their current areas of interest. "They are a form of continuing education," says new managing editor Miriam Miller. "They are not written like textbooks, but are quite personal and often witty. Stanford's is the only Alumni Association in the country that publishes books."

Ratner came to Stanford in 1974 after receiving the first doctorate in music awarded by UC-Berkeley. He was named professor of music in 1957 and a Guggenheim Fellow in 1962. He has twice been visiting lecturer at Bar-Ilan University and the Hebrew University in Israel, and has taught at Stanford overseas campuses in Beutelsbach, Semmering, and Florence. This summer he co-hosts an Alumni Association trip along the Rhine River with German Prof. Walter Lohnes.

Ratner's first major book, *The Listener's Art,* was published in 1957 and is still widely used as a textbook in introductory courses. *Classic Music,* which Ratner refers to as "the book of my life," was published in 1980 to great acclaim. An historical and encyclopedic study of the classic principles of composition, it has already become a basic reference book for the Classic period (the era of Haydn, Mozart, and Beethoven) and a model for the study of musical style.

Ratner is not resting on his laurels, however. He has completed the first draft of a book on Beethoven's string quartets.

—Julia Sommer

Leonard Ratner

Alumni Assoc. sponsors Australia and New Zealand travel

The Stanford University Alumni Association will sponsor a 25-day travel study seminar to Australia and New Zealand August 28 to September 21 in association with Betchart Expeditions Inc. of Cupertino, Calif.

The expedition is open to friends of the University as well as alumni and provides an outstanding introduction to the best of Australia and New Zealand—cities, art galleries, botanical gardens, zoos, museums, and national parks.

Participants will be able to tour the cosmopolitan cities of Sydney, Melbourne, Auckland, and Christchurch, as well as the unforgettable Outback.

From Green Island on the Great Barrier Reef to the rich rain forests of Cairns and the pristine alps of Mt. Cook and Milford Sound, the travelers will encounter the unique flora, marsupials, and birdlife of Australia and the stunning fiords, glaciers, and alpine countryside of New Zealand.

Other special highlights of the trip include a gala evening at the Opera House in Sydney and an entire day and evening spent with a farm family on a sheep station in New Zealand. In addition, there will be time for walks through historic districts and national parks; gardens in spring bloom; swimming and snorkeling.

The expedition will be lead by Stanford alumnus Dr. Ian Smith, a native of Sydney, Australia, and professional field naturalist Robert Nansen.

Well-versed in the socio-political scene in Australia and New Zealand, Smith will introduce seminar members to the cultural heritage, arts, and traditions of these two nations while Nansen, expert naturalist and worldwide expedition leader, will interpret the unique natural history of both countries.

The trip fee of $2,625 per person includes land transportation, accommodations in deluxe or "best available" hotels, meals as indicated in the itinerary, park-museum entrance fees, instruction, leadership, and educational materials. Air fare is separate.

For more information contact Alice Coogan at 497-2021.

Escondido offers daycare homes

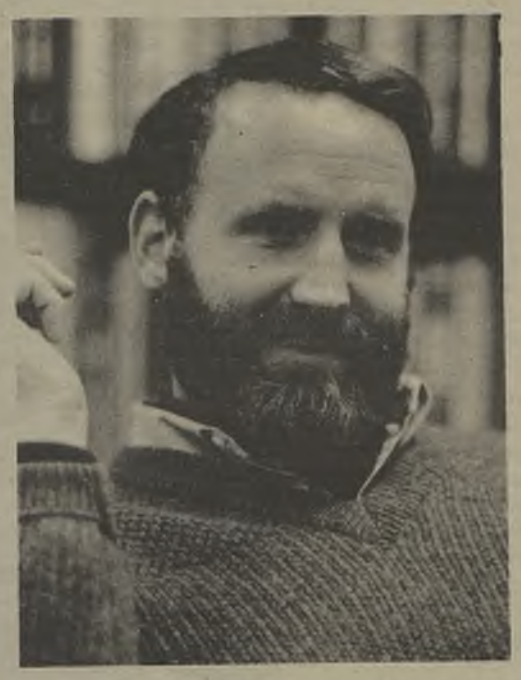
Even though local daycare centers often have waiting lists, responsible childcare is available now on campus in daycare homes located in Escondido Village, according to Phyllis Craig, Stanford consultant on childcare.

Frustrated parents, searching for care for toddlers or school age children, find a warm, individual solution to their problem in a family daycare home, where a student spouse often looks after one or two children in addition to her own. All the children have access to the sand pools and play equipment in the court, as well as other children to play with.

The fees charged by daycare mothers vary from $1.25 to $3.50 depending in part on how many children are involved in the home.

The Childcare Resource Center, located in the Escondido Village Office, maintains a list of daycare homes, and tries to match families seeking daycare with those homes that seem most appropriate.

Interested parents may come to the Resource Center Monday through Thursday from 10 a.m. to 12 noon to review the listings or to ask for other advice and assistance. Their phone number is 497-1660.



Durham to seniors: See life as fieldwork in 'foreign' land

Following is the Class Day Address by Prof. William H. Durham, anthropology.

It's a special pleasure to be with you today when, for probably the first time in four years, class attendance is nearly perfect, there are smiles on every face, and no one is taking notes in four colors with one of those frightful "pre-med pens."

In anthropology, the one other time that we are called upon as faculty to address a group of departing students comes when our Ph.D. students leave Stanford destined for fieldwork in another culture. Typically, these are bright, enthusiastic young folks off to undertake research among peoples in diverse and interesting places—among colorful native villagers of Mayan ancestry in Mexico or Central America, for example, or among Tibetan agropastoralists in remote Himalayan villages at 14,000 to 16,000 feet, or among fabled warriors (even headhunters) in the humid tropical forests of the Amazon, the Congo, or island Southeast Asia. Off they go, our Ph.D. students, to remote places, exotic peoples, and to what have sometimes been called "primitive" cultures. . . .

Well, if there is one thing we have learned in anthropology over the years, it's that what's remote depends primarily upon where you are, it's that what's exotic lies purely in the eyes of the beholder, and it's that what's primitive is at least a matter of some debate. So, if you'll forgive me this afternoon, I'd like to suggest an explicit parallel—a parallel between the situation advanced anthropology students face when they leave Stanford, and the situation you graduates face starting with commencement tomorrow. In many ways, you, too, can be seen as bright, young Stanford anthropologists setting off for a kind of fieldwork experience in a very foreign culture. And you, too, must now begin participant-observation among peoples, places, and cultures that will at

William H. Durham

times seem remote, exotic, and—yes—primitive in the course of your field stay. Tomorrow, when you head out Palm Drive for your own exotic, primitive tribe, whether it be in Cambridge, Cincinnati, or Cupertino, remember that these are valuable years of life's built-in apprenticeship in anthropology.

To speed you on your way (and for goodness sake, do stay out of trouble if you ever visit the People's Republic of China!), let me propose to you three simple guidelines that I hope will make your fieldwork happy, rewarding, and productive.

First, even before you arrive at your primitive tribe and remote field site, work to challenge your own preconceptions. Keep yourself open to human diversity however awesome and bewildering it may sometimes seem, and work to drive from your thinking all pre-conceived bias, intolerance, and prejudice even if (or especially if) we as your teachers are its source. Remember that an important goal of all fieldwork is to test, relentlessly, your conceptions and models of what people are all about against data that you collect for yourself.

This won't be easy, especially at the outset, for it may have been some time since the host population has been exposed to someone from your culture as well. Expect some "culture shock" on *both* sides, and a kind of mutual "warming-up" period. An excellent if slightly exaggerated example of this can be seen in one of anthropology's favorite descriptions—the arrival of a young, new researcher like you for the first time in a Yanomamo Indian village in the rainforest of Venezuela. He wrote:

"My heart began to pound as we approached the village and heard the buzz of activity within the circular compound. . . . The entrance to the village was covered over with brush and dry palm leaves. We pushed them aside to expose the low opening to the village. The excitement of meeting my first Indians was almost unbearable as I duck-waddled through the low passage into the village clearing.

I looked up and gasped when I saw a dozen burly, naked, filthy, hideous men staring at us down the shafts of their drawn arrows! Immense wads of green tobacco were stuck between their lower teeth and lips making them look even

Communism is now authoritarian, not revolutionary, according to Wesson

World commmunism is becoming "more ambiguous and amorphous," according to Robert Wesson, editor of the 1983 Yearbook on International Communist Affairs, just published by the Hoover Institution Press at Stanford.

A professor of political science at the University of California at Santa Barbara, Wesson has been a senior research fellow at Hoover since 1978.

Joan Oppenheim will teach Japanese flower arranging this summer for STARTS. See Page 19 for more information. (Photo by M.L. Cunningham)

"The essential unity of the Marxist-Leninist movement is not pro-Sovietism but anti-Westernism, especially anti-Americanism," he declares.

"Since 1960, it has been impossible to assemble a world communist conclave, and the Soviet party seems long since to have given up trying. Even international front organizations prosper only by pretending, in the manner of the World Peace Council, to have nothing to do with world revolution.

"Doctrinal unity has vanished," but communist parties remain "attached by the image of power and the assistance that a great power can give its friends.

"Under former police chief Andropov, perhaps even more than under party boss Brezhnev, the Soviet Union has become a model not of revolutionary change but of modernized authoritarianism, a strongly governed and disciplined society.

"Lenin is still an icon for all the (communist) parties, even those of China and Albania, not because he stood for the masses but because he taught how to organize a communist party to grasp and wield power. . .

"World communism is the spearhead of the resentment of those who feel more or less deprived or pushed around by the advanced industrial world, a drive sharpened and mounted but not made or controlled by the Soviet Union. As such, it prospers to a considerable extent with the failures and misfortunes of the Western world, especially the U.S.

Poor year for all

"The past year has not been a good one for the Western sphere, with the severest recession since the 1930s bringing grievous debt, financial and trade problems. Although the Soviet sphere also had a poor economic year, the balance was against the West.

"Accordingly, one might expect that the Marxist-Leninist cause prospered in 1982. Rather remarkably, it has not done so."

Andropov's "accession to the throne of Lenin" marked "another step away from the original meaning of the Russian Revolution," Wesson says.

While U.S.-China relations cooled, rapprochement between China and the Soviets was "hindered by the ongoing conflicts in Afghanistan and Kampuchea, both of which seriously damaged the communist position in Asia," he adds.

"In the Middle East, communist prestige suffered from the defeat of the Palestine Liberation Organization in Lebanon, the apparent inferiority of Soviet arms used by Syria, and the inability of the Soviet Union to play a significant role in the entire crisis. . . .

"In sub-Saharan Africa, Soviet influence appeared weakened chiefly by inability to fill material needs, and various Marxist-Leninist-oriented states turned to the West in compensation.

"In the Americas, political and economic problems made opportunities for radicals of all brands, but the communists in most countries continued to be a minor political force, awaiting worse times.

"In Bolivia, however, they emerged to play an important part in the redemocratized state. In El Salvador, communist-led guerrillas strengthened their hold on large parts of the countryside. The dictator of Surinam turned to Castro for help in holding power and apparently added one to the trio of Marxist or quasi-Marxist states in the Caribbean area.

"An offsetting reversal for the Marxist-Leninsts was the apparent success of the Rios Montt government of Guatemala in reducing the long-standing insurgency."

Now in its 17th edition, the Yearbook on International Communist Affairs includes a register of Communist Parties and profiles of their activity in each country by 74 different scholars. Copies (534 pp, cloth $44.95) may be ordered direct from the Hoover Institution Press, Stanford Calif. 94305 Phone (415) 497-3373.

Durham/ continued from page 6

more hideous, and strands of dark-green slime dripped or hung from their noses. We arrived at the village while the men were blowing a hallucinogenic drug up their noses . . . and the Indians usually let it run freely from their nostrils. My next discovery was that there were a dozen or so vicious, underfed dogs snapping at my legs, circling me as if I were going to be their next meal. I just stood there holding my notebook, helpless and pathetic. Then the stench of the decaying vegetation and filth struck me and I almost got sick. I was horrified. What sort of a welcome was this for the person who came here to live with you and learn your way of life, to become friends with you? . . .

I pondered the wisdom of having decided to spend a year-and-a-half with this tribe before I had even seen what they were like. I am not ashamed to admit, either, *that had there been* a diplomatic way out, I would have ended my fieldwork then and there. I did not look forward to the next day when I would be left alone with the Indians; I did not speak a word of their language, and they were decidedly different from what I had imagined them to be. The whole situation was depressing, and I wondered why I ever decided to switch from civil engineering to anthropology in the first place. (From N. A. Chagnon, *Yanomamo: The Fierce People*, 1977.)

Now I wouldn't expect your arrival to go exactly like that, although it has been some time since I visited the natives in Cambridge, Cincinnati, and Cupertino, but you get the point. In the face of novelty and diversity, fight off your preconceptions and work to keep yourself open. You'll be happy to know that the frightened researcher in the passage went on to become a prominent professor of anthropology.

Second, in your fieldwork, strive not only to observe, describe, and chronicle human diversity, but more importantly, strive to understand it. It's not enough simply to see differences as a tourist would and react to them. It's your job, in fieldwork, as an apprentice anthropologist, to interpret and explain those differences. Look for the reasons why the natives organize their lives the way they do. Search for an explanation and don't let up until you have one that fits all the data you have collected.

Let me give you a second example from the annals of anthropology—another exaggerated case to make the point with emphasis. Even within the written record of anthropology, Tibet and Nepal stand out as remote and exotic places, and for years outsiders have been amazed, intrigued, and bewildered by their system of marital diversity. Well, a young colleague of mine named Nancy Levine walked into a Nyinba village in Nepal in 1975 and began a survey of 89 marriages in this one village. To make a long story short, she found approximately 40 percent of the 89 marriages to be monogamy (one husband, one wife), 10 percent of the 89 to be polygyny (one husband, several wives), and 50 percent of the 89, still in the same village, to be polyandry (one wife, several husbands). Moreover, five of the polyandrous marriages were actually polygynandry (that is to say group marriages where plural males are simultaneously married to plural females)—and she found as many as nine and ten full-grown adults all married together at the same time in one legal matrimony.

To give you some concrete idea of what this entails as a case of human diversity, let me attempt a translation for you. One of the things all of us enjoy about Class Day at Stanford is that you graduating seniors can be with your families during this part of the graduation proceedings. Well, imagine how Class Day would be different if you were sitting with all seven of your fathers, all three of your mothers, together with seven or eight brothers and sisters, some of whom were, in fact, actually your genealogical cousins (i.e., children of your father's brother). I can see it now—sometime next May I'll get a letter from the caterer, "Prof. Durham how can we implement your wonderful plan for a bigger and better Class Day?"

But again you see my point. Human behavior is marvelously diverse on this planet and it's your job in fieldwork to help make sense of it all. The first outside visitors to Tibet and Nepal described this marital system as immoral, deplorable, savage, and disgraceful, and sadly enough, over the years we've carried forward some of that prejudice. Recently, Levine and others who have gone there for fieldwork have found that the entire pattern of marriage diversity follows from a few simple and rational rules that Tibetans explicitly discuss and adhere to. One is the rule of family property conservation: to prevent partition of precious family land resources at each generation, parents simply arrange marriages so that all their sons as heirs are married together in one family with one inheritance in each generation. If parents have two sons, they arrange bi-fraternal polyandry, if three sons, tri-fraternal polyandry, and so on—all to conserve family property. Marital diversity thus follows from the observance of a simple rule or set of rules.

In computer simulations here at Stanford I and a number of your classmates working with me have been able to show that any other rule of marriage—any other rule about land division among heirs in Tibet and Nepal—would cause whole families to go extinct in three to five generations. In short, the reasons for marital diversity in Tibet are good ones, I submit, and if you are diligent and persistent in your own fieldwork, you too will find good reasons for why the natives do what they do.

My third and final point is simply to remind you that as apprentice anthropologists, about to begin your own exotic fieldwork, you have a responsibility not only to pursue the understanding of human diversity, but also to spread the understanding of that diversity. We live in a world of rapidly decreasing differences, of cultural homogenization—a world where social, economic, and political pressures serve to reverse the general trend of prior millennia toward increasing human diversity. It is a world in which we must see remaining cultural differences as a resource, not a threat, and a world in which we must strive for greater mutual tolerances, respect, and understanding. My point is not that you must agree with all of the natives you encounter in your fieldwork. But I am asking-you to study their positions, to understand their differences, and to help spread such understandings. I hope that all of you will join us, as anthropologists, in the task of understanding, preserving, and appreciating human diversity. Come back to see us, bring along your field notes for consultation, thanks, and good luck.

Masters to grads: Become conscious as consumers

Following are the Class Day remarks of Adjunct Prof. Gil Masters, civil engineering, associate dean of the School of Engineering:

Thank you for asking me to share this celebration with you, it is a great honor for me to be here. You have worked hard, you have done well and you are to be congratulated for your accomplishments. You and your parents have every right to be proud. We were asked to deliver *short, light* talks. . .I'm not going to be very light, so I will try to make up for it by being short.

In trying to decide what to say today I was influenced by the play that my eight-year-old son was in the day before yesterday, called "Anyone could, But. . . ." It was a simple play in which a king was looking for a suitable prince for his daughter, so early one day he dug a small hole in the dirt road leading into town, then filled it with gold and covered it with a large stone. Then he hid by the side of the road and watched and listened as people began to pass by.

This provides a fine opportunity, by the way, for all the second graders to get into the act and recite a few lines to the effect "look at this stone right in the middle of the road, how terrible, the king ought to do something about that, let's go tell the king to move it and so on. . . .

One after the other the actors complain about this stone in the way and the king's negligence, and so on, until finally, the hero comes along and says. . ."Hey there's a stone in the road, it is in the way and so he rolls it off to the side. And of course he gets the gold and princess. "Anyone could, but."

The moral is simple and seems applicable to my main area of professional interest, which is energy. If you despair over the deterioration of our air quality, the creation of national sacrifice zones for energy development, the inevitable oil spills, the radioactive wastes, the sterilization of our lakes by acid rain, the possible alteration of global climate through the release of carbon dioxide during combustion, and finally, and most threatening, the need to build tremendous armaments in part, to protect our access to Middle East oil.

And if you look toward government, or to big national laboratories filled with scientists and engineers working on development of breeder reactors, synthetic fuels, controlled nuclear fusion, or orbiting solar power stations in space, then I would say you are not unlike the second graders in the play waiting for the King to take care of things.

Seniors, you are about to become consumers in a big way You are going to earn handsome salaries, and as soon as you pay your parents back, you are going to be buying cars and furnishing apartments and houses. Maybe even someday building your own house. The decisions you make about the products you buy are going to have enormous consequences to the energy future of the U.S.

You and I and people like us—individuals, plain people—

Gil Masters

directly control about 40 percent of the energy used in this country, energy that we use in our own vehicles and in our own residences. We can waste it or we can use it frugally.

What we choose to do will make a difference—it is making a difference already. The big story in energy since the oil embargo has been energy conservation—not big power plants, not big government programs. Energy demand is dropping in the U.S.—in part due to the recession, in part due to conservation. In the last decade, however, energy consumption per dollar of GNP has dropped 20 percent.

Consider some examples of the power we hold in our own hands. Consider an almost trivial example. The next time you stop at the gas station, put some air into your tires, enough to bring them up to the recommended maximum pressure. On the average, fuel efficiency will go up by about four percent. If we all did that we could save about $2.5 billion in imported oil at essentially zero cost. Compare that to the proposed '84 Department of Energy budget for all energy conservation programs, $100 million. That, by the way represents one percent of the total DOE budget, 60 percent of the DOE budget is for defense—that's DOE not DOD.

Consider a less trivial example: You know we have mandatory fuel efficiency standards in new vehicles that are gradually leading us toward cars that average 27.5 mpg. As older less efficient cars are being replaced by newer ones, our dependence on imported oil is dropping. In fact, if every car on the road today would have the fuel efficiency required of the 1983 models, we would not have had to import any oil from OPEC last year. (OPEC supplied only half of our imports last year.)

Another: If all of us were driving around in cars that were equal in fuel efficiency to the most fuel efficient car in that size range—that is, if you would drive the best station wagon available instead of the one you are driving, and if all 4-passenger cars were as good as the best, and so on, the U.S. would have been a net energy exporter last year. That is, without downsizing, and with automobiles that you can buy in the showroom, we would be exporting more energy in coal than we import in oil. We would still be importing oil however.

If you want to eliminate all imported oil, one way we could do it is all drive 50 mpg vehicles, which by the way are available today. If we were doing that last year we would not have needed to import a single barrel of oil and we would have saved about $50 billion dollars in one year.

How about energy use in our homes. that's about one-quarter of the U.S. total. Let's start with the cracks around our windows and doors. Cold air leaks in those cracks in the winter and hot air leaks in the summer. About five percent of all U.S. energy leaks in or out of those cracks in our homes. At the price of imported oil, that is about $15 billion worth a year, at least $5 billion of which could be saved if we all spent a Saturday with a caulk gun and a roll of weatherstripping.

What about our appliances? How many of you would rank the energy consumption of a new refrigerator as one of the most important concerns in making your choice? Probably not many. A PGE survey indicated that purchase price was the primary concern of refrigerator buyers but energy was sixth on the list. Yet you will probably spend three times as much money operating that refrigerator as you will on buying it in the first place.

We need to pay more attention to energy labels on appliances and we need to learn to care more about lifecycle costs than initial costs. We could save as much energy in lighting as is currently being produced by all of the nuclear power plants in the country—and do so at about one-third the current cost of electricity.

Conserved energy does not mean "freezing in the dark" as some imply. It is our best source of future energy. It is the cheapest, cleanest, safest, surest, and quickest, source available. By and large the products are on the shelves—and it is up to us not to act like second graders in a play, but like adults responsible for our own futures and for the futures of our children and grandchildren.

Trustees discuss permanent Environmental Safety Facility

A centralized program to manage the procurement, use, and disposal of hazardous materials at Stanford University was discussed by the Board of Trustees at their meeting on the campus Friday, June 10.

According to a report made to the Board, such a program is necessary to protect public health, to respond to increasingly complex governmental regulations, and to contain rising costs.

Included in the program is a proposal to build a permanent Environmental Safety Facility (ESF) on the west side of the campus to handle infectious, chemical, or radioactive items used at, or produced by, the Medical Center, chemistry, and physical science buildings, and other scientific laboratories.

Made up of small buildings totaling 23,000 gross square feet, the facility would replace and augment a temporary structure near the Hospital and augment a temporary structure near the Hospital now used to receive, monitor, and process materials for on-campus use and off-campus disposal.

Alain DeCleve

"By commercial standards, the volume and level of hazardous wastes produced at Stanford are quite low," according to Dr. Alain DeCleve, director of health and safety. "They are the inevitable by-products of a large research hospital, extensive scientific laboratories, and patient clinics."

"County, state, and federal regulations require that such materials be safely handled. Those regulations are becoming so strict and complex that all of Stanford's responsibilities can only be addressed by a central management program."

DeCleve said that the new facility, proposed for construction next year, would be located in a "support services area" to be developed south of the Medical Center. It would be convenient to the generating sources, yet would not occupy "close-in" land that could be needed for future academic use.

The EFS would include the program's administrative offices, areas for handling potentially hazardous wastes, small labs for waste treatment and handling, and space for training programs for safety committees being formed.

Two small incinerators would also be located there, replacing aging equipment at the Stanford Hospital.

DeCleve emphasized that there would be very little danger from the facility, with many safeguards to separate, store, and neutralize the materials. It would be built and operated in accordance with strict government regulations, he said.

By detoxifying and neutralizing much of the material at the ESF, the University would be able to reduce the volume to be sent to off-campus land-fill sites, DeCleve noted. Such sites are decreasing in number every year, he said.

Private contractors would pick up weekly for off-campus disposal those materials which could not be burned or detoxified.

The support services area in which the ESF will be located is in an area already used for storage anad other ancillary activities. It is listed in the University's long-range land-use plan as an area roughly corresponding to the corporation yard facilities on the opposite side of the campus, off Serra Street and Campus Drive.

The Trustees will be asked for concept approval in the fall, the report states, and for project approval early in 1984. Under that schedule, the ESF could be operational by early 1985.

Distribution of salaries 1982-83

The table below has been developed to show the distribution of higher level administrative salaries. The people whose salaries are counted include those professionals who work in areas generally considered as administrative; they include University officers and other individuals who are involved in the creation, application, or interpretation of University policy. Professionals involved with research, library, computer, and other support areas are counted in the Comparison Salaries section.

The data source is the Personnel Office's Salary Management Analysis System (SMAS Personnel) file. Similar tables have been published annually in Campus Reports since 1975-76. This year's data differs from those reported in previous years and reflects more accurate counts of administrative personnel. Thus, while the format of the table is similar to those tables published in years past, it is not possible to track trends. The lower bound salary figure of $27,500 was chosen to show an appropriate increase over the previously published lower bound of $25,000.

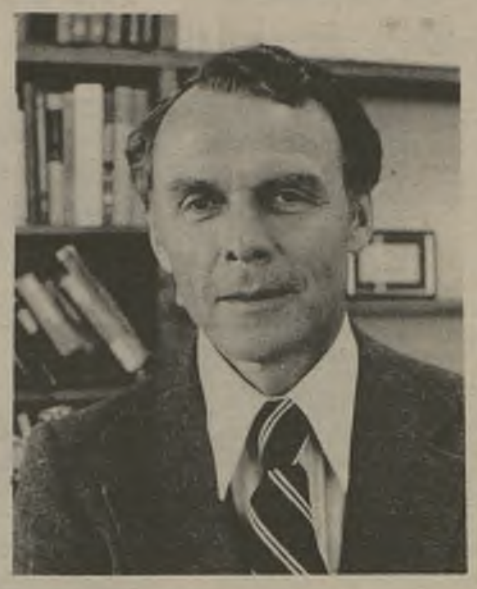
To facilitate comparisons of administrative salaries with faculty and other exempt professional salaries, the table includes the relevant tabulations below. To establish an equivalency for comparative purposes, academic year faculty salaries were multipilied by 4/3, a figure intended roughly to account for the three months that lie outside the nine month school year. The 4/3 figure also reflects the basic supplementary compensation limit established in University policy. Individuals who wish to view faculty salaries from another point of view can, of course, interpolate.

	$27,500-32,499	$32,500-37,499	$37,500-42,499	$42,500-47,499	$47,500-52,499	$52,500-57,499	$57,500-62,499	$62,500 & Above	Totals
Administrative Salaries									
Academic									
Schools and Departments	48	16	12	11	7	15	10	21	110
Research Labs & Institutes and SLAC	24	22	11	6	11				104
Student and Academic Support Services									
University Libraries and C.I.T.	5	5	7	11	3	7	Above $57,500: 49		40
Student Services	20	4	5	6					42
Administration and Auxiliaries									
President's and Provost's Office, Public Affairs, and University Counsel	9	11	6	3	7	20	20	33	57
Business and Finance	74	79	36	20	19				249
Development	9	15	11	10	3				57
Medical Center (including Hospital)	8	14	42	27	16				129
Administrative Totals[1]	197	166	130	94	66	42	Above $57,500: 93		788
Comparison Salaries									
Faculty Salary Equivalents (12 months)[2]									
Medical School Faculty	6	13	4	8	27	27	18	221	324
All Other Faculty	34	81	52	84	63	74	62	355	805
Research Associates	57	51	41	13	13	Above $52,500: 16			180
Other Non-Administrative Exempt	173	135	59	25	6				409

1. These figures do not include the heads of academic departments. They do include 25 faculty members who hold full-time administrative posts; these 25 are not included in faculty counts below.

2. To establish an equivalency for comparative purposes as noted above, nine-month salaries are multiplied by 4-3. Professorial ranks of full professor, associate professor, assistant professor, and assistant professor subject to Ph.D. comprise the faculty reported herein.

NOTE: Total regular faculty count for 1982-83 is 1,152.



Cox helps write geologic timeclock, basic reference tool

A Stanford geologist and five colleagues have published a new version of an essential geologic reference tool, the time scale that traces the history of the earth.

"We're trying to synch our global watches," said Allan Cox, dean of Stanford's School of Earth Sciences. "We have to sit down and make sure we're all running on the same clock."

Geologists throughout the world will use the time scale to correlate and compare their own findings to past work and to each other.

"It provides a framework by which to ask a question like: Did dinosaurs become extinct at the same time in Europe and North America, or perhaps at the same time as a marine extinction?" said Cox.

Allan Cox

Multicolored chart

Cox collaborated with Cambridge University and British Petroleum Co. Ltd. scholars to assemble and document the new timetable, presented as a multicolored wall chart which capsulizes decades of geologic research. They also wrote a 100-page text with over 350 references to accompany the chart.

A useful tool

Cox and his British colleagues wrote the time scale "as a service to the profession," said Cox. "It doesn't break any new intellectual ground but it's an extremely useful thing that will be used a lot by students and researchers."

Geologists use such a time scale as they work to establish the order of events all over the world long before human history began. They gather clues from rocks about what the world was like when the rocks were forming. As natural historians they also need to know precisely when the rocks formed.

Petroleum geologists hunting for oil have a special interest in the timetable. They need to know the timing of two geologic events: first, the burying of myriad marine organisms whose bodies will turn to oil, and second, the bending of rock layers to form pockets that will trap oil as it rises toward the surface. This sequence is so important that many major oil companies, like BP, write their own time scales.

The new time scale has four time-lines climbing in parallel up a three-foot poster. Geologists use a different method of dating rocks to define the geologic ages on each scale. Several "tie points" are marked where two or three time-lines have well-documented events that occurred simultaneously.

The leftmost scale represents the oldest and most common type of dating: fossils. The time periods, most of which were originally dated by the fossils they contain, are named and ordered in a column. Human history fits into the top few millimeters.

Familiar names like Mesozoic and Pleistocene appear among the hundred or so eras, epochs, periods, and ages.

Radioactive decay

While marine fossils are nearly ubiquitous, it is radioactivity that gives the most consistent age estimates. Geologists calculate a rock's age using the steady rate of radioactive decay that commences as soon as a newly formed rock cools.

Fluctuations of sea level while rocks were forming provide more information to geologists. The new timetable includes two time lines estimating the sea levels, called "sea stands."

The magnetic time scale arose from Cox's own research and that of other geophysicists who measured the magnetism of land rocks--lava flows or limestone, for example. They used this rock magnetism to show that the earth's own magnetic field has flipped direction hundreds of times since the earth's formation. The earth's magnetic field gently magnetizes rocks as they form, by forcing some of their electrons to align with the field.

A continuous record

The ocean floor provides the most continuous record of the earth's magnetic field. Cox explained that as the North American and African continents creep away from each other (as they have been doing for 150 million years), the sea floor must grow. New, volcanic rock becomes magnetized as it forms at the fissure near the middle.

The result of the changing field is a magnetic pattern of stripes from which geophysicists like Cox can read the history of the earth's magnetic field, much like reading the history of a tree from its rings. Ships crossing the Atlantic can read this magnetic record on the ocean floor simply by towing a sensitive magnetometer behind them.

All this sleuthing would be unnecessary, Cox said, "if we had a clock that was running and printing a digital signal on every rock that was forming. But we don't. So we pick a physical body of rock and define the time that elapsed during the formation of that body of rock as our basic unit of geologic time.

"We then use all of the tricks of our trade to tie these units to other events in earth history that have left their marks on the rocks. That is exactly what we have tried to do in our new time scale."

—Julie Kiser

Trustees approve more planning funds for $42 million cogeneration plant

Stanford trustees have approved additional planning funds for a proposed $42 million cogeneration facility on campus.

Project approval will be requested from the board in October.

The proposed facility, to be located near the existing central energy plant at Jordan Way and Campus Drive, would produce both electricity and steam from a single fuel.

At their June 10 meeting, the trustees authorized $270,000 to continue preliminary design and cost estimating work, securing necessary permits for construction and operation, negotiating contracts for the purchase of natural gas fuel and sale of surplus capacity and energy, and developing a financial plan.

Since the concept of the cogeneration facility was approved in October 1981, the trustees have authorized nearly $1.4 million for planning purposes.

Early projections indicated energy cost savings of $8 million or more annually could be realized from a cogeneration plant.

$2 million more for COIN program

The Board of Trustees has authorized an additional $2 million for the Stanford second mortgage coinvestment program (COIN).

The June 10 action brings total authorized funds for this purpose to $32.3 million. The additional authorization will enable deans to meet commitments for housing assistance made to recent faculty recruits.

The trustees authorized a $9.3 million expansion of COIN in December, when it expected a successor program would be in place by June. The new program is expected to be ready for consideration by the trustees in September.

Dating the "Sunnyvale Girl" —The Garden of Eden *wasn't* in California

A group of scientists, including a Stanford anthropologist, reported Friday, June 10, that "Sunnyvale Girl," a skeleton believed by some to prove that humanity originated in California, is probably only an old Indian.

Instead of being 70,000 years old, as some suggest, the skeleton, found in 1971 in Sunnyvale, Calif., north of San Jose, is only between 3,500 and 5,000 years old, about the same age as other Indian skeletons found in California, the scientists reported in the current issue of *Science* Magazine.

"Sunnyvale Girl" has been the object of considerable controversy after Jeffrey L. Bada, a geochemist at the University of California's Scripps Institution of Oceanography in La Jolla, determined that she was 70,000 years old. That would have made the skeleton by far the oldest human skeleton ever found in North America, and would have upset the widely-held belief that humans first came to this continent 12,000-14,000 years ago from Asia.

Bada, using a method of determining age by analyzing amino acids, also dated a skeleton found in Del Mar, near La Jolla, as being 40,000 years old, also too old for the theory.

A book on the subject even suggested that the skeleton was proof that the Garden of Eden was in California, not the Middle East. The book attained some quasi-religious status.

But the group of scientists from UC Riverside, the National Science Foundation Regional Facility for Radioisotope Dating at the University of Arizona, and Prof. Bert Gerow, professor emeritus of anthropology at Stanford, have determined "Sunnyvale Girl" can't be more than 5,000 years old.

Evidence that the skeleton was not unusual goes back almost to its discovery. Several scientists, including Gerow, have claimed since 1972 that the surrounding soil and bone artifacts discovered with the skeleton made it impossible for it to be 70,000 years old.

"The human skeleton had a maximum age of 10,000 because it was included into a soil horizon that was dated at 10,000," Gerow said. "In other words, it had to be less than 10,000.

"Bada proceded to ignore all of this information, which is published, and just goes on merrily on his own way."

The new paper says that scientists at Arizona, using a new technique involving a cyclotron (atom smasher) have found support for his position, Gerow said.

The paper in *Science* lists four possible dates, three obtained with the cyclotron, one with a conventional Geiger Counter.

"They show that the dates range between 3,500 and 5,000, and they would average somewhere around 4,500."

That puts "Sunnyvale Girl" as something of a contemporary to other Indian skeletons found in the area, including Stanford Man 1, discovered by a graduate student on the Stanford campus in 1922, and Stanford Man 2, discovered here by Gerow in 1963.

Gerow said that the amino acid dating system developed by Bada, has been used to date ocean fossils, "but it hasn't been accepted by archeologists for bones."

He said people who want to believe Bada's theory do not want to study specific cases.

"Sunnyvale is a specific case for which we have all of the evidence but he won't look at all of the evidence. We're not just talking about just radiocarbon dates; we're talking about a knowledge of the geology. . . the formation of (San Francisco) Bay. . . settlement patterns. We know where most of the sites were located in relation to ground water.

"We're talking about a whole series of lines of evidence that point clearly to it being a recent, totally Holocene phenomenon and probably not more than 4,400 years old."

The *Science* paper was co-authored by R.E. Taylor and Louis A. Payen at UC Riverside, D.J. Donahue, T.H.Zabel, A.J.T. Jull, and P.E. Damon at Tucson.

Study underway

Ulcers may be treated with hypnosis instead of medicine

A gastroenterologist and a psychiatrist at Stanford University Medical Center are looking for volunteers to learn whether ulcers eventually may be hypnotized away.

"We're a long way from having any definite answers, but we have at least an indication that hypnosis might lower stomach acidity for some people," said Kenneth Klein, clinical instructor of medicine and a specialist in diseases of the stomach and intestines.

"Since lowering stomach acidity has been shown to aid in ulcer healing, there is a possibility that hypnosis exercises might someday be a useful substitute in some cases for medication in the treatment of ulcers," he added.

> ***We're a long way from having any definite answers, but we have an indication that hypnosis might lower stomach acidity for some people."*** **–Dr. Kenneth Klein**

Klein is working with David Spiegel, associate professor of psychiatry, who has studied the medical uses of hypnosis.

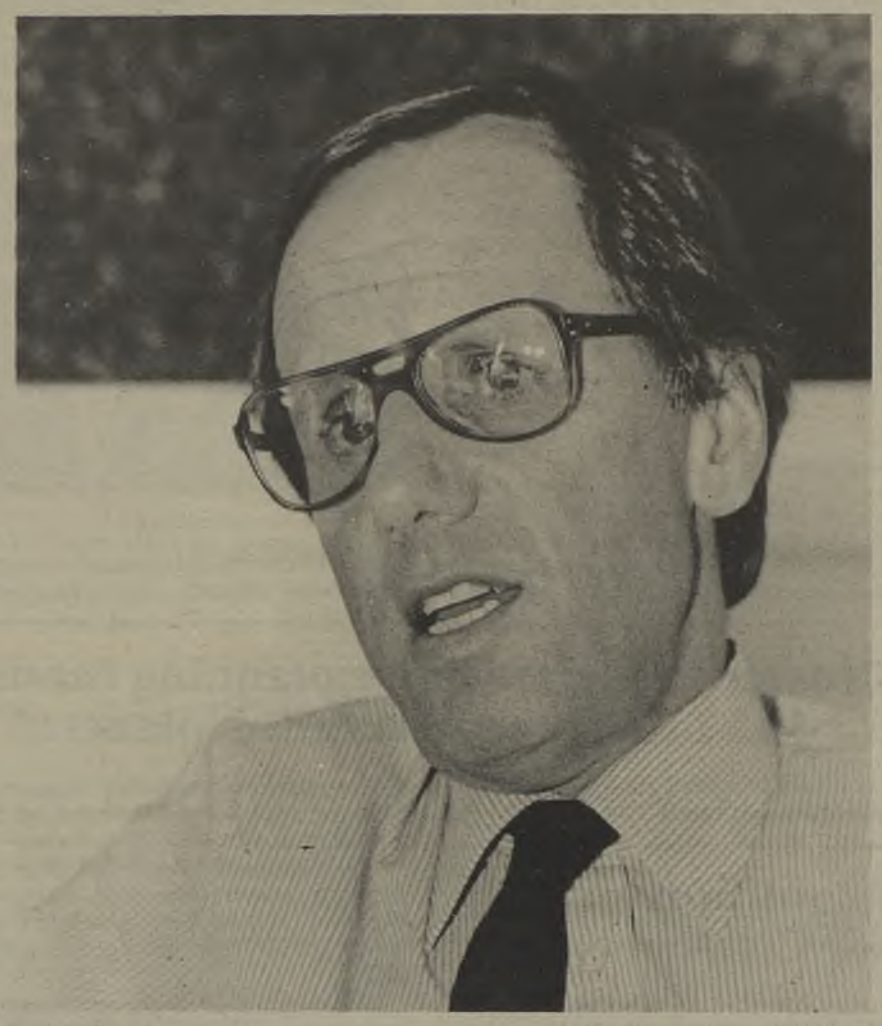
Klein cautioned that his study is intended only to give an indication—not proof—of whether hypnosis might be useful as an ulcer treatment. If the technique is eventually found to heal ulcers, it would only be helpful for the 25 to 50 percent of the population who are good hypnotic subjects, Klein said.

Volunteers for the current study should be healthy adults who will be tested to determine whether they are hypnotizable. (Former ulcer patients are acceptable if they are showing no current symptoms, Klein said). Their stomach acidity will be analyzed using a tube inserted into the stomach through their nose after a local anesthetic is applied. Then a hormone, pentagastrin, will be administered to stimulate acid production, and stomach acidity will be compared with the first test.

A week later, the volunteers will return to the Medical Center and their stomach acidity will be reanalyzed. But this time, half the volunteers—about five persons—will be hypnotized and given coaching and suggestions intended to lower their stomach acidity. About five other volunteers will repeat, again without hypnosis, the test taken earlier to serve as controls.

So far, one volunteer has completed the procedure, his stomach acidity declined markedly under hypnosis, Klein said.

"Hypnotism has been viewed with some skepticism by the medical community, but after 10 years of experience with it, I am quite convinced of its ability to dramatically effect many physiological processes. I'm most anxious to study its potential effects in my own specialty, gastroenterology.



The physician added that the current study could begin to offer some scientific answers about what mechanisms trigger gastric acid production.

Klein explained:

"If a person can control acid production through the mental concentration or trancelike state which hypnosis brings, we might be able to learn more about how acid production is triggered. We don't know, for example, the relative importance of the central nervous system, the vagus nerve and various hormones in causing gastric acid secretion. If we can prove that hypnosis—which presumably acts primarily through the central nervous system—can moderate acid production, we can begin to explore the intervening pathways."

Klein said the medication most often

Trevor Clay

Education leads to better image, nursing leader says

Education is the key to advancing the British nursing profession in its efforts to catch up with its American counterpart, said one of the country's nursing leaders.

Addressing a group of Stanford University Medical Center nurses at the third distinguished lecture series dinner Thursday (June 16), Trevor Clay, general secretary of the Royal College of Nursing of the United Kingdom (RCN), said the "slowness with which the nursing process has caught on in Britain is a measure of the deep-seated conservatism among many nurses: a reluctance to think for oneself bred by an over-hierarchical nursing structure and a less than enthusiastic medical profession."

As general secretary, Clay is responsible for the staff and services, and is chief negotiator of about 60 percent of the country's nurses who belong to the RCN, which functions as both a professional and labor organization.

Advancing the nursing process, Clay continued, will improve clinical expertise and standards of care. As such, the RCN has proposed a new structure based on four key principles: individual nurse's accountability, the role of the ward sister (head nurse), professional development through continuing education, and promotion dependent on fulfillment of specific criteria at each step in the nurse's career.

Many of the issues British nurses are now facing are the same that American nurses have encountered in recent times. It's essential, Clay stressed, that British nurses pursue academic education in addition to the clinical skills they acquire in the "apprentice training" that now constitutes the major portion of education for about 95 percent of the country's nurses. Many nurses, he added, are reluctant to get a university-based education.

"Nurses as a group will only be taken seriously as total health professionals when they are seen as such by their patients and clients, and—more importantly—when they see themselves in this way," Clay said. "There is only one way of effecting this change of attitude among nurses and that is through education."

The profession's attempt to upgrade its image must also deal with resistance from physicians, and from the public, Clay continued. Physicians "see us as a young profession seeking to encroach upon the territory of an old, established one," he said. Rather, he explained, he wants nurses, physicians, and other health care providers to enter a collaborative relationship. "I want nurses to be more accountable not just to the next person on the hierarchy, but because she feels like a qualified practitioner, responsible for the patients she cares for."

The nurse-physician relationship will be effected by the change in public image as well, he continued. A campaign has been launched to rid the profession of its image as "dedicated spinster," doctors' handmaiden," and "battleaxe," Clay said.

Heart-lung patient "critical but stable"

The fourteenth heart-lung transplant patient is in critical but stable condition following the operation that began early Friday morning (June 17) at Stanford University Medical Center.

The patient, 29-year-old Susan Teixeira, from Ludlow, Mass., had been waiting for the operation for 10 months.

She was taken off the respirator Monday (June 20) at 7 a.m.

Teixeira went into the operating room at 7:30 a.m. Friday, where the transplant team, headed by Dr. Stuart Jamieson, assistant professor of cardiovascular surgery and head of the heart-lung program, replaced her diseased heart and lungs with those of an unidentified donor.

Her husband, Dave, and two children, ages 3 and 4, have been riding out the wait with her in their temporary home in Mt. View.

Teixeira was diagnosed as having primary pulmonary hypertension nearly two years ago. Her physicians in Massachusetts first blamed nerves for her shortness of breath, chest pains, insomnia, and edginess. She then began retaining water—40 pounds in less than a month—and her blood began seeping through her veins.

Primary pulmonary hypertension is a fatal lung ailment with no known cause and no known cure. The lungs become irreparably damaged due to the high blood pressure resulting from a poorly-pumping heart, necessitating replacement of both organs.

Ten of the 13 patients who underwent heart-lung transplants at Stanford are living today. The operation was first performed here in March, 1981, following the discovery of the immunosuppressant drug Cyclosporine, which helps prevent organ rejection and promotes healing.

AIDS: hospital authorities answer some common questions

Acquired immunodeficiency syndrome (AIDS) has gained widespread, and often alarming publicity recently. Dr. Thomas Merigan, chairman of the department of infectious disease, and Carol Oakes, R.N., assistant director of care review/risk management for the Stanford University Hospital, helped to prepare the following column to help Stanford community members separate fact from fiction on current understanding of the syndrome and how it is spread.

What is AIDS?

Acquired immunodeficiency syndrome strikes the immune system, zeroing in on two types of T-lymphocytes (T-cells), a class of white blood cells crucial to the human body's ability to battle infection. Helper T-cells, the generals of the immune system that regulate the army of cells that mobilize each time a foreign substance or organism enters the body, usually are found twice as frequently as suppressor T-cells in a healthy person. But in a patient with AIDS, suppressor cells, which normally keep the immune system from running amok, outnumber helper cells. In addition, the overall number of T-cells is reduced. As a result, the AIDS patient's immune system is stripped, leaving him vulnerable to infections that a healthy person can easily thwart. Incubation time between the exposure to AIDS and the onset of symptoms has been between six and 18 months in some cases.

What are some of the diseases affecting AIDS patients?

About 90 percent of the cases studied have had one or both of two rare diseases: a usually rare type of cancer known as Kaposi's sarcoma, and *Pneumocytosis carinii*, a parasitic infection of the lungs. Other infections that have afflicted AIDS patients include yeast infections, cytomegalovirus (CMV), herpes, and toxoplasmosis.

How serious is AIDS?

AIDS has a high mortality rate, ranging from 20 to 70 percent, depending on the specific infection. Patients don't die from AIDS; they die from the serious infections that develop because AIDS has stripped away most of their natural immunity to disease. The Centers for Disease Control report that, as yet, they know of no AIDS patients who have regained immunity, so that even if a specific bout of illness can be curbed, repeat infections are likely.

Is AIDS a new disease?

Yes, apparently so. Careful studies show no clear evidence of AIDS before 1979. The origins of the disease are still unclear, although many scientists now believe that AIDS is caused by an unidentified virus that specifically attacks lymphocytes. Such a virus might be a mutated form of a more common human or animal virus, and probably interacts with a number of other factors to cause disease.

Are there any symptoms characteristic of AIDS?

There are no clear cut symptoms to indicate a loss of immunity, but many patients with AIDS complain of fever, a loss of appetite, sudden weight loss, extreme fatigue and enlargement of the lymph glands. These symptoms often develop over a period of several months before becoming severe enough to be markers for specific diseases. Early symptoms of Kaposi's sarcoma include brown or blue-violet spots that can appear anywhere on the skin or in the mouth. As the disease progresses, the spots grow larger and may become open sores. Pneumocystis pneumonia triggers symptoms similar to any other form of severe pneumonia, highlighted by fever and difficulty in breathing.

Is there a laboratory test for AIDS?

There is no specific laboratory test that can diagnose AIDS patients. However, 95 percent of AIDS patients show an identifiable change in the numbers of different types of cells in their immune system. This difference is currently being used at the Stanford Medical School Blood Bank as an indicator of donated blood that might inadvertantly have come from a person with AIDS. The blood screening method is not perfect. Sometimes a harmless viral infection can initiate the same change in the blood cells, and some healthy people contain the unusual characteristic naturally in their blood. But physicians at Stanford's blood bank feel that the very small amount of blood lost because it was mistakenly thought to have come from a person with AIDS is worth the extra protection it affords blood recipients. Researchers around the world are currently seeking a less expensive, more effective method of screening blood for AIDS.

Who is at risk of contracting AIDS?

Currently, the people known to be at highest risk for infection are homosexual men with many partners (75 percent of the cases), intravenous drug abusers, hemophiliacs and Haitians. The link between the first three groups appears to be exposure to blood or blood products. Whatever spreads the disease seems to be present in blood and semen, and perhaps mucus and saliva. Airborn spread, through a cough or a sneeze, and spread through casual contact with a person with AIDS do not seem likely means of disease transmission.

Needles shared by drug users provide an obvious route of transmission. Hemophiliacs who lack a vital clotting factor in their blood often receive a transfused concentrate of the factor to stop their bleeding. Such a factor, which occurs naturally in minute quantities in blood plasma, may be pooled from hundreds of donors for one transfusion. The mode of transfer of disease among homosexuals is unknown, although the small amount of bleeding from the lining of the anus that can occur during anal intercourse has been suggested as a likely possibility. The Haitian victims, as yet, do not fit the blood-transmission pattern.

A few people who don't fall into the identified high risk groups have contracted the disease, but nearly all seem to have had some close connection to one of these groups. The detection of AIDS in a few women and babies, for example, does not mean that all mothers and babies are at risk. The women who developed the syndrome had sexual partners who had AIDS. Except for the few children who have acquired the illness through blood transfusion, babies who contracted the disease were born to women who probably had AIDS themselves and may have transmitted the illness during pregnancy or while giving birth.

Are hospital employees at risk for contracting AIDS?

To date, no cases of AIDS have been reported among those caring for the slightly more than 1500 AIDS patients around the world. Researchers studying the disease recommend that hospital personnel take the same precautions when caring for AIDS patients as those used for patients infected with hepatitis B virus, which seems to follow the same pattern of transmission as AIDS.

Guidelines from the Centers for Disease Control in Atlanta, Georgia, suggest that "patient-care and laboratory personnel should take precautions to avoid direct contact of skin and mucous membranes with blood, blood products, excretions, secretions, and tissues of persons judged likely to have AIDS."

A private room, disposable dishes, careful bagging of linen and trash as well as the use of gowns, gloves and sometimes masks (depending upon the specific infection) are standard procedure in caring for these patients at Stanford. Members of the health care team are advised to use special care while drawing blood and disposing of needles to avoid pricking themselves. Any specimens of blood or body secretions sent from AIDS patients to the hospital laboratories are labeled as having come from patients in isolation. Laboratory workers should avoid getting such specimens on skin, mucus membranes or mouth pipettes.

Giving of oneself to help others

The Stanford University Blood Bank goes on location to collect pints of the vital resource. Here, Hewlett Packard (Palo Alto) employees volunteered to donate blood. The Blood Bank plans to hold drives at Wilbur Hall, June 27 from 3:30-7:30 p.m., and at SUH, July 6 from 11 a.m.-4 p.m.

News Notes

Spotlight on...

Dr. James Loomis, *assistant professor of anesthesia and pediatrics, was given a teaching award by the pediatrics housestaff.*

Each year the housestaff in that department chooses one faculty member to receive this honor at the time of graduation. Loomis' award is especially noteworthy in that his primary appointment is in anesthesia.

* * * *

Dr. Norman Lewiston, *associate professor of pediatrics (clinical), was named Secretary of the Cystic Fibrosis Club at the recent meeting of this group in Kansas City, Missouri.*

Among other activities, the Cystic Fibrosis Club sponsors an annual meeting which spotlights research in cycstic fibrosis and related genetic disease.

The Cystic Fibrosis Foundation is located in Rockville, Maryland.

* * * *

Dr. J. Kent Garman, *associate professor of anesthesia (clinical), completed the 26th session of the Stanford Sloan program of the Graduate School of Business at Stanford University.*

Garman was awarded a Master of Science degree in Management at graduation ceremonies Sunday, June 12.

The Sloan program is geared towards executives in middle management, from both the U.S. and abroad, who are expected by their organizations to rise quickly to the senior management level. They come from both the public and private sectors, to engage in very intensive study during the nine-month program which teaches general management skills. Acceptance into the program is highly competitive.

Garman was on sabbatical leave since last September from his Medical Center duties. His participation in the Sloan program was funded by a Henry J. Kaiser Family Foundation fellowship.

(Dr. James Silverman, chief of staff at SUH, is also a graduate of the Sloan program.)

Dr. Frederick Behling, *clinical associate professor of surgery, received the Tenth Annual President's Cup Challenge Award from the 8,000-member National Athletic Trainers' Association (NATA).*

The silver cup was presented to Behling at NATA's annual awards banquet in Denver, Colorado, last Tuesday evening, June 14.

Behling is an orthopedic surgeon with the Palo Alto Medical Clinic, the Health Care Division of the Medical Foundation. He has been team physician to Stanford University's sports teams (since 1961), the San Francisco Giants baseball team, the annual East-West Shrine Games, and until recently the San Francisco Forty-Niners football team. He is active with several other professional and athletic organizations.

NATA cited Behling's "efforts over the past 25 years toward encouraging increased professionalism and public acceptance of the athletic training profession, and for initiating legislation which has markedly reduced the injury risks in contact football."

He has strongly advocated eliminating the use of the head and neck in blocking and tackling in football, and has been instrumental in greatly reducing other hazards of the game, NATA officials said. He is an advocate of youth health care and physical fitness.

The award is presented each year to a doctor of medicine or osteopathy for an outstanding contribution to sports medicine.

* * * *

Dr. Edward H. Shortliffe, *assistant professor of medicine and computer science, has been appointed chairman of the Biomedical Library Review Committee for 1983/84 by the National Library of Medicine.*

The committee reviews grants and applications dealing with a variety of topics in medical library and medical computer science.

You should know...

The Stanford University **Blood Bank** *presented a certificate of appreciation last week to the Hospital* **Print Shop** *staff, in recognition of that service's valuable contributions to the blood bank's activities.*

SHDPP seeks volunteers for study

Volunteers are needed to participate in a study aiming to clarify the relationship between blood pressure and moderate alcohol intake.

Researchers based in the Stanford Heart Disease Prevention Program (SHDPP) are seeking 40 to 60 healthy, non-smoking men, over 30 years old, who drink one to four alcoholic beverages per day. The study will run from July 7 through the end of August.

Participants will be asked to abstain from drinking for a three-week period, and to record their alcohol intake throughout the rest of the study period. They will make short weekly visits to the SHDPP's clinical facility on Welch Road, to have their blood pressure, weight and height measured. Volunteers are expected to gain a better awareness of their own health status.

Principal investigator for this new study is Dr. Stephen Fortmann, director of communication studies for the SHDPP. For further information or to volunteer, call 497-5046, from 1 to 5 p.m. weekdays.

Hypnosis...

continued from page 10

prescribed to relieve ulcers works by lowering stomach acidity, even though acidity might not be the only cause of ulcers.

If hypnosis is effective, some patients might be able to avoid taking any medication for their ulcers, Klein said.

Patients, he said, could be taught to self-induce a hypnotic trance several times daily at key times when controlling acid production is crucial. This would eventually be less expensive than drugs and would bypass the potential side effects which are always present when drugs are given.

Klein explained that hypnosis was a state of intense concentration, not relaxation, so that techniques of relaxation cannot be used as substitutes for hypnosis. He added that the ability to be hypnotized appears to be innate and cannot be acquired.

"Easily hypnotizable people don't appear to show any consistently common qualities, except perhaps that they have the ability to concentrate intensely and have long attention spans.

"We will be giving our volunteers a test which will indicate their ability to be hypnotized. The test involves answering some questions, and measuring how they respond to a brief hypnotic session," the researcher said.

Persons interested in participating in the study may telephone Klein at (415) 497-5488.

Persons who complete the study will be paid $40. Each of two sessions will take about 2 1/2 hours, he said.

Klein said there were no risks from hypnosis. The gastric tube may be uncomfortable for some participants and cause a minor sore throat, or gagging as the tube is inserted.

The hormone to stimulate acid production may cause brief nausea or flushing and rapid heart rate, while a very rare subject might suffer an allergic reaction, Klein said.

Nursing...

continued from page 10

And, as in the U.S., nurses are working to get higher wages. "Any material advantages gained will no doubt be offset by some tarnishing of our public halo," he observed. But, he conceded, a little tarnishing would be fine "if the resulting image were to be a closer approximation to reality."

The make-up of the nursing profession has changed in recent years, Clay went on. "Nurses are not a workforce made up of an army of unmarried women anymore." Many are married with children, and about 10 percent are men. About 50 percent of the men, however, are top managers and educators.

Clay also made a plea for internationalism among nurses, especially to help third world countries set up nursing systems. "Newspapers in Britain regularly raise a hue and cry over the issue of British-trained nurses going abroad, but they ignore the fact than nine out of ten return enriched by the experience," he said. We have an enormous amount to gain from sharing our differing experiences with each other."

Medical Center Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, JUNE 22

"Small Beginnings"—Today is the final day of this display, an overview of nursing care in the Intensive Care Nursery. Sponsored by nursing staffs of ICN, extended care nursery and intermediate intensive care nursery. 9 a.m. to 5 p.m., outside the hospital cafeteria.

Div. of Hematology Wednesday noon conference: topic to be announced. Speaker: Dr. Joseph Miletich (Washington University School of Medicine, St. Louis). 12 noon, S102.

Dept. of Clinical Social Work and the American Cancer Society: "I Can Cope"—a program for cancer patients and their families. 5:30 to 7:30 p.m., room TF-122c. To register, call 497-5091.

Hematology Support Group: A meeting for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to 12 noon, room TF-122c. For further information, call 497-6961.

JUNE 22 and 23

Dept. of Pharmacology Second International Symposium on the Biochemical Basis of Drug Action. Final two days of the symposium, to be held at Fairchild Auditorium. A fee is charged. For further information, call 497-6834.

THURSDAY, JUNE 23

Div. of Surgical Pathology Conference: "Spindled Neoplasms of Breast"—Dr. Gertrude Crabtree. 8 a.m., L201.

Dept. of Medicine grand rounds: "Comprehensive and Cost Effective Management of Patients after Myocardial Infarction"—Dr. Robert DeBusk. 8:30 a.m., Fairchild Auditorium.

FRIDAY, JUNE 24

Dept. of Pediatrics grand rounds: "Snakebites"—Dr. Frederick Lloyd. 8 a.m., M106.

SATURDAY, JUNE 25

Eating Disorders conference: sponsored by the Dept. of Psychiatry and Behavioral Sciences. A one-day conference to inform parents and the community about modern treatments for obesity, bulimia, and anorexia nervosa. The public is invited, and a fee is charged. 8:45 a.m. to 4 p.m., M104. For further information or to register, call 497-7871.

MONDAY, JUNE 27

Dept. of Gynecology and Obstetrics REI (Reproductive Endocrinology/Infertility) conference: "Hirsutism"—Dr. Alan Shapiro. 8 a.m., A336.

WEDNESDAY, JUNE 29

Div. of Hematology Wednesday noon conference: "Pediatric presentation"—Dr. Bertil Glader. 12 noon, S102.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Research principles emphasize individual responsibility

continued from page 1

In a minority report to the Senate from the committee, Garwin noted that the statement of principles concerning research, adopted by the faculty 12 years ago, did not envision the trend toward large scale, collective research.

This policy affirms that "the individual scholar should be free to select the subject matter of his research, to seek support from any source for his work, and to form his own findings and conclusions."

It also states that "the University. . . .should allocate space, facilities, funds, and other resources for research programs based on the scholarly and educational merits of the proposed research and not on speculations concerning the political or moral impropriety of the uses which might be made of its results."

While these principles circumscribe the University's role in research, the statement adds, "they in no way diminish, and indeed they reinforce, the individual's personal responsibility to assure that the source of funding for his research, and its perceived applications, are consistent with his own judgment and conscience."

SLAC faculty concern

A majority of the SLAC faculty believe their personal responsibility would be "abrogated" if the weapons-related work were conducted at SSRL, Garwin said.

If they refused to provide services to those aspects of SLAC which serve SSRL, this action "might be construed as nonperformance of academic duty, with possible disciplinary consequences," he noted.

The "inadequacies" of the present policy "will become increasingly apparent with present research trends," he argued.

Prof. James Meindl, electrical engineering, chairman of the Committee on Research, noted that 85 percent of the controversial proposal dealt with the applications of high energy physics to other sciences. Roughly 15 percent, as measured in dollar costs, concerned calibration of radiation detectors. While intended to measure x-rays from weapons-testing, other applications "abound," he said.

Prof. Robert Mozley of SLAC said present policy "isn't adequate—it isn't working" where "two bigs labs are intermingled."

The controversial project seeks $5 million from the Department of Energy's Office of Military Applications and an additional $1 million from the University of California for research by UC faculty.

Meindl noted that the committee members objected more to an "outside" proposal than they would to one from Stanford faculty.

Mozley said "it's not the research itself, it's the perception of what we're contributing to" that leads many SLAC faculty to object. "It's working for Project R"—work at Lawrence Livermore—"very direct involvement."

Asked to examine "the volume and character of weapons-related research at Stanford," the Committee on Research concluded that "virtually all research at Stanford could conceivably have some military application."

Prof. Ronald Rebholz, English, asked what military applications might stem from his studies of Shakespeare.

Vice Provost Gerald Lieberman, dean of graduate studies and research, said the committee felt that if war-related research was put on a scale of zero to 10, most research at Stanford would fall in the range between one and nine.

Prof. Bernard Roth, mechanical engineering, urged the committee to examine the impact of "very large differences" in research funding growth between the Department of Defense and the National Science Foundation, particularly where one agency provides a majority of the funding for a Stanford department.

Computer science now gets 63 percent of its research funds from Defense, he said, and electrical engineering about 58 percent.

Exposed to pressure

This can leave the institution more exposed to pressure—if the Defense Department attempts to classify more information, for example, he added. While universities may welcome the "floodgates of expansion" now they could find themselves in trouble later, when federal dollars diminished.

Prof. Gerald Gillespie, German studies, argued that openness remains a "very important criterion" for research, since this means any results can be drawn upon by every other conceivable researcher, if desired.

Mozley noted that it was sometimes difficult to obtain information on the declared intent of research, especially when work unit summaries aren't public.

Prof. Kenneth Melmon, medicine, said "naive individuals in the process of being educated" should be encouraged to think about the implications of their research. But it was hard to understand the "servitude" of full professors.

President Donald Kennedy noted that faculty in government contract laboratories may have centrally assigned duties, unlike principal investigators in a smaller scale research group.

At a recent meeting with SLAC faculty, Kennedy said he understood that department or school faculties might make themselves subject to "research policies that are somewhat more stringent than the university as a whole, provided that these policies do not conflict with university policy."

But such actions are likely to have effects on other units of the university or funding agencies that would make them "not particularly practical," he added.

Mozley noted that what the SLAC faculty may be consulted by the director, control remains with the director. Prof. Wolfgang Panofsky, SLAC director, has made it clear that SLAC would "cooperate fully" if the controversial proposal is accepted by SSRL and the University.

—Bob Beyers

TIAA-CREF. . .

continued from page 1

total compensation for retirement is "desirable and worthy of encouragement," the task force said, it clearly is "less than optimal" for those with relatively low salaries and high expenses, including housing.

President Donald Kennedy noted that if the matching requirement were dropped, "those who are willing to make the contribution would subsidize those who were not," since all the funds would come from those available for faculty compensation.

Prof. Bernard Roth, mechanical engineering, called on the Senate to "get rid of the popular wisdom" and "deal with science" in showing more concern for older persons.

Challenging past statements by Humanities and Sciences Dean Norman Wessells that brain cells diminish with age, he cited a *Nature* magazine article which claimed "no significant decline" in psychometric test data on individuals as their average age rose from 64 to 73.

Hastorf, a psychologist, responded there was pretty clear evidence that short term memory diminishes with age.

A veteran observer with diminished capacity could recall no similar semi-scientific argument in the Senate since 1968.

—Bob Beyers

$3.2 million for 14 condominiums

The Stanford Board of Trustees has authorized $3.2 million for construction of 14 condominiums for faculty housing on Rural Lane.

The 3.4 acre site is adjacent to the 13th hole of the Stanford Golf Course.

The project will include seven pairs of duplexes. Two basic floor plans will be offered: 1) a one-story unit of 1,900 square feet with two bedrooms plus den, and 2) a two-story plan of 2,100 square feet with three bedrooms plus den.

A low block wall may be built along Alpine Rd to serve as an acoustical buffer.

In February, the trustees approved the concept of 15 clustered housing units and an application for annexation of the unincorporated portion of the site to the city of Menlo Park.

The reduction to 14 total units came in response to comments from the Menlo Park Planning Commission and the University Committee on Land and Building Development.

Construction is expected to start sometime between September 1983 and April 1984 with completion eight to 12 months later.

SSRL Vacancy announcement

A Research Associate position is available at the Stanford Synchrotron Radiation Laboratory starting after September 1, 1983 to work with Consulting Prof. R. Z. Bachrach. The renewable term appointment will be from 1 to 3 years.

Candidates should have experimental research experience in Semiconductor Surface Physics or Soft X-ray Radiation Physics and should have demonstrated experience with synchrotron radiation related instrumentation and computer control.

The Research Associate will participate in experiments utilizing absorption or photoemission spectroscopy to probe the atomic and electronic structure of condensed matter. The Research Associate will also participate in the implementation of SSRL Beam Line WUNDER, a high performance soft X-ray spectroscopic capability using a periodic magnet insertion device in SPEAR.

Write to: Prof. R. Z. Bachrach, Stanford Synchrotron Radiation Laboratory, SLAC Bin 69, P.O. Box 4349, Stanford University, Stanford, CA 94305.

Stanford University is committed to equal opportunity through affirmative action in employment and we are especially eager to identify minority persons and women with appropriate qualifications.

Telecommunication and SUNet update

continued from page 1

allow most moves and changes to be made (using) software rather than hardware changes. . .

"A modern system will allow for much more efficient use of outside and long-distance trunk lines."

The new Telecommunications Building is estimated to cost $1.5 to $2 million. The present facility is not large enough to accommodate the new equipment and is located far from the main concentration of telephones on campus. Nearly two-thirds of Stanford's phones are in the triangule bounded by the Main Quad, Forsythe Hall and the Medical Center. The new building would be located atop the underground thermal storage reservoir, or "cool pool."

Bids on the new telephone project will be received this summer. Project approval will be sought from the board in October.

At their June meeting, the trustees approved $1.6 million for the first phase of the energy management and control system. Modern, proven, digital controls will permit more effective management of utilities. This is expected to reduce electrical consumption 1.9 percent, steam by 0.9 percent, and chilled water by 5 percent, providing an internal rate of return of 21 percent on the investment.

Design of the campus-wide, broadband SUNet is nearing completion. Interbuilding prototype network links have been installed, with completioon of the first phase of the prototype network planned for this summer.

Engineering design and cost estimates are expected to be complete this summer. Project approval will be sought from the trustees in October.

Tennis lessons

Small group tennis lessons will again be offered to staff and-or their families on weekdays or evenings. Players are grouped by ability in these lessons taught by Dick Gould's staff.

Call 497-1160 on weekday mornings to receive detailed printed information and registration form.

Board of trustees act on variety of investment decisions

The Board of Trustees took the following actions at its meeting on June 10, 1983:

1) Approved actions already taken by the Office of the Vice-Provost and Dean of Graduate Studies and Research to enter into contracts and grants for research for the month of April, 1983, totaling $12,745,298. The monthly average of such awards for the twelve-month period ending April 30, 1983, was $14,608,086 compared with $13,312,356 for the corresponding period the year before.

2) Accepted gifts received during the month of May, 1983, totaling $3,971,217.

3) Accepted statements concerning:

a) Offsets and revisions in the Operation Budget for 1982-83.

b) The Conditional Budget for 1982-83.

c) The fact that the balance of the Operating Budget Reserve was $2,695,000 on August 31, 1982, and is projected to remain that at the end of the fiscal year on August 31, 1983.

4) Elected its officers for 1983-84 as follows:

President: William R. Kimball

Vice-Presidents: Nancy Barry Munger, Barbara Denning Finberg, John A. Young, John T. Packard.

5) Approved expenditure for 1983-84 from Merged Endowment Pool-A of the amount of 97 cents per share, first from ordinary income earned, and next from prior year's income that had been reinvested; and of the amount of 96 cents per share from Merged Endowment Pool-B, first from ordinary current income, next from prior year's income that had been reinvested, and, if ordinary income is not sufficient, from realized net appreciation in the value of assets. Expenditure of net appreciation, however, shall not exceed one percent of the average share value of Merged Pool-B, currently 21 cents per share.

6) Raised the limit of the advance to the Alpine Chalet, Inc., to $500,000 for a term not to exceed five years.

7) Approved the project and design for construction of fourteen condominiums on Rural Lane for eligible faculty and staff; authorized a total budget of $3,210,000; and approved provision of interim financing for construction from the Expendable Funds Pool with repayment by proceeds from sales of the condominiums.

8) Authorized the Vice-President for Business and Finance to invest up to an additional $2,000,000 from the Merged Investment Pools under the Second Mortgage Coinvestment ("COIN") Program to provide "COIN" funds for eligible recruits for faculty and senior staff.

9) Received a report summarizing performance of investments in the past calendar and fiscal years, changes in the mix of assets, and other matters concerning the University's endowment.

10) Heard a report on the University's activities in the lending of securities.

11) Heard a report on the status of further possible diversification, internationally, of the University's investment funds.

12) Heard a report from the Subcommittee on Real Estate Investment of the Committee on Investments.

13) Approved budgets for 1983-84 for the Auxiliary Activities and Service Centers: Student Housing, Food Service, and Conferences; Stanford University Press; Tresidder Memorial Union, and the Department of Athletics, Physical Education, and Recreation.

14) Authorized the Vice-President for Business and Finance to execute external financing from a bank or banks or via taxable bonds for an amount not to exceed $9,000,000, the proceeds to be used to provide working capital for the Faculty Practice Plan in the Medical Center.

15) Concerning the proposed facility for cogeneration of energy:

a) Authorized additional funding of $270,000 to continue activity on design, receipt of permits, financing, and negotiating of contracts, carrying the project forward to December 31, 1983, for a total authorization to date of $1,390,000.

b) Authorized funding of this maximal addition by an interim internal advance or an interim advance from external borrowings for General and Research Equipment to be replaced upon final approval of the project by permanent external financing.

16) Concerning the Electronic Communications Media Project, authorized various approvals for site, projects, expenditures, and funding of expenditures for the Telephone Replacement Project, the Distribution System Project, the Energy Management and Control System, and the Stanford University Network (SUNet).

17) Concerning renovation of the south wing of the building at 800 Welch Road, approved the project, design, total budget of $1,756,000, and funding by an interim internal advance to be replaced, when appropriate, by permanent long-term debt financing through the California Educational Facilities Act or other external sources.

18) Approved the design for the renovation of the Angell Field Track House.

19) Approved the concept and site for the expansion of the Bowman Alumni House.

20) Approved the concept of this project to improve facilities in the Stadium.

21) Authorized the Vice-President for Business and Finance to execute a Fourth Amendment to the University's lease with the United States government (Stanford Linear Accelerator Center—SLAC) adding 5.1 acres to its leasehold.

22) Authorized transfer to term endowment of half of the gifts made by Leslie Anne Weeks for endowment and of half of the matching funds earned by such gifts, to be expended over a 10-year period for fellowships at the Stanford Humanities Center, provided that the total to be transferred from gifts of Marta Sutton Weeks and Leslie Anne Weeks shall not exceed $500,000.

23) Established the Catharine and Howard Avery Professorship in the School of Medicine.

24) Heard a report on the impact on the University's debt of three projects currently being considered for debt funding.

25) Heard a report on the proposed Environmental Safety Facility.

26) Heard a report on progress toward reconstruction of the Red Barn and Stable.

27) Heard a report on the Samuel J. and Ileen B. Campbell Wing of the Braun Music Center.

28) Heard a report comparing projected financial results for auxiliaries and non-academic service centers for 1982-83 with those for 1981-82.

29) Heard a report on the budgets of Operations and Maintenance and the Stanford University Investment Management Organization (SUIMO).

30) Received the Annual Insurance Report.

31) Received a report on the status of construction on campus.

32) Heard an informal report from Fred A. Hargadon, Dean of Admissions, and Robert P. Huff, Director of Financial Aids.

33) Authorized an increase of up to an additional 10 percent of the amount originally subscribed, or $500,000, in Endowment and Foundation Realty Partnership—JMB I.

34) Authorized an investment of $5,000,000 in Endowment and Foundation Realty, Limited—JMB II.

35) Authorized an investment of $25,000,000 in the Common Fund-International Fund.

Governing board approves faculty appointments, promotions, titles

On June 10, 1983, the Board of Trustees approved the following actions, effective September 1, 1983, unless indicated otherwise.

PROMOTIONS:

Thomas E. MaCurdy, associate professor of economics.

REAPPOINTMENTS:

Carson E. Agnew, assistant professor of engineering-economic systems; Jan Ehrenwerth, assistant professor of anesthesia; Michael Eliastam, assistant professor of surgery and medicine; James W. French, associate professor of pediatrics (clinical); Anthony E. Howes, assistant professor of radiology; J. William Langston, assistant professor of neurology; Raymond E. Levitt, associate professor of civil engineering; Abdul Matin, assistant professor of medical microbiology; Thomas A. Raffin, assistant professor of medicine; Ron. G. Rosenfeld, assistant professor of pediatrics; Peter Rudd, assistant professor of medicine; James Silverman, associate professor of radiology (clinical); Kelley M. Skeff, assistant professor of medicine; Richard M. Swanson, assistant professor of electrical engineering; Frank M. Torti, assistant professor of medicine; Bruce G. Wallace, assistant professor of neurobiology; Stuart Young, assistant professor of radiology.

APPOINTMENTS:

Joel S. Beinin, assistant professor of history; Thomas J. Campbell, associate professor of law, 7-1-83; William T. Clusin, assistant professor of medicine, 7-1-83; John W. Etchemendy, assistant professor of philosophy, 7-1-83; John W. Frost, assistant professor of chemistry; Robert W. Gordon, professor of law, 7-1-83; Lawrence D. Hammer, assistant professor of pediatrics, 7-1-83; Frederick O. Holley, assistant professor of anesthesia, 7-1-83; Holly Hosford-Dunn, assistant professor of surgery; Donald C. Johanson, professor of anthropology (teaching); Daniel S. Kapp, associate professor of radiology, 7-1-83; Antonio C. Lasaga, professor of geology; Stephen F. Lundstrom, associate professor of electrical engineering (research); Alan K. Miller, professor of materials science and engineering (research); Mark. H. Munn, assistant professor of classics (subject to Ph.D.); Michael Pavel, assistant professor of psychology; Peter M. Pinsky, assistant professor of civil engineering, 1-1-84; David D. Pollard, associate professor of applied earth sciences; William J. Poser, assistant professor of linguistics (subject to Ph.D.); Leonard Roberts, professor of aeronautics and astronautics (research) 6-1-83; Kristine M. Samuelson, associate professor of communication (teaching); Krishna Saraswat, professor of electrical engineering (research); Peter Sarnak, associate professor of mathematics; Stephen J. Shochat, associate professor of surgery (clinical) and pediatrics (clinical), 7-1-83; Mark Shulman, assistant professor of anesthesia; Dennis C. Stowe, assistant professor of mathematics; Daniel A. Weinberger, assistant professor of psychology (subject to Ph.D.); Barry R. Weingast, associate professor of business and the environment, GSB; Brian White, assistant professor of mathematics.

REPORT MATTERS:

Fernando Alegria, professor of Spanish and Portuguese, appointed chairman of the Department of Spanish and Portuguese, 9-1-83 to 8-31-85.

Malcolm A. Bagshaw, professor of radiology, appointed the Catharine and Howard Avery Professor in the School of Medicine, effective immediately.

James B. McClenahan, director of Cowell Student Health Center, emeritus, 9-1-83.

Edward Teller, reappointed senior research fellow at the Hoover Institution, 7-1-83 to 6-30-85.

Ewart Thomas, professor of psychology, appointed chairman of the Department of Psychology, 9-1-83 to 8-31-86.

FACULTY EMERITUS TITLES:

The following members of the faculty have elected early retirement and will be granted the following titles effective September 1, 1983, unless another date is indicated:

George Leland Bach, Frank E. Buck Professor of Economics and Public Policy, GSB, and professor of economics, Department of Economics, emeritus.

William A. Bonner, professor of chemistry, emeritus.

John V. Breakwell, professor of aeronautics and astronautics, emeritus.

Chi-Chang Chao, professor of aeronautics and astronautics, emeritus.

Wendell Cole, professor of speech and drama, emeritus.

Herbert Hultgren, professor of medicine, emeritus.

Eric Hutchinson, professor of chemistry and academic secretary, emeritus.

Dudley Kirk, Dean and Virginia Morrison Professor of Population Studies, Food Research Institute, and professor of sociology, emeritus, 1-1-83.

David Thompson, professor of industrial engineering, emeritus.

Walter Vincenti, professor of aeronautics and astronautics, emeritus.

Alan T. Waterman, professor of electrical engineering, emeritus.

Mitchel Weissbluth, professor of applied physics, emeritus.

STAFF EMERITUS TITLES:

Robert M. Butler, Medical School controller, emeritus, effective 3-1-83.

Gertrude Rulofson, assistant dean of the School of Earth Sciences, emerita, effective 9-1-83.

Letters to the editor

Edwin Harwood responds to Rebholz, then rests his case

Editor, *Campus Report*:

In his letter to the *Campus Report* (June 15), Prof. Rebholz suggests that I might possibly have engaged in "nonmalicious slander" in questioning the sincerity of his motives in criticizing the relationship between Hoover and Stanford. He also claims that I identify "nonmalicious slander" as one type of "rabid and vicious demagoguerie."

If you pursue the chain of Prof. Rebholz's reasoning to its logical terminus, then you arrive at the absurd conclusion that I myself may have engaged in rabid and vicious demagoguerie.

First, I am not alone in raising questions about Prof. Rebholz's motivations. Prof. Thomas Grey, whose letter (*Campus Report*, June 8) was a source of gratification to Dr. Rebholz, has also raised qustion about Dr. Rebholz's motives.

Although he confesses that he does not know what Rebholz's motives were, he is willing to go out on a limb and assert that both Rebholz and Prof. Juilland "probably have mixed motives" in organizing their respective petition drives. (However, Prof. Grey offered no compelling evidence in Prof. Juilland's case whereas I went to considerable trouble to document the bona fides of my argument in the case of Prof. Rebholz and the other signers of both the Franklin brief and Hoover petition.)

Second, I do not identify slander with rabid demagoguerie. I raised the quite legitimate question of whether the Franklin *Amicus Curiae* brief signers' agreement that political opinions could assume "rude forms, even the nonmalicious slander of public personalities" was to be taken as a *defense* for Franklin's behavior which went far beyond the heckling observed among backbenchers in the British Parliament. (The example the Franklin brief signers used.) If anything, the only valid inference to be drawn from what I wrote is that there is a world of difference between the two kinds of behavior.

Thirdly, I do not like slander, whether malicious or nonmalicious, and would write no brief in its defense irrespective of whether or not it is protected by the First Amendment. It may be considered acceptable conduct by politicians or by editors of magazines like *National Enquirer* but in my opinion is very unseemly for the scholar whose principal mission is to seek truth and wisdom.

I am a very cautious man. By no means do I enjoy attacking anyone in print. And I do not call into question the sincerity of a man's motivations unless I believe that the issue at hand is of overriding importance, that doing so is essential for articulating a convincing rebuttal to the opposing side's position, and that the evidence is such that I have the strongest possible case for raising the question.

Since we cannot know one another's minds or hearts directly, we must build our case from what an individual writes and says. My case rested on the contradictions I perceived between the stand Dr. Rebholz and others took in the Franklin affair and the stand taken in the Hoover controversy and which I developed at length in my two *Campus Report* (letters).

Interestingly, the point I considered most important is the one that neither Prof. Grey or Dr. Rebholz have responded to: namely, the fact that Dr. Rebholz, as a signer of the Franklin brief, allowed in 1971 that Stanford could take a partisan stance as an institution on certain issues whereas in the Hoover controversy he asserted that neither Stanford or any of its affiliated centers could behave otherwise than to remain "nonpartisan."

I would add, finally, that had Rebholz and the others been genuinely concerned about academic freedom in 1971, then isn't it plausible to assume that they would have been at least as much, if not more, concerned over the threat that left-wing extremists posed not just to the academic freedom of conservatives on campus but to the scholarly community as a whole?

I rest my case.

Edwin Harwood
National Fellow
Hoover Institution

Commencement celebration

Editor, *Campus Report*:

Back in the '70s, when I last took part in the commencement exercises, those exercises were rather sober affairs. This year's commencement was refreshingly lighthearted: bands playing, champagne corks popping, lots of banter—even from the Secretary of State—and high spirits coupled with generally respectful attention to the program.

Even the human rights message, in which I joined, seemed upbeat, constructive, and symbolic of the free expression and tolerance of diversity that one hopes to find at the best universities. What a contrast to the self-serious, intolerant, and shameful disruptions of speeches by Jeanne Kirkpatrick and others that have taken place elsewhere.

Obviously, Don Kennedy sees commencement as a celebration. He has also managed successfully to communicate that spirit to the entire commencement body.

Armin Rosencranz
Former university trustee

Contracts and grants

Following is a selected list of government and nongovernment contracts and grants of $200,000 and over, received for the month of April:

FEDERAL

New Contracts

Karl H. Pribram, Herbert Solomon, and Richard F. Thompson, psychiatry, "Theoretical and Experimental Analysis of the Neural Bases for Learning and Memory," $938,990 from the Department of the Navy for 3 years.

Contracts—Amendments

James D. Meindl, Stanford Electronics Laboratories, "Joint Services Electronics Program," $520,000 from the Department of the Army for 1 year.

New Grants

Albert E. Dien, Stanford Center for Research in International Studies "East Asia National Resource Center and Fellowship," $285,480 from the Department of Education for 1 year.

Charles H. Kruger, Morton Mitchner, Sidney A. Self, and Robert Eustis, mechanical engineering, "Fundamental Processes in Partially Ionized Plasmas," $200,000 from the Department of the Air Force for 1 year.

Hugh O. McDevitt, medical microbiology, "Lymphocyte and Macrophage Genes, Proteins, and Receptors," $780,518 from NIH for 1 year.

Grants—Amendments

David A. Clayton, School of Medicine, "Medical Scientist Training Program," $669,137 from NIH for 1 year.

Stanley N. Cohen, genetics, "Genetic Mechanisms in Bacterial Antibiotic Resistance," $245,721 from NIH for 1 year.

A. Dale Kaiser, biochemistry, "Training in Biochemistry," $229,790 from NIH for 1 year.

Henry S. Kaplan, radiology, "Biological Aspects of Carcinogenesis by Radiation," $381,230 from NIH for 1 year.

Henry S. Kaplan, radiology, "Human Hybridoma Antibodies in Neoplastic Disease," $257,946 from NIH for 1 year.

Saul A. Rosenberg, Department of Medicine, "Clinical and Laboratory Studies of the Malignant Lymphomas," $1,370,580 from NIH for 1 year.

George R. Stark, Biochemistry, "Mechanism and Role of Gene Amplification in Mammals," $294,196 from NIH for 1 year.

NON-FEDERAL

New Contracts

Lorrin M. Koran, Keith I. Marton, and Harold C. Sox, psychiatry, "A Medical Evaluation Study of Mental Health Service Clients—Four County-Stanford Medical Evaluation Study," $445,000 from the State of California for 15 months.

Gary K. Schoolnik, Department of Medicine, "A Pilus Vaccine for the Prevention of *E. coli* Urinary Tract Infections," $461,760 from Cetus Corporation for 3 years.

Richard N. Zare, chemistry, "Reaction Dynamics in Condensed Media," $409,954 from Standard Oil Company AMOCO Research Center," for 3 years.

New Grants

John W. Lewis, political science, "Arms Control and Disarmament Program," $600,000 from the Hewlett Foundation for 4 years.

John R. Perry, Institute for Mathematical Studies in the Social Sciences, "Situation Semantics for Natural and Programming Languages," $725,824 from the System Development Foundation for 29 months.

Grants—Amendments

Ruth T. Gross, pediatrics, "General Pediatrics Academic Development Program," $357,396 from the Robert Wood Johnson Foundation for 2 years.

Accidents and injuries

Accidents and Injuries Occurring During Week of June 6-17

Cause of Accident or Injury	Number of Incidents	Number of Days Off
Animal contact	1	0 (0)
Chemical inhalation	1	0 (0)
Contact with object:		
Cut by object	3	0 (0, 0, 0)
Impact with object	1	0 (0)
Fall from height	1	1 (1)
Fall from same level	2	10 (10, 0)
Foreign body in eye	1	0 (0)
Job stress	1	16 (16)
Lifting improperly	2	4 (1, 3)
Overexertion	3	8 (0, 3, 5)

Campbell steps down as chairman of Regents, takes up U.S.—Japan posts

W. Glenn Campbell, director of the Hoover Institution at Stanford University, will finish his term as chairman of the University of California Board of Regents June 30.

The senior appointee of former Governor Reagan, he will complete his 16-year term as a member of the board in March, 1984.

Effective July 1, Campbell assumes the chairmanship of two separate organizations concerned with Japanese-U.S. relations: the American panel of the Joint Committee on Japan-U.S. Cultural and Educational Cooperation and the Japan-U.S. Friendship Commission. The latter group, established by Congress in 1975, administers a $30 million fund to promote educational and cultural activities between the two countries.

Campbell has a distinguished record of public service having held six appointments under four U.S. presidents. He currently serves as chairman of the President's Intelligence Oversight Board and as a member of the President's Foreign Intelligence Advisory Board.

From 1972-1978, he was a member of the Board of the National Science Foundation (the largest foundation in the United States), a member of the President's Committee on Science and Technology (1976), and a member of the President's Commission on White House Fellows (1969-1974).

Campbell, who has been director of the Hoover Institution since 1960, is well known as a successful organizer and builder of public policy research organizations, having directed research at the American Enterprise Institute from 1954 to 1960 and having been one of the founders of the Center for Strategic and International Studies at Georgetown University, both located in Washington, D.C.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

42001-LL (JCC:3152) DEVELOPMENT OFFICER IV: Develop & implement fundraising programs which will secure a significant fraction of the gift funds required to modernize SU Hospital ($15 million) & construct the New Children's Hospital at Stanford ($40 million); respon will res w/ Assoc Dir to identify prospective major donors, involve them in Med Ctr & see that they are asked to contribute in a timely fashion; draw on existing resources as well as develop new programs; able to organize & motivate volunteers,faculty admin & sr. staff; QUALIFICATIONS: must have a proven record of accomplish't which demonstrates initiative, creativity & endurance; exp in a teaching hospital working w/ Med Staff & community volunteers & organizations highly desirable; broad knowl of local community (San Mateo & Santa Clara counties)—its corporate base, its non-profit organizations & its leading citizens helpful; understanding of major gift fundraising & marketing.; C09; $2972-3642.

30525-DS (JCC:4068/4076) Programmer Analyst, Genl I/II: SYSTEMS ANALYSIS: respon for identifying user needs & problems, evaluating approaches, & translating into sys designs; develop solutions for improvements to Payroll/Personnel & other computer sys; develop test plans for new sys enhancements; PROJ COORD: monitor status of sys projs for users, liaison w/ user & tech support teams; report on progress & performance according to schedule & budget; PROGRAMMING/CONSULTATION: moderate programming in Stanford software—e.g., WYLBUR, SPIRES, Mark IV, SPSS; consult w/ end-users; liaison w/ CIT; DOCUMENTATION: develop, write, & maintain sys documentation in user area of existing sys; explore methods & promote uniform standards of documentation; QUALIFICATIONS: knowl of & exp w/ sys concepts required; ability to write clear, concise descriptive prose required (writing sample requested); ability to describe, address, & solve problems; ability to plan, schedule, & coord tech projs preferable; prior exp w/ Stanford software preferable.; C05/C06; $1670-2086/1854-2312.

39485-TC (JCC:5588) LIFE SCI RES ASST I: Maintenance of cell line for cultivation of viruses; cultivation of viruses fr clinical specimens as well as reference stocks; propogation & preservation of virus stock; cloning of virus DNA & extraction fr bacterial cultures; DNA hybridization using nick translated xxxx labelled 32P probes, incl DNA hybridization on clinical specimens; analyses of virus antigens using polyacrylamide gel electrophoresis & immunodetection procedures; problem solving & planning of new experiments, etc; QUALIFICATIONS: BS degree w/ several yrs lab exp; familiar w/ advanced biochemical lab skills; thorough understanding of theory behind procedures used & ability to interpret resuits & change procedures based on this theory.; C05; $1670-2086. 1

36185-TC (JCC:5588) LIFE SCI RES ASST I: Involves the characterization of the role of small ribonucleoprotein particles in the processing of eukaryotic primary transcript in vitro; requires the use of independent judgment & application of theory relating to RNA-DNA interaction & RNA processing; exp in cell culture, protein & RNA purification & analysis by electrophoresis & electrofocusing, filter hybridization, nick translation & restriction enzyme analysis, preparative DNA gel electrophoresis & RNA sequencing; QUALIFICATIONS: exp/training in protein, DNA & RNA biochemistry, RNA hybridization & cell culture & be capable of independently designing, performing, & analyzing procedures & experiments; Bachelor's degree or its equiv & relevant work exp required.; C05; $1670-2086.

22525-LL (JCC:5596) LIFE SCI RES ASST II: Asst faculty investigator in carrying out res projs; primary respon for purifying enzymes & nucleic acids; conducts experiments & procedures under the supvn of faculty investigator, thus familiarity w/ tech for purification & characterization of enzymes, e.g. gel electrophoresis, chromatography, radioactive isotope assays growth & maintenance of bacteria, phages, phage-infected bacteria are preferred; supv routine maintenance & operations of lab; prov 1 assistance to postdoc fellows & grad students; order supplies, etc; QUALIFICATIONS: BA or BS in Biochemistry, Chemistry or Biology; 2 yrs lab exp nec.; C06; $1854-2312.

40384-JB (JCC:6306) R & D ENGR II: Work closely w/ scientists & engineers to design precision optical mech res instrumentation & related components for use in synchrotron radiation beam lines; requires a synthesis of mech engrg calculations (e.g. heat transfer & thermal effects in objs struck by intense x-ray beams; mech stresses, deformations vibrations in various structures & mechanisms) & practical mech design of precision instruments, guided by the analytical calculations as well as by prior design exp & familiarity w/ commercial mat'ls & components, fabrication techiques, & budget & schedule realities; QUALIFICATIONS: advanced degree(MS Minimum) in mech engrg, w/ ability to perform complicated heat transfer & mat'ls stress calculations essential; working familiarity w/ computer solutions of such problems highly desirable; familiarity mech drafting practices, & machine shop & fabrication tech, essential; min 5 yrs working exp in mech design-related areas; knowl of ultra-high tech helpful.; C99; $2113-OPEN.

40551-LL (JCC:2136) ACCOUNTANT III: Respon for all Faculty Practice Program financial reporting functions; incl consolidation of income, expense, activity , accts receivable & other info on FPP depts into a comprehensive financial report on a monthly basis; reporting on FPP admin cost ctrs & indiv physician performance; respon for calculation & payment of physician incentive payments; respon for a financial report which currently exceeds 300 pages each month; familiar w/ a large number of reports & several distinct computer sys; highly visible w/in Med Ctr involving physicians & administrators; QUALIFICATIONS: Bachelor's degree in acctg w/ 6 yrs work exp or equiv; excel verbal & written commu skills; knowl of complex physician billing & acctg sys; knowl of data processing concepts w/ some exp w/ spread-sheet software; some knowl of statistical analysis.; C07; $2113-2724.

Hospital

Please submit all applications/resumes to the Hospital Personnel Department to the attention of Celia Corchado, 770 Welch Rd., Suite 100.

32946-LL (JCC:5940) CLINICS STAFF NURSE IV: Research nurse will monitor several clinical res protocols for treatment of Hodgkin's disease & non-Hodgkin's lymphomas, studying primary chemotherapy & radiotherapy treatments & toxicity of treatments; involve patient care, patient interviews, review of chemotherapy records, assessment of treatment toxicity & mgmt of data, incl some computer entry & retrieval; clinical studies w/ interferon will incl Phase I-II testing of new products & a Phase III adjuvant study in nodular lymphoma; help to coord lymphoma teaching conferences & interface w/-several add'l res projs, incl monoclonal antibody studies for diagnostic & therapeutic use; QUALIFICATIONS: valid Calif Registered Nurse's License; prev exp w/ Oncology patients.; K04; $2061-2229.

Nonexempt

25645-PM (JCC:2058) ADMIN ASST I: (N) 8-5, occasional wkends; Admin Asst to VP for Public Affairs; plan & organize VP's schedule; draft original corresp; requires summarizing, excerpting, & drafting on specific issues, such as tax policy, other public policy issues, position memo to offices of univ, trustees & govt officials at all levels; typing; maintain files; screen phone calls; receive visitors; organize mail, expense reports; represent VP at selected mtgs in his absence; assemble bkground mat'l for VP's daily mtgs & for continuing issues & projs; arrange travel plans; QUALIFICATIONS: typ 50; good organizational skills; atten to detail; good judgment & discretion dealing w/ sensitive & confidential matters; good written verbal skills; knowl of univ policies & procedures & prior univ exp desirable; send appl/resume to Rene 1 Cortinaz, Public Affairs, Bldg. 170.; B16; $1593-1671.

28291-BP (JCC:2058) ADMIN ASST I: (N) Asst ASM in Admin Offc of Stanford Electronics Lab in complex & sensitive matter requiring high degree of judgment & independence in performing the varied tasks assigned; review all res proposal budgets for correctness & compliance w/ Univ acctg practices & Agency requirements; develop budgets for faculty in EE fr scratch to be submitted to Govt & Private Agencies complying w/ all governing requirements; respon for maintaining records on all pending proposals & awards; respon for prep of monthly, as well as annual reports for awards & monthly expenditures & maintain effort report sys; serv as liaison between SEL & approp Univ Offc; QUALIFICATIONS: good organizational, commu skill nec; diplomacy & tact essential; knowl of Univ's personnel forms helpful; some math ability nec; knowl of word processing helpful; able to deal w/ people & their related questions & problems in a professional manner; send appl/resume to Beverly Yates, AEL Room 107.; B16; $1593-1671.

38883-PM (JCC:2596) SECY II-SPEC: 50%; typing of tech manuscripts & some corresp; maintaining ledger & running balances for several grants; preparing monthly summary of total funds remaining in grants, checking monthly budget statements on grants, & as grants near close of funding period, being able to forecast amounts available for expenditure; keeping payroll records of large research group; preparing purchase orders, etc; answering phones; ordering of supplies; QUALIFICATIONS: typ 60-65+; excel typing a necessity; willingness to work w/ figures essential; exp w/ Stanford expenditure statements very useful; willing to 1 deal w/ large res group (20-25 people); send appl/resume to Janet Shaw, Dept. of Chemistry, Seeley Mudd Bldg. Rm. 121A.; B12; $655-687.

21983-BP (JCC:2596) SECY II-SPEC: Typ tech papers, proposals, corresp; prepare purchase reqs, expense rprts; checks reqs & interdept'l requests; willing to learn word processing (NBI); perform genl offc duties for 2-4 faculty members; run errands; distribute mail; answer phones, etc; summer employment optional; QUALIFICATIONS: typ 75-80; 2-3 yrs of genl offc exp; knowl of tech typing (med terms & math equations); send appl/resume to Judith Haccou, Terman Eng. Ctr, Rm 551.; B12; $1310-1373.

40333-PM (JCC:5484) DATA AIDE II: Maintaining control over epidemiological survey & surveillance records fr off-site centers; respon for records going thru manual validation procedure; respon for use of computer report to make corrections to data; prep of simple statistical tables; 25% of duties involve clerical support to data group; QUALIFICATIONS: typ 50; knowl of large data bases essential; must have exp w/ data collection & mgmt; familiarity w/ computer processing procedures; exp on Stanford computer helpful (WYLBUR, SPIRES, SAS); med terminology helpful; send appl/resume to Kay Wilson, SHDPP, 730 Welch Road, Suite 234, or call 497-7822.; B10; $1189-1246.

24688-BP (JCC:2462) OFFICE ASST III: Answer telephone & counter inquiries; direct students to proper staff member; disburse student loans after checking ID, obtain signatures on documents as required; explain credit disclosures & terms of various funds; process all incoming mail & date/time stamp & sort by category; prep all coding for address changes to Student Loan Sys; opens & checks student loan payments & prepares for loan payment processor; alphabetizes & numerically sorts large volume of documents; balances petty cash fund; QUALIFICATIONS: typ 40; 1 yr genl offc exp plus receptionist exp; requires good interpersonal skills, neatness & accuracy; good numerical skills required; able to tolerate continuous interruptions; send appl/resume to J. Jedd/J. Kitaji, 104 Old Union.; B11; $1246-1310.

43702-PM (JCC:2462) OFFICE ASST III: Greet visitors; answer phones; make appts for Dept of Med offc; operate Xerox 860 word processor for reports, corresp, grant proposals, mailing lists, etc; act as resource person by training & assisting users 1 of word processing in dept; handle typing, filing, & ordering of supplies; key Operator for dept copy machines, etc; QUALIFICATIONS: typ 55; good typing & offc skills; ability to learn all aspects of word processor; aptitude for figures; contact: Linda Barozzi, SU Med Ctr, Rm S-102.; B11; $1246-1310.

40332-PM (JCC:2470) OFFICE ASST IV: Prov offc & sec'l support for key personnel in an international collaborative research proj, the Lipid Res Clinic of Stanford Heart Disease Prevention Program; typ draft mat'ls & format final copies of corresp, reports & forms; some data entry on computer; proofread & update vital data records; transcribe infor; record & transcribe minutes of mtgs; bkup to Subj Coord, Data Coord, & Clinic Receptionist; maintain records & files; perform lib reference searhes; screen applicants for various staff openings; schedule appts for participants, etc; monitor clinic budget for Trial Coord & Dir; QUALIFICATIONS: typ 60-70; s/h, preferred; superior sec'l & commu skills; excel spelling; transcription & word-processing exp helpful; good interpersonal skills essential; prior exp w/ univ res helpful; send appl/resume to Patti Mathis, 730 Welch Road, Suite B, 497-6254.; B14; $1440-1514.

39284-BP (JCC:2470) OFFICE ASST IV: Respon for payroll & personnel records for dept'l staff, 25 regular employees, 300 student employees, 33 resident fellows; monitor, reconcile, & analyze budgets on a monthly basis; interface w/ other Univ depts; asst in prep of yrly budget proposal; coord info w/ financial aids, grad awards; act as bkup receptionist-sec to Sec III, etc; QUALIFICATIONS: able to work w/ diverse group of people; work w/ numerical detail accurately & quickly; able to handle several tasks at one time; maintain confidentiality; accuracy in typing & proof reading ability; typ 45; send appl/resume to E. Hiyama, 311 Old Union.; B14; $1440-1514.

27473-BP (JCC:2520) OFFICE ASST IV-PREM:

continued on page 18

SLAC

94117-JM (JCC:2058) ADMIN ASST I: (N) 75%; coord all voice telephone moves & changes; receive, analyze & assist telephone serv requests; plan, organize, implement & coord telephone changes; authorize telephone co. rep on implementing & modifying sys; QUALIFICATIONS: must be familiar w/ telecommu industry; excel 1 interactive skills incl effective oral & written commu; ability to demonstrate helpful & patient attitude; understand telephone configurations & have a working knowl of features available & of sys limitations; able to plan, organize & implement telephone moves & changes; ability to coord multiple telephone activities.; B16; $1195-1253. APPLY AT SLAC

93745-JM (JCC:2596) SECY II-SPEC: Prov full sec'l serv to large group of physicists; typ corresp, incl tech terminology; typ final tech papers using physics terminology; use dictaphone to transcribe work; answer inquiries; interact w/ short & long term foreign visitors; QUALIFICATIONS: typ 50-65; ability to use Greek & math symbols; ability to carry out a wide variety of tasks w/ minimal supvn; exercise good judgment in screening activities; ability to compose ltrs fr oral or written instructions; knowl of punctuation & syntax; dictaphone exp desirable.; B12; $1310-1373. APPLY AT SLAC

95511-JM (JCC:2262) FIN/MGMT ANALYST II: Assist in preparing annual budget documents for submittal to DOE; review & analyze cost performance against budget; participate in spec analyses as required; assist in long range planning process; establish group/proj budgets; development & maintenance of computer models; QUALIFICATIONS: BS or equiv exp in Business Admin, Economics or tech discipline w/ some acctg bkground; MBA desirable; ability to commu both orally & in writing.; C07; $2113-2773. APPLY AT SLAC

Bargaining unit

26603-TC (JCC:5638) LIFE SCI TECH I: 50%; TMS Unit; order lab supplies, animals & eqpt; maintains inventory; keeps records; in charge of animal surgery & histology rooms & maintain them in good & clean condition & has the authority to require all users to do so; makes media, reagents, etc; will be trained to perform routine histology, incl perfusions, tissue sectioning, mounting & staining & to assist w/ routine animal surgery; may train lower level part-time employees; QUALIFICATIONS: any exp in working in a lab or edu'l bkground in Biology or Psychobiology would be helpful but not nec; must have interest in working in a lab w/ a large staff of Grad Students, Post Doctoral Fellows, Res Assoc, etc.; A18; $ 7.50.

32874-TC (JCC:5644) LIFE SCI TECH II: TMS Unit; participate in devising tissue culture conditions, preparation of media; respon for RNA & DNA large scale prep, protein electrophoresis & DNA sequencing gels; incl plasmid prep, screening plasmid & phage lib, enzyme assays, working w/ radio-labelled compounds; make decisions as to mat'l required & proceed w/ ordering all supplies; perform analysis & maintain documentation of all data; QUALIFICATIONS: fully trained in both molecular biology & basic biochemistry tissue culture tech, & skilled in working w/ radio-labelled compounds; 3-5 yrs of closely related research desirable.; 1 A24; $ 8.65.

44336-TC (JCC:5736) TISSUE TECH II: TMS Unit; 7:30-4pm M-F or Tues-Sat; cutting 3-5 micron sections of paraffin embedded tisuue incl lymph node, spleen, liver, & kidney biopsies w/ a high degree of skill & speed; performing routine H&E & spec stains; embedding, coverslipping, & iabeling surgical specimens; lab bookkeeping, other misc histology lab duties such as knife sharpening, solution prep, etc; QUALIFICATIONS: ASCP in Histology preferred; exp as active Histotech; skills in high quality sectioning.; A30; $ 9.97.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, June 28 in Room 270, Tresidder Union.

The sessions are open to all new employees without preregistration.

Carpools

Ride share between SF and Stanford M-F, mornings and eves (times flexible), call Jennifer at 346-6411 after 8 p.m.

Ride needed from Sharon Heights Shopping Center to Stanford, in exchange for gasoline. My hours are 8 a.m. to 5 p.m. Please call Dixie Dodson at 497-9150.

Four Rodin masterpieces displayed in courtyards of Quad

Four major bronze sculptures by Auguste Rodin, representing four Burghers of Calais, have been installed in courtyards of the Stanford Quadrangle.

On loan from the B. Gerald Cantor collections, they will remain on view in the courtyards for the next two years. They eventually will become part of the B. Gerald Cantor sculpture garden, being built immediately south of the Stanford Art Museum. It is scheduled for completion by June 1985.

According to Stanford art Prof. Albert E. Elsen, one of the world's foremost authorities on Rodin, Cantor felt these great sculptures should be placed out on campus where they could be seen and enjoyed rather than placed in long-term storage.

The statue of Eustache de St. Pierre, elderly leader of the Burghers, has been installed in History Corner Courtyard; Jean de Fiennes and Pierre de Wissant in Memorial Courtyard; and Jean d'Aire who carries the key to Calais, on the terrace on the western Lomita Mall side of the Quad between Mathematics and Values, Technology, and Society.

Burghers of Calais

Rodin conceived the Burghers of Calais in response to a commission for a monument to their memory by the city of Calais in 1884. The final monument, completed in 1889, but not installed until 1895, was to all six Burghers who in the 14th century, at the beginning of the Hundred Years War between France and England, offered their lives as hostages to the King of England if he would lift the seige of their city.

Each of the Burghers was conceived separately and ultimately joined into a single final monument. During Rodin's lifetime, statues of the individual Burghers, notably those of Eustache de St. Pierre and Jean d'Aire, were exhibited, purchased and publicly installed in various European cities. Thus the installation of these single statues in the Quad and historical precedent in the artist's lifetime. They also date from the time that Stanford University was being built.

According to Elsen, "Rodin's conception of the Burghers surprised and dismayed many in Calais because he did not show them stoically and happily accepting their fate. Rodin's view of heroism credited his public with greater sophistication than it had at the time.

"He saw true courage as the overcoming of fear, and each of his Burghers is revealed in terms of how he came to terms with his own death. Such displays of feeling were considered at the time unbecoming secular martyrs, but ultimately Rodin imposed his vision on the public.

Symbols of surrender

"Rodin has shown the Burghers stripped of their armor or normal attire, wearing shifts and ropes around their necks as symbols of surrender. Each figure is a powerful recreation of an individual Burgher, a marvelous confluence of artistic imagination and realism.

"In the absence of any contemporary recording or description of the physical appearance of the hostages, Rodin had to rely upon his imagination and custom of working from live models. He sought to show men who before the siege had been hardy of physique, but who had suffered from starvation before their surrender.

"He made these figures with what from close up seem very large hands and feet, but which he knew was necessary for their gestures to visually carry from the great distance when seen out-of-doors. Their movements are almost dance-like as Rodin choreographed the way their spirits resisted but their bodies complied with the demands of duty. All the Burghers were made of the same height to signify the equality of their sacrifice.

"The Burghers remind us of the great tradition of western art in which public monuments were made to celebrate the dead and dying, heroes for causes in which they believed, and men who despite the injustice of their fate met it bravely.

Nationalist spirit

"Such sculpture was frankly intended to arouse the spirit of nationalism in all who saw it. Rodin's monument was to heroes in defeat, and a reminder to his countrymen who had suffered a humiliating defeat at the hands of the Prussians in 1870, that Frenchmen could act nobly under the worst of circumstances.

"Each Burgher as interpreted by Rodin is a drama within an overall play. Just as each sculpture is expressive when seen from every prospect, so too do successive views help to reveal unfolding aspects of the individual dramas. Each figure is a summation of successive physical movements.

"Rodin believed that the artist should learn from nature, but not be inhibited from exaggerating what he found—to lie in order, to tell the truth, as he put it, in order to create credible and important art."

With this latest addition to outdoor campus sculpture, Stanford has one of the finest public installations of the history of modern public sculpture in the nation.

Stanford student stops to examine Auguste Rodin's statute of Eustache de St. Pierre, elderly leader of the Burghers of Calais, now on display in the courtyard of History Corner. The famed bronze is the loan from the B. Gerald Cantor collection.

Teachers are the key to improved science teaching

Any efforts to improve science teaching in the schools must recognize teachers as the key resource, says Dean Myron Atkin of the Stanford School of Education.

A former high school science teacher, Atkin's views on "The Improvement of Science Teaching" are featured in the current issue of *Daedalus* magazine.

Educational policies "should be constructed at least as much to enhance teachers' strengths as to guard against their weaknesses," he comments.

"If external initiatives are directed exclusively toward assuring some prespecified minimum level of effort or achievement, and not toward enhancing the work of those who do the job best, the profession will gradually become less attractive to its most able practitioners, because the minimum tends to become the standard."

Able science teachers are in critically short supply. Perhaps only 10 percent of those students now planning teaching careers rank academically with the top half of those in other preprofessional, four-year programs, he estimates.

Given the great shortage, Atkin suggests that only able science teachers should be assigned to work with youngsters of the highest achievement in high school.

"This is not to suggest that these teachers should not work with students of lesser ability, too," he adds.

"Perhaps more controversial, school districts should give serious attention to offering science courses only to the degree that qualified teachers are available.

"Even if 'qualified' were defined broadly to include all those teachers certified in the subject, there would be a significant winnowing out of teachers who have been redirected to science from English or social studies or physical education because of declining enrollments.

"If such a policy were pursued, a certain amount of science now taught would disappear from the schools—temporarily, one would hope—but the loss probably would not be great.

"Nothing kills interest and misrepresents the field as surely as the unprepared teacher."

Another possibility would be to extend the influence of the most effective science teachers by enabling them to reach larger numbers of students. At the university level, Atkin notes, it is common for professors to lecture to large sections, while assistants supervise laboratory and discussion groups.

Another means of tapping the interests of the most talented teachers might be to permit part of the high school science program to be tailored to the qualifications and interests of the available teachers.

Concentrating science teaching resources even more than is now done at the elementary level also should be tried. "Able youngsters seem to be able to progress to college, even with uninspired teaching, provided their motivation is sustained when they are young," Atkin observes.

"None of these possibilities has been studied sufficiently to be advanced without reservation. Each has some superficial appeal; each some serious flaws and costs."

While a pluralistic approach among the nation's 20,000 school districts may seem uncoordinated, "it may well be that the sopundest policies are formulated when people with immediate responsibility for improving the educational system are accorded some scope," provided their objectives are shared in the community and they consider a suitably broad range of options.

"Government agencies can provide incentives and attempt to fill important resource gaps, but...solutions are almost always local and special," Atkin says.

"In some districts it may make sense to emphasize elementary school science at the expense of high school, but in other districts not.

"To become too prescriptive is to risk transforming teaching into an occupation that will attract few people of high ability. To become too anarchic is to risk the development of educational programs that do not elicit sufficient support—and therefore resources—for high quality education to occur.

"But whatever policies are adopted for the improvement of science teaching, the closest attention should be given to their probable effect on recruitment and retention of the nation's most capable people as teachers. At the moment, nothing in the school or in the education policy arena is more important."

Rental housing

HOUSING AVAILABLE

☐ **NOW:** SHARE: Young single woman seeks M/F nonsmoker for 2BR/2BA lux. condo in Old Mill complex. AEK, secure bldg, elev. pool. Call Leslie 948-6185, eve.

Help wanted in rental listings

The service is seeking a second person to help with listings which appear weekly in *Campus Report.*

Simple bookkeeping, typing and telephoning skills are required.

The job pays $6 an hour, and when shared, needs a time commitment of five to seven hours weekly. Most of this is Wednesday through Friday, plus being available at a phone certain days of the week.

If you are a campus resident interested in such a partnership, please write SCHOA Rental Housing, Box 7772, Stanford, Calif. 94305. Or call Dorothy, 857-0414.

Batik works by Jamaican artist shown at I-Center

The Batik art of Sharon Chacko of Kingston, Jamaica, will be on view at Stanford's International Center from July 4 until August 14. A reception honoring the artist will be held at the Center from 5 to 7 p.m. Wednesday, July 6.

Chacko uses the traditional technique of resist-dying of cloth to create images of personalities and situations. Although batik is more conventionally employed for design and patterning of fabric rather than as a medium for artistic expression, she finds that its unique effects illuminate and emphasize her ideas.

She notes that batik was an intrinsic part of ancient Far Eastern and African cultures and yet survives as an individual textile art in spite of modernization and mass production. Chacko's batik method is a personally developed combination of traditional patterning and more diffuse application of the wax-resist with oil painting brushes, sticks, and Indonesian *tjanting*.

Chacko was born and educated in the West Indies. She graduated with honors in history and Spanish from the University of the West Indies in Kingston.

She has developed her batik art over the last six years without formal art instruction through the difficult but rewarding process of trial and error. Her batik portrait entitled "Rasta Queen" (1978) was used as the symbol for the Exhibition of Third World Art at the First International Festival of Women Artists sponsored by the United Nations in Copenhagen in 1980.

Chacko had a solo exhibition of her batik in New York in 1982 and has been included in several group exhibitions.

The International Center, located on the Stanford campus at the intersection of Mayfield Ave. and Lomita Dr. is open for viewing exhibitions from 8 a.m. until 11 p.m. on weekdays all summer and from noon until 11 p.m. on Saturdays during July.

'Malika,' a batik by Sharon Chacko

Tresidder's holiday hours

Some of Tresidder Union's facilities will have slightly reduced hours for the July 4 weekend, as follows:

The Tresidder Store—Saturday and Sunday, July 2-3, 7:45 a.m. to 11 p.m.; Monday, July 4, 8 a.m. to 4 p.m.

The Coffee House—9 a.m.-7 p.m. Saturday and Sunday; 11 a.m.-6:30 p.m. Monday.

The Recreation Center—11 a.m. to midnight Saturday, 11 a.m.-11 p.m. Sunday; 11 a.m.-7 p.m. Monday.

The Information Center—10 a.m.-10 p.m. Saturday and Sunday; closed Monday.

The Wells Fargo Express Stop is open 24 hours a day.

HEALTH IMPROVEMENT PROGRAM

HIP classes will pep you up in no time!!

Summer quarter will be an active one with a full schedule of exercise classes offered by the Health Improvement Program.

HIP is Stanford's health promotion program for faculty, staff, and their families, funded by the Benefits Office and Administered by the Stanford Heart Disease Prevention Program.

This quarter's session began officially on Monday, June 20, with the exception of Aerobic-Movement Workout Section II which beings Tuesday, June 28, but there is still space in all classes. And, because of summer vacation schedules, HIP is offering special six-, seven-, and eight-week rates for all aerobic movement-workout classes. Participants may join classes at any time during the summer.

Here's a schedule of this summer's classes:

Aerobic Movement-Workout: Classes consist of stretching, aerobic and toning exercises to music.

Section I meets Mondays, Wednesdays, and Fridays from 12 noon to 12:50 p.m. in Roble Gym. The instructor is Sue Jackson. The special summer rates are $25 for seven weeks and $20 for six weeks.

Section II begins Tuesday, June 28, and meets Tuesdays and Thursdays from 1-1:50 p.m. in the Encina Gym Wrestling Room. This class is taught by Barbara Frey Hewitt. The special summer rates are $15 for seven weeks and $10 for six weeks.

Section III meets Mondays and Wednesdays from 5:30-6:20 p.m. in the International Center Assembly Room. The instructor is Sue Jackson. The special rates are $15 for seven weeks and $10 for six weeks.

(The special summer rates quoted are $5 off the usual price.)

Walk-Jog-Run classes consist of walking, jogging, and running at all ability levels. Special focus is placed on those who have never jogged before or have not done so recently.

Section I meets MWF from 12:10-12:50 p.m. on Roble Field. Cost is $5 for the eight-week summer session.

Section II meets TTh from 12:10-12:50 p.m. on Roble Field. Cost is $5 for the eight-week summer session. Participants are encouraged to attend five days per week, but it has been broken down into sections because less frequent workouts are often preferred. Instructors for this class are Flay Adams and Julie Sahakian.

The Joy of Swimming class offers individualized swimming instruction at all ability levels. It is taught by Corinne Powell and David Schrom.

Section I is a new section at 11 a.m. at DeGuerre Pool. There will also be 12 noon and 1 p.m. sessions. People who have little or no experience swimming are especially encouraged to take the class. Cost is $10 for the eight-week summer session.

To register for any HIP class, send your name, campus address and phone, the class you would like to take and a check payable to Stanford University to: HIP, School of Medicine. For more information, call the HIP office at 497-9649.

STARTS offers summer classes for all tastes from chocolate to aerobics

STARTS (Student Arts at Stanford) summer classes, including unusual things like a chocolate workshop and Japanese flower arranging, begin this week.

Dance and exercise classes include modern dance (TTh 6:30 p.m.), ballroom dance (M 7:30 or 8:30 p.m.), Your Body: Use It or Lose It (M 6 p.m.), morning dance (TTh 7:30 a.m.), ballet (MW 5:30, 6 p.m.), floor barre alignment (MW 4 p.m.), and aerobic exercise (MTh noon).

Arts and crafts lovers can take knitting (M 8-10 p.m.), crochet (Th 7:30 p.m.), calligraphy (M 7 p.m.), Japanese flower arranging (W 7:30 p.m.), and photography (T 7 p.m.).

For musicians there is folk guitar (W 3-4 p.m., 4-5 p.m., 5-6 p.m.), and recorder (Th noon).

Other choices are Assessing Your Thinking Style (W 7-9 p.m.), Creating Your Own Image (two evenings in August), Auto Mechanics (W 7 p.m.), the chocolate workshop for hard core chocoholics (W 7-9 p.m.), and its recommended partner, Natural Weight Control (Th 5:15 p.m.).

Call the STARTS office at ext. 7-9671 or inquire at the Tresidder Information desk for starting dates, places, and prices for the above courses.

Patio Faire

Flowers, plants, and fine arts prints from the Fox Galleries of San Francisco, balloons, music, and food (including a "Chocoholics Delight"—goodies to fulfill every chocolate lover's dream) will be on sale Monday through Friday, June 27-July 1, on Tresidder's front patio.

The Summer Patio Faire will be sponsored by STARTS (Student Arts at Stanford). For more information call the STARTS office afternoons at 497-9671.

Publishing 'greats' come to Stanford

More than 50 leaders in the publishing profession from throughout the United States will converge upon the campus this week to serve on the faculty of the Stanford Publishing Course.

They will discuss the current status and the future of the book and magazine industries with the 200 Course participants, themselves professionals.

The program is sponsored by the Stanford Alumni Association under the direction of Della van Heyst, director of publications.

Harold Hayes, for 10 years editor of *Esquire* magazine and currently vice-president of editorial planning and development for CBS Publications, was the keynote speaker at Monday evening's opening dinner.

On Thursday, June 23, Pulitzer Prize-winning journalist Harrison Salisbury will be on hand for an evening Fireside. Long with the *New York Times*, he has been that paper's op-ed page editor since 1972. Salisbury has recently published his memoirs, *A Journey for Our Times*.

Among the other speakers will be Jerome Rubin, group vice-president of the Times Mirror Company in Los Angeles, where he overseas book publishing subsidiaries. A former president of Mead Data Central, he will consider the future of data base publishing.

Preservation Hall's back again for July 4 celebration

The Lively Arts at Stanford will present the annual Independence Day Picnic and Concert on Monday, July 4, in Frost Amphitheater.

Gates will open at 12:30 p.m. for a fun-filled family afternoon of picnicking and games, plus concerts by Queen Ida and the Bon Temps Zydeco Band at 1:30 p.m. and the Preservation Hall Jazz Band at 5 p.m.

As a sepecial treat, in honor of the Louisiana roots of both bands, Cajun food will be available in addition to traditional Fourth of July fare.

The celebration also will include the non-traditional playing of the Los Trancos Marching Band.

Each of the old-fashioned games—egg and spoon race, watermelon eating contest, three-legged and sack races—will be held twice, once for children under 10 years old and once for everyone else. Face-painting will be available.

The Preservation Hall Jazz Band will make their 91st appearance at Stanford, since first playing here in 1967.

Appearing with the Band this year will be Percy Humphrey, trumpet and band leader; Willie Humphrey, clarinet; Josiah "Cie" Frazier, drums; James Edward "Sing" Miller, piano; Narvin Kimball, banjo and bass; Frank Demond, trombone; and Allan Jaffe, tuba.

Most band members are in their 60s, 70s, and 80s, and have created and performed traditional New Orleans jazz for more than 50 years.

Though their jazz is simple in style, it can be quite complex in execution, as each musician improvises and adds his own personality to the performance.

Queen Ida and the Bon Temps Zydeco Band will present their own unique brand of Cajun music, an appealing blend of blues, dixieland jazz, and Latin music, influenced by reggae, calypso, country, and western swing.

The picnic and concert are presented in cooperation with *The Peninsula Times Tribune*.

Tickets are available at Tresidder Ticket Office, (415) 497-4317, and all other BASS outlets.

This striking image of the Annunciation as interpreted by Federigo Barocci is one of the etchings in the permanent collection of the Stanford University Museum. It will be viewed in the context of its influence on the prints of such master painter-etchers of the 17th and 18th centuries as Rembrandt and Giovanni Batista Tiepolo, whose prints are on exhibit. Docent tours will be presented on Thursdays at 12:15 beginning June 23 at the Museum.

Gallery exhibit shows Stock Farm items

In conjunction with the renovation of the Red Barn at Stanford, an exhibition of paintings, drawings, prints, photographs, and memorabilia related to Leland Stanford's interest in breeding and training fine trotting horses and thoroughbreds will open in the Art Gallery on June 28.

Stanford's Palo Alto Stock Farm was once the finest stable in the country and was known throughout the world. In operation for 27 years, it was at its peak between 1880 and 1891.

Jockey's silks, boots, bits, bridles, and other paraphernalia removed from the stables and stored in the Museum basement will be on view together with 19th-century tools from the blacksmith's shop.

A feature of the exhibition will be the historic photographs taken of Stanford's horses during the 1870s by Eadweard Muybridge.

Among these photographic experiments was the development of the zoopraxiscope, a machine that projects images from rotating glass disks in rapid succession. The first showing of these "motion pictures" took place in the Stanfords' Palo Alto home in 1879. A copy of the original machine will be included in The Stanford Horse Show.

The exhibition closes August 14.

The Art Gallery, on the Stanford campus next to the Cummings Art Building, is open Tuesday through Friday from 10 a.m. to 5 p.m.; Saturday and Sunday, from 1 to 5 p.m. It is closed on Mondays. Admission is free.

Tour fancy hotel suites tomorrow

Do you want to see the exclusive hotel suite where Flo Ziegfeld's wife, Anna, bathed nightly in 30 gallons of milk? Or the historic rooms where world leaders met in 1945 to charter the United Nations?

There are a few tickets left for the Committee for Art's Suite Story tour of San Francisco's most beautiful hotel suites tomorrow (Thursday, June 23).

The tour, which starts at 10 a.m., includes door prizes, refreshments, and transportation between the four hotels on the itinerary—the Westin S. Francis, the Mark Hopkins, the Fairmont, and the Hyatt Regency.

If you get the ticket today, it'll be $15; tomorrow the price is $20. Call the Committee for Art at the Museum for quick service, 497-2997, and pick up the ticket yourself. Tomorrow you could be in the suite that Beverly Sills favors because of its grand piano and model English butler.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., June 22, to cover the weeks of Mon., July 4, through Sun., July 17. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

MONDAY, JUNE 27

n: STARTS Exhibit and Sale of Fine Art Prints and Plants. Outdoor Faire featuring Fox Gallery prints, plants, flowers, music, food. 11 am - 5 pm. Tresidder Front Patio.

STARTS Speaking Jazz Lecture Series: "Guitar in Jazz, Old and New Directions and Approaches," by Bruce Forman. Muse recording artist has worked as bandleader and sideman with Grover Washington, Bobby Hutcherson, Richie Cole, Freddie Hubbard, Eddie Jefferson and others. 7:30 p.m. Tresidder Union. $3 admission, $25 for full series.

FRIDAY, JULY 1

n: STARTS Exhibit and Sale of Fine Art Prints and Plants. See details on Monday above. 11 am - 5 pm. Tresidder Front Patio.

EXHIBITS

Chicanos in California: Organization, Politics & People. An exhibition selected from the Chicano Manuscipt Collection, Dept. of Special Collections. 8 a.m.- 5 p.m. . Louis Lurie Rotunda, Green Library. April 25 - June 30.

The Stanford Quadrangles: Design & Construction. An exhibition of materials relating to the early planning, development and construction of the university; compiled from the resources of the University Archives. Second floor gallery, Green Library. May 23 - July 28.

Arthur Schnitzler 1862-1931, Documentary Photo Exhibition. Cecil H. Green Library, West Wing Corridor. May 23 June 30.

Boris Ilyin, exhibition of recent oil, acrylic, & watercolor paintings. Reception, Friday, June 10, 5-7 p.m. Bechtel International Center. June 3 - June 30.

"Propaganda Posters of Two Revolutions". Features over 40 posters from the Russian Revolutions and Civil War, 1917-1922, as well as the German Revolution of of 1918-1919 and the German elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover Memorial Exhibit Pavilion. June 8 - Jan. 31, 1984.

Graphic Artists Work. The work of Tresidder's Marketing Dept. staff - see the process involved in creative advertising as well as cartoons and graphic design work. Upper Lobby and Coffee House Galleries of Tresidder Union. June 16 - July 3.

Photographs by Aurangreb Khan. Coffee House Gallery, Tresidder Union First Floor. July 3 - Aug. 1.

Paintings by Liz Cheney. Atmospheric style and designs by a student of the Stanford Fine Arts Dept. Upper Lobby of Tresidder Union. July 3 - Aug. 1.

CAMPUS REPORT

Volume XV, Number 39 | A publication for Stanford University faculty & staff | June 29, 1983

Stanford West proposal cut by 175 units

Stanford will reduce the size of its proposed Stanford West housing project by 175 units and will contribute up to $2.1 million to traffic and transportation improvements under the terms of a proposal developed by the University and Palo Alto staffs.

Announced Thursday in a staff report to the City Council, the terms have yet to be approved by that body, or by the Stanford Board of Trustees. The Council will consider project details and its Environmental Impact Report (EIR) on July 7.

The proposal also calls for Stanford to provide 180 below-market-rate (BMR) housing units in the project, and to make the 4.2-acre Mayfield School site on El Camino Real available to the city for housing for $100,000.

As now proposed, Stanford West would consist of not more than 1,100 condominium units on a 46-acre Willow Road site, and 194 Medical Center-related units on a five-acre parcel at the corner of Willow Road and Pasteur Drive.

The 46-acre site is zoned for 1,666 units. Stanford initially proposed 1,275 units, but has cut that figure to reduce the size of the buildings in the development.

"We think that we have met the city and our neighbors more than halfway in these various agreements," said Frank Morrow, Stanford director of real estate. "We will be providing badly-needed housing, including three times as many BMR units than have been built in all of Palo Alto so far, and we will be making a substantial contribution toward road improvements in that area of the city."

Under the BMR agreement, 15 percent of the units in the project will be priced to be affordable to families with an income between 80 percent and 120 percent of the Santa Clara County median. Palo Alto will be able to buy 50 of the units, and Stanford has agreed to make 130 units available at affordable prices for 51 years.

All together, the project's EIR and the various mitigations, including the BMR program, are valued at nearly $10 million, Morrow said. The EIR alone has cost $700,000, he reported.

In addition to that, Stanford has recently extended Campus Drive to Junipero Serra Blvd. at a cost of $850,000, plans to extend Welch Road to Campus Drive at a cost of more than $250,000, and has proposed to extend Willow Road to El Camino Real for an additional $1.5 million, Morrow said.

According to the staff report, Palo Alto will pay $235,000 for a right turn lane on Quarry Road at Arboretum, and to computerize traffic light timing on Willow Road.

Taxes from the housing would more

Prince Talal urges more help for starving children

Photo by Chuck Painter

Saudi prince criticizes U.S. press coverage

Multimillionaire Prince Talal of Saudi Arabia came to Stanford Monday, June 27, to beg for the starving children of the world. He hardly got a word in.

Talal, who is one of the 48 brothers of King Fahd, has for 18 months been president of the Arab Gulf program for the U.N. Development and Humanitarian Organizations (AGFUND) which raises money for UNICEF and other UN developmental and aid programs. All its members are Arab states.

In a 30-minutes news conference at Hoover Institution, only the last five minutes was given to the starving children of the world. All the rest of the time was taken up by political questions hurled at Prince Talal by reporters.

Draped in a gold-trimmed brown robe, with his dark hair covered in the traditional Arab headdress, Talal listened earnestly to the barrage of questions.

"Is the United States the friend or the enemy of Saudi Arabia?" asked Talal. "All we seem to receive in the American press is attack, attack." He referred to inaccuracies and slanted reports in leading newspapers, specifically to a report in the *New York Times* of an impending *coup d'etat* by one of Talal's brothers, a report which was going to be corrected.

No other country received so much hostile reporting as Saudi Arabia, said the prince, in spite of the fact that the Saudis had given $7 billion in aid to the underdeveloped world, had imported $35 billion worth of products from the U.S., other large sums from other leading countries, had given money generously to such countries as France and Germany, and had tried to act as an honest broker in the troubled Middle East.

Talal was asked whether Saudi Arabia could help to persuade the Syrians to withdraw from Lebanon. He urged the U.S.

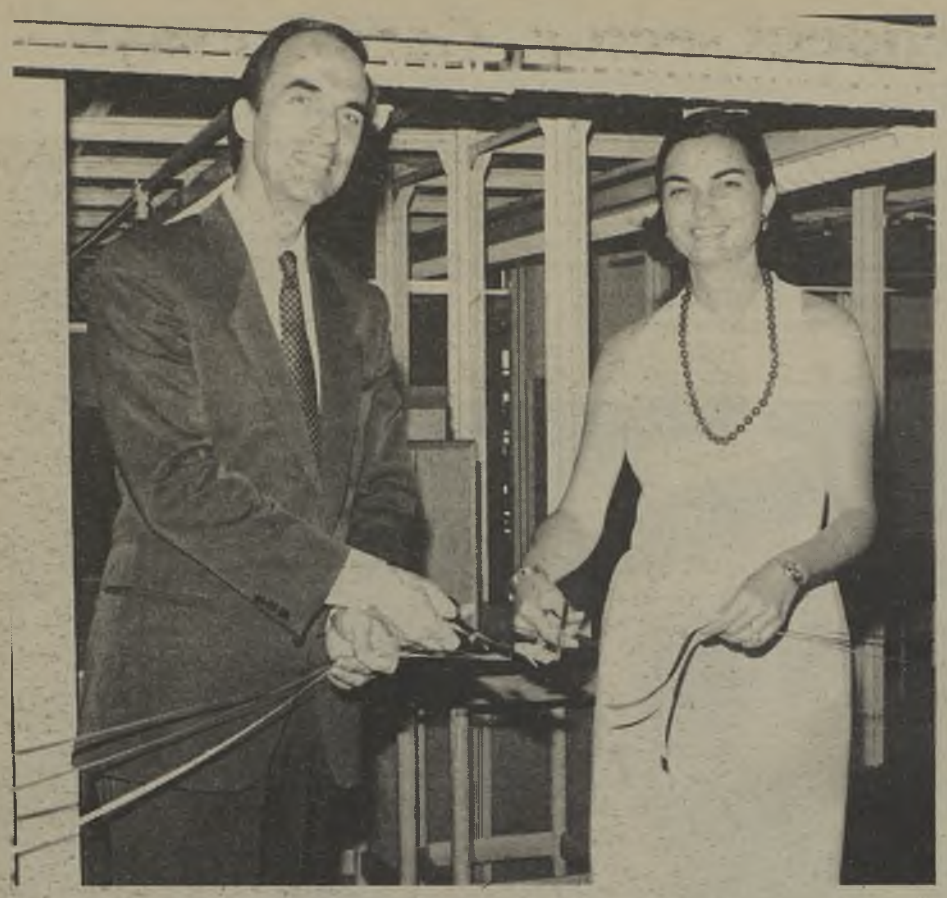
Police postpone auction of remaining stolen goods

An auction originally scheduled for July 9 to dispose of unclaimed property found in the home of convicted burglar Robert Lee O'Connor has been postponed, according to Police Capt. Raoul Niemeyer.

Superior Court Judge Robert M. Foley ruled Tuesday, June 28, that O'Connor and his codefendants should have an opportunity July 25 to demonstrate why the property should be returned to them.

On May 24 Foley had ordered the Santa Clara County Public Administrator's Office to dispose of the unclaimed property, and the preview and auction had been set for July 8 and 9 in the Stanford Police Department parking lot.

O'Connor, suspected of involvement in 181 Midpeninsula burglaries during the past two years, pled guilty March 22 to 21 counts of burglary. Police recovered more than $2 million in stolen property from his home following his November arrest by San Mateo County sheriff's deputies. O'Connor was sentenced to 19 years in prison.



Stanford police, who headed the investigation that led to his arrest, have stored the recovered merchandise in two trailers. Niemeyer said persons from more than 2,000 households have sifted through the items looking for their belongings since Nov. 15.

"We've exhausted our ability to locate victims whose property is still here," Niemeyer said. He speculated that some of the stolen property might be from Southern California, other western states, and

Philip R. Jonsson and Margaret Jonsson Charlton

Jonsson Library dedicated

The day after Commencement new Stanford alumna Laura Charlton, '83, was joined by members of her family for the dedication of the Jonsson Library of Government Documents in Green Library.

The expansion and renovation of the department of Government Documents as a library-within-a-library were made possible by a gift of the Jonsson foundation of Dallas in honor of Laura Charlton's grandparents, Erik and Margaret Jonsson of Dallas.

Mr. Jonsson is a long-time friend and business associate of Cecil H. Green and the late Eugene McDermott, in whose memory the McDermott Foundation made a gift for the McDermott Suite and Eugene McDermott Room in the Curatorial and Reference area of Green Library. Thus the names of all three of the principal founders of Texas Instruments are joined in Green Library.

President Donald Kennedy, Director of Libraries David C. Weber, and Jonsson Foundation Trustee Margaret Jonsson Charlton spoke at the brief dedication ceremony in the Jonsson Library of Government Documents.

Mrs. Charlton's brother and fellow foundation trustee, Philip R. Jonsson, joined in the traditional gesture of cutting the ribbon, pictured above, at the entrance to the stacks in the Jonsson Library of Government Documents.

Students serve as faculty liaison at LOTS

In order to improve communication, two students have been appointed to newly created faculty liaison positions at LOTS computer facility, Director Ralph Gorin reports. The student coordinator will focus on the students' needs and the consulting staff, while the faculty liaisons can accommodate the faculty's needs.

Steve Miner, a junior majoring in electrical engineering, and Pierre King, an undeclared junior, will serve as faculty liaisons during the next year. Greg Ching will serve as student coordinator.

"Over the past several years, LOTS has been in the position of providing limited computing resources to an ever-increasing user community. Unfortunately, our staff size has not increased proportionately. Because of this increased user-staff ratio, most of the staff's time has been spent on maintaining the system, rather than on communication. It has become quite obvious to us at LOTS that this is unsatisfactory; that close interaction with the faculty and students is of paramount importance," Gorin said.

Research associate in psychology

The successful candidate for this position will act as study director for a large-scale longitudinal field study of divorce and custody including survey field research as follows: designing questionnaires and interviews; training interviewers; conducting and supervising data gathering by telephone and face-to-face interviews; computerized data processing, analysis, and write-up of results.

Persons interested in applying for this position must have a Ph.D. in psychology, sociology, or in a related social science; academic experience in all phases of survey field research as described above related to family functioning, family law, family roles, or child development; prior research should preferably concern both adults and children; statistical expertise required.

Qualified candidates should send a resume to: Prof. Eleanor Maccoby, Psychology Department, Building 420, Stanford University, Stanford, Calif. 94305.

Stanford is committed to equal opportunity through affirmative action in employment and we are especially eager to identify qualified minority and women candidates.

Sutro and Co. donates $100,000 endowed fellowship to aid MBAs

A $100,000 endowed fellowship that will provide financial assistance for MBA students at the Stanford Business School has been announced by Robert K. Jaedicke, dean of the School, and Warren H. Berl, president of the Alice and Sidney L. Schwartz Foundation and chairman of the Sutro and Co. Inc. executive committee.

The Sutro and Co. Incorporated Fellowship was established with a $71,000 contribution from the Schwartz Foundation and augmented by contributions from Sutro and Co.

Founded in 1858, Sutro and Co. is the oldest investment banking firm on the West Coast.

Sidney L. Schwartz, who died in 1975 at the age of 89, joined the company in 1906. As its senior partner from 1930 to 1959, he developed Sutro from a small family enterprise to one of the largest regional full service investment banking institutions in the western United States, and continued to serve as chairman emeritus after his retirement.

Among his many other civic and charitable activities, Schwartz was a founder of the San Francisco Boys Club and the San Francisco Rotary Foundation. A writer, artist, collector, and philanthropist, he was also a generous donor for many years at UC-Berkeley's Business School, library, and athletic program.

People

Marsh McCall

Prof. Marsh McCall, chairman of the Classics Department, was the main invited speaker at the annual meeting of the Classical Association of Canada, held June 2-4 in Vancouver B.C. He gave a lecture entitled "Actors' Roles and some problems of interpretation in Greek tragedy."

Earlier this year McCall was visiting scholar at the Institute for Classical Studies in London. He spent two weeks at the Institute, which is a leading international center for classical studies, and gave a seminar on the subject of Greek tragedy.

Michael Oman
Tony Macias

Associate Provost Michael Oman of Stanford will assume the newly created position of director of foundation and corporate relations in the Office of Development, effective July 1, acting Vice-President Bruce Hinchliffe has announced.

Tony Macías, who has served both as assistant dean of the School of Engineering and acting director of corporations in the Development Office, will become full-time associate dean in the School of Engineering.

Both changes were made with the concurrence of Prof. Henry Riggs, who will assume office as vice-president for development July 15.

Robotics Society to form here

The newly formed Robotics Society of America held its first general membership meeting at the Terman Residence at Stanford July 11.

The residence is located at 445 Escarpado on the campus.

The agenda calls for "artificial entertainment by robots and real refreshments by humans."

The society is open to anyone interested in the problems of robotics. Membership dues are $25 for adults, $15 for children. Anyone interested can contact the society at 200 California Ave., Palo Alto, Calif., 94306, or call executive director Walter Tunick at (415) 326-6095.

Alan Fahrenbruch

A major treatment of a growing branch of solar technology, *Fundamentals of Solar Cells: Photovoltaic Solar Energy Conversion*, by Alan L. Fahrenbruch and Richard H. Bube, has just been published by Academic Press.

Fahrenbruch, senior research associate in the Department of Materials Science and Engineering, carries on an active research program in thin film photovoltaic materials for large area terrestrial solar energy conversion in collaboration with Professor Bube, department chairman.

Fahrenbruch also teaches an annual course, "Photovoltaic Solar Energy Conversion," MSE 215, upon which the book was based. The book treats the fundamental physical principles of solar cells, introduces specific devices, and illustrates the possibilities for innovative design.

Small gifts backbone of independent sector, Gardner says

BY DONALD STOKES

Mr. and Mrs. America give nine times more to nonprofit organizations than is given by the foundations and corporations.

Last year over $54 billion flowed out from private pockets, mostly in gifts of modest size. Foundations and corporations gave a total of about $6 billion.

This is one of the reasons why John W. Gardner, former Health, Education, and Welfare secretary, founder of Common Cause, and until his retirement last winter a longtime trustee of Stanford, is a robust optimist about the spirit and future of the United States.

Gardner is still active in Stanford affairs, but these days most of his time is spent helping the growth of another national organization which he founded and chairs. It is Independent Sector, a coalition of voluntary organizations, foundations, and corporate giving programs devoted to the public interest.

Independent Sector now has 465 affiliated organizations which cover almost every important area of effort in the public good.

The idea that inspired it came when Gardner was attending a meeting of the Stanford Board of Trustees in 1977.

"I heard some gloomy fears expressed about the future of private nonprofit organizations," he said.

"I began to look around after that and found that a lot of people shared those fears. They felt that voluntary effort for the common good, which had always been an enormous part of American life, had seen its best days, and that the walls were closing in.

"I decided to do something about it, and brought together some organizations which were interested. Apprehensions were extremely grave in the late 1970s, long before the present administration cut the budget and reduced the funds going to many worthwhile institutions. There were fears about inflation, an erosion of private giving, worries about relationships with government.

"Today our members include corporate giving programs, foundations, activist groups, women's rights organizations, charities, religious bodies. We have people from every segment of American public purpose.

"We do not believe that the private sector can make up for the administration's cuts in social programs. That is not the point. The government's social programs are important. But the private sector has a unique role to play."

Gardner, interviewed in San Francisco, was there to attend the premiere of a film "To Care: America's Voluntary Spirit," made for Independent Sector.

"We believe that if Americans are made more aware of the depth of this tradition of private help for the community they would put more into it," he said.

"Private effort for the community is a really tremendous feat, which few of us realize. In 1982 $60 million was pumped out to nonprofit organizations. Out of that huge sum, roughly five percent came from the foundations, five percent from corporations. The remaining 90 percent came from individual givers.

"This surprises people when they learn it. They think that the giving is mostly from foundations and corporations.

"But in fact, the vast majority of private help for the common good is a Mississippi River of five- and ten-dollar checks."

Gardner includes himself among the people who were surprised when they learned the full extent of the generosity of Americans.

Another impressive fact, he said, is that a significant amount of money given to churches goes to such nonsacramental purposes as overseas relief. The churches do more effective work in the inner cities than any other category of nonprofit organization.

The first priority of Independent Sector is to educate the public in the power of and the need for private giving. The second is to deal with the problems caused by government.

"We do not take an adversarial position toward government. Far from it. Many nonprofits receive government grants or contracts," he said.

"The trouble is that first comes the government dollar and then comes the government rule-book, which gets fatter all the time. Also, the rules keep changing all the time.

"We serve as a mobilizing point for dealing with such matters."

The purpose of a university is not to train people for jobs, but to train them for life. In any case, we do not know what the future jobs are going to be. We may guess for five years out, but not for 15. We are educating for an unknown future.

—John W. Gardner

As an example, Gardner mentioned that in January the Office of Management and Budget (O.M.B.) issued a new circular which would have drastically reduced the right of advocacy of members of nonprofit organizations which received any government funds. This included universities and colleges.

"This circular," he said, "did not simply limit you against carrying on advocacy with government funds—that would be understandable—but even limited the extent to which you could engage in advocacy using private funds.

"We took up the matter vigorously with O.M.B. and with Congress, and the circular was withdrawn.

"How do we go about such a battle? Our 465 organizations have roots in every Congressional district. When a Congressman hears from the local arms of these institutions in his area, whether it is the local Boy Scouts or the corporate executive who heads the local United Way, he tends to listen.

"Not that lobbying is our main business. It is not our primary objective, except when government deliberately does something that is offensive to nonprofit institutions. Then we have to take up the fight."

Independent Sector is run by a comparatively small staff of nineteen people, with a budget of about $1.3 million a year.

"The private pursuit of public purpose is an honored tradition in America," said Gardner. "Independent Sector is a meeting-ground for organizations serving that tradition."

When he retired from the Stanford Board of Trustees last winter his colleagues passed a resolution that described Gardner as having been 'the conscience of the Board in consistently advocating that Stanford strive for excellence.'

When reminded of this, Gardner waved it away. "I refuse to accept that label. The other Board members care about excellence too. But I do think that it is very important to keep in mind certain basics about the purpose of education. Sometimes things get so complicated that we forget what that central purpose is.

"The purpose of a university is not to train people for jobs, but to train them for life. In any case, we do not know what future jobs are going to be. We may guess for five years out, but not for 15. We are educating for an unknown future.

"We must develop young people's senses of what they are about, what their community and their culture is about, their capacity to solve problems, basic strengths that will stand them in good stead wherever technology takes them."

Gardner served on President Kennedy's Task Force on Education and was chairman in the same period of the President's Commission on International Education and Cultural Affairs. He was chairman of President Johnson's Task Force on Education and of the 1965 White House Conference on Education. He served as Secretary of Health, Education, and Welfare from July 1965 to March 1968.

His work in education, from the time of Sputnik on, helped the explosion of activity on education matters during the 1950s and early 1960s.

Asked what has caused the sorry decline of American education since that time, Gardner replied: "I believe that about 1967, after virtually 10 years of lively national interest in education, there came a period of disinterest on the part of the American people.

"We have had 15 or 16 years of comparative neglect. In this country there are ups and downs of interest in major issues, and when the interest falls to its lowest, the public doesn't even think about the

Gardner/ continued from page 3

particular issue.

"It would seem that Americans just got tired of thinking about education. They haven't given it the time of day since 1967—until this year. We went through all those years of apathy you just couldn't penetrate.

"There were a number of social problems which may have helped to turn off interest. There were the disputes about busing, about racial discrimination, and so on. Nobody really knows why Americans lost interest in the education of their children. Some say that when the federal government began to support education, the American people lost interest. But the federal contribution to education never rose above seven percent of the total.

"Today that is changing. Interest is returning. We are having a resurgence, thanks in part to the efforts of people like Donald Kennedy, president of Stanford, and Myron Atkin, dean of Stanford's School of Education.

"Part of the reason interest in education is coming back is worry over our competition with the Japanese. It is regrettable that we cannot be enthusiastic about education for its own sake. It seems that a prod from outside is necessary to wake up the American people.

"There are fears that we are losing our position in the forefront of economic growth and development, particularly in high technology. The Japanese have penetrated our position over a wide front.

"I like the high motivation today, but it tends to be centered on vocations. I worry about the competitive scramble to get into the big corporations, when there is so much else that students should be preparing themselves for.

"Young people really should be preparing themselves for an unknown future. They don't know what is coming, and nor does the older generation.

"There are several things which favor basic work in the humanities and sciences as an important part of the educational system. First, the rate of change is such that any really smart youngster is bound to give a little thought as to whether he should spend all his time on specialization. To specialize implies that you know what is coming.

"In view of the way the world is changing it might be better to know some basic things about yourself and your species, and of the world in general."

Gardner rose and walked around the room, earnestly seeking for the words to express his deepest feelings. "Let me tell you what I would like for my grandchildren—I have four. I would like them to feel that they are part of a long story that started way back, and I would like them to understand something about that story.

"I think a sense of continuity is terribly important, not only in terms of the past but also of the future. We should feel a powerful link with those who preceded us and a strong sense of responsibility for the generations to come.

Santayana said 'Life is not a feast nor a spectacle—it is a predicament.' I would like my grandchildren to know something about that predicament.

"You have to have the sciences because the physical environment and your own physical nature are part of the story; but I put a lot of emphasis on the social sciences and humanities. History, philosophy, and literature, for example, introduce you to the predicament through quite different doors.

"I am thinking in very practical terms. My convictions about the humanities don't rest on the fact that I want my grandchildren to be cultivated in some old-fashioned sense. I want them to be introduced to an extraordinary story, which they are not going to understand unless they come to it through many doors."

In his book *Self-Renewal* Gardner wrote that many people fear George Orwell and Aldous Huxley were right in forecasting that the individual will become obsolete, that individuality in the old sense will not be able to survive the impersonal demands of modern mass society. Asked whether he still thought this was true, Gardner replied:

"The danger of monolithic societies, made up of brainwashed citizens, is real. We must combat it with all the resources at our command. Fortunately those resources are substantial.

"There is something unpredictable about the human spirit, not always comfortable, but something that will never be wholly tamed. Not necessarily a noble rebellion, maybe a cranky or even unpleasant tendency not to believe what you are told to believe.

"I do not believe that any amount of indoctrination can stamp out that spirit from our species. Perhaps it can be stamped out in 99 persons, but the 100th will nurse some thought that is not permitted.

"The human mind is mischievous, unpredictable, its spirit is volatile and troublesome. I have faith that the rebellion of the human spirit against authoritarianism will continue. It is built into our species.

"If a society hopes to achieve renewal, it will have to become a hospitable environment for creative men and women with the capacity for self-renewal. Thanks to recent research, we now know a good deal about the creative person and about the environment which fosters creativity.

"Orwell and Huxley were so worried by the question of liberty and what would happen to it, that they tended not to take into account the inefficiency of the monolithic societies they envisaged.

"On at least two occasions in the last quarter of a century the Soviet Union has tried to decentralize some responsibility, because the people at the top were conscious that something very undesirable had happened in those insulated layers below them. Factory managers, for example, didn't appear to have the spirit and initiative they would probably have had in a more decentralized organization.

"Both those two efforts failed. The vast middle layers of Soviet bureaucracy had no intention of carrying out the instructions to decentralize.

"In some ways it is rather similar to a difficulty faced by many large corporations in the U.S. Alfred Sloan, chairman of General Motors during its great years, was very strong for decentralization. He did not think of it in terms of democracy or political liberalism, or philosophy. I used to talk to him about it when I was writing *Self-Renewal*.

"He would say to me 'All I am interested in is in keeping that regional manager awake, and making him feel that he is part of the future of General Motors. The only way I can do that is to push more responsibility in his direction.'

"Sloan approached the issue quite outside the realm of philosophy, but he said what many philosophers of our system today are saying: 'Unless you give people a piece of the action they are not going to stay awake.'

Modern philosophers are fashionably pessimistic. Life has always been harsh, and a sensible view of life has always been based on a clear-eyed view of the ironies and absurdity of the human condition.

"It is hardly surprising that men and women today take a less cheerful view of the world than their grandparents did. But for some of our contemporaries the pendulum has swung so far toward a bleak and despairing view of life that one may ask whether it has reached the end of its arc.

"One is inclined to hope so as one contemplates the excessive, self-dramatizing and essentially romantic pessimism that characterizes some modern writers, artists, and thinkers."

Gardner founded Common Cause in 1970. It met a national need to enable citizens to hold government accountable. It is growing steadily and now has 240,000 members. During 1982 a record 66,000 new members were enrolled.

Gardner is a consultant to Common Cause, but is no longer chairman.

Gardner was asked about rumors that he had in the past turned down offers of the presidency of Columbia and of Stanford.

"I have never allowed any suggestion of this sort to come to the point of my refusal. There have been many occasions when universities have approached me to explore the extent of my interest, and I have always thought that the only fair way was to say either 'Yes, I'm ready' or 'Please don't make me an offer.' So it is accurate to say that I have not refused any presidencies."

Gardner, a Stanford alumnus, agreed that he declined to be considered for the presidency of Stanford. "I was deeply honored by the thought," he added.

Gardner was the editor of President Kennedy's book *To Turn the Tide* and is the author of the books *Excellence*, *Self-Renewal*, *No Easy Victories*, *The Recovery of Confidence*, *In Common Cause*, and *Morale*. He is co-editor with his daughter Francesca Gardner Reese of *Quotations of Wit and Wisdom Know or Listen to Those Who Know*.

He has received a large number of awards, decorations, and honorary degrees. In 1964 he was awarded the Presidential Medal of Freedom, the highest civilian honor in the United States.

Excerpt. . .

Free men must set their own goals. There is no one to tell them what to do; they must do it for themselves. They must be quick to apprehend the kinds of effort and performance their society needs, and they must demand that kind of effort and performance of themselves and of their fellows. They must cherish what Whitehead called "the habitual vision of greatness." If they have the wisdom and courage to demand much of themselves—as individuals and as a society—they may look forward to long-continued vitality. But a free society that is passive, inert and preoccupied with its own diversions and comforts will not last long. And freedom won't save it.

Today any reference to the weaknesses of our society is seen in the context of our international rivalries of the moment. But long, long before such rivalries were formed we were committed, as free men, to the arduous task of building a great society—not just a strong one, not just a rich one, but a great society. This is a pact we made with ourselves.

DeTocqueville was not speaking rhetorically when he said, ". . . there is nothing more arduous than the apprenticeship of liberty." And he might have added that the apprenticeship is unending—the unchanging requirement of a free society's survival is that each generation rediscover this truth. As Chesterton put it, "The world will never be safe for democracy—it is a dangerous trade."

But who ever supposed that it would be easy?

John W. Gardner
Excellence

Leaders need to balance innovation, analysis —Leavitt

Some current best seller books on management may delude rather than enlighten us if we come to believe that a return to individual leadership is all we need to solve complex managerial problems.

So said Stanford Business School Professor Harold J. Leavitt, of the nation's most eminent managerial psychologists, in a campus interview. Leavitt, who holds the Walter Kenneth Kilpatrick Professorship in Organizational Behavior and Psychology, is best known for his textbook, *Managerial Psychology*, a work which has been published in 15 languages.

Books such as *In Search of Excellence: Lessons from America's Best Run Companies,* by Peters and Waterman, reflect a pendulum swing away from the rational and analytic and toward the emotional and entrepreneurial, a movement he personally welcomes. But Leavitt worries that in the process we may be seduced by simple answers to problems that are not simple.

"A lot of the recent books are being widely read because managers have recognized that in the last few years there is something wrong, and they've gotten itchy and unsure of themselves," he said. "The biggest single reason is the success of the Japanese. Americans, who have been sure they knew what to do and exactly how to do it, have found that the Japanese have been doing it differently and doing it better.

"All these books point to something that may be a little too seductive. They say to managers, in effect, 'You'll succeed if only you go out and walk the plant, lead your troops emotionally, have a few simple messages about what you believe in, and send those through the organization.'

"This is a kind of return to individual leadership. It is important, but one of the things that scares me about it is that it is too easy. One of the reasons managers like it is it gives them things to do that they already know how to do. It doesn't require serious change. It doesn't say you have to learn Fortran. It says you walk around the shop and smile. Those things are true and managers should be doing them. But they should also be using their staff analysts and doing their projections and the other hard stuff."

What's happened is that analysis has stuck its head up above the clouds, when everything else is down below. We ought not to be pulling the analytic tower down but instead, we ought to be raising the towers of implementation and pathfinding.

—Harold J. Leavitt

Pendulum swings

Leavitt said the pendulum swing away from the analytic is an appropriate correction for American management. But rather than tear down the analytic, American management needs to bring innovation and implementation up to the level achieved in the analytic portion of the managing process. "What's happened," he said, "is that analysis has stuck its head up above the clouds, when everything else was down below. We ought not to be pulling the analytic tower down but instead, we ought to be raising the towers of implementation and pathfinding."

The post World War II push toward analysis and quantitative methods in business schools was, said Leavitt, "a visionary movement away from the then-existing view of business education as a simulation of current business practice," a movement which he said was as important for the development of the management field as was the turn-of-the-century shift away from the apprentice system in medicine.

"This heavy push toward numbers in business schools was extremely sensible at the time," he said. "Some very wise people perceived correctly that rapid growth in technology and the emerging computer offered a rich and promising vein to be mined to improve management practice. We did that way ahead of anybody else and we are still doing that far better than anybody else. But while we did that well, we ignored some other things around us because we didn't see that those things were being neglected."

The human aspect of getting things done is much more important now, he said, because the nation has become a knowledge-based society "with people carrying more of their skills in their heads. Work no longer means using your arms and legs; now it means using your head. And we don't know better ways to do that than going back to some rules about how you involve people so that they use their heads. Before, you may have told people what to do. Now, you provide a fertile work environment and hope they will do things that are in the interest of the organization."

In his balanced model of the managing process, Leavitt challenges the axiom that decision-making should come before implementation. He calls, instead, for an interactive process between problem solvers and implementers, acknowledging that the success of Japanese management has lent major support for that interactive process.

"There is where the Japanese have really helped us organizational behavior types," said Leavitt. "The whole thrust of organizational behavior has often been seen as softheaded, and kind of crazy. We're known as people who make decisions by committee, and everyone knows that committees make lousy decisions, and that authority has to rest at the top. Now the Japanese come along, and the song we've been singing suddenly becomes popular. Groups and quality circles and bottom-up management suddenly look reasonable."

Primacy of the problem-solving view has led organizations to put planning and decision-making people into one camp and implementing people into another, and that specialization and separation of the two camps is a major cause of trouble.

"The point of hand off, where the problem solvers have to pass the ball to the implementers, is where the trouble usually starts," he said. "The reason is simple: people don't like other people's babies nearly as much as they like their own. Implementers will find all sorts of reasons for disapproving of the problem solvers' plans that have been passed on to them. On the other hand, implementers love their own decisions and will fight hard to make them work."

Leavitt suggests that an interactive process between decision-makers and implementers will capitalize on the strengths and offset the weaknesses of both. "An army designed by extremal problem solvers would be made up of well-trained, well-organized, obedient, but reluctant troops," he said. "An army designed by extremal implementers would be peopled by a committed, enthusiastic, but undisciplined mob.

"Decision-makers and implementers can rally around the same ideas, although their agreement may be for different reasons," said Leavitt, and he suggested decentralization as a case in point.

"Both believe almost fervently in decentralization—astonishing, until one looks inside. Problem solvers love decentralization because it provides mechanisms of control. It pinpoints responsibility in a few key profit centers, and by controlling at those points one can control the whole organization. Implementers love decentralization because small is beautiful, and the more you can break larger into smaller units, the more possible it is for members to deal directly with one another.

"For implementers, then, decentralization messes up the organization, making it less orderly, and more human. And that is what's good. For problem solvers, the same decentralization provides order in an otherwise dangerously chaotic world."

What can business education do to encourage interaction between problem solving and implementation?"

"What we do now is divide the world into sectors—problem solving and implementation—and we teach each of those sectors," he said. "We need a lot more interaction so that students can see that the two processes are tied closely together.

"One way to do it is for faculty to put into their courses more problems which require students to extend their thinking through both problem solving and implementing. In most business school courses, the solution itself is victory—success. In organizational behavior, which has traditionally had responsibility for implementation, success is making the solution happen—people changing their behavior. Now, we have to get both in the same courses."

Leavitt acknowledges that both the implementers and the problem solvers need to modify their courses.

"We need to ask students not only to solve a problem but to come up with feasible solutions; feasible in the sense that they are implementable; and to evaluate students not only by whether their solution is elegant in terms of the discipline, but whether it is a usable solution in terms of the realities of the organization in which the solution is to be implemented. If a course confines its view of the world to one that starts with a problem and ends with a solution, and doesn't carry the issues any further, students are going to learn to value just the solution."

On the other hand, said Leavitt, professors teaching implementation would be admonished to "get your students to worry about whether or not the solution they are recommending—the changes they are bringing about—are any good from an analytical point of view."

Going overboard

Leavitt is quick to point out that he does not support across-the-board integration of problem solving and implementation in all aspects of the academic program. "You can go overboard on this too, and say, 'Let's not do any research that does not concern itself with implementation.' But we ought to be doing a lot more to promote marriage between the hardnosed analytic courses, such as accounting, finance, and quantitative methods, and the softer organizational behavior courses."

Leavitt also contends that a better marriage between problem-solving and implementation is not enough. The "emergence of large bureaucratic organizations and the development of orderly, specialized, systematic, top-down organizational designs" in the last 25 years has discouraged the nurturance of innovators or what he calls pathfinders, but that current American business problems, in combination with recent national interest in new technology growth open the way for the reappearance of such innovators.

There are steps business schools can take to increase the enrollment of, and improve the educational environment for, such pathfinders. "As an educator, I think you start using different selection methods, so you pay less attention to quantitative scores on the admission test, and look for other clues about people who are movers and shakers, doers, and creators.

"We can also build into the curriculum a lot more emphasis on those kinds of things. This is not to say that we know how to teach them. I think we probably don't know much about how to teach creativity, for example, but we can explore ways of trying to teach them. We can put energy and resources into experimenting.

"We can also teach by modeling—by doing more innovative, creative things ourselves, and sending messages to students which, in effect, say, 'It's ok to listen to your guts, and to have dreams about things that you might do or start.' Actually, I don't think we have much trouble there because I think students are already going in that direction, probably faster than we are.

"Currently, business schools are apt to train pathfinding out of students. But if we are wiser, we'll change business schools to encourage pathfinding in people who already have propensities in that direction and try to develop it in others."

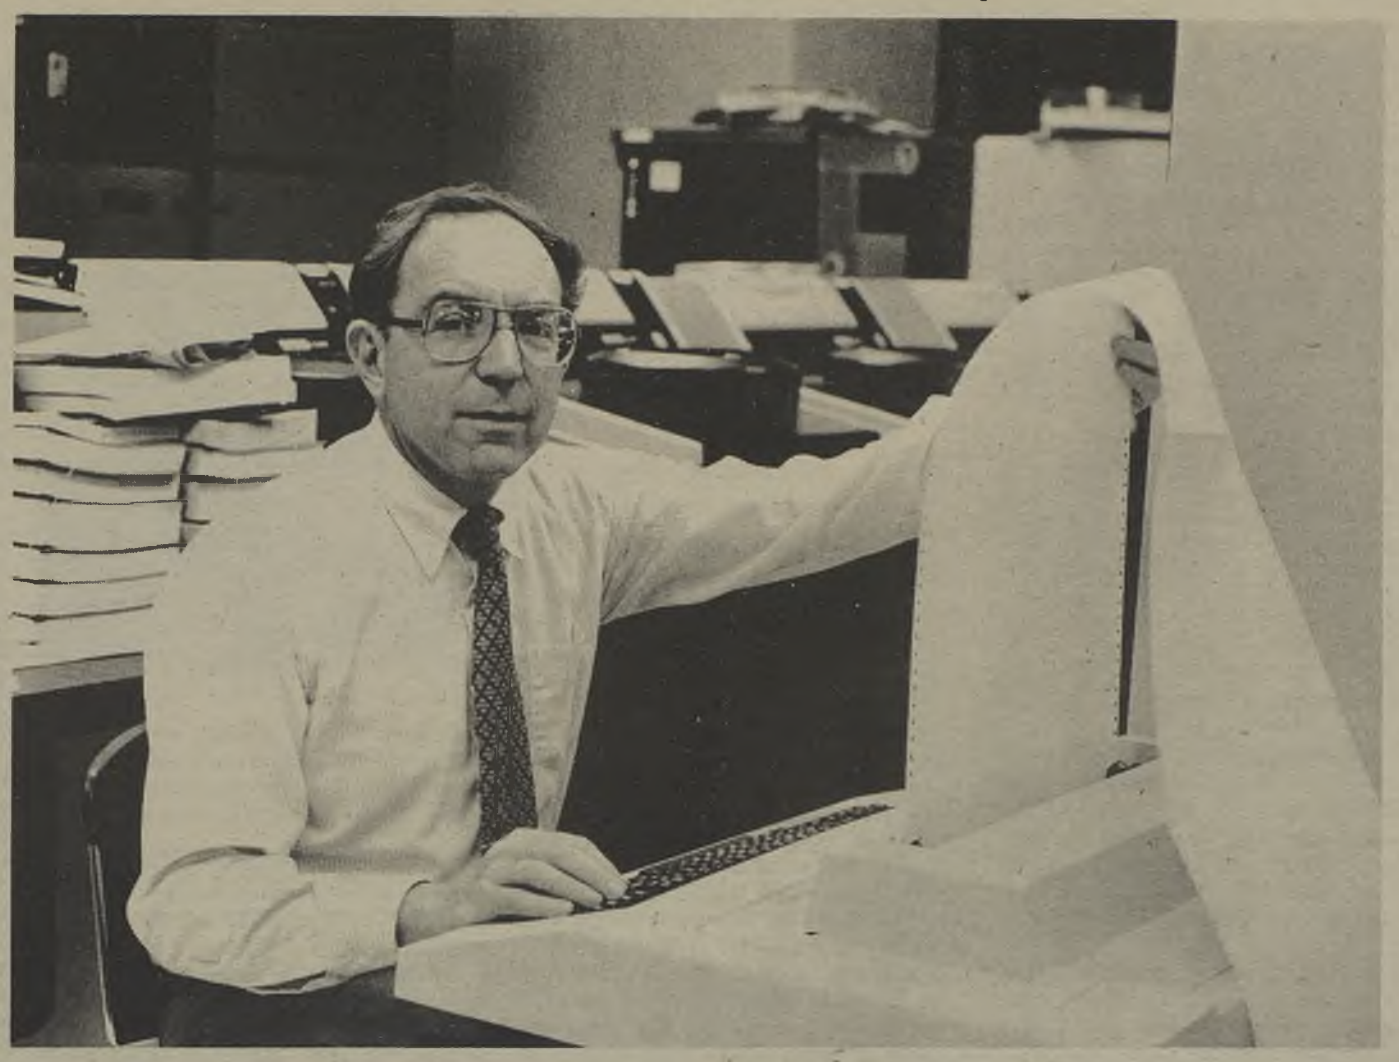
—Herb Blanchett

Knowledge will be the new 'wealth of nations' Feigenbaum says

Knowledge will be the new "wealth of nations" in the 21st century, and unless the United States does something dramatic, the Japanese will corner the market, with supercomputers and intelligence software, Stanford computer scientist Edward Feigenbaum says.

Feigenbaum calls for a mobilization of the national will, perhaps embodied in a national research center, similar to those set up for physics and space exploration. It will certainly require American corporations to alter the way they go about their business, Feigenbaum says.

The issue is the new computers, dubbed the Fifth Generation by the Japanese, and those computers' ability to make use of the relatively new science of artificial intelligence. He calls AI the "Manifest Destiny of computing."



Feigenbaum and science writer Pamela McCorduck, have written a new book, *The Fifth Generation* (Addison-Wesley Publishing Co., $15.55), warning of the dangers of the loss of American pre-eminence in the computing industry, and why it is important.

The Japanese have begun a "remarkable and audacious new ten-year project for developing computers that they will use and sell in the 1990s and beyond," Feigenbaum said.

"The Japanese have set for themselves a national industrial goal of becoming number one in the world's computer market in the mid-1990s, and create great new industries which will use the fifth generation machines. They call this the knowledge industry.

"The concept is based on the idea that knowledge is the new wealth of nations."

The Japanese government is contributing $450 million over the next ten years to the project, and Japanese industry is kicking in $400 million. The United States has been slow to respond, and that, Feigenbaum and McCorduck contend, could be disastrous.

Edward Feigenbaum

Information processing

"The information processing industry is about to be, if it is not already, our most important industry," Feigenbaum said. "Computing is spreading into every industry, every business, and everybody's life. It is the great modern industry. As our old industries pass away, computing is taking its place—computing qua information processing.

"It is the cutting edge industry of all the other industries," he added.

"Knowledge is power, knowledge always has been power. The pen really is mightier than the sword, in the long run. Those with knowledge, those societies with knowledge technology, win. . . .

"Consider two of the greatest knowledge technology inventions of all time. Number one: the Greek alphabet. Number two: the printing press. . . . Those two inventions alone might be seen as accounting for the hegemony of western culture, the spreading of it all over the world. "Now we're talking about the ultimate in knowledge technology. . . .

"The appearance on earth of a non-human intellect of great power would have enormous consequences, economic, social, military, political.

"The Japanese are talking about not only producing the machines that will supply this tremendous revolution. . .capturing the base structure underneath the computers, the software, but they're also talking about packaging knowledge. They're going to be selling knowledge. . .in its active form.

"That can have tremendous economic ramifications and power."

Feigenbaum and McCorduck point out that the technology involved was invented here. "We pioneered in the computer areas, and we did most of the underlying research work in artificial intelligence.

"Unless we are diligent and energetic, that lead, that position, will pass to the Japanese. Some have said that the 20th century was the American Century; that the 21st Century will be the Japanese Century."

Feigenbaum admitted that he and McCorduck were not optimistic in their book.

"There were no grounds for optimism when we were writing that book, there wasn't a stirring of anything except the beginnings of a research consortium. A few companies, very few, were committing themselves to MCC (Microelectronics and Computer Technology Corporation—a cooperative effort in the industry). Now it has thirteen companies. They haven't gotten started yet, they just picked a site (Austin, Texas), they haven't hired any scientists or engineers yet.

Pre-competitive phase for MCC

"MCC is a piece of the answer. One has to be very sympathetic and friendly and wish them well. It's the first great American cooperative enterprise of the type the Japanese routinely put together. The Japanese call such cooperation the pre-competitive phase. . . ."

But MCC is up against the Japanese computer industry and the Ministry of International Trade and Industry (MITI), which plays by different rules.

For instance, MCC will keep its developments proprietary so that benefits "do not accrue to non-members." The Japanese find inter-company competition less important. MCC runs into American anti-trust laws, which are not significant in Japan. MCC may not have the financial resources of the Japanese effort.

Some have said that the 20th century was the American Century; that the 21st century will be the Japanese Century.

—Edward Feigenbaum

There is the way American companies work.

"We see our corporate executives paying very close attention to the bottom line, if not on a quarterly basis, then on an annual basis. Their bonuses are awarded on the basis of the bottom line. What company do you know has a vice president for planning that gets his or her reward based on a beautiful ten-year plan?" Feigenbaum asked.

American companies usually "go the equity route" to raise money, putting the emphasis on the short term. The Japanese companies do not have this problem. MITI can pressure the banks to make loans and to accept a low interest rate. Japanese savers are accustomed to low returns so the banks can make the loans without harming themselves.

Corporate America lacks vision

There is a lack of vision in American corporate headquarters, Feigenbaum maintains.

"Ask yourself this—we have a company that is the world's largest company in computers. It owns most of the world's market share. It is in all respects a fabulous company. It keeps its employees happy, makes a lot of profit. When is the last time you heard a speech or saw an article by the president of that company expounding a national vision on computing, where it's all going, and why it's going there? Never."

The new, high-flying electronics companies do not have the luxury of this kind of forward thinking, he says. "A start-up company rarely thinks of doing research, rarely thinks of a ten-year plan. They don't know if they'll be alive next December."

Strategic Computing Initiative

The federal government may be beginning to understand the problem, Feigenbaum says. The Department of Defense has requested funding for a supercomputer project called the Strategic Computing Initiative, although it is not officially aimed at the Japanese. There is also money in one version of the National Science Foundation authorization bill for new super computer research.

"I don't have fix-it answers," he admits. "We barely came up with one fix-it answer in the book, a brief mention of a National Center for Knowledge Technology. The U.S. has traditionally handled major national goals with national centers like the Manned Spacecraft Center, the Kennedy Space Center, the Fermi Lab in physics, but we haven't done it very often.

"We should, for once, imitate the Japanese as they have done so often with us in the past. Pick a page out of their book, set up a national center. . .get our industries to cooperate with the center.

"The center could also serve, not only as a technology focus, but as a focus for the national will."

—Joel Shurkin

Voyager I data disclose internal gravity waves in Titan's atmosphere. . .

The Voyager 1 spacecraft has detected surging waves of gas called internal gravity waves in the atmosphere of Titan.

Stanford researchers believe these waves are similar to ocean waves on Earth.

The waves originate near the surface of the Saturnian moon, possibly the result of "Titanic" thunderstorms, but the researchers are not sure of the mechanism.

The study, published in the current issue of "Icarus," was derived from a doctoral dissertation by graduate student David Hinson and work by his adviser, G. Leonard Tyler, research professor in electrical engineering at the Center for Radar Astronomy.

All the data came from Voyager 1, which swept by Saturn and Titan on November 12, 1980.

The technique used to gain the data is called radio occultation, in which the spacecraft flies behind the moon so the radio waves from the spacecraft to the Earth are forced to pass through the atmosphere. The radio waves appear to "twinkle" before they are blocked out entirely, and the twinkling provides the information.

Bland atmosphere

"The Titan atmosphere appears very bland from the images; there's almost nothing there to see," Tyler says. "Other analyses have shown generally a very uniform, slowly varying, and well-behaved type of atmosphere."

But the temperature of the moon does vary slightly from the equator to the pole, about 4 degrees Kelvin. This means that there has to be some winds aloft. Other scientists have calculated the wind speed to be about 80 meters per second (about 180 mph). The waves in the atmosphere probably carry energy to maintain the winds.

The twinkles seen in the radio occultation showed that there was internal structure in the atmosphere above 25 kilometers (82,000 feet), which surprised scientists.

"Could it be layers? One possibility was that it might represent stratification similar to cloud layers," Tyler says, like "stratus clouds or inversions in the earth's atmosphere.

"A second possibility is that it could be caused by convection, like the turbulence you encounter in thunderstorms."

The Voyager data showed that it was neither of those phenomenon, but the wave action within the atmosphere. The waves are probably generated below the 25-kilometer level, he said.

"We don't know what the source of these gravity waves is," he added. But the waves are "a very important phenomenon" in the atmosphere.

G. Leonard Tyler

On Earth gravity plays a part in maintaining lenticular clouds on the leeward side of mountains.

"The wind over the mountain is like water going over a rock, and it produces a wave pattern downstream of the rock in the water.

At Titan the waves are not tied to any particular feature. Being in the upper atmosphere of Titan in a ballon would be like being in a small boat where waves from distant storms were tossing you about, Tyler said.

The gravity waves on Titan are a "discovery," he said. "It's very surprising."

Study is continuing on the data, a process Tyler describes as "cleaning, scrubbing, filtering, sharpening, focusing—the real process is focusing."

The technique used to study the gravity waves is also being used to study the magnetic fields of Saturn and Jupiter, Tyler says.

"That hasn't proceeded to the point where we have any new results but has proceeded to the point where we know that in future missions we can use radio measurements to make a substantial contribution in studying magnetic fields.

"In the case of Jupiter we know there is a problem in the present field model because our data are not consistant with those models. In the case of Saturn it looks like the. . .field is much simpler than Jupiter's and the present field model derived from the fly-bys look very good.

Hinson's and Tyler's work is supported by NASA.

. . .Saturn's giant moon does not have methane oceans, Stanford team says

Data from the Voyager spacecraft indicates that Titan, Saturn's giant moon, is not the world of broad methane oceans and frigid methane rains that many scientists had theorized, Stanford researchers report.

Radio occultation experiments indicate there is not enough methane to form rain, according to Von Eshleman of Stanford's Space, Telecommunications, and Radioscience Laboratory. The results of the experiment are published in the current issue of *Science* magazine.

Titan is bigger than the planet Mercury and the only moon in the solar system with an atmosphere. Titan's atmosphere, like Earth's, is mostly nitrogen, but it is four and a half times as dense.

The experiment was performed while the Voyager 1 spacecraft flew behind Titan in November 1980. The moon gradually blocked out radio transmissions from the spacecraft to Earth. The recently completed analysis of the changes in the radio signal as Voyager passed behind Titan shows the atmosphere with remarkable accuracy.

No methane rain

Scientists had long speculated that the clouds that completely cover Titan were made of particles of condensed methane. These particles were believed to combine and fall to the surface as rain, forming methane rivers and eventually methane seas.

Many found the idea of methane clouds, rains, and oceans very appealing because of the possible parallel between the roles of methane on Titan and of water on Earth. Some have discussed what it would be like to sail the Titanic oceans, and an analysis has been made of the possibilities.

Scientists were also intrigued because methane is the simplest hydrocarbon, one of a family of compounds that are believed to have been required for the origin of life on Earth. Voyager detected small amounts of more complex hydrocarbons and other organic molecules in Titan's atmosphere, where they were formed from methane as the result of solar radiation.

Chemical evolution

Thus Titan might provide an example of the chemical evolution that led to the possibility of life on Earth. The process on Titan has been arrested by the deep-freeze conditions of the outer solar system.

"It's been known for many years that there's methane there," Eshleman, professor of electrical engineering, said in an interview, "and that it's very cold. It turns out that the temperature structure of the atmosphere is approximately at a condition where nitrogen might condense, and where methane would condense if there was enough of it. We don't know exactly how much there is, but it now appears that the amount is less than previously thought."

"If you read most of the things you'd think maybe it's been fairly well established that there'd be oceans. Everyone picks up on that and it is of interest."

But in the *Science* paper, Eshleman, G. Leonard Tyler, research professor at the laboratory, and Gunnar F. Lindal of the Jet Propulsion Laboratory in Pasadena, reported that there is no evidence of such oceans or of methane rain clouds.

"If there were oceans a cumulus cloud would form above the surface," Eshleman said.

The condensation of the clouds would produce characteristic changes in temperatures in the atmosphere, but the temperatures did not vary in this way, according to the Voyager data. They indicate instead that the methane "humidity" is low.

Polar regions

This does not necessarily mean there is no methane on the surface (Eshleman says there could possibly be some at the polar regions) but there is not enough to form widespread oceans.

There may not even be enough to condense into a thin, high altitude haze of methane ice crystals, which would mean concentrations in the atmosphere of less than 1.3 percent. Eshleman expects that the observed haze may be due to the other hydrocarbons and organic molecules.

"I wouldn't expect what we really call rain; I think it would be a slow settling of the haze material. And over geologic time it might build up to quite a bit.

"The surface is probably fundamentally different than any other surface in the solar system, but we don't know exactly in what way."

Most of Titan is water ice and that is probably the main constituent of the surface, Eshleman says.

The occultation experiments measured two places on Titan separated by a hemisphere so the sampling is believed to be very representative, Eshleman says. The results indicate that the atmosphere is remarkably uniform.

Von Eshleman

Accident insurance coverage improved

Improvements to the Voluntary Accidental Death and Dismemberment (AD and D) Plan will be effective August 1, 1983, says Jeannie Thomas, manager of Benefits and Records.

The maximum amount of coverage under the AD and D Plan will increase from $100,000 to $250,000 for faculty and staff; and from $100,000 to $150,000 for spouses. If a faculty or staff member wishes to purchase coverage in excess of $150,000, the maximum that may be purchased is the lesser of $250,000 or ten times annual base salary. Additional benefits have been added to the Plan covering loss of speech and hearing.

The premium rate has been reduced to $.04 per $1,000 of coverage per month. Previously, the rate per $1,000 of coverage was $.06 for faculty and staff, and $.05 for spouses.

Over the next week, an information packet is being sent to the home of each faculty and staff member.

Current participants are asked to re-enroll at this time to insure that the University has the most up-do-date coverage and beneficiary information. For current participants who fail to re-enroll current coverage will continue at the new lower rates. The new rates will be effective on July 22 paychecks.

Faculty and staff not participating currently may enroll in the AD and D Plan at this time. There is no deadline for enrollment. Faculty and staff may begin participation in the plan at any time.

Individuals having any questions, or needing additional information, should contact the Office of Benefits and Records at 7-1776 or 7-1777. Employees located at SLAC should call 2357.

1983-84 N.E.H. professional journalism fellows announced

Twelve professional American journalists have been awarded National Endowment for the Humanities fellowships to study at Stanford for the 1983-84 academic year.

Joining them as a part of the Professional Journalism Fellowship Program will be six journalists from other countries.

All 18 will pursue independent courses of study and participate in special seminars in the humanities.

The American group includes six women and six men, while the international fellows will have two women and four men. Their average age is 38.

The 1983-84 year will be the 17th at Stanford (11 of them under N.E.H. Funding) for the program, designed to give journalists the opportunity to stand back from their work and acquire new perspectives on its humanistic content through study of its historical, cultural, social, and philosophical dimensions.

The Stanford program is under the direction of Prof. Lyle M. Nelson. Harry N. Press is managing director.

The American Fellows and their courses of study:

Jennifer Boeth, 40, staff writer, *Dallas Times-Herald*. Issues of power, freedom, and ethics; the history of ideas; philosophical and intellectual history.

Peter Carey, 43, investigative reporter, *San Jose Mercury News*. Social change and the impact of technology.

Donald Colburn, 35, reporter, *The Herald*, Everett, Wash. An interdisciplinary study of America's health care delivery system.

Rasa Gustaitis, 49, associate editor, Pacific News Service, San Francisco. The ethical, medical, legal, and emotional facets of decisions involving life and death.

Arthur M. Jester, Jr., 31, higher education reporter, *Lexington Herald-Leader*, Lexington, Ky. International relations.

Margery Lipton, 36, field producer, "ABC News," London. The history and practice of propaganda, and the dynamics and influences of public opinion.

Walker Lundy, 40, executive editor, *Tallahassee Democrat*, Tallahassee, Fla. The impact of the information society, and the role of information media into the 21st century.

Janice Schaffer, 33, business writer, *Philadelphia Inquirer*. The relationships among cultural patterns, economic institutions, and urban affairs.

Mary Tuttle, 34, community affairs producer, KANU radio (public radio), Lawrence, Kan. Social change in the United States since 1920, through history and literature.

Gerald Volgenau, 42, science editor, *Detroit Free Press* Historical roots of today's national migration caused by the shift from the industrial revolution to the information revolution.

Amei Wallach, 41, arts critic, *Newsday*, Long Island, N.Y. The social, political, and economic forces that shape art, and how art shapes those forces.

Richard Zahler, 35, special projects editor, *Seattle Times*. English literature, and the narrative and creative arts; regional North American cultures.

The International Fellows:

Herman De Prins, 42, journalist and newscaster, Belgian Radio and Television, Brussels, Belgium.

Franzalbert Joku, 30, editor, *The Times of Papua*, New Guinea.

Myong-sik Kim, 42, city desk editor, *The Korea Times*, Seoul, Korea.

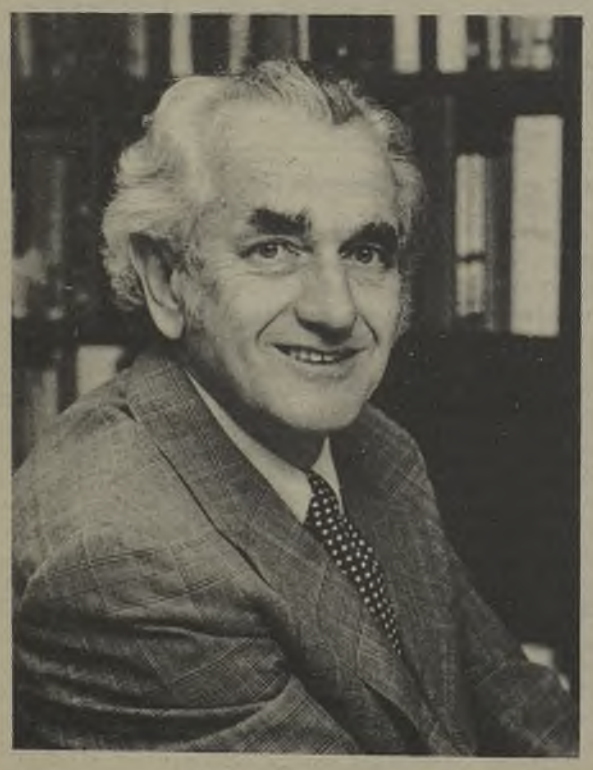
Mary Lee, 34, specialist writer, *Far Eastern Economic Review*, Hong Kong.

Teresa Otondo, 39, editor, *Cultural Supplement*, O Estado de Sao Paulo, Brazil.

Erich Vogt, 33, producer-editor, German Television, Hamburg, Germany.

Degler on Pioneer 10: knowledge of our universe exceeds that of ourselves

Following are remarks at Ames Research Center, June 10, by Prof. Carl N. Degler, history, on the departure of Pioneer 10 from the solar system.



Let me make clear at the outset that I come here today, not as a historian of technology or of science, but as a social historian who believes that science and technology, because they are human products, enlighten us about what human beings are.

To me, the exciting aspect of Pioneer is that for the first time an object made and directed by human beings will escape from the confines of our solar system.

Technology in league with science has freed men and women from the power of nature before. Recall how steam power multiplied many times the ability of human beings to perform work, or how the airplane lifted men above the ground in sustained flight, or how rockets made it possible for men and women to free themselves from our planet's confining pull.

We cannot help be moved by the intellectual power implied by all of these efforts to overleap the limits imposed by nature. In this regard, however, Pioneer 10 is in a class by itself, not only because it has escaped the largest cage yet—the solar system itself—but because it is still pressing against an ever larger confine—the heliosphere and perhaps even beyond that.

Surely there is justified pride in this latest scientific accomplishment by men and women, but there is also danger from what our ancestors used to call "overweening pride." Such hubris encourages us to forget how much we are still a part of, and controlled by nature.

Carl Degler

There was a time, to be sure, during which human beings, and especially those in America, with its vast expanse, rugged terrain, and seemingly endless forests, saw nature as something to be conquered, mastered, and overcome. The movement of Americans from the Atlantic seaboard to the Pacific in less than a century is but one measure of that urge to make nature do man's bidding.

Pioneer 10, unlike the settling of the American frontier, is not an example of the mastering of nature, but of understanding it. The very success of its mission is a dramatic monument to human understanding of how nature works. Consider the transmission of signals from Pioneer 10, now almost three billion miles away from earth. Only because the antennae here are extremely sensitive can that signal, which begins as a mere 8 watts of energy be detected when it arrives four hours later on earth.

Mastery over nature has been essential in order for us to achieve our present social and economic state. Yet we are also becoming increasingly aware that such mastery has a negative side. It can and does result in destroyed farmland, denuded forests, devastating floods, encroaching deserts, and the disfiguring of nature's beauty. Understanding the workings of nature, however, has no such evil consequences and that is surely one of the admirable achievements of Pioneer 10.

There is another insight into human values to be gained from Pioneer's flight. So far as I know, nothing of immediate practical use will be learned from this journey that literally has no end.

Much, to be sure, has been learned already, and more may well be learned about that invisible body that seems to be affecting the orbits of Pluto and Neptune. But even if that mystery is cleared up by Pioneer 10 no obvious practical consequences will follow.

Indeed, the lack of immediate practicalities is an impressive tribute to the curiosity about nature that has been the foundation of all intellectual inquiry, whether it be in science or in the humanities.

As a historian, whose work also often has little practical consequences, I can only admire the dedication of the many people here at Ames and elsewhere in seeking simply to find out more about the universe in which they reside. That sense of wonder about the natural world which we often see as a most endearing quality in a child is actually more than engaging, it is an attribute that helps to define what it means to be human.

Because of my own professional interest in the past, I could not help reflecting on possible precedents for this latest triumph of human beings to reach beyond the cages in which they must spend their lives, however broad these confinements may be.

There is only one that comes close to the novelty of Pioneer's achievement. It was the discovery of the New World. Long before Columbus, of course, people had migrated into new regions, but when they did they were not taken by surprise in the same way that they were in the early sixteenth century, when it finally dawned upon Europeans that what Columbus had chanced upon was not China or Japan, but a land mass no one had thought was there.

Indeed, their surprise was so great that Europeans were not at all sure that the inhabitants were fully human. One of the truly amazing events of the era grew out of the questions raised about the nature of the beings found in the New World. So perplexed was the Spanish Crown that it ordered in 1555 a conclave of theologians to debate the ability of the Indians to live in liberty and to become Christians. Until the issue was resolved, the King ordered that no further conquests be undertaken in the New World.

The Europeans of the sixteenth century may have encountered other human beings in their New World, but so far Pioneer 10 has not met any in its. Yet there is an expectation that it might, for on the side of the spacecraft is a plaque depicting a male and a female human being.

When will we learn to deal with each other as productively as we have with the cosmos?

—Carl Degler

The belief that there must be other inhabited worlds than earth is not new, though to hold that view in the past was often dangerous since it flew in the face of the Christian belief in a single creation. Today we seem to have progressed beyond the hostility the Europeans displayed toward the Indians.

In the depiction of human beings on the plaque on Pioneer 10 the male has his arm raised in what I suspect was intended to be perceived as a gesture of friendship. (That the beings Pioneer 10 would run into may have quite a different gesture for friendship, if they have limbs at all, is a question I will not enter upon now.) In short, there seems no doubt that today we have progressed beyond the sixteenth century in our attitudes toward outsiders—at least if they live outside the solar system.

It is that last ironic remark that brings me to my final observation on the historic meaning of Pioneer 10. It is that this little artifact in its near perfection as a functioning machine puts to shame our ability to master ourselves as social beings.

As a species we still find it impossible to live in peace or to control the appetites that our all too human values have caused us to cultivate. And if the aliens that Pioneer 10 encounters are anything like us, it is not at all clear that they will be any friendlier than the Europeans were when they encountered the people they called then and forever after: "Indians."

For human beings are dominating as well as curious and intelligent; it is that drive to dominate, to control, and to exploit that still shapes our lives here on earth, even as we reach literally to the stars for more knowledge of our universe and the way it works.

Twenty-five centuries ago, Socrates urged his students to know themselves. Our knowledge of the outer universe, as epitomized by Pioneer 10, has indeed grown enormously since then, but our knowledge of the universe within has made only modest advances.

For that reason, the great success of Pioneer 10 leaves me, as a historian and student of social behavior, not a little jealous. As a human being, who hopes for a peaceful as well as a just world, it leaves me wistfully wondering when we will learn to deal with each other as productively as we have learned to deal with the cosmos.

University won't commit more land to open space to get Stanford West OK

continued from page 1

than meet the added costs of city services, according to the project EIR. That area of Palo Alto, including the Shopping and Professional Centers, provided the city with $2.3 million in sales and property taxes and net utility revenues in 1980.

Stanford would pay $1,000 per unit to finance traffic improvements at 13 streets intersections and a third lane for foothills-bound traffic on Willow Road between Pasteur Drive and the San Francisquito Creek bridge. An additional $200 per unit payment would fund "alternative means of travel" for those living at Stanford West, with a $10 a month homeowner's fee earmarked for the same purpose.

The two staffs could not reach agreement on Palo Alto Planning Commission recommendations that the University commit off-site vacant lands to open space, or guarantee the affordability of more units, as conditions of approval.

"We cannot forego the use of our academic land endowment in that way, even though there are areas of our lands that may never be used, and even though we anticipate little major growth in the foreseeable future," Morrow said.

"As to the question of affordability, we already have gone well beyond the city's below-market-rate requirements, and expect that half the project will be affordable to families in the County's 120 percent-150 percent range. We are unwilling to commit ourselves beyond that."

Stanford also declined to guarantee that future academic development outside the city would not cause traffic to exceed certain prescribed levels, without regard to the merits of the proposed program or other conditions that might exist at the time.

The University also agreed to continue notifying neighboring jurisdictions of major development on its lands, but could not commit itself to an added level of review by a joint committee of area governments and agencies.

The University will continue comprehensive studies of the traffic and transportation needs of the entire campus, including the Stanford West area, with the intention of devising an efficient, integrated circulation system, the report notes.

Morrow said that the proposed lot coverage at Stanford West is half of what the zoning allows, that the open space will be three times that required, that the density will be 34 percent less than permitted, and that the set-backs will be far greater than the zoning calls for.

The housing will be available to Stanford faculty and staff; to graduate students; to those who work on University lands; and to those who work elsewhere in Palo Alto, in order of priority.

"About half of the condominiums are expected to be rentals and half for sale. The university is also exploring other forms of ownership such as cooperative housing," Morrow said.

Stanford West responds to both a University need for housing and to long-standing Palo Alto policies to reduce commute traffic and the imbalance between jobs and residential units in the community, Morrow pointed out.

Specific details of the project will be reviewed by the Palo Alto Planning Commission and the Architectural Review Board this fall and winter, Morrow said.

Police offer tips for reducing theft of property from home and offices

With the summer season here, many people will be vacationing, leaving their homes vulnerable to burglars. Here are some tips to help prevent burglaries over the summer vacation:

Residences:

★Have good locks on all doors and windows, **and use them**. Be sure all screens are fastened from the inside.

★Engrave all your valuables with your California driver's license number (preceded by "CA"), and post Operation I.D. stickers in all entry doors and windows. (Available at Stanford Dept. of Public Safety.)

★Never leave your house keys hidden under a doormat, in a flower pot, or on the ledge of a door.

★Make your house appear "lived in." Use timers for lights and radios. Have a neighbor or friend pick up all mail, packages, and newspapers, and keep the lawns mowed and watered. If possible, cancel all deliveries.

★Light up your porch and yard with outdoor lights to increase the likelihood that a burglar will be seen.

★Leave your shades and blinds as you normally do. Closed blinds keep the sun out, but they also hide burglars.

★Leave your trip plans and an emergency phone number with trusted neighbors or friends. Notify your police department when you'll be leaving and when you expect to return.

Offices:

★Record the serial numbers, brand names, and descriptions of property or valuables which are kept in your office. Keep a duplicate copy of this information somewhere else. This information is often invaluable in reporting a theft and recovering the stolen property.

★When you are not using your desk, lock it up and take the key with you.

★If you leave your office, always lock the door, and tell your neighbors so they can keep an eye on your office.

★Never leave keys in an unlocked drawer or cabinet. Do not tape keys under desk drawers or file cabinets.

★Never prop open a door for someone joining you later.

★If you see a suspicious person, call the police immediately at 9-911.

Dept. of Public Safety hours are 8 to 5, Monday through Friday at 497-9633. For specific questions about Property Crime please ask for Kat Berry or Dan Smith.

Saudi prince seeks UNICEF support. . .

not to underrate the importance of Syria, which had a crucial role to play in Lebanon. Syria had been invited in to Lebanon, unlike the Israelis, who had invaded the country, caused 150,000 deaths and 250,000 wounded, mostly women and children.

"There is a limit to what we can do," said Talal, "we are not a super-power. One of the most hopeful factors is that Israel will still listen to the U.S. Also, the peace movement is growing inside Israel.

"One of the most important things to keep in mind is that the legitimate government of Lebanon should play a key role in the negotiations."

He referred to the popular image of the Saudis as being the sole beneficiaries of the huge oil production there. "Your major oil corporations are getting much of the benefit, and the commercial relations between our two countries are growing more extensive.

"We are willing to take American advice," he said several times, "but our influence in the world is limited. All we ask is to be treated on a fair basis."

He refused to comment on the new situation created in the Middle East by the ouster from Syria of Yasser Arafat, leader of the Palestine Liberation Organization.

When the questions finally turned to the starving children of the world, Talal explained that as part of his current role as special envoy for UNICEF he had visited nearly 40 countries in Asia, Africa, Latin America, and the Caribbean and had participated in study missions to see for himself UNICEF's lifesaving work.

He had seen the human devastation in Bangladesh, where UNICEF doctors and nurses are saving lives and providing health care where before there had been none. He had seen wells being dug in remote parts of West Africa to bring clean water to the people for the first time, he had seen food distributed to starving families in ravaged Cambodia.

Since he had become president of AGFUND the organization had handed over some $53 million to UNICEF.

Figures handed out by aides showed that by far the largest amount of aid commitments by UNICEF this year are to India ($107 million) followed by Pakistan ($57 million). Also high on the list are Bangladesh ($50 million) and Vietnam ($27 million).

How much of the millions raised had actually reached the children? Talal was asked.

"Over 93 percent," he replied. "The administration costs only seven percent compared to the range of fourteen to twenty-six percent which is usual for most other fund-raising efforts.

Prince Talal has nine children himself—five sons and four daughters.

—Donald Stokes

Auction. . .

even the East Coast, where O'Connor also traveled.

O'Connor had been dubbed the "connoisseur burglar" due to the high quality of the items found in his possession, including furs, antique guns, violins, jewels, Oriental rugs, and gold dinner plates.

O'Connor, his estranged wife Maureen, and his girlfriend, Nancy Burt, now claim the leftover property is theirs, Niemeyer said.

If after hearing O'Connor's case the judge orders the auction to proceed, it might be held in August, Niemeyer said.

If you fail to pay parking tickets promptly your car may be impounded

Library employee Nancy Bryant, arrested at work Thursday, June 23, on an outstanding traffic warrant, has been charged with failure to pay 56 parking tickets she accumulated on campus, according to Stanford Police Capt. Raoul Niemeyer.

Taken to Palo Alto Municipal Court Judge Edwin Scoyen, Bryant was charged with one count of driving with a suspended license and suspended vehicle registration, along with failure to pay the outstanding parking fines.

According to Niemeyer, Bryant at one time accumulated $8,000 in parking citations. Many were dismissed because of the statute of limitations.

Niemeyer said that more than a year ago Bryant was not allowed to renew her vehicle registration because of her many parking tickets. Bryant's license was suspended when she continued to drive an unregistered vehicle.

Police impounded Bryant's car following her arrest. Recent legislation enables police to impound a vehicle if a person receives five or more parking citations in a five-day period and does not pay the fines. Niemeyer said.

Action was taken against Bryant because the "county wants to collect fees that are due" from parking tickets, he said. In 1981, 52,107 citations were issued on campus and another 4,604 at the hospital. The number decreased in 1982, down to 34,438 on campus and 3,411 at the hospital.

Further arraignment is set for Bryant at 9 a.m. July 13 in Palo Alto.

Saul Rosenberg

Oncologist honored with Professorship

Dr. Saul A. Rosenberg, professor of medicine and radiology at Stanford University School of Medicine, has been awarded a Professorship in Clinical Oncology by the California Division of the American Cancer Society.

Rosenberg is the second scientist in California to receive the professorship. The Society is funding only 17 others in the country.

The professorship was established in 1971 to allow receipients to improve and expand cancer teaching programs and cancer patient care at their institutions.

"It is an honor to be selected from among the candidates throughout the state," Rosenberg said. "It reflects not only on my work, but on the excellence of the institution."

Rosenberg will receive $125,000 over the next five years. The funding, he said, will facilitate the department of medicine's and Medical School's search for another cancer investigator, which will allow Rosenberg more time to become more involved with cancer-related activities at the Medical Center and within the region.

"We hope to be able to collaborate further in our multidisciplinary approach to cancer teaching, research, and patient care," Rosenberg said.

Rosenberg has recieved international acclaim for his research on Hodgkin's disease. He and Dr. Henry S. Kaplan, D'Ambrogio Professor of Radiology, have made dramatic advances in the diagnoses and treatment of the disease.

Rosenberg is chief of the Division of Oncology at Stanford, having been among those who spearheaded the development of oncology as a specialty of internal medicine. He is also director of the Debbie Probst Oncology Day Care Center, a treatment center for cancer patients.

He has received the Henry J. Kaiser Award for excellence in Teaching, and was the first recipient of the Arthur Bloomfield Award for Excellence in Teaching in Clinical Medicine.

Basic research discovery has clinical uses

A potent anti-clotting factor discovered in recent years in the cells that line blood vessel walls is already showing important clinical use in open heart surgery, hemodialysis and in stroke victims, a British Nobel laureate told an international conference at Stanford University Medical Center on Wednesday (June 22).

"Prostacyclin," a hormone-like substance discovered almost by accident in 1976, is an excellent example of how often basic research bears clinical fruit, said John Vane, the pharmacologist from Wellcome Laboratory, Kent, England who shared the 1982 Nobel prize in medicine.

"The medicines of tomorrow will be based on the discoveries made right now," Vane told a meeting of 150 pharmacologists, chemists and biologists gathered at the second annual symposium on the biochemical basis of drug action.

Vane won the 1982 prize for his role in deciphering the mode of action of aspirin and similar drugs as they inhibit a family of chemical messengers called "prostaglandins."

Originally thought, 50 years ago, to be manufactured only by the prostate gland, prostaglandins are now known to be produced by nearly every type of cell in the human body and to play a regulatory role in activities as far flung as protection against ulcers, the contraction of the uterus during labor and the dilation of blood vessels.

Vane's current work focuses on prostacyclin, a highly unstable derivative of the prostaglandins, that is produced primarily by cells that line the walls of blood vessels, and is a potent inhibitor of blood clotting. Vane and colleagues have used the substance to unravel the mystery of how platelets—bandaids of the blood vessel network—"know" when to begin formation of a blood clot and when to sail through the vessels without clinging to vessel walls.

"For years, people said that the reason platelets didn't stick to the walls of healthy arteries was because of the smooth, slippery nature of the blood vessels," said Vane. "But we now believe that it's the production of prostacyclin that helps keep the platelets from sticking."

While cells of the blood vessel produce prostacyclin, platelets themselves produce "thromboxane," a chemical similar in structure to prostacyclin but opposite in function. Together the two chemicals help maintain a delicate balance, in ways still not understood, to make sure blood clots only when necessary.

Now, more and more physicians are taking advantage of this balance to fine tune the control of unwanted bleeding, said Vane.

During procedures such as open heart surgery or hemodialysis, when blood is circulated outside the body through synthetic tubing, the risk of clotting would be great, Vane said, were it not for anti-clotting additives. Most often heparin, another anti-coagulant, is trickled into the blood, but can lead to unstoppable bleeding in some patients. In contrast, prostacyclin only prevents clots temporarily, he said, and is a superior alternative for patients, such as hemodialysis patients with bleeding ulcers, for whom heparin poses a risk.

Still fairly difficult to store because of its instability, prostacyclin will probably not replace heparin, said Vane, but could be used supplementally to reduce the doses of heparin needed.

Physicians in the United States and Europe are currently exploring other uses for prostacyclin, Vane said, including limiting the damage done by strokes, and in helping prevent and dissolve blood clots in patients with peripheral vascular disease.

"We only know about a tenth as much now about the fundamental processes as we shall know in a year's time," said Vane. "There are plenty of ideas and plenty of things left to discover. The trick is in finding the path from one to the other."

John Vane

Gordon Holmes

Donald Prolo

Alumni group picks new officers

Dr. Donald Prolo, a San Jose neurosurgeon, is the new president of the Stanford Medical Alumni Association, and Dr. James Gordon Holmes, a Berkeley surgeon, is the president-elect for the 1983-84 year.

Holmes' election was announced at the recent alumni reunion held at the Medical School, which coincides with the organization's annual meeting.

Prolo, '61, has served on the association's board of governors, and is regional chairman for the south peninsula chapter of the Medical Fund, which provides financial aid for medical students.

He succeeds Roy Cohn, '33, emeritus professor of surgery at Stanford.

Holmes, '47, has been the association representative to the Medical School faculty senate. He has been on the board of governors, as well as other association committees. He also is a professor in health sciences and medical education at University of California, Berkeley.

Task force looks into cable TV use

A five-member task force to explore how Stanford University Medical Center might participate in cable television programming has been appointed by Lawrence G. Crowley, vice president for medical affairs.

"The University is actively exploring the possibility of joining with the City of Palo Alto and other nearby communities in developing a cable TV system," Crowley said. "As a medical center we are primarily concerned (as in other parts of the University) about securing the potential capability to initiate and distribute educational and cultural programs over such a system."

The task force is charged with identifying key center interests and concerns, advise the Vice President, and maintain liaison with the University Cable TV Steering Committee chaired by Mike Oman.

Members of the task force are Spyros Andreopoulos, director of Office of Communications, Stanford Medical Center; Roland Merchant, director, Office of Management and Strategic Planning, Stanford University Hospital; Carole R. Price, associate administrator at Stanford University Hospital; Edward Rubenstein, M.D., professor of clinical medicine and associate dean for postgraduate medical education; James Silverman, M.D., associate professor of radiology and chief of staff, Stanford University Hospital; and Duane Walker, R.N., associate administrator and director, Stanford University Hospital Nursing Service.

...News Notes...

Spotlight on...

Dr. Lawrence G. Crowley, *Stanford vice president for medical affairs, has been elected to the educational advisory committee of the National Fund for Medical Education. The appointment is for a three-year term.*

The Fund, based in Hartford, Connecticut, supports programs designed to promote better health care by improving the quality of medical education. The Fund is giving priority to projects that show promise of containing the cost of health care, improving the continuing education of practicing physicians, and the educational programs in schools of medicine and teaching hospitals.

Crowley is also president of Stanford Univeristy Hospital and board chairman of the New Children's Hospital at Stanford, now planning a consolidated new children's medical center adjacent to Stanford Hospital.

* * * *

Frank Tanaka *has been appointed accounting supervisor in the SUH General Accounting Office effective June 9, announced manager Roger Knobles.*

A graduate of Purdue University with a major in industrial management, Tanaka has extensive experience in general accounting as well as financial analysis and budgeting. He comes to the Hospital from Moore Business Forms, Inc. where he was subcontracting manager. Tanaka may be reached at 7-5862.

You should know...

The **SUH Pension and Benefits Department** *announces a new benefit geared towards Hospital employees who are within 10 years of retirement.*

The "Can You Afford To Retire When You Want To?" theme of the pre-retirement planning program was developed by Kathleen Ghazvini, manager of Pension and Benefits; Carol Peters O'Neill, benefits specialist; and Beverly Hauser, benefits specialist.

The program consisting of three interlinking sessions will be held on three consecutive Wednesday evenings, 6 p.m. to 9:30 p.m., Room M112 on August 3, 10 and 17.

Talks during the sessions are as follows:

Aug. 3: *"Overview of the Program," Kathleen Ghazvini, manager of the SUH Pension and Benefit; "Your SUH Health, Dental and Life Insurance," Beverly Hauser, SUH benefits specialist; "Heart Disease Prevention," Dr. Peter Wood, Deputy Director of the Stanford Heart Disease Prevention Program; "Diet and Exercise," Patricia Kearney, SUH Dietary Department; and " Psychological Planning for Retirement," Steven Johnson, Palo Alto Medical Clinic.*

Aug. 10: *"Your Social Security and Medicare Benefits," Virgil Kocher, Social Security Administration; "Part I—Planning your Financial Future," Dandridge M. Gray, licensed financial planner, Judy and Robinson Securities, Inc.*

Aug. 17: *"Part II—Planning your Financial Future/Estate Planning," Dandridge M. Gray; and "Your SUH pension plans and Tax Deferred Annuity plans," Carol Peter O'Neill, SUH benefits specialist, Dan C. White, William M. Mercer, Inc.*

The program is open to all Hospital employees at no charge, but priority seating and attendance will be given to employees and their spouses who are within 10 years of retirement. Med faculty openings

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

The pathology department of Stanford University School of Medicine invites applications for a position at the assistant professor level. Candidates must have demonstrated the capacity to conduct first-class research and will be expected to establish an independent and fundable research program in coagulation or cognate areas of laboratory medicine or pathology. Postgraduate training and certification in pathology are desirable. An extensive laboratory background and a record of prior publications are essential.

Applicants should send a curriculum vitae and the names of at least three references to Dr. Howard H. Sussman, Director of Laboratories, Department of Pathology, Stanford University School of Medicine, Stanford, California 94305.

The division of cardiology at Stanford University School of Medicine is seeking applicants at the assistant professor level. The position involves major commitment to both clinical activities and research, and direction of electrophysiology laboratory. Demonstrated research productivity is essential and invasive laboratory skills mandatory.

Send curriculum vitae to: Edwin L. Alderman, M.D., Search Committee Chairman, Cardiology Division, Stanford University School of Medicine, Stanford, CA 94305.

Medical Center MEMO

This issue of Medical Center MEMO marks the start of the biweekly publication schedule for the summer. The next issue is scheduled for July 13. The MEMO is prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. The editor is Lisa Ames, who can be reached at 497-6911.

Staff employment opportunities

Mattax to give harpsichord concert July 15

Stanford's Department of Music will present harpsichordist Charlotte Mattax in a free concert at 8 p.m. Friday, July 15, in Annenberg Auditorium.

She will perform works by Sweelinck, Tomkins, Rameau, Bach, and Scarlatti.

Mattax expects to receive her D.M.A. in Early Music this year. She recently returned from a year's study with leading harpsichordist Gustav Leonhardt in Amsterdam. In 1980 she won second prize at the International Harpsichord Competition in Bruges, Belgium.

Mattax received her B.A. from Yale and M.M. from Juilliard. A recipient of the 1979-80 Harriet Hale Woolley Scholarship, she studied with Kenneth Gilbert in Paris and Bob van Asperen at The Royal Conservatory in The Hague.

The Peninsula Times-Tribune wrote after her last Stanford recital: "Charlotte Mattax is a name to keep in mind, for in her hands the harpsichord becomes a remarkably eloquent instrument. . . . Her playing was splendid and moving."

The Summer Music Workshops, open to all students of orchestral instruments, is under the direction of music Prof. Arthur Barnes and Stanford MA Sara Salsbury (above with young student).

At far left, practicing the string bass, is Noell Toso, Cindy Giver, and Susan Hintz.

A beginning string player, left, plays a sonata in shorts.

Barnes to direct summer music workshops starting July 12

The fifth annual Summer Music Workshops sponsored by the El Camino Youth Symphony Association will be held on campus at the music annex on Tuesday, Wednesday, and Thursday evenings during the last three weeks of July (July 12 to July 18).

The Workshops, which are open to all students of orchestral instruments, do not require membership in the El Camino Youth Symphony and are designed to supplement students' private lessons and school musical studies. The faculty of professional musicians and graduate students will be under the direction of Stanford music professor, Dr. Arthur Barnes, who has been the conductor and music director of the El Camino Youth Symphony since 1975, and Sara Salsbury, MA Music Education, who directs the ECYS Chamber Strings and Preparatory Ensemble.

Instruction will be offered in beginning and intermediate ensemble playing, theory, string, and wind technique. Chamber ensembles, master classes, and a repertory orchestra will be offered for experienced instrumentalists and will be open on a space available basis to ECYS alumni, friends, and family.

Tuition fee is $60. For more information and application forms please call (415) 493-8523.

Dramatists give series of free one-acts, starting June 29

The Department of Drama's "Stanford Summer Theater Workshop" is presenting a series of seven one-act plays in the Nitery theater beginning on Wednesday, June 29.

A new play will open each Wednesday and play through Friday at noon with added performances on Friday and Saturday evenings at 8 p.m. Each performance will be approximately 45 minutes in length. Admission is free.

The plays will be directed by Drama Department doctoral students and recent graduates and cast from members of the Summer Theater Workshop. The settings, costumes, and lighting will be designed by faculty, graduate, and undergraduate designers, and by members of staff.

The plays will be presented in the following order:

David Edgar's *Ball Boys*, June 29-July 2 at noon; July 1-2 at 8 p.m.

John Guare's *Something I'll Tell You Tuesday* and *The Loveliest Afternoon of the Year*, July 6-9 at noon; July 8-9 at 8 p.m.

Romulus Linney's *Tennessee*, July 13-16 at noon; July 15-16 at 8 p.m.

Becky Smith's *Man Strapped to Bridge*, July 20-23 at noon; July 28-29 at 8 p.m.

Eugene O'Neill's *The Rope*, July 27-29 at noon; July 28-29 at 8 p.m.

Christopher Durang's *An Actor's Nightmare*, August 3-6 at noon; August 5-6 at 8 p.m.

An original review, *Summer's End*, August 10-13 at noon; August 12-13 at 8 p.m.

Seating in the Nitery is limited but at least one hundred persons will be seated at each performance.

Shape up for summer

Swimming lessons

Swimming lessons are being offered in two-week sessions at de Guerre Pools this summer. The second session begins Tuesday, July 5.

The program includes eight half-hour lessons Monday through Thursday during each session for anyone over the age of five years, beginners through advanced swimmers.

The cost is $35 per person for each of the four sessions. Full information is available at the guard office at de Guerre Pools or may be obtained from Skip Kenney, men's varsity swimming coach, at ext. 7-2210.

Tennis lessons

Small group tennis lessons will again be offered to staff and-or their families on weekdays or evenings. Players are grouped by ability in these lessons taught by Dick Gould's staff.

Call 497-1160 on weekday mornings to receive detailed printed information and registration form.

Aerobic class time

The aerobics exercise class "Your Body: Use It or Lose It" meets MW at 5:30 p.m. for one hour, not at 6 p.m. as previously advertised. This ongoing exercise class costs $2 each class, or $18 for the entire six-week session. For more information, please phone the STARTS office at 497-9671, afternoons.

Children's song concert July 16

Tom Hunter, songwriter and performer who specializes in songs for children, will present an outdoor concert at noon Saturday, July 16, at Bing School, 850 Escondido Road on campus.

Hunter has performed at schools throughout the Bay Area.

Tickets at $3 for adults, $1.50 for children, will be available at the gate. Seating will be on the lawn.

For more information call 497-4865.

Aerospace technology seminars open

The 20th annual Aerospace Technology Seminar began June 22 at the Terman Engineering Center Auditorium.

The seminar consists of presentations made at 8 p.m. every Wednesday through August 3rd. The presentations:

June 29—Richard S. Shevell, professor of aeronautics and astronautics, Stanford, on "From Icarus to the Boeing 767 and Beyond."

July 9—Fredric H. Schmitz, NASA-Ames and Stanford, "Rotary Wing Aircraft—Fooling Mother Nature."

July 13—J. Myron Atkin, dean, School of Education, Stanford, "The Crisis in our Schools."

July 20—R.J.P. Lyon, professor of mineral exploration, Stanford, "Why Look Down When the Stars Are Up; A Geologist Remotely Probes Our Finite Earth for Food, Fiber, Oil, and Copper."

July 27—Robert V. Wagoner, professor of physics, Stanford, "Expanding Horizons of Cosmology".

August 3—Richard J. Jahns, professor of earth sciences and Geology, Stanford, "Coalinga and Akita: New Challenges to Earthquake Prediction."

The seminar is open to registered Stanford students for one credit and is open to the public.

For more information call 497-3079.

Robert Hagopian and Alexandra Hawley

Hawley, Hagopian plan concert July 8 of flute, piano duos in Dinkelspiel

Flutist Alexandra Hawley and pianist Robert Hagopian will perform duos at 8 p.m. Friday, July 8, in Dinkelspiel Auditorium at Stanford. Hawley teaches flute for the Department of Music.

Their program will include Telemann's *Sonata in F minor*, Hummel's *Sonata in D Major*, *Sonataz* by Poulenc, *Fantaisie* by Faure, *Poem* by Griffes, and Bartok's *Suite Paysanne Hongroise*.

Hawley and Hagopian have been performing as a duo for seven years, giving concerts and workshops throughout California, the East Coast, and Midwest. They have performed at the Metropolitan Museum of Art in New York as part of the Myra Hess Memorial Series in Chicago. They have been invited by the Phoenix Chamber Music Society to perform at the Scottsdale Center for the Performing Arts July 15.

A *San Francisco Chronicle* critic once wrote of a Hawley-Hagopian concert: "(It) was as perfect as I have encountered. Programming, technique, musicality—all rated a 10. Hawley has every arrow available. But beyond mere control and mastery, she and Hagopian reached exceptional levels of classy musicianship."

Tickets for their July 8 concert are $4 general, $2 students and senior citizens, available at Tresidder ticket office, 497-4317 and at the door.

Recordings of great jazz pianists will be played by Wodehouse July 9

Artis Wodehouse will present "Great Jazz Pianists of the Past, an Evening of Historical Recordings" at 8 p.m. Saturday, July 9, in Dinkelspiel Auditorium Rehearsal Hall at Stanford. The free public event is sponsored by the Stanford Archive of Recorded Sound.

The lecture will trace the evolution of jazz piano performance from ragtime at the turn of the century through early jazz of the '20s, and swing of the '30s and '40s, using historic recordings taken from the Stanford Archive of Recorded Sound's extensive holdings. Featured artists will include Eubie Blake, James P. Johnson, Jelly Roll Morton, Fats Waller, Earl Hines, and Art Tatum.

Wodehouse is an authority on the history of early recordings. She received a DMA from Stanford and recently gave a series of lectures at Stanford on historic recordings of pianists, violinists, singers, and conductors.

This year she presented two lectures on great singers from the past at the Frank V. de Bellis Collection in San Francisco and also spoke on early recordings at several East Coast colleges. She currently is studying the performance style of George Gershwin.

Wodehouse performs frequently in the Bay Area.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the two weeks in which the events occur. The next deadline is Wed., July 6 to cover the weeks of Mon., July 18 through Sun., July 31. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

TUESDAY, JULY 5

Stanford Museum Lunch Hour Tour: "Approaches to Painting". 12:15 pm. Stanford Art Museum. Free.

WEDNESDAY, JULY 6

Drama Department: John Guare's SOMETHING I'LL TELL YOU TUESDAY, and THE LOVELIEST AFTERNOON OF THE YEAR. Two one-act plays, directed by doctoral student Tom Lindblade. Both plays together run approx. 45 min. Noon. The Nitery. FREE..

Book Sale: SU Libraries Gift and Exchange Division. Books and periodicals in many fields : hardbound $1.50 +, paperback 25 cents+, periodicals 10 cents+. 11 am - 1:30 pm. Green Library West Wing, First Floor, Rm 101. n.

Stanford Museum Lunch Hour Tour: "Approaches to Painting". 12:15 pm. Stanford Art Museum. Free.

Aero-Astro/NASA/ASEE Seminar: "Rotary Wing Aircraft Fooling with Mother Nature;" Fredric H. Schmitz, NASA-Ames Res. Center. Open to the public. 8 pm. Terman Auditorium. Free.

THURSDAY, JULY 7

Drama Department: John Guare's SOMETHING I'LL TELL YOU TUESDAY, and THE LOVELIEST AFTERNOON OF THE YEAR. Two one-act plays, directed by doctoral student Tom Lindblade. Both plays together run approx. 45 min. Noon. The Nitery. FREE.

STARTS/Summer Jazz Workshop Speaking Jazz Lecture Series: Don Hass: "The World of Chord Substitution, Observations and Applications". 7:30 pm. Tresidder Lounge. $3; $25 for series of 10 lectures/concerts.

FRIDAY, JULY 8

Drama Department: John Guare's SOMETHING I'LL TELL YOU TUESDAY, and THE LOVELIEST AFTERNOON OF THE YEAR. Two one-act plays, directed by doctoral student Tom Lindblade. Both plays together run approx. 45 min. Noon, 8 pm. The Nitery. FREE.

SATURDAY, JULY 9

Drama Department: John Guare's SOMETHING I'LL TELL YOU TUESDAY, and THE LOVELIEST AFTERNOON OF THE YEAR. Two one-act plays, directed by doctoral student Tom Lindblade. Both plays together run approx. 45 min. noon, 8 pm. The Nitery. FREE.

TUESDAY, JULY 12

Stanford Museum Lunch Hour Tour: "The Chinese Tradition". 12:15 pm. Stanford Art Museum. Free.

WEDNESDAY, JULY 13

Drama Department: "Tennessee", by Romulus Linney. One-act play directed by doctoral student Stephen Weeks. Noon. The Nitery. Free.

Stanford Museum Lunch Hour Tour: "The Chinese Tradition". 12:15 pm. Stanford Art Museum. Free.

Aero-Astro/NASA/ASEE Seminar: "The Crisis in Our Schools"; J. Myron Atkin, Dean of School of Education, SU. Open to the public. 8 pm. Terman Auditorium. Free.

THURSDAY, JULY 14

Drama Department: "Tennessee", by Romulus Linney. One-act play directed by doctoral student Stephen Weeks. noon. The Nitery. Free.

STARTS/Jazz Workshop Speaking Jazz Lecture Series: Frank Sumares: "How to Develop Your Rhythm Section Into a Cooking Machine". Pianist, adjudicator, and director of Jazz Studies at Chabot College will work with a rhythm section for this lecture-demonstration. 7:30 pm. Tresidder Lounge. $3.

FRIDAY, JULY 15

Drama Department: "Tennessee", by Romulus Linney. One-act play directed by doctoral student Stephen Weeks. noon, 8 pm. The Nitery. Free.

SATURDAY, JULY 16

Drama Department: "Tennessee", by Romulus Linney. One-act play directed by doctoral student Stephen Weeks. noon, 8 pm. The Nitery. Free.

EXHIBITS

The Stanford Quadrangles: Design & Construction. An exhibition of materials relating to the early planning development and construction of the university; compiled from the resources of the University Archives. Second floor gallery, Green Library. May 23July 28.

"Propaganda Posters of Two Revolutions". Features over 40 posters from the Russian Revolutions and Civil War, 1917-1922, as well as the German Revolution of of 1918-1919 and the German elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover Memorial Exhibit Pavilion. June 8 - Jan. 31.

The Stanford Horse Show. In conjunction with the renovation of the Red Barn at Stanford, the exhibit contains items related to Leland Stanford's interest in horse breeding and training. T-F 10-5; S-S 1-5; closed Mondays. Stanford Art Gallery. June 28 - Aug. 14.

Paintings by Liz Cheney. Atmospheric style and designs by a student of the Stanford Fine Arts Dept. all building hours. Upper Lobby of Tresidder Union. July 3 - Aug. 1.

Photographs by Aurangreb Khan. Coffee House Gallery, Tresidder Union First Floor. July 3 - Aug. 1.

Sharon Chacko - Batik. Reception Wednesday, July 6, 5-7 pm. International Center. July 4 - Aug. 14.

CAMPUS REPORT

Volume XV, Number 40 | A publication for Stanford University faculty & staff | July 13, 1983

The gender gap in earnings may be changing about as fast as this angel's portrait, a CROW scholar believes. See story, page 5.

Mosher termination justified, scholars say

Steven W. Mosher's termination as a Stanford doctoral candidate in anthropology was "justified," three nationally prominent scholars have advised Dean Norman K. Wessells of the School of Humanities and Sciences.

See texts, pages 10-12

Mosher has blamed his termination on a popular Taiwan press article he wrote documenting forced abortions in China and on "slanderous" allegations by his former wife. In an 11-0 vote Feb. 24, the Stanford anthropology faculty agreed with an investigating committee report that found Mosher's "seriously unethical conduct" in China "endangered his research subjects."

While Mosher was given a copy of the 47-page report, it has never been made public. The three scholars—Stanford Prof. Gordon Wright, past president of the American Historical Association; Stanford Prof. Ernest Hilgard, past president of the American Psychological Association; and Prof. Ward Goodenough of the University of Pennsylvania, former president of the Society of Applied Anthropology—said that "such disclosure is inadvisable for ethical considerations relating to the welfare of other parties."

"The investigating committee's findings, taken all together, do not reveal merely honest mistakes or ill-considered actions," the scholars said.

"Rather, they reveal a pattern of dealings that involved deliberate disregard for the law of the host country and the instructions of its officials, a deliberate disregard of the requests of the funding agency regarding dealings with officials in the host country, a manipulative approach toward the people with whom he was living and working, a serious lack of candor in his dealings with his supervising professors and with the representative of the U.S. Committee on Scholarly Communication with the People's Republic of China, and a continuing lack of candor in his dealings with the investigative committee.

"The pattern as a whole, as it unfolded through the course of the investigation, progressively eroded any possibility for a relation of trust between Mr. Mosher and the faculty of anthropology at Stanford...

Stanford West conditions cause University to pause

The Palo Alto City Council approved the Environmental Impact Report for the proposed Stanford West housing project Monday night, but added several conditions to those already agreed to by University staff.

See Massy letter, page 8
See coop letter, page 13

The Council voted that there should be a setback averaging 150 feet on the "south" side of Willow Road, between Pasteur Drive and the Stanford golf course. The property is in the University's academic reserve, outside the city. It lies across Willow Road from the Oak Creek Apartments.

There should be no vehicular access from that property to Willow Road, the Council voted.

In addition, the lands bounded by Willow Road, Campus Drive, Pasteur, and the golf course should be held only for academic and support services, the Council said.

Another action had to do with a proposed playing field on the Stanford West site, a 46-acre parcel on the "north" side of Willow Road. The field should not be for

FBI may join Hoover search of archives

The Federal Bureau of Investigation may join the search of President Reagan's 1980 campaign and transition archives at Stanford's Hoover Institution.

Charles Palm, Hoover acting archivist, said Tuesday "We have received a letter from Edwin Meese, as trustee of the Reagan collection, authorizing us to provide representatives of the Department of Justice access to the materials and to permit copying of any document the Department of Justice deems relevant to its ongoing inquiry."

Agent Keith Berry of the San Jose FBI office met Tuesday afternoon for about an hour with Palm, Hoover research fellow Molly Tuthill, and Richard Burress, associate director of the Hoover Institution.

Four trustees to consider University-Hoover study, page 6

"We had a preliminary discussion concerning access to materials," Palm said. "It was an information gathering trip for him. We surveyed the area where the documents are stored and the search area.

"We discussed space requirements for a possible team of FBI agents to conduct their own search.

"Berry had no decision on whether there would be a team or not. We discussed the status of our own search. He said he would take information back to his superiors for evaluation and decision. We communicated our intention to cooperate fully with the Department of Justice. Meanwhile, our search continues."

Berry gave no indication of when he would return, but "my impression was he'd be back soon," Palm said. If the decision is made to have FBI agents participate, "we asked them to send people familiar with records management or archives."

Palm expressed confidence that any sharing of responsibility could be managed so that both the Department of Justice and the Hoover Institution can meet their requirements.

"It's really up to them to decide," he emphasized.

RLIN book file expansion set

The book file of RLIN, the online bibliographic support for the Stanford University Libraries, will not be available from July 5-26 so that the Research Libraries Group (RLG), the owner and manager of the database, can complete the final phase of an archival load project. This will add approximately four million records, almost doubling the size of the database.

Included in these records are books cataloged by 15 member libraries before they become members of RLG (Yale, Columbia, Princeton, etc.), 177,000 records from the National Library of Medicine, about 65,000 records of government publications from the Government Printing Office, and 89,000 East Asian records from the University of Toronto.

During this time, the libraries' Acquisitions and Catalog Departments will continue operation but they will not be able to do any inputting into the system to either order or catalog books or produce catalog cards for books.

Books which have received a rush request for cataloging are an exception and will be manually processed, as will a few select emergency rush orders to purchase new books.

For the library users, this means that the staff will not be able to check the database for the status of books to see if they are on order or have been received by Stanford but not yet cataloged. Nor will the staff be able to check to see if other libraries, whose book holdings are included in RLIN, own a particular title.

The main card catalog in Green Library has cards filed for all but the most recently cataloged acquisitions for most libraries. Call the Information Desk between 10 a.m. and 5 p.m. Monday through Friday at 497-9108 to check titles listed in the main card catalog.

At other times Green Library is open, call the General Reference Desk at 497-1811 for catalog information.

Maggie McCarty

Word Graphics expands

Maggie McCarty has assumed a newly created position in customer relations for Word Graphics. McCarty comes to Stanford University from the University of San Francisco where she was the director of publications. Her background includes marketing, sale, graphic design, printing, and public relations. She will use these talents to spread the word about Word Graphics' services. If you have any questions about printing, and how Word Graphics can help you, call McCarty at 7-4811.

Chris Chafe, Jon Berger, David Jaffe

Three composers new NEA fellows

Three of the 35 NEA (National Endowment for the Arts) composer's fellowships for 1983-84 have been awarded to Stanford composers: Jonathan Berger, lecturer in music; Chris Chafe, research associate at CCRMA (Center for Computer Research in Music and Acoustics); and David Jaffe, graduate student in music.

Berger's $6,000 grant is to support composition of an opera for singers, instruments, and computer-generated tape. Berger has also received a $1,000 Young Composer's Award from ASCAP (American Society of Composers, Authors, and Publishers) for his DMA composition, *The Fires of the Night*.

Chafe received his DMA degree in January and works at CCRMA. His $9,000 NEA grant is for a computer piece. In November he leaves for IRCAM (Institut de Recherche et de Coordination Acoustique-Musique) in Paris for one year to compose and provide technical assistance to CCRMA's sister institution.

Jaffe was awarded a $5,000 NEA grant to compose three pieces: 1) a double concerto for mandolin, violin, and small orchestra; 2) a piece for eight channels of computer-generated sound; and 3) a work for six English horns and violin.

His double concerto, entitled *Would You Just as Soon Sing as Make that Noise?* was written for the Mostly Modern orchestra and premiered by them in March at the Vorpal Gallery in San Francisco.

Emmons, Vucinich edit new book about *The Zemstvo in Russia*

Prof. Terence Emmons and Wayne S. Vucinich of the Stanford History Department are editors and contributors to *The Zemstvo in Russia*, published by the Cambridge Century Press.

The book consists of 13 essays written by experts, each of whom has attempted to assess Russian experience with the rural local self-government embodied in the elective institutions called *zemstvos* (1864-1918). The essays were originally read at a Stanford conference in 1978. Subsequently expanded and edited, they represent the first attempt to investigate *zemstvo* systematically since the Revolution of 1917.

Vucinich recently edited another book, *The First Serbian Uprising, 1804-1813*, a collection of essays, published in the Brooklyn College Studies on Society in Change Series, distributed by Columbia University Press.

The First Serbian Uprising is the first book to appear on the subject in the West since the appearance in 1825 of the highly regarded but now antiquated work by Leopold von Ranke, the famous German historian. Each essay in *The First Serbian Uprising* is written by an American or foreign scholar. Vucinich wrote four.

The collective work treats such fundamental questions as the genesis and essence of the Serbian insurrectionary movement, the leadership of Karageorge, the policies of the foreign powers toward the Serbian uprising, the role played by the Serbian Orthodox Church, the military and political organizations of the insurgents, and the impact of the Serbian uprising on other subjects of the Ottoman Empire.

The overthrow of the Ottoman theocratic and feudalistic order, and attempts to organize the Serbian peasant society and to lay the foundations for the modern Serbian state are highlights of this book.

Black students honor three staffers

Linda Bradford, Beverly Scott, and Ruby Mason were each honored by the Black students of the graduating class of 1983. The staff members were saluted by being given a Staff Appreciation Award for Exceptional Service and Guidance to Students at the 9th Annual Black Baccalaureate Dinner that was held on June 11, 1983, at Tresidder Union.

The recipients of the newly instituted award were chosen because each had been "the most helpful to the majority of the Black students of the graduating class of 1983 over the past four years."

Each one of the recipients is a familiar and significant figure in the arena of student services at the University. Bradford, who has a long career in the field of student personal services, is a financial aids advisor in the Financial Aids office. She advises applicants, parents, and students on all aspects of financial aids. She has been in the capacity of advising at the university for five years.

Scott has been at Stanford since 1969 and has been coordinator of extradepartmental programs and is currently assistant dean of minority programs in the School of Engineering. In her roles, she has come into contact with a large number of students; her aim being to facilitate students' successful participation in the University environment.

Mason is an advising consultant in the Academic Information Center. She began working at the University in 1969 and has been advising undergraduate preprofessional students for the past five years. In her work, she focuses on curricular planning, selection of majors, and on minority group students.

Gutenberg Express schedule to change

The following changes in Gutenberg Express service between the Stanford and Berkeley Libraries will go into effect on Monday, July 18. The shuttle service is administered by the University of California Department of Communication and Transportation Services.

1. On Monday, July 18 a 32 passenger bus will begin services from Berkeley with the following schedule:

Leave Berkeley, 7 a.m. and 3:45 p.m.

Leave Stanford, 8:30 a.m. and 5:15 p.m.

2. A fare of $2.25 per passenger will be charged for each one-way trip. Passengers may pay this fare in exact change at the bus, or purchase a booklet of eight coupons at the Central Garage, 1952 Oxford Street, Berkeley (located on the west side of the campus).

3. It is anticipated that with the larger bus, reservations will not be required.

4. The old system, using vans without fees, will continue through July 15.

These changes result from a recent survey of Gutenberg Express riders which indicated strong support for continuing the service even with a fee. Since the survey, various schedules and fee structures have been reviewed with an eye toward meeting the objectives of transporting library materials between the two campuses and of providing users of the respective libraries a source of transportation.

For additional information about this service, please contact Joe Jezukewicz, Stanford University Libraries (ext. 7-2018).

CAMPUS REPORT
(ISSN:0049-2108)

Published weekly in January, February, March, April, May, June, October and November; two issues in July and August; three issues in September and December.
Published by the Stanford University News Service. Patricia J. Black, editor; Karen Marman, design assistant; Debbie Jeppson, production assistant; Charles Painter and Ed Souza, photographers; Medical news editor, Lisa Ames, ext. 7-6911.

DEADLINES: For campus news, the Friday before each Wednesday's issue at the News Service, Press Courtyard, Santa Teresa St., ext. 7-2558. For Medical Center news, the Wednesday before each issue at the Medical Center News Bureau, TC-135, ext. 7-6911.

Second class postage paid at Palo Alto, CA. U.S. mail subscriptions at $9 per year or $3 for one quarter are available at the *Campus Report* office, Press Courtyard, Santa Teresa St., Stanford, CA 94305.

Vincent D'Andrea has spent lifetime counseling those in distress—and he's found his own secret for contentment

by Donald Stokes

Peer counseling is rapidly growing more important to meet the needs of those in emotional or psychical crisis, in view of the slashing of federal funds for social services.

In the worst cases, those of threatened suicide, peer counseling is invaluable. Among college students, suicide is second only to auto accidents as a cause of death, markedly more so than in the population as a whole.

Fifteen out of every 100,000 students kill themselves each year. There are about 10 times more suicide attempts than those actually carried out, so it is estimated that 1,600 students, out of the 10.7 million in higher education, are alive today in America's 3,221 universities and colleges after failed attempts at suicides.

The number who are probable suicides in suspicious "accidents" (involving guns, cars, or drugs, etc.) is believed by many observers to double the real total of those who destroy themselves.

These terrible totals are quite separate from those of students who are talked out of killing themselves.

This is where Vincent D'Andrea comes in.

Coping with the psychic crises of students is the medical art of Dr. D'Andrea, psychiatrist and a principal instructor of the peer counseling courses at Stanford's Cowell Health Center. There are eight such student groups at Stanford, each dealing with a particular range of student problems.

D'Andrea has been taking care of Stanford students for 12 years as part of a lifetime of counseling those in need. With Peter Salovey (Stanford '81, now at Yale) he has published the only book which deals with the techniques of how students can help other students who are in psychic distress (*Peer Counseling: Skills and Perspectives*, Science and Behavior, Palo Alto, 1983, $9.95).

Over the years D'Andrea, who has spent his career in teaching, psychological counseling, and psychobiology, has not only built up student counseling centers but also suicide hotlines, networks of dormitory advisers, and helped establish peer counselors on other campuses.

"Although suicide calls to peer counselors are relatively uncommon, compared to other types of calls received by our emergency services, suicide attempts are not an infrequent occurrence," said D'Andrea in a campus interview.

Typically, those who attempt suicide are female, aged from 20 to 30. Ninety percent of all suicide attempts are made by women. Those who actually kill themselves are usually males over 40.

"Contrary to the common impression, it is not those who are sunk in a prolonged depression who are most likely to do away with themselves. Those most likely are those who are 'cycling' rapidly into or out of depression. People who are chronically depressed often do not have the energy to take their own lives."

D'Andrea believes that the eight counseling networks at Stanford and the expertise which has been handed down for more than a decade has done much to make suicide, or attempts at it, a rarity among Stanford students.

D'Andrea relaxes by practicing the ancient art of winemaking

Even so, the volunteers who man the 24-hour telephones at The Bridge, the focus of Stanford's peer-counseling groups, are carefully coached in the techniques of helping the desperate people who have self-destruction on their minds.

Two chapters are devoted in D'Andrea's book to depression and suicide. Many of the counselors have the relevant pages pasted up near the phones.

There is great competition to become peer counselors at Stanford. "In The Bridge course there is always tremendous over-subscription," said D'Andrea. "I cannot train more than 22 in any quarter, and usually I get up to 50 applications. For those not interested in earning credits, there is an overspill course which is taught by training assistants."

A group of students approached the Health Service in 1970, with the idea of forming a peer counseling group. "The need was clearly there," said D'Andrea."Students were looking around for ways to get support within their own ranks. We co-founded The Bridge when the ferment on American campuses had only recently reached its peak."

D'Andrea helped to arrange training in counseling and various support systems focused on a "drop-in" center where students in distress or need could go for help with their crises. He developed a course which was first held under the auspices of SWOPSI (Stanford Workshops on Political and Social Issues). From 1976 the courses were held at the Learning Assistance Center. D'Andrea became the principal instructor in counseling courses.

From the original Bridge there are today eight spinoffs, or satellite programs, which deal with particular areas of the student population. These include various ethnic counseling groups and special interest associations which cover such aspects as birth control, drugs, and specific health problems. The next group likely to be formed is one designed for blacks.

The peer academic advisers have major programs in the various residences for students and in other parts of the university.

The basic course that all peer counselors have to take has two main components. The first is in listening and counseling skills. The second component focuses on the content which is relevant to the particular task of the student.

Asked how many students sought the help of the peer counseling groups, D'Andrea said that the only figures available to him were for The Bridge, which has about 60 "drop-in" visits every quarter, plus up to 200 phone calls, often from people anxious to hear a friendly voice.

"This is a 24-hour operation, so that at any time advice can be given on referrals, on crises, and counseling. Four students who live in man the phones. They are all volunteers. They range from freshmen to graduates, but we do not encourage seniors to take on the work, as they will soon be gone, and continuity of experience is valuable here.

"Many of the volunteers are studying psychology or human biology. For others, it seems to be a sort of antidote for their own stresses and problems, or helpful to their own studies.

"We have many counselors from science, engineering, business, and law who relish the work because they feel it adds a more human dimension to their studies."

Is there any particular type of student who is more likely to need counseling? "No, a great many students find it difficult, during a 10-week stay in a campus residence, to develop any real relationship to another person. And there is so much competition. These peer counseling programs provide an opportunity for students to achieve more cooperative kinds of relationships, to draw off the academic sparring and to address themselves to more everyday concerns.

continued on next page

D'Andrea/ continued from page 3

"The most common problem that requires peer counseling is the upset of a relationship. Usually it is a man-woman thing, but quite often it is a family matter, when a student has received a really upsetting call from home, with bad news, or disapproval. People may go into crisis in these sorts of situations.

"Sometimes the trouble has roots in longer-term issues, such as the return of former depression over a deep-rooted problem.

"I don't have any data, but it seems to me that for a while there were more women wanting to be peer counselors, and that now the two sexes are about evenly balanced.

"Women are often more interested in relationships than men, they are more verbal and more free in expressing feelings. That is why they often volunteer in larger proportions than their ratio to men on campus."

D'Andrea's observation over the years has been that women are more slow than men to enter a relationship, but once they have entered it they are more interested in nurturing it than men are. However, they also seem to be more decisive over ending a relationship, whereas men often jump into a relationship much more quickly, and have a difficult time in ending it.

"Both sexes suffer when this occurs. For many it is their first real relationship with the other sex, outside the family. My impression—and I may be wrong—is that it is harder for men to understand why a relationship has soured, what went wrong. Men are also less apt to come in and talk about it. Women, on the other hand, are very interested in finding out why a relationship went wrong. They want to analyze it and understand it more thoroughly.

"It could be that things have changed somewhat over the years I have been here. They may well have, but I have no firm data. Men and women seem to be growing more androgynous; perhaps there is a more cooperative ethic.

The next most common problems are those of negative feelings. Sometimes it is anxiety or depression, for any one of a wide range of reasons. Students frequently feel that they are up against a problem they cannot solve, or they are overwhelmed by the pressures of study. Often they feel they cannot study sufficiently anymore, they feel burned out, they lack motivation, they feel withdrawn and listless about their studies.

"They say they don't feel smart any more, they feel useless, the demands being made on them are beyond their limits. These bright people feel—probably for the first time in their lives—that they are at the limits of their capabilities.

"They have come to the end of the endless optimism and enthusiasm of adolescence, and have been hit by the realities of the later years.

"Our task is to make that realization one that does not destroy them. I spend a lot of time with students and their peer counselors in discussing this issue of how you maintain your self-esteem when it is heavily assaulted.

"I ask the students 'What are the sources of your self-esteem? Are they all based on performance? Do you have good feelings about yourself apart from your role as a student?'

"Even if a student gets lots of A's and does not have an inner core of self-respect, he can develop great insecurity. This often begins to show among graduate students, in spite of the fact that they are invariably extremely bright. Often they lose their sense of bearings, as they realize that their self-esteem and what other people think about them is too narrowly confined in that basket of intellectual attainment.

"The third largest area where the peer counselors are needed is in the specific dilemmas of individual students, often focused on their academic work. Sometimes it concerns anxiety as to whether the area of study they have chosen is the right one for them. Or they may have run out of steam and feel very low intellectually.

"Those who are nearing the end of their studies grow increasingly worried about their chances of finding appropriate jobs. These sorts of problems are often more complex than the others, and they involve much deeper motivations and fears."

D'Andrea explained how Stanford deals with afflictions caused by psychic problems. Of these the most common are anorexia nervosa (dieting to the point of malnutrition) and bulimia (over-eating followed by deliberate regurgitation). These are now so familiar that those afflicted would often appear before peer counselors and identify themselves as victims.

A program called Overeaters Anonymous has been in operation at The Bridge for many years.

"There are certain characteristics of bulimics. For example, a bulimic woman is likely to show a pattern of perfectionism in pleasing others, beginning in adolescence. They tend to be very cheerful, agreeable, bright, lovely young women who are very concerned about other people and worry about what others think and feel. They are very eager to please.

"They are also preoccupied with their personal appearance, and they tend to spend a great deal of their time on their looks and clothing, their body image. They have an obsessive concern with maintaining a specific weight and shape.

"There is a sort of magic belief which bulimics stumble on to the effect of 'I can eat as much as I like to please myself, and can avoid gaining weight simply by vomiting or taking laxatives or diuretics.'

"There is the public picture of this attractive and agreeable woman, whereas in private they confess to us their self-hate.

"Anorexia nervosa is a much more serious condition, and often it is life-threatening."

D'Andrea has had a strong interest in psychological and pharmacological treatments which have effects on thinking and feeling; he published a book on psychoactive drugs in 1973.

D'Andrea is interested in acupuncture, which he began to study, together with other Chinese medicine, during the campus troubles during the early 1970s, when he was, in his own words, "a sort of hippie doctor."

D'Andrea emphasized that he does not practice acupuncture, because of licensing restrictions. He is convinced, however, that the latest research shows acupuncture often to be a valuable physiological function. "It is associated with the release of endorphins, which have an effect on pain.

"What people don't realize is that the good results obtained with it in China are partly the result of the extraordinary rapport that acupuncturists there build with their patients.

"I was myself treated by acupuncture in a California clinic for pericarditis, an inflammation of the sac of the heart. This is an extremely painful condition. I was taking all kinds of medications that were having unpleasant side-effects.

"I had previously been to some lectures on acupuncture, and had met a fine young physician, Harry Oxenhandler, who was then practicing in Palo Alto. I went to him and told him I was having great pain, and detailed all my symptoms.

"I was suffering severely, had a high fever, and felt very badly. Oxenhandler carried out a treatment and in one and a half hours I walked out of his office, entirely free from fever and pain. The doctor checked with my cardiologist, and they worked together when I took subsequent treatment by acupuncture. I was freed from pain and the effects of my affliction.

"I still keep up with the literature on acupuncture, but purely as an avocation. I continue to be interested in the psychobiology of acupuncture and also of meditative states."

D'Andrea's great hobby is winemaking. It began when he was living in south Palo Alto in the early 1960s and became partners with his next-door neighbor in winemaking. Later they joined with a group of engineers working at Stanford Research Institute who had a vineyard on Montebello Ridge.

"We learned a great deal from each other, each year making large quantities of various kinds of varietal wines. I have been making wine since 1962, each year making up to or at the legal limit of 200 gallons (one thousand bottles), usually producing a range of reds and whites, including Cabernet Sauvignon, Zinfandel, and Pinot Noir."

His winery and workshop are next to his home near Middlefield Road in Menlo Park. He says that he learned to make wine in the way the finer wines are made in Europe, which is to use 100 percent varietal grapes and not to add anything to them. He takes great care to protect the mix.

Asked where he obtained his grapes D'Andrea laughed: "There's a whole Byzantine business entailed in that. One calls around in the pre-harvest and asks the big vineyards whether they are selling grapes to home winemakers. That requires some delicate arrangements and contacts.

"I derive great pleasure out of getting to know a great deal about winemaking, in creating good wines on which I put my own label, and in giving some to friends and relatives.

"The reds usually have to mature for up to four years. I still have a few bottles of my 1962 Cabernet Sauvignon."

His label—Villa Cimbrone—is that of his home, which in turn is named after a famous villa in Ravello, Italy, where Wagner is said to have composed parts of *Parsifal*.

He is helped in his winemaking by his wife Shirley, and often by various of his four children. The oldest, Daria, is a musician who studied at the San Francisco Conservatory of Music. His two sons, Christopher and Steven have studied, respectively, literature and comparative literature at UC-Berkeley. Christopher was a finalist in both the Rhodes and Marshall Scholarships selection process last year. The youngest child, Claudia, is a junior at Castilleja School in Palo Alto.

My impression—and I may be wrong—is that it is harder for men to understand why a relationship has soured, what went wrong. Men are also less apt to come in and talk about it. Women, on the other hand, are very interested in finding out why a relationship went wrong.

—Vincent D'Andrea

D'Andrea was born in Philadelphia 53 years ago and received his M.D. at Temple University in 1957. When he was a medical student at Temple he held a clerkship under O. Spurgeon English, the grand old man of psychiatry, and this sparked his interest in human behavior.

"I worked in the out-patient department, which was called the Comprehensive Medical Clinic. We were taught a style of family practice which involved not only serving the patient but also the whole family. Often we had home meals with them and took down the medical histories of each member. We would make an assessment of the family's health needs, and then try to make appropriate recommendations.

"In college, I took a double major, in English and biology. I was dissuaded from a career in literature by my father, but my fascination with the human condition remained. I believe all this made me very interested in psychomatic medicine, in social

CROW studies subtle ways men maintain work preserve

Despite the highly publicized achievements of Sally Ride and many other individual women, occupational segregation by sex is "no better today than it was in 1950—and probably no better than it was in 1900," according to Associate Prof. Myra Strober of the Stanford School of Education, director of the Center for Research on Women (CROW).

An economist who has found significant differences in the career progress of men and women MBA's, Strober believes occupational differences by sex should be considered in a cultural context.

Several recent Stanford studies indicate that the closer data are examined, the greater the true differences become.

"Women get a ticket to ride after the train has left the station" was the way Stanford students Susan and Michael Carter summarized their comparison of earnings differences by sex in several professions.

In medicine, for example, women MD's are more likely to work for a clinic than for themselves. In law, women work in the less lucrative specialties.

In dentistry, one of the few professions where practitioners are not being "deskilled" and where relative incomes are still rising, women comprise only three percent of the practitioners and four percent of the students.

By allowing dental hygienists to do more routine tasks, dentists have upgraded the work they perform as professionals. Hygienists, of course, are overwhelmingly women.

While women have become proportionately greater among computer programmers and systems analysts, the importance of this field may be diminishing. Surprisingly, the students found, between 1970 and 1977 women's incomes rose from 70 percent to 80 percent those of men while their share of these jobs rose from 20 percent to 26 percent.

Men's earnings increase less rapidly when a profession is "deskilled" and an oversupply of trained personnel develops.

Men are territorial

"Men workers are very interested in protecting their territory," Strober observes. If more women enter a predominantly male field, they increase the labor supply. At some point, men may fear their jobs could become "women's work," with results not unlike those of "white flight" from neighborhoods fearing residential integration.

Subtle differences in communication style proved a powerful barrier to women enrolled in a welding course in a Seattle community college, Cecile Andrews found in Stanford doctoral dissertation study.

The class included 15 men and three women. While there was no overt sexual harrassment, the women were effectively ostracized, Strober said. No one spoke to them in class or in the college cafeteria. The women felt "unwanted."

In class, women asked simple direct questions—"what does this mean?" for example.

Men would take longer to ask questions, usually supplying a potential answer. The teacher would reply simple "yes" or "no," and "usually the men students were right," Strober said.

Where the women were starting with no knowledge of welding, the men used code words to suggest they knew the answers. This enabled the men to view the women as "dumb." By the end of the course, the women said they were not at all sure they wanted to become welders. They missed the chance to talk with friends in a "female" culture.

Other studies have reached similar conclusions, notably Cynthia Epstein's analysis of women lawyers and Judith Steihm's report on women at the U.S. Air Force Academy.

In a third Stanford study, Wanda Brewster O'Reilly interviewed 12 dual career couples on the interaction between family and corporate life.

While all the couples said they were interested in furthering both careers within the marriage, they behaved in ways which advanced the husband, Strober said.

"This makes economic sense, since in all the couples studied, the men earned more than the women."

Where married women in professional careers often say they see no conflict with their family roles, further questioning and analysis shows they have lowered their expectations.

Strober suggests several ways in which companies can work toward a more integrated work force:

1) Bring in more than a few token women, when possible. Some research suggests that men may feel more threatened when the number of women increases.

2) Enable women to create support groups across corporations as well as within their employer's firm. "Women in professional careers need other women to talk with," she notes.

3) Provide more child care availability.

4) Consider adding a "wide" track to the "fast" track, an idea suggested by O'Reilly for those who recognize family commitments as well as those to the company.

The "superwoman" syndrome has become increasingly evident in business, law and several professions, where people are paid well but expected to work 60 to 80 hours a week, Strober observed.

In one bank with a very good policy on maternity leaves, talented women were not returned to their original position but often were promoted into positions of "extreme overload" soon after having a child.

Even when housework is shared, women are often responsible for picking up youngsters from child care or the doctors, she noted.

Between 1950 and 1980, she notes, the proportion of women with children under age six who are in the work force nearly quadrupled, from 12 to 45 percent. The proportion of women with children age 6 to 17 in the work force doubled, from 30 to 60 percent.

While women's experience in the work force increased and their "exit rate" declined sharply, the earnings gap in comparison with men has increased since 1955.

Among full-time employees working year-round, white women's earnings fell from 65 to 59 percent of those of white men by 1980.

During the past 20 years, black women's earnings have moved up to nearly 95 percent of those of white women, as former domestic workers have moved into clerical, nursing and teaching jobs.

Marked improvement for blacks

Between 1955 and 1980, there also has been a "marked improvement" in the earnings of black men compared to white men, with the ratio increasing from 60 percent to 75 percent.

But as recently as 1979, white men with only eight years formal education earned an average of $14,500, compared to only $13,000 for white women with a college degree.

While more than 200 different studies have examined possible reasons for this difference, only 40 percent can be attributed to such factors as differences in years of education, work experience, skills, and absentee rates. And some—including Strober—believe even this figure probably is high.

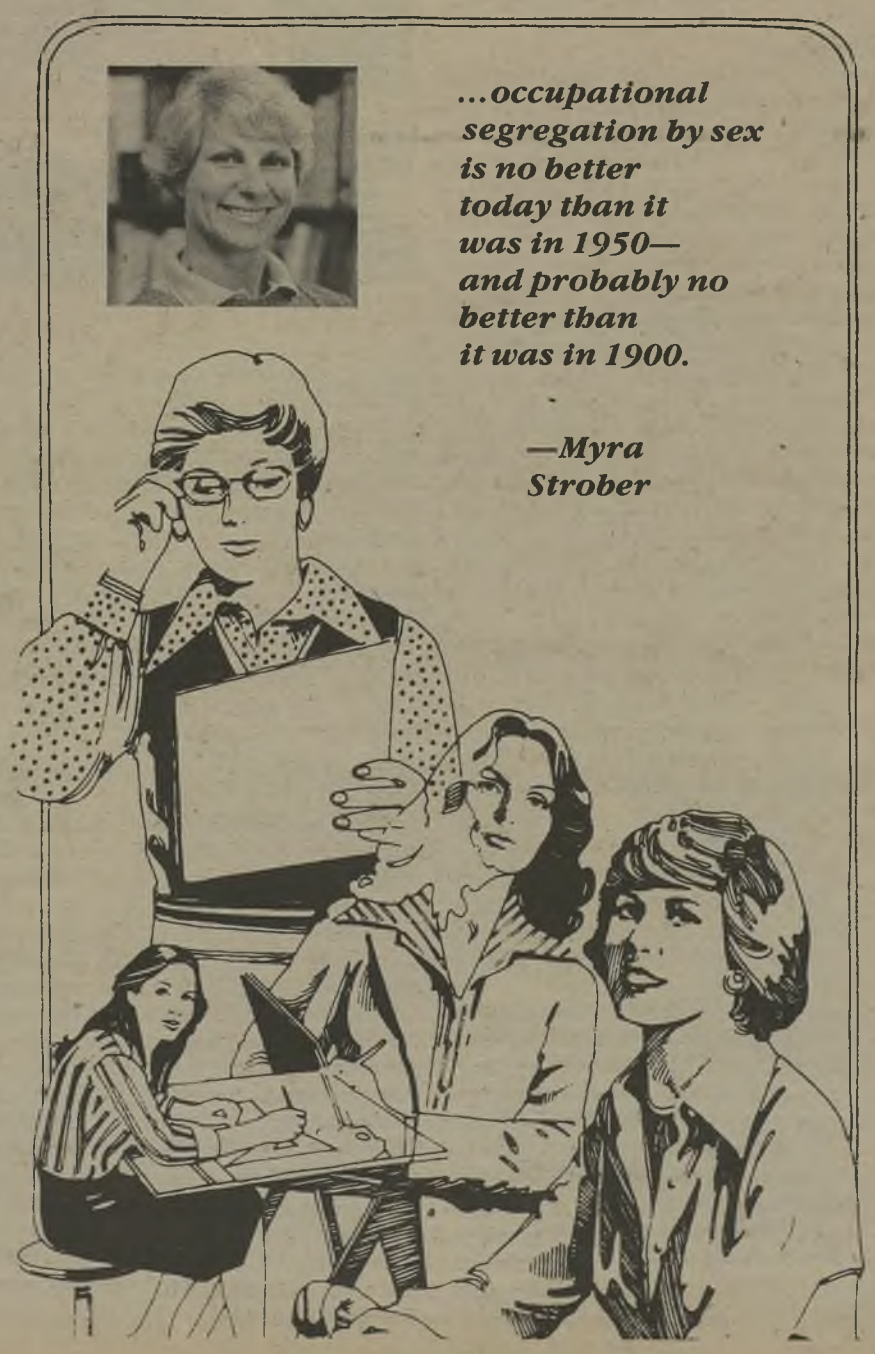
Whenever women have children, the impact on earnings is negative. But for men, having children tends to be positively correlated with earnings.

While the press highlights individuals moving across traditional occupational lines, statistics tell a different story, Strober notes.

Studies by June O'Neill of the Urban Institute show that the proportion of all employed women who worked in predominantly male occupations—defined as those with 60 percent or more men—rose from 9 percent in 1972 to 10 percent in 1978. The proportion of all employed men working in predominantly female occupations fell from 9 percent to 8 percent in the same period. Those working in "integrated" occupations (with no more than 60 percent of either sex) rose from 16 percent to 22 percent.

Detailed analysis often reveals greater segregation than aggregate data suggest, Strober observes. Where government statistics often lump crossing guards and bridge tenders together, for example, the first group is predominantly women, the second mainly men.

A National Academy of Sciences study by Heidi Hartman found that while 49 percent of all assmebler were women, in the auto industry the ratio was only 17 percent, while in electrical machinery it was 74 percent.



In a 1979 study of 400 business establishments, James Baron of the Stanford Graduate School of Business and William Bielby found that in half the firms examined, no men and women shared the same job title. The mean index of segregation by sex was .84 on a scale where 1.0 meant total segregation.

"The more carefully you look, the more segregation you find," Strober comments.

In a recent study of more than 5,000 students in 23 computer camps, Prof. Robert Hess of the Stanford School of Education found that about 75 percent of the students were boys, 25 percent girls. The proportion of boys was highest at the most expensive camps, suggesting parents were willing to spend more for them to acquire this skill.

Strober's views were discussed at a corporate seminar for management and personnel sponsored by CROW on campus June 29.

—Bob Beyers

...occupational segregation by sex is no better today than it was in 1950—and probably no better than it was in 1900.

—Myra Strober

Ad hoc committee to study University-Hoover relationship

Four Stanford trustees will consider how a proposed study of the relationships between the University and the Hoover Institution should be conducted.

The ad hoc group includes Board President William Kimball, Los Angeles attorney Warren Christopher, San Francisco attorney Frank "Sandy" Tatum, and Nancy Barry Munger, who also serves on the Hoover Board of Overseers.

Starting in mid-July, the group plans several meetings during the summer to recommend the composition and charge for a study committee to be created by the full board this fall.

Kimball favors broad representation on the study committee, including individuals from the University, the Hoover Institution, and outsiders not connected with Stanford.

The board authorized formation of the ad hoc group by Kimball at its June meeting.

On May 26, with a single dissenting voice, the Faculty Senate urged University President Donald Kennedy "to consult with the Board of Trustees with a view to appointing a committee in the near future to explore and reassess the relations between the Hoover Institution and the University, including governance and appointment procedures, with the goal of promoting more effective and cooperative relations."

Earlier, Kennedy and Kimball had agreed it would be "a good idea" for a visiting committee to study governance and appointment processes, indicating such a study would include both trustees and outsiders.

On May 27, Hoover Institution Director Glenn Campbell said the Board of Trustees is "the proper place to conduct any review of the relations between the Hoover Institution and Stanford University."

Earlier, Campbell pointed out that "many binding resolutions and agreements. . .have been entered into by the Stanford Board of Trustees, the Hoover family, and the Hoover Institution Board of Overseers, which have been scrupulously followed during the years I have been director of the Hoover Institution.

"This includes the appointment procedures that have been worked out over the years by the president of the University and the director of the Hoover Institution, based on the above resolutions and agreements."

A 1962 Board of Trustee resolution requires that the director of the Hoover Institution must be "previously approved" by the trustees of the Hoover Foundation, Inc., a New York corporation.

The present charter also specifies that the director "must be a man who reflects the purposes of the institution. He should be of an age which gives him a substantial period of service before the retirement age of 65."

The Hoover Institution operates as "an independent institution within the frame" of the University. Senior fellows, the highest ranking scholars at Hoover, are subject to review by the president of the University. Any appointments made jointly with Stanford's regular academic departments are subject to normal faculty review. Others are not.

The Faculty Senate action followed circulation of a petition signed by 84 faculty, of whom 76 were publicly identified, which called for "an immediate and independent inquiry" into the relationship between the Hoover Institution and the University.

Its preamble stated that "the existence of a partisan organization, whether liberal or conservative, within the University, raises grave questions concerning the academic independence, integrity, and national reputation of the University."

More than 131 faculty signed a counterpetition saying that an investigation of alleged partisanship by Hoover would be a "grave threat. . .to academic freedom."

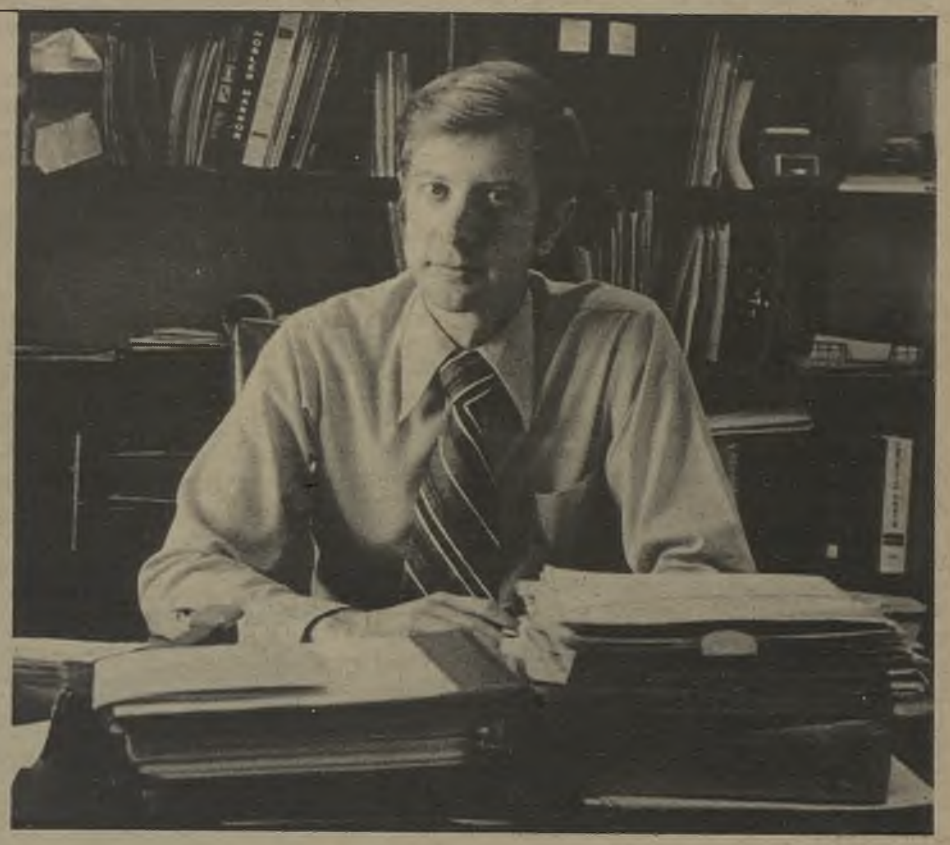
The Senate adopted a substitute motion with no preamble.

Hoover...

continued from page 1

The Reagan campaign collection includes 550 linear feet of material shelved in manuscript boxes. Collected over six weeks in December 1980 and January 1981, it was left with a letter of deposit at the Hoover Institution. Reagan retains ownership of the documents.

Palm and Tuthill initiated a search of the collection June 27 in response to a White House request. On July I, White House attorney Fred Fielding requested that copies of any documents found be sent directly to the Justice Department.



Palm flatly refuses to say whether the search so far has turned up any documents pertinent to what the press has dubbed "Debategate."

Any information about what's found, if anything, would properly come from the Department of Justice, he emphasizes. He noted that it is the Institution's policy not to release the originals of any reports to anyone, including the Justice Department. Copies would be sent.

Palm estimated that the Hoover Institution search now has covered about half the volume of the campaign collection—but not necessarily half the time needed for the full collection.

"Large parts of the records have not been processed," Palm explained. "The uncertainty of what's in the remaining boxes makes it difficult to predict how long the search will continue." Both he and Tuthill have been working long days and weekends since the search began. Palm fielded 38 media calls concerning the collection Monday.

Palm said there was no discussion at Tuesday's meeting with the FBI on a House subcommittee request for documents. Accordig to *The New York Times*, Fielding sent a letter to Rep. Donald Albosta, Michigan Democrat who heads the investigating group saying "The President has directed that representatives of the Department of Justice meet with you to work out procedures to provide you and your subcommittee with access to any such materials located in the Hoover Institution or elsewhere to assist you in your investigation while assuring the integrity of the Department of Justice investigation."

Charles Palm

Palm indicated that some training might be needed if an FBI team participated in the search "to insure the integrity of the files as the materials are searched."

How long would depend on who was sent, but "we'd probably work together smoothly in a day or two," he added.

"As professional archivists, we're well aware of the evidentiary nature of archival materials. We're trained to be aware of documents as potential legal evidence."

Carter plans private session with engineers

Former President Jimmy Carter will meet privately with Stanford President Donald Kennedy and several engineering faculty members Friday afternoon, July 15.

Participants will include Engineering Dean William Kays, Assistant Dean Anthony Macias; and Profs. James Meindl, electrical engineering, codirector of the Center for Integrated Systems; Warren Hausman, chairman of industrial engineering; Charles Kruger, chairman of mechanical engineering; and Robert Freelen, vice-president for public affairs.

According to Macias, the purpose of the meeting is to brief Carter about high technology engineering activity at Stanford, issues facing major research institutions in the U.S., and relations between higher education and business.

Carter plans to stop briefly in California en route to Japan, Macias said.

Stanford West...

continued from page 1

the exclusive use of Stanford West residents, the Council voted, and its use should be coordinated by the residents and the Palo Alto Recreational Department.

Robert Freelen, Stanford vice-president for public affairs, noted that the University staff already had agreed to recommend paying up to $2.1 million in traffic mitigations, to making 15 percent of the project available at below-market-rates, and to mitigating the impacts of the housing in numerous other ways.

"These latest conditions will give us serious pause. Some of them are basically land use control measures on our academic lands beyond the City's jurisdiction, and are unrelated to the housing itself."

"Those conditions, when coupled with the major costs already envisioned, give us serious reservations about the viability of the project as a whole."

Freelen noted that the zoning within the City along Willow Road calls for only a 25-foot setback. Stanford land use policies call for wide buffer areas, and the use of the Willow Road property for academic purposes. "However, there is a considerable difference, between a land use plan and a contract required by a city regarding lands outside its boundaries. A plan gives general direction or guidance, whereas a contract would eliminate future flexibility."

Stanford and Palo Alto signed an agreement in 1974 which set forth procedures to be followed in the development of Stanford's academic lands in the county, Freelen said. Those procedures gave Palo Alto greater opportunity to express its views to Santa Clara County about Stanford proposals through public hearings and City recommendations.

"We have adhered to the letter of that agreement, and have even gone beyond it," Freelen said. "The process already is in place which allows the City to express its preferences regarding our academic growth."

As to the use of the recreational field on the 46-acre site, Freelen said that the University preferred to have the future residents of the project determine how the field should be used.

Freelen said that the University would examine all the conditions for the project and formally reply to the City within the next few week.

Clare Bell helps engineer new robots, writes science fiction, works for IBM— then plays dulcimer and builds 'critters'

Writing a fantasy novel takes a special breed of imagination. But so does engineering a robot or earning a masters degree at Stanford. This year Clare Bell did all three.

Bell, 31, who received her masters in mechanical engineering at commencement this June, recently finished her work on a robot control device for quadriplegics. Bell studied for the degree while working full-time as an engineer at IBM. Her book, *Ratha's Creature,* (Atheneum) has already won a literary award, even though it has just been published.

Bell, who laughs easily and speaks softly, explained about each project. She talked about relating her writing and her engineering to a question facing us all: How will human society adjust to the fast and furious growth of technology?

For example, in *Ratha's Creature* Bell imagines the discovery of fire in a society of intelligent cats who, in her imagination, lived 25 million years ago. Ratha, the female cub who made the discovery, had to flee her clan's angry terror when she brought fire to them.

When she returned from a long banishment, the clan made Ratha its new leader. But the fire had changed the cats, empowering them either to destroy each other or to build a civilization different from what it had been.

"They gained the capability for greater heights and greater depths," said Bell. "They were no longer animals. . .and they could become much more evil or much more enlightened."

Ratha's story is a gentle treatment of the questions raised by technology's growth as society develops. But more than that, it is a fast-moving fantasy tale of battles among the cats, of hidden and revealed identities, and of Ratha's coming of age.

While Ratha's clan grappled with fire, Bell and her coworkers tinkered with machines that could make science fiction. For Bell's mechanical engineering project, they designed a mouthpiece whereby a quadriplegic might control a robot.

The device, called a "palatal splint," sends a dot or dash of Morse code to a computer as the user bites on either side of his mouth. The computer in turn commands the robot to perform simple tasks like helping a person drink from a cup.

The palatal splint suits non-vocal paralytics, for whom available voice recognition systems are useless, and who, said Bell, "need contact the most, because they have an active brain imprisoned in that body."

Bell gestured as she described the ultimate improvement of the device. She envisions a translator and transmitter entirely inside the mouth, so that a person could direct the robot with essentially invisible equipment.

Bell's writer's mind takes her beyond the engineering.

"One nice thing about being in the science fiction area and also being in the secular area is they are constantly cross-pollinating." She is considering a story based on the robot project.

"Suppose you gave a person one of these devices," said Bell, "and they learned how to use it. At first they were very, very depressed, wanting to die. . . . Then when they were given the robot the first thing they did was to pull out the plug on their respirator.

"I'm sure it's going to happen," she added. Bell is not morbid about these possibilities, but realistic.

"Technology demands. . .a lot of scrutiny. In the coming years, we're going to see. . .all sorts of incredible stuff. . .supercomputing machines. . .we can't even guess what it will be."

Bell's imagination produces more than books and inventions. She plays the dulcimer, does pen and ink drawings, and builds "critters," fanciful beasts of pipe cleaners and cloth. Her personal pet is a night-black winged horse with green eyes.

"People like them so much that they are always writing me letters begging me to make them one." She made one critter at the request of science fiction author Andre Norton, and enclosed a sample of her writing with the model. Norton saw promise in the writing and eventually helped get *Ratha's Creature* published.

The book recently won the Award for Writing for Young People given by an association called Poets, Essayists, and Novelists.

Bell's early writing efforts appeared in magazines which publish amateur science fiction based on the Star Trek characters. These "mediazines" have published two of Bell's novels about Captain Kirk and Mr. Spock. Bell hails the magazines as "good training ground for a writer."

She is now working on a sequel to *Ratha's Creature*, in which these gifted cats confront their lack of manipulative ability. Just as humans have trained horses to provide transport and dogs to track game with their sense of smell, the cats try to train lemurs to use their delicate hands for feline purposes. For the books, Bell chose the species of cat called *nimravus,,* an evolutionary ancestor of the sabertooth.

Bell, now an engineer and author, originally graduated with a double degree in biology and chemistry from the University of California at Santa Cruz. For two years she did research for the U.S. Geological Survey on a ship in San Francisco Bay, analyzing water samples and plankton populations.

Soon after, in a program called Women in Engineering, she trained as an electrical engineer and took a job at IBM. She spoke warmly of the "camaraderie" among the women in that program and of her treasured women friends. "They are the rocks when everything else is shifting."

Some of that appreciation came out in Bell's book.

"Ratha definitely had a dash of feminism in her," Bell said. In fact, "I had to go back over the manuscript and take out some polemical remarks."

Her stepfather also helped Bell to push the limits of her imagination and her technical training.

"I was lucky in having a family, especially my stepfather, who did not have any preconceptions of what women were able and not able to do."

What she has done is explore possibilities.

—Julie Kiser

Intelligent cats who discover fire 'gained the capability for greater heights and greater depths. 'They were no longer animals. . . and they could become much more evil or much more enlightened.'

—Clare Bell

Children's Hospital at Stanford has been given the Atari 5200 super system computer won in the Bay-to-Breakers race by the Accelepede, a 62-leg, 31-person burlesque of the Stanford Linear Accelerator. John Winston of SLAC and Rob Witthaus, in accelepede boxes, unwrap the gift with Children's Hospital patients Ellena Chukreeff and Diana Goodman. Accelepede organizer Ken Witthaus is at right rear.

Massy tells city council preservation of land endowment matter of principle

Following is a letter to Palo Alto Mayor Betsy Bechtel and members of the City Council from Vice-President William F. Massy:

As you have read in your staff report, the City and University staffs have reached tentative agreement on a comprehensive proposal regarding the Stanford West housing project. The proposal is the product of long hours of discussion during the past months, and must be reviewed and approved by the Council and the Board of Trustees. The final proposal is one that we think goes far toward meeting the expressed housing needs of both Stanford and Palo Alto.

Basically, the Stanford staff will recommend to our Board that we reduce the project by 175 units on the 46-acre site, provide 180 below-market-rate units, make the Mayfield School site available to the city for $100,000, and pay up to $2.1 million just to mitigate the traffic impacts cited in the EIR. Although we have reservations as to whether or not the impacts reported justify the expenditures requested, we recognize the need both for general traffic improvement in the Willow Road area as well as the overall desirability of reducing the local jobs-housing imbalance.

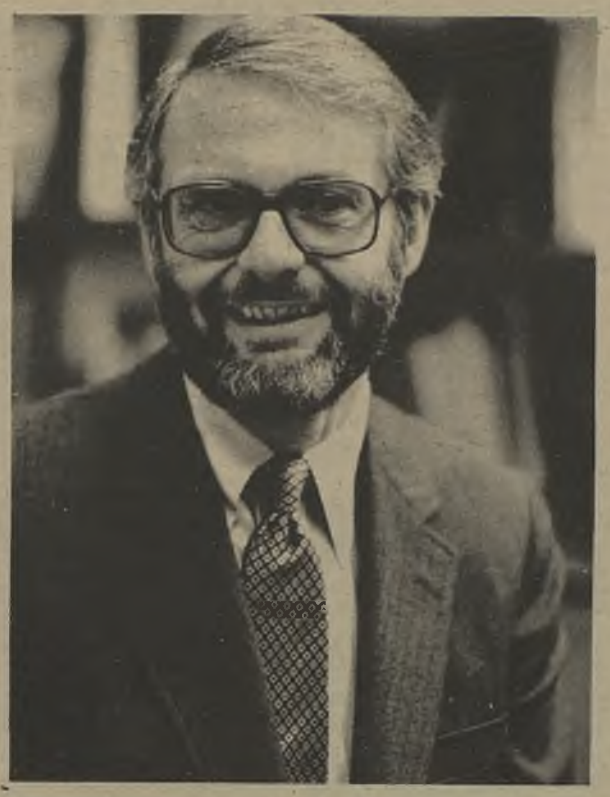
We estimate that the total extra costs incurred in the project will be in the range of $10 million, or the equivalent of nearly $10,000 per unit. If built as proposed, the BMR agreement would cost several million, (including the $3.5 million value of the Mayfield School site), and the traffic and transportation mitigations would add $2.1 million. The Environmental Impact Report alone has cost $700,000 to date. Various other mitigations will cost hundreds of thousands more. In addition to that, we are prepared to recommend that Stanford forego right-of-way costs in improving several road intersections in that area of the city.

These costs are in addition to the $880,000 expense of the recently extended Campus Drive to Junipero Serra Blvd; the proposed extension of Welch Road to meet Campus Drive (thereby diverting 5,000 cars a day from Willow Road); and the proposed extension of Willow Road to El Camino Real at a cost of $1.5 million.

This compares favorably, we think, with the City's plans to spend $235,000 on road improvements in an area of Palo Alto that returned $2.3 million in sales tax, property tax and net utility income to the City in 1980.

In short, we believe that Stanford has gone to unusual lengths to help create the housing that the City's Comprehensive Plan calls for so loudly; to meet the University's own internal housing and traffic needs; and to ease traffic problems elsewhere on University lands within Palo Alto.

We think, too, that the proposal is responsive to the concerns of our neighbors. Stanford West would cover only half the area that the zoning allows. It would leave three times more open space than required. It would be 34 percent less dense than permitted. And, it will be surrounded by setbacks far greater than those called for by City regulations.



We have agreed to provide a 65-foot by 100-foot recreational field on the site, in addition to the major central open space and "neighborhood" recreational areas throughout the project. The University may build additional recreational facilities to serve the west side of the campus, and they also would be available to Stanford residents of the housing. We also are willing to discuss the interim use of the Mayfield site as a convenient, interim recreational area for Palo Alto.

The two staffs were unable to agree on a number of issues, including suggestions that the University commit vacant lands to open space or guarantee the affordability of additional units, in exchange for approval of up to 1,275 units on the 46-acre site.

As I stated at the May 16 Council meeting, the preservation of our land endowment is a matter of principle to us. Even though there are areas that may never be used, and even though we anticipate little major growth in the foreseeable future on our academic reserve, we simply cannot forego the use of the property. Let there be no misunderstanding on this score: We would abandon the Stanford West housing before we would agree to trade our open lands for city approvals.

It should be noted that the lands that seem to be receiving the most attention—Stanford property south of the City limits between Pasteur Drive and the Golf Course, on the east side of Willow Road—are within our academic reserve. They also fall under "Area B" of the 1972—CS Zone agreement.

What that means is that, under Santa Clara County policy, only academic facilities of less than 5,000 square feet may be built there under the University's general use permit. Academic structures larger than that must receive a special use permit, allowing the City and the public greater opportunity to make their views known at the County level. If commercial growth is proposed—and none is even contemplated under our Land Use Plan—the land must be annexed to Palo Alto and development take place under City regulations.

We would abandon the Stanford West housing project before we would agree to trade our open land for city approvals. **—William F. Massy**

Perhaps it cannot be emphasized enough that the Stanford Land Use Policy views the University's vacant lands as an academic resource to be held for the future, rather than a financial resource. Our Land Use Plan—1980 reflects that in maps showing the lands beyond Pasteur Drive as part of the academic reserve, and not as potential income—producing property. Academic growth on the Stanford campus has been probably the slowest form of development in this entire area.

As adjacent cities have built up to our borders, two-thirds of our total holdings, or some 5,600 acres, remain open or lightly used. Stanford does not have the incentive to develop property as rapidly as other landowners. When we do develop for academic purposes, we almost invariably do so at low or medium density, with minimal traffic impacts. And when we develop commercially, it is under the full control of Palo Alto or Menlo Park.

There appears to be some concern in the community that tighter planning and stronger controls are needed on Stanford lands in the Willow Road area. Stanford has, and does, engage in sound and timely planning for the area, and proper controls already exist.

Our planning goes back to the days of Frederic Law Olmsted and to the creation of the first planning office on a college campus at Stanford in the early 1950s. Our 1980 Land Use Plan was drawn up in cooperation with Palo Alto, and we have worked with the City staff in a review of our General Use Permit with Santa Clara County. We agreed long ago to notify Palo Alto in advance of all major development on our lands community, and to give the City a stronger voice in proposed growth in three sensitive areas by way of special use permit hearings at the County.

Palo Alto understandably has an interest in Stanford's academic land uses, and we respect that through our adopted referral procedures. (Even though it can be strongly argued that our academic growth outside the City has little real impact upon the community as a whole).

In a very real sense, Palo Alto has the best of both worlds: considerable influence over Stanford's land uses in the County without the commensurate political or financial responsibilities. No other city in the County enjoys such a degree of control over adjacent unincorporated lands without agreeing to assume the costs of municipal services or capital improvements upon development of those areas.

Thus Santa Clara County is the controlling agency over our unincorporated lands, with Palo Alto playing an advisory role. We will continue to abide by—and often exceed—the County's requirements.

As to the question of affordability, 15 percent of Stanford West will meet the City's BMR requirements, with the potential for some 85 units beyond that on the Mayfield site. We expect that, overall, about half the project will be affordable to families in the County's 120 percent-150 percent income range. We are giving serious consideration to cooperative housing, which would open home ownership to many now priced out of the housing market.

I repeat another May 16 statement: The units at Stanford West are targeted to be affordable to a broad cross-section of Stanford staff and others, at market prices and rents, under economic conditions that are expected to prevail on average over the life of the project.

Those are significant concessions and goals for any developer. We are not prepared to go beyond them in guaranteeing another level of affordability—not because we are opposed to affordability, but because that would carry with it a requirement to administer the program over time that would be both costly and unwieldy. I spoke to that point at some length on May 16. In the final analysis, the subsidization of units also represents a drain on the University's academic resources in one form or another, much as mitigation costs add to the price of units.

Other points of disagreement had to do with the maintenance of prescribed levels of traffic service on or near Stanford lands, and with the formation of a joint area committee to review Stanford's academic land use proposals. While they may appear to be sound planning measures, we find both to be flawed.

In the first case, such a standard could mean that the merits of an academic project could be outweighed by short traffic delays at a nearby street intersection, or that unreasonable new costs could be incurred, or that the role of other activities in the area could be overlooked. In the second case, we will continue to notify neighboring jurisdictions of major developments on our lands, but we believe that yet another level of review by area governments and agencies would be burdensome and unnecessary.

We found, too, that we could not agree to a proposal to provide sheltered, lockable bicycle storage space on campus. The University has built 1,400 bike racks and 27 miles of bike paths in the past several years, and we will continue to build more. It would be financially and aesthetically costly to provide sheltered storage space on the campus for the many thousands of bicyles used by employees and students. We are presently planning a comprehensive review of our total campus circulation system, including Stanford West, with the intention of further improving and integrating the system. The needs of bicyclists will be carefully considered in that study.

Another, and perhaps the essential point in Stanford's view in reaching an agreement for this proposal, concerns the funding of transportation and traffic mitigations in the Willow Road corridor. This funding under the proposal is to cover the costs of all such work major or minor, not only for the Stanford West project but also for the Hospital Modernization Project, and the Willow Road Extension project. Should other costs be identified, under this proposal Stanford will not be asked to pay for them.

We believe that the payment of up to $2.1 million plus right-of-ways plus the cost of the Willow Road and Welch Road extensions is more than enough in view of the actual impacts of the three projects on many of the intersections scheduled for improvements.

Finally, we should all keep in mind that many of the details of this proposal still must be worked out between Stanford and Palo Alto. For example, since you received the staff report, we have already mentioned several areas requiring clarification to your staff. The BMR proposal in particular requires more specification, for example, in the definition of "affordability" or in the Mayfield School lease terms.

A list of the specific rights-of-way contemplated in the transportation mitigations has not been worked out. For example, Stanford will have objections if included is a right-of-way on Stanford land for the frontage road, or one which eats into parking at the Shopping Center for the left turn at Arboretum and Willow, or a free right-of-way for the judhandles. Nor can Stanford accept the changes for the Shopping Center entrance in Table 14 should the Willow Road extension not be approved. The extension is sought to relieve the flow of traffic through the Center. It would not make sense to aggravate that problem even more by making it easier for non-Center traffic to use the Center's parking lots as a major artery. These details and clarifications, however, can be worked out as we move forward.

Let me conclude on a positive note. Stanford West is a proposal that fits well within Palo Alto's policies and regulations. The housing that both the city and the university wants will be created. Commute traffic will be reduced. The taxes generated will pay for the additional services required. The major impacts of the housing will be alleviated. In general, I think we have the framework of a mutually-beneficial agreement.

We ask that you certify the EIR and recommend reasonable mitigation measures. We all may then move ahead on this important undertaking.

William Massy
Vice-President for Business and Finance

McKinnon says dollar overvalued 15 to 20 percent, urges monetary ease

The U.S. dollar remains overvalued by 15 to 20 percent, compared to the Japanese yen or German mark, says Stanford economist Ronald McKinnon.

"Recent criticism of the Federal Reserve Board for unduly rapid monetary expansion in late 1982 and early 1983 is unwarranted," he declares.

"Because of the worldwide economic depression, short-term monetary expansion in the U.S., with only nominal or below-trend monetary growth in Germany and Japan, is an appropriate strategy for realigning exchange rates," he declares.

"The huge U.S. fiscal deficit magnifies dollar overvaluation and harms American manufacturing, mining, and agriculture. The resulting trade deficit accentuates protectionist pressures in the U.S.

"Indeed, the open U.S. economy may now be 'anti-Keynesian,' with broad cuts in government spending and increases in permanent tax revenue likely to increase output and employment."

Need to avoid depression

The overvalued dollar is "a signal of unusually strong demand for money in the U.S., where extraordinary monetary expansion is necessary to avoid depression," he observes.

McKinnon's ideas have been read and discussed by high officials in the central banks of the U.S., Germany, and Japan. In a campus interview July 6, he warned that currency expansion by other countries has proceeded more rapidly than the U.S.

"This means the exchange rate won't get corrected. If continued, it may lead to excessive expansion in the world system," he said.

While Japan has held expansion of its money supply below six percent in the past year, Germany has expanded about 12 percent and Britain about 14 percent, compared to 10 percent for the U.S.

Pressure is now mounting for the Federal Reserve Board to tighten the money supply, a move McKinnon opposes. The best way for the overvaluation of the dollar to be corrected is for the U.S. to continue to expand its money supply while Germany and Japan show restraint.

In return for short-term monetary expansion and reduced interest rates in the U.S., the Bank of Japan should stop suppressing interest rates in the Tokyo capital market, McKinnon believes.

"Because of its extraordinarily high rate of domestic saving, Japan is a natural creditor country. Rationalizing the role of the Tokyo capital market is necessary for long-run stability of the world financial system.

"Liberalizing exchange controls by 1980 was the first welcome step. Freeing Japanese interest rates is equally important to avoid regression to more lending restrictions."

Massive federal deficits

Massive federal deficits literally force the U.S. economy to rely on the savings of other nations. The U.S. must put its fiscal house in order to correct its trade deficit and prevent a severe outbreak of protectionism.

"Surplus Japanese saving would then be freed to provide yen-denominated finance for the Third World—a more appropriate role for Japan as an international creditor," McKinnon says.

Even with a more expansionist monetary policy, the large U.S. fiscal deficit will continue to depress the American economy. The real dollar exchange rate could not be fully realigned to restore American industrial competitiveness with the rest of the world.

A large trade deficit and protectionist pressures in Congress are the inevitable consequence, a foretaste of which has already been felt in steel, autos, motorcycles, and machine tools.

Worldwide slump lingers

"The current worldwide slump shows little sign of abating," McKinnon notes. "In Japan, the wholesale price index has actually fallen over the past year. In Germany, price inflation has abated, but unemployment is at an all-time high, above eight percent.

"However, American authorities don't seem to realize that continuation of the worldwide slump may provoke the Bundesbank or Bank of Japan into a unilateral monetary expansion." This would accentuate the depression in U.S. tradeable goods industries and provoke even stronger protectionism.

Ronald McKinnon

"The only acceptable way out is for a sharp monetary expansion in the U.S., not matched by equivalent expansions in Germany and Japan. Otherwise, if all three expand simultaneously, there is a long-run inflationary danger—and, of course, dollar overvaluation would not be corrected," he concludes.

McKinnon's views were developed in discussion papers for the Center for Economic Policy Research at Stanford and are slated for publication by the Brookings Institution and in the Keiza seminar papers in Japan. He currently is a visiting professor at the Hoover Institution.

Bunzel backs equal opportunity, opposes racial quotas

John H. Bunzel, one of three nominees to the U.S. Civil Rights Commission, strongly backed equal opportunity but opposed racial quotas in testimony prepared for delivery in Washington, D.C. Wednesday, July 13.

A senior research fellow at Stanford's Hoover Institution, his views were developed in a statement for the U.S. Senate Committee on the Judiciary.

"My long-standing commitment to civil rights is rooted in the firm belief that equality of access and opportunity rather than of condition and result should be the defining principle of our quest for equality and freedom," he said.

I believe in providing special training and advice so that they can perform better on the job.

—John Bunzel

Former president of San Jose State University, Bunzel said: "I do not believe the way to eradicate racism in this country is for the government to encourage, much less compel, individuals to treat some people better than they treat others because of race. . . .

"The way to get beyond racism is to get beyond it today, not tomorrow—and we do that by opposing all practices which give persons any advantage, or impose on them any disadvantage, because of anything extraneous to their own skills, abilities, achievements, and promise—in a word, their own merits."

As an undergraduate at Princeton, Bunzel opposed the "quota mentality" in admissions, criticized "insidious anti-semitism on campus," and sought to recruit qualified blacks as students, he said.

"I continue to support not only equal justice under the law but equal enfranchisement, equal respect for all individuals, equal access to education on a nondiscriminatory basis, equal opportunity for individuals to compete for the rewards of excellence. . . . These values and principles are central to our liberal democracy, very much worth fighting for, very much worth conserving.

"But. . .I do not believe that race should be the predominant basis on which status is determined, individual worth assigned, entitlements settled, or legal rights measured.

"I am opposed to racial quotas, or their functional equivalents, because they are self-contradictory when they are used as a means to end discrimination.

"I have not forgotten the long struggle to resist and overcome quota systems which once kept people from advancement because of their race or religion. Those who assume that quotas can be involved in a good cause—that is, to overcome discrimination—fail to see that bad means cannot assure us of good ends. I have never accepted the notion that we should overcome discrimination against some by discriminating against others."

Bunzel favors affirmative action "when it calls for setting up special programs for women and minorities so they can be given every chance to have equal opportunities in employment and education. So do the people of this country.

"I believe in providing special training and advice so that they can perform better on the job. Along with most Americans, I have consistently favored special-aid programs that enable disadvantaged minorities to increase their skills and opportunities, and thereby catch up to the standards of competition set by the large society."

John Bunzel

On the other hand, he noted, "I do not favor affirmative action when it becomes, in practice, a policy of racially preferential hiring in the name of a newly defined equality that requires the distribution of jobs in some arithmetic proportion among the groups composing society."

'You abused student-professor relationship'

Wessells: Mosher's behavior unethical for lengthy period

Following is Dean Norman K. Wessells letter to Steven W. Mosher July 1, 1983 accepting the committee's report and recommendations:

On April 25, 1983 I received a grievance from you concerning your dismissal from the Ph.D. program of the Anthropology Department at Stanford University. After considering the content of your grievance I set up a Grievance Committee composed of Emeritus Professor of Psychology Ernest R. Hilgard, Emeritus Professor of History Gordon Wright, and Professor of Anthropology at the University of Pennsylvania, Ward H. Goodenough.

All three persons enjoy great distinction in their respective disciplines, have widely held reputations of fairness and independence of mind, and have had ample experience at Ph.D. graduate training. Mr. Goodenough brought to the Grievance Committee special expertise in anthropology, especially with respect to the ethics of conducting field research, the ethical standards of the anthropology profession, and the norms of behavior between student and faculty preceptors in the profession of anthropology.

None of the three Grievance Committee officers have had professional interests in the People's Republic of China or its citizens, and none have had special relationships with the Anthropology Department at Stanford or with you.

My charge to the Grievance Committee was intentionally broad:

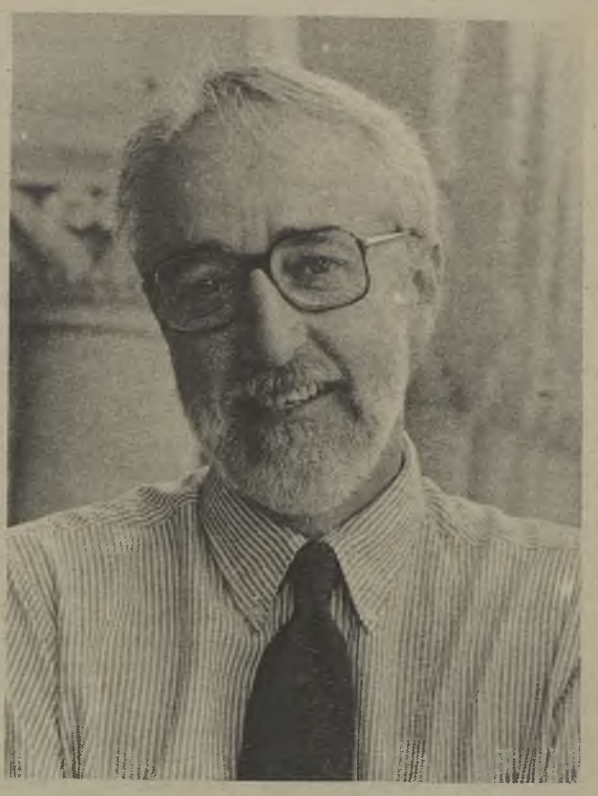
The charge: I request that you review the case thoroughly and provide me with a report of your review, your recommended findings, and the way you recommend that I rule.

I desired that the Grievance Committee should investigate the full case since your grievance and the public accusations you have made about the Anthropology Department and its faculty raise deep questions of propriety that go well beyond the grievance per se, and ones that I as Dean would be obliged to address, if they proved true.

The Grievance Committee worked on the case during the months of May and June 1983. They requested that you meet with them at Stanford. You declined the invitation to travel at Stanford's expense to the campus in order to do so. The Grievance Committee has now completed its work and has reported to me both verbally and in writing. A copy of their report is enclosed.

With respect to my actions in your case, I have studied the Grievance Committee report, the report of the Investigative Committee of the Anthropology Department, and correspondence between you and the Department, the Grievance Committee, and myself. After considering all aspects of the case that have come to my attention, I make the following decisions.

I regret to inform you that I must deny the grievance that you have filed with me. I accept the unanimous recommendation of the Grievance Committee and find that the action of the faculty of the Anthropology Department of Stanford University was both proper and in conformance with standards of professional behavior expected of groups and members of the learned professions.



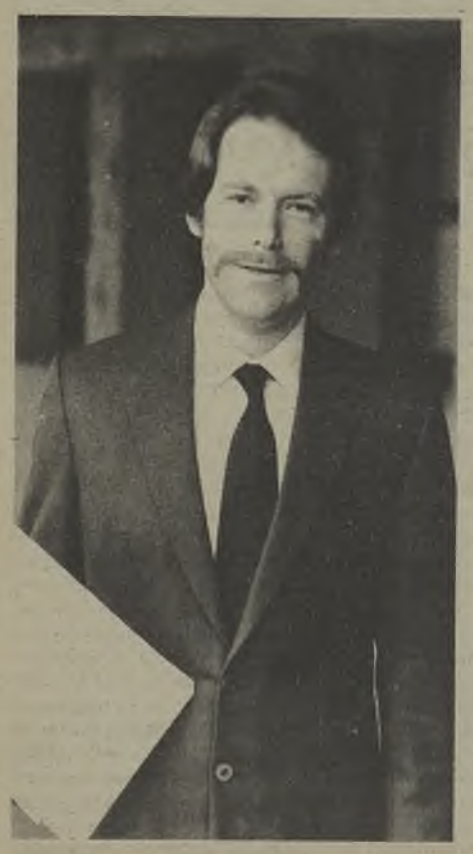
As indicated in the Grievance Committee report, there are several reasons other than purely academic ones why students may be terminated in their studies toward a graduate degree or from a university. Though most often applied in professional schools such as medicine or law, standards of ethical professional conduct apply equally well to all learned disciplines in humanities, social sciences, and natural sciences. The faculties of departments in those disciplines have no lesser obligations than their colleagues in medicine and law with respect to unwritten implications about an individual that accrue when a degree such as the Doctor of Philosophy is awarded.

I agree with the Investigative Committee, the faculty of the Department of Anthropology, and the Grievance Committee that the pattern of your behavior over a lengthy period of time, involving diverse actions and separate incidents, is inconsistent with standards of ethical conduct appropriate for a person entering the profession of anthropology. Furthermore, I find that you abuse the student-professor relationship in such an egregious manner that it was fully reasonable for faculty persons in Stanford's Anthropology Department to decline to serve as your major professor or as members of your thesis committee.

If you desire to pursue the matter of your dismissal from the Department of Anthropology further, then your next recourse is to appeal to the Dean of Graduate Studies, Gerald J. Lieberman.

You will recall that my charge asked the Grievance Committee, if possible, to prepare a report that could be released to the public. They have done so and have certified that their report may be released without doing harm to innocent parties, but they have also asserted that the report of the Investigative Committee of the Anthropology Department should continue to be treated as a confidential document that should not be released.

Since you have placed your case in the public arena, since you have called for public release of documents justifying the Anthropology Department's action, and since you have publicly raised issues that question the intengrity of that Department's faculty, it is appropriate that this letter and the Grievance Committee report should be made public. I will not release it until sufficient time has elapsed that you may be expected to have received both documents.



Norman Wessells

In closing, I regret the impact of your actions in the People's Republic of China on your academic career. It is conceivable to me that the suggestions made in the last paragraph of the Grievance Committee report, coupled to changed behavior on your part, might provide a route to continue your academic career.

I urge you to consider carefully the wonderful, private rewards of a life in scholarship and the many years of satisfying work that would lie ahead of you if you can reestablish yourself as worthy of deserving the credential of Doctor of Philosophy in Anthropology.

Norman K. Wessells
Dean

Mosher declined to appear before grievance committee at Stanford expense

Stephen Mosher

continued from page 1

Mosher was invited to appear in person before the grievance committee, travelling from Taiwan to Stanford and return at University expense, but declined to do so.

Agreeing with the investigating committee, the anthropology faculty, and the grievance committee, Wessells wrote Mosher July 1 that "the pattern of your behavior over a lengthy period of time, involving diverse actions and separate incidents, is inconsistent with standards of ethical behavior appropriate for a person entering the profession of anthropology. . . .

"You abused the student-professor relationship in such an egregious manner that it was fully reasonable for faculty. . .to decline to serve as your major professor or as members of your thesis committee."

Mosher currently is in Taiwan. He may appeal to Vice Provost Gerald J. Lieberman, dean of graduate studies, and to University President Donald Kennedy.

The grievance committee's 14-page report to Wessells noted that "termination of Mr. Mosher's candidacy does not mean that he has been 'expelled' from Stanford, as the press has repeatedly put it. He is free to apply to another university or another department at Stanford.

"His graduate credits for course work and residence are valid. There is ample evidence of Mr. Mosher's talent and energy. Completion of the doctorate under other auspices could enable Mr. Mosher to salvage his graduate education and to find a place in the academic community."

Wessells wrote Mosher it was "conceivable" that "changed behavior on your part might provide a route to continue your academic career.

"I urge you to consider carefully the wonderful, private rewards of a life in scholarship and the many years of satisfying work that would lie ahead of you if you can reestablish yourself as worthy of deserving the credential of doctor of philosophy in anthropology."

Responding to procedural issues raised by Mosher in his grievance, Wessells said that "though most often applied in professional schools such as medicine or law, standards of ethical professional conduct apply equally well to all learned disciplines in humanities, social sciences, and natural sciences.

"The faculties of departments in those disciplines have no lesser obligations than their colleagues in medicine and law with respect to unwritten implications about an individual that accrue when a degree such as the Doctor of Philosophy is awarded."

Contrary to Mosher's claims, the grievance committee noted that University officials had informed the Anthropology Department that "questions of professional conduct and ethics belong properly within the province of the department of school concerned.

"(The officials) cited precedents, notably in the professional schools, where degree candidates have been terminated, after due investigation, on the ground that (they) ought not to be certified for the profession in question."

Mosher's charge that the department's procedures lack legitimacy because they were ad hoc and without precedent is "not justifiable," the scholars said. "The procedures adopted were exemplary."

They noted that the investigating committee "decided that Mr. Mosher's article on birth control, published in a popular Taiwan weekly, while evidence of injudicious behavior, was within his rights and therefore was not a basis for action.

"Mr. Mosher was granted several extensions of time, at his request, to enable him to provide satisfactory answers to the allegations against him. In the end, he failed to provide satisfactory answers, and fell back on blanket denials of all charges."

"He eventually accused the Ad Hoc Investigative Committee of undue delay in arriving at a decision, although a major cause of the delay had been his own requests for more time.

Unanimous report from Grievance Committee

Faculty termination of Mosher as Ph.D. was 'justified'

Following is the June 18, 1983 report of the Grievance Committee in the case of Steven W. Mosher.

On May 17, 1983 the undersigned were appointed by Norman K. Wessells, Dean of Humanities and Sciences, Stanford University, as a Grievance Committee in the case of Steven W. Mosher. The charge read as follows: "I request that you review the case thoroughly and provide me with a report of your review, your recommended findings, and the way you recommend that I rule." The letter of appointment referred further to the official Guidelines for Student Academic Grievance Procedures, which contain the following relevant passage:

The review of a grievance and-or appeal undertaken by grievance officer(s) normally shall be limited to the following considerations: a) Were the proper facts and criteria brought to bear on the decision (or, conversely, were improper or extraneous criteria brought to bear on the decision)? b) Were there any procedural irregularities that substantially affected the outcome? c) Given proper facts, criteria, and procedure, was the decision one which a person in the position of the decision-maker might reasonably have made?

It is clear from the charge and the guidelines that it was not our function to "retry" the case or to seek out additional evidence, but to weigh as objectively as possible the facts that were considered by the Department of Anthropology in the Mosher case, the procedures that were used, and the decision that was reached.

The charge to the Grievance Committee was, however, considerably broader in scope than the complaints contained in Mr. Mosher's formal statement of grievance against Stanford University. That statement focused primarily on issues of jurisdiction and procedure, but added as a kind of afterthought the complaint that University officials engaged in "libel and slander" in a press release dated March 7, 1983.

In this latter regard we note that the press release in question was a response to Mr. Mosher's statements during what he called a "press conference" on February 24, and was not made until the Department had acted on the findings of the Investigative Committee.

Since that time the press has carried a number of "revelations" and alleged leaks emanating from Mr. Mosher, from members of the Department of Anthropology, and perhaps from unidentified sources. These accounts, all of them subsequent to the Department's action terminating the Mosher candidacy, do not fall within our province.

Procedures followed by the grievance committee

Ward Goodenough

All of us have read the report of the Ad Hoc Investigative Committee of the Department of Anthropology, with its appendices, upon which the Department's vote to terminate Mr. Mosher's candidacy was based. Two of us (Hilgard and Wright) have read through the voluminous files of that Committee. The same two of us have interviewed a number of Department members and University officials who were, in one capacity or another, involved in the case.

The third member of the Grievance Committee (Goodenough), being an anthropologist, has avoided having any contact with members of the Anthropology Department at Stanford University during the review period.

We asked the Dean of Humanities and Sciences to invite Mr. Mosher to return from Taiwan at University expense to clarify certain aspects of the case and to justify his grievance in person. Mr. Mosher declined this invitation. While Prof. Goodenough was in Hawaii, the two of us on campus consulted with him by telephone or letter and exchanged judgments.

The full Committee met at Stanford University on June 27-28, 1983 for additional face-to-face discussion and to arrive at the conclusions embodied in this report.

It may be proper to add that none of us has been personally or professionally involved in the case before our appointment to the Grievance Committee. We have not met Mr. Mosher, and what little we knew of the case prior to our appointment was only what we had read in the public press, which did not enter our deliberations. None of us has been or is presently engaged in China studies. These disclaimers of course do not guarantee that our judgments will be olympian in their fairness and objectivity. But we believe that we began our task without bias or vested interests, and we have tried to maintain that stance.

Were the procedures followed by Stanford University appropriate?

Since Mr. Mosher's grievance addressed to the Dean of the School of Humanities and Sciences, received April 25, 1983, concentrates heavily on the jurisdictional issue, we are forced to deal with it in some detail.

Mr. Mosher asserts that in September 1981 "the Stanford administration" investigated charges that he had violated the Fundamental Standard and cleared him of such charges, leaving it up to the Department of Anthropology to decide whether or not to conduct its own investigation based on questions about Mr. Mosher's professional conduct. The administration's action, according to Mr. Mosher's grievance, was "erroneous," and led to "an unwarranted investigation, for which there is no provision under Stanford University procedures," and which "violated the University's own regulations."

Ernest Hilgard

Contrary to Mr. Mosher's assertion, it is clear that University officials did not investigate the charges against Mr. Mosher and did not "clear" him of violations of the Fundamental Standard. When the Department of Anthropology reported to the President's office that it had been informed of allegations against Mr. Mosher and wished them investigated in accordance with established procedures, the University's legal officers ruled that the Fundamental Standard did not apply to cases of misconduct committed off campus; they did not "investigate" the charges or "clear" Mr. Mosher.

They informed the Department of Anthropology that questions of professional conduct and ethics belong properly within the province of the department or school concerned. They cited precedents (notably in the professional schools) where degree candidates have been terminated, after due investigation, on the ground that said candidates ought not to be certified for the profession in question.

Since the charges against Mr. Mosher stemmed from his conduct as an anthropologist during field research in China, the legal officers held that the case fell within the jurisdiction of the Department of Anthropology. With considerable reluctance, the Department then proceeded to name an Ad Hoc Committee to investigate and recommend action.

Mr. Mosher's grievance asserts that the administrative decision was in error, since it permitted "a faculty already prejudiced against him to conduct an unwarranted investigation, for which there is no provision under Stanford University procedures." Furthermore, he holds that the action "violated Stanford University's own regulations" and that "the only grounds specified for faculty action leading to dismissal during candidacy are failure to make adequate academic progress."

As to the charge of faculty prejudice, we note that the members of the Ad Hoc investigating committee were persons who were not in a supervisory relationship with Mr. Mosher, had no interests of their own in China, and included a member of the faculty of the School of Law. It is clear that the Department was concerned to create a committee that would confront the allegations without bias.

As to the problem of precedent, we recognize that the University has not spelled out in detail the procedures to be used when degree candidates are charged with violations of professional ethics. This gap stands in contrast to the University's regulations on violations of the Fundamental Standard, and on procedures for initiating and considering academic grievances; in both of those areas, procedures are indeed spelled out fully.

If the University were governed solely by statutory law, the absence of specific rules on matters of professional ethics would not doubt support Mr. Mosher's grievance on this point. But common sense and precedent suggest that in some areas, something like the common law prevails.

As noted, a number of degree candidates have been terminated at Stanford (notably in the School of Medicine) because their conduct in clinical situations indicates that they ought not to be certified for practice, even though their academic records were satisfactory. It seems reasonable to believe that similar considerations apply in a number of fields within the jurisdiction of the professional School and the Departments of Humanities and Sciences: for example, the law student accused of professional misconduct during a summer internship in a law firm; the aspiring clinical psychologist who abuses his relationship with patients; the candidate in the Department of Communications who violates the confidence of informants.

The charge by Mr. Mosher that the Department's procedures lack legitimacy because they were ad hoc and without precedent is not justifiable. The procedures adopted were examplary.

On what grounds does a department have the right to drop a graduate student from its Ph.D. program?

Citing page 49 of the *Stanford University Bulletin: Information 1983*, Mr. Mosher argues that a graduate student may be terminated only for academic reasons. What he cites are the stated procedures for terminating a graduate student at the candidacy level *for such reasons.*

Clearly, Stanford University and its schools and departments may terminate students for other than failure to make satisfactory academic progress. Violations of the Fundamental Standard constitute other than academic progress. Violations of the Fundamental Standard constitute other than academic reasons. They have to do with conduct bearing on membership in the on-campus University community.

Gordon Wright

Violations of the ethical standards of conduct relating to the particular professions or scholarly and scientific disciplines for which students are in training also constitute grounds for termination. Such violations are referred to the professional schools and departmental faculties for appropriate action.

In scholarly disciplines such as anthropology, these ethical standards have to do with several things. First, they have to do with the integrity of scholarly and scientific work and an individual's conduct in his dealings with others that affect his peers' confidence in that integrity. Secondly, where research or practice involves human subjects or working with human communities these standards pertain to the treatment of those subjects and communities in a manner consistent with the respect to which fellow humans are entitled. Thirdly, they concern dealing with funding or other sponsoring agencies and also with governmental authorities in the research locales in a way that does not bring one's profession or discipline into disrepute among those agencies or authorities. And fourthly, they require truthful representation of one's research objectives or professional capabilities to sponsors or clients. For anthropologists, moreover, the American Anthropological Association's Committee on Ethics has made it clear that an anthropologist has an obligation not to publish or disseminate information that can jeopardize the welfare of people he has studied.

In these matters, honest or unwitting mistakes can be made and can be forgiven. In a discipline such as anthropology, the field researcher can easily find himself presented with many problems and dilemmas touching on ethical conduct. A graduate student doing field research must consult with his supervisors about these problems and be entirely candid with them in regard to any questions that arise.

What is importantly at issue, here, is the relationship of trust that must obtain between teachers and students. If trust is destroyed, the relationship cannot continue. Serious mistakes can be made without the relationship of trust being undone. Much depends on the extent to which questionable acts are indicative of a style of conduct that is incompatible with the ethical requirements of research or professional practice, such as duplicity or evasiveness in dealing with others. It may be in relation to data, it may be in relation to sponsors and funding agencies, and it may be in relation to supervising faculty or scholarly and scientific colleagues.

If evidence of such conduct is met by an accusing and antagonistic attitude toward teachers who are seeking for an accounting, the relation of trust between teacher and student is liable to be destroyed. In the latter event, there is no choice

continued on next page

Mosher text. . .

continued from page 11

but to terminate the student.

A department has considerable discretion in regard both to its admissions standards and its degree qualifications (including "internships" or "field work"), and it retains the same discretion in dismissing a student on grounds that are related to the department's program and purposes, as long as they are not invidiously discriminatory against an individual. Within this area of discretion, there are considerations other than academic achievement as narrowly defined by grades and written reports of research.

Was the investigative committee fair in its dealings with Mr. Mosher? Were its procedures such as to give Mr. Mosher every reasonable opportunity to clear himself of the allegations against him?

We find no evidence of unfairness of impropriety in the Investigative Committee's handling of the case. The Committee exercised unusual care and diligence in pursuing evidence for and against the allegations of misconduct. Some witnesses were unwilling to testify, or refused to allow their testimony to be shared with Mr. Mosher; but the Committee clearly did its best to persuade all parties to speak.

From the outset, the Committee decided to consider no evidence that could not be shown to Mr. Mosher, and toward the end of its work it destroyed all such evidence that had accumulated in its files. (The destroyed evidence consisted of testimony by witnesses who were not willing to share that testimony with Mr. Mosher.) Destruction of the evidence was carried out because Mr. Mosher himself insisted that it be destroyed, and because University legal officers advised the Committee to meet Mr. Mosher's wishes on this point.

The Committee also ruled out as irrelevant the charge that Mr. Mosher's conduct led the Chinese government to restrict access to China by western social science researchers. Furthermore, it decided that Mr. Mosher's article on birth control (published in a Taiwan popular weekly) while evidence of injudicious behavior, was within his rights, and, therefore, was not a basis for action.

Mr. Mosher was granted several extensions of time (at his request) to enable him to provide satisfactory answers to the allegations against him. In the end he failed to provide satisfactory answers, and fell back on blanket denials of all charges.

He eventually accused the Ad Hoc Investigative Committee of undue delay in arriving at a decision, although a major cause of the delay had been his own requests for more time. Mr. Mosher was invited to come to Stanford from Taiwan, at the University's expense, to present his case. He did so twice—once to appear before the Investigating Committee and once to be heard by the faculty of the Department of Anthropology.

We conclude, therefore, that the Investigative Committee's procedures were fair and thorough, and that he was given every reasonable opportunity to clear himself.

Were the investigative committee's findings reasonably arrived at and consistent with the evidence presented?

The findings appear to us to have been reasonably arrived at. The Investigative Committee decided that since it was not engaged in a criminal proceeding but in one to determine a student's status as a degree candidate, the appropriate standard of proof would be "strongly persuasive evidence" rather than "proof beyond a reasonable doubt." We regard this decision as proper.

By that standard, there were adequate grounds for the Investigative Committee's conclusions that certain allegations against Mr. Mosher were supported by sufficient evidence to make a case against him—allegations that Mr. Mosher could easily have refuted if they had been without merit.

Mr. Mosher did not refute them other than to make a blanket denial without supporting evidence, to claim that his former wife was being vindictive and was therefore not to be believed, and that some other witnesses were politically motivated. Indeed, in the course of the investigation Mr. Mosher increasingly impaired his own credibility by the way in which he dealt with the Investigative Committee. We find nothing in the record to justify setting aside the Committee's findings, or to support Mr. Mosher's contention that those findings were politically motivated.

Was the department justified in deciding to keep the report of the ad hoc investigative committee confidential?

By the accepted ethical standards of anthropology, it is improper to publish information that may jeopardize the welfare of people under study or betray their confidences. In the judgment of the Grievance Committee, the report of the Investigative Committee should remain confidential.

In this we note that confidentiality in no way has violated due process or Mr. Mosher's rights, since he had possession of the report and has had access to all of the evidence on which the report and the Department's decisions were based. We recognize the interest of the anthropological community and the wider public in full disclosure of the facts of the case, and regret that such disclosure is inadvisable for ethical considerations relating to the welfare of other parties.

Were the Investigative Committe's recommendation of termination (rather than censure) and the Department's subsequent unanimous vote for termination justifiable within the framework of the Investigative Committee's findings?

This issue commands the attention of the Grievance Committee for the reason that the Investigating Committee's report concludes with a resume of its findings and with a recommendation for termination without discussion of how the specific findings relate to that recommendation. The report, in effect, treats the basis for its recommendation as self evident in light of its findings.

The relation of findings to the recommendation can be considered from several points of view. Are violations of the law of the host country and disregard of its instructions regarding travel grounds for a recommendation of termination? Violation of law by a student need not in itself be regarded as grounds for termination. The nature of the violation, its cicumstances, and what these imply for the student's continuing ability to function as a member of the academic community in which he has been a student—these are relevant considerations. In short, as indicated earlier in this report, what matters is the extent to which the actions and the circumstances in which they occurred represent a violation of the trust accorded the student by his faculty supervisors and by his institutional sponsors.

The Investigative Committee's findings, taken all together, do not reveal merely honest mistakes or ill-considered actions. Rather they reveal a pattern of dealings that involved deliberate disregard for the law of the host country and the instructions of its officials, a deliberate disregard of the requests of the funding agency regarding dealings with officials in the host country, a manipulative approach toward the people with whom we was living and working, a serious lack of candor in his dealings with his supervising professors and with the representative of the U.S. Committee on Scholarly Communication with the People's Republic of China, and a continuing lack of candor in his dealings with the Investigative Committee. The pattern as a whole, as it unfolded through the course of the investigation, progressively eroded any possibility for a relation of trust between Mr. Mosher and the faculty of Anthropology at Stanford University.

For this reason, the Investigative Committee was justified in recommending termination of his status as a degree candidate in Anthropology, and the Department of Anthropology was justified in voting for such termination.

Recommendation

In light of our finding that the Ad Hoc Investigative Committee was justified in recommending termination and the Department of Anthropology was justified in voting for termination, we see no reason for reversing that recommendation and decision. We recommend, therefore, that the Department's actions be upheld.

We would like to add, however, the observation that termination of Mr. Mosher's candidacy does not mean that he has been "expelled" from Stanford, as the press has repeatedly put it. He is free to apply to another university or to another department at Stanford. His graduate credits for course work and residence are valid. There is ample evidence of Mr. Mosher's talent and energy. Completion of the doctorate under other auspices could enable Mr. Mosher to salvage his graduate education and to find a place in the academic community.

aspects, in systems, in how people interact, in how an illness impacted on all members of a family.

"I found myself more interested in the effects of illness, rather than its treatment—which seemed fairly straightforward. English was such a remarkably fine teacher that I read everything I could about pyschoanalytic theory. Novelists and poets taught me more about being human than my medical text ."

He became an intern at Southern Pacific Hospital in San Francisco, where he was able to continue his close interest in psychomatic medicine. "It was a wonderful place for a young man to have his internship. We served the men working railroad, and we were called on to help with every sort of malady you can think of.

"When the time came for my medical residency there I became exposed to what was then the beginning of technological medicine. I was not very interested in laboratory work nor in much chemistry, which I saw as a sort of scientification of what was really an art."

Just before internship he had married Shirley McFarland of San Francisco, and this influenced him to accept the offer of a residency in psychiatry at Stanford, which he joined in 1959.

The department of psychiatry was at that time being run by Tom Gonda as acting chair; today he is chairman. "We were waiting for the new chair, Dave Hamburg. We had a number of very exciting teachers. Among those who had a big influence on me were Gregory Bateson, Don Jackson, and Eric Berne (who started transactional analysis)."

When Hamburg arrived D'Andrea was asked to become chief resident, a post he held for a year, and then he became an instructor.

In 1963 he became chief psychiatrist at the Peace Corps training center in Hawaii, which trained recruits for service in Southeast Asia. He assisted psychologists there in assessing psychological fitness for overseas service.

"The transition training camp was in a lush valley. There, with the assistance of various specialists, was created a replica of a village in Southeast Asia, complete with 'inhabitants' who spoke the native tongues.

"There were anthropologists, experts in the various countries, psychologists, and psychiatrists. It provided a total cultural immersion. The valley would become, in turns, a particular part of Southeast Asia."

Novelists and poets taught me more about being human than my medical text.

—Vincent D'Andrea

In 1964 he went to the Peace Corps headquarters in Washington, D.C., where after three years service he rose to be chief psychiatrist. While there, he taught at George Washington University School of Medicine.

Washington was both very good and very bad for him, he now believes. "I have a distinctly liberal bent, and I had always wanted to make myself available to young people, and to listen to their points of view.

"I learned a great deal about large social systems which I apply here in my work at Stanford.

"But when I had been in Washington for a while I found myself thinking like a Washington bureaucrat. For example, I was very much a hawk over Vietnam.

"I believed at that time that people in high places knew what they were doing. After a while I began to realize that wasn't necessarily the case."

D'Andrea got back on track. In 1967 he joined the Palo Alto Medical Clinic as a general psychiatrist; in 1970 he became associated with the Department of Student Health at the Clinic. Meanwhile, on joining the Clinic, he had also become an associate clinical professor of psychiatry and behavioral science at Stanford. In 1970 came his co-founding of The Bridge.

D'Andrea had found his niche, as the center of a network that protects some of the brightest young minds in the country. He is a happy man, and his family and winemaking help balance his own psyche.

Letters to the editor

Limited equity housing cooperative approach considered for Stanford West

Editor, *Campus Report*:

It has been brought to our attention by several of our members who work on campus that many Stanford employees must commute long distances because adequate housing they can afford is not available locally.

It has also been suggested that the efforts of Cooperative Housing of Palo Alto, Inc. to ameliorate this situation in our community be publicized among those of you who are in need. This is an invitation to all interested parties to join in our efforts.

Our organization is composed of concerned citizens who wish to promote housing as basic shelter rather than as commercial commodity. A practical vehicle for achieving affordable home ownership is the Limited Equity Housing Cooperative Plan. It is our purpose to foster the development of such cooperatives in the Palo Alto area.

A study done by Palo Alto's Planning Department concisely defines the concept:

"A housing cooperative is a form of home ownership which is owned cooperatively by the people who live in the development. Cooperative members do not own the individual units but own a share in the cooperative, or corporation, and are given a membership or stock certificate. This certificate entitles the member to an occupancy agreement, or proprietary lease, granting the member an exclusive right to occupy a unit.

"A non-profit corporation is formed which has as many shares as units in the building. "Tenants" purchase a share by paying a down payment, and commit themselves to monthly payments which cover their share of the mortgage payments plus taxes, utilities, insurance, maintenance, and other operating costs.

"All the units in the development are financed under a single, or blanket, mortgage. The cooperative is run by a Board of Directors elected by the members. Other members may participate by serving on maintenance, management, or other committees. In this way, members have a direct say in how the cooperative is operated.

"In 1979, AB 1364 (Chapter 1068) was passed by the State legislature defining the limits on the rate of appreciation for a limited equity cooperative member's share. The law states that the "transfer value" of the membership share cannot exceed the original share cost (down payment) by more than 10 percent annual return. An adjustment may be made, however, for improvements made to the unit.

"This cap on equity build-up is intended to insure that individuals' shares will remain affordable to new members over time. Equity is limited through restrictions contained in cooperative by-laws and articles of incorporation. The cooperative generally has the right of first purchase of a share when a member desires to sell.

"A second provision of the law governs the equity growth of the Corporation. This is defined as the difference between the market value of the project minus the members' equity (share value). The corporate equity growth can be used to finance the improvement of the project and benefit of the corporation (e.g. re-finance to allow a new roof, larger meeting room, or reduction in monthly payments), but not distributed to individual members. Upon sale of the project, this corporate equity must be paid out, or the project title transferred, to a public or charitable purpose. This provision encourages continuation of the cooperative and prevents a windfall profit to the last members." ("The Cooperative Housing Concept," Glenn Miller, planner, City of Palo Alto Planning Department. Jan. 5, 1983.)

A limited Equity Housing Cooperative provides the advantages of homeownership for those who otherwise might not enjoy it: security of tenure, homeowner's tax advantage, control over one's own housing. Also statistics show that monthly operating costs of a cooperative are considerably less than a rental development (as much as 50 percent less). In addition, a cooperative share owner has the mobility of a renter. When they wish to leave, their share is simply sold back to the cooperative without the complicated and expensive resale procedures associated with condominiums and single-family dwellings.

It needs to be emphasized that the advantages of a Limited Equity Housing Cooperative are for all future share holders of the project. The amount of equity a member may acquire is limited (usually to the down payment), so the price of shares remains constant—affordability, essentially, in perpetuity.

No one may buy shares for more than one unit which must be occupied by the owner (short-term subleases may be approved by the Board of Directors for reasons of emergency). Thus incentives for speculation are eliminated. Yet, although, the mutual owner may not look forward to an inflated selling price at some future date, they do gain substantial savings every month in reduced housing costs which may then be applied to other types of housing if they so choose.

Limited Equity Housing Cooperatives are becoming popular throughout the nation, including California, and are now being strongly encouraged by both federal and state governments. HUD, the Federal Home Loan Bank, and California State Housing Finance Agency are finding more and more means to make financing easier for the development of Limited Equity Cooperatives.

It is wonderful news that Stanford is considering Limited Equity Housing Cooperatives for part of the Stanford West housing development proposed for Willow Road. This will make it possible for Stanford faculty, staff, and students to enjoy savings in housing costs, commuting time, and travel expenses. It will also encourage walking and bicycling to jobs on campus and to the medical center, cutting down on Willow Road traffic.

For all who wish to discuss the opportunity of Limited Equity Housing Cooperatives further, there will be a meeting affiliated with the Action Research Liaison Office at 7:30 p.m. Thursday, July 28, at 430 Sherman Ave., Palo Alto. For more information, call either 493-2786 or 493-3819.

Rose Ballen
Vice President
Cooperative Housing of Palo Alto, Inc.

Medical Center MEMO

As confirmed by international conference. . .

Biotechnolgy race to build a better bug gains momentum

Forty years ago, harnessing tiny organisms to produce needed chemicals meant grinding up bread mold and extracting a crude rendition of penicillin, the miracle antibiotic of the 1940s. Last week, 300 scientists from 17 countries gathered at Stanford University Medical Center to discuss their increasing ability to reach inside the genetic machinery of live bacteria, where they can manipulate a few chemical "gears" to produce precisely the product they want for use in medicine, industry and agriculture.

Though commercial production of such chemicals has been relatively .slow, the scientists who came to compare their growing list of biochemical tools predicted that a new bacterial friend, *Bacillus subtilis*, may speed the process considerably, perhaps producing its first commercial products within the year.

Long used in the fermentation industry in production of food and detergents, *B. subtilis* and other members of the *Bacillus* family are now giving *Escherichia coli* a run for its money as the favorite slave of genetic engineers.

"These soil bacteria are amazing creatures compared to *E.coli*, especially when one looks at the diversity among the *Bacillus* bugs," said A.T. Ganesan, the Stanford professor of genetics who organized the second international conference on the genetics and biotechnology of *Bacilli* together with James Hoch of Scripps Clinic in La Jolla.

"We have not even touched the surface in terms of exploiting the useful characters of these organisms in the fermentation industry, in breaking down proteins and other compounds in the soil, and in the production of antibiotics," said Ganesan, who has studied the genetics of the bacteria for 25 years. "The bugs will also have an important role to play in the production of safe insecticides and in improving cereal crop production," he said.

"It's important for any company that wants to stay on top in this field to place part of its bet on *B. subtilis*," said Tom Parmeter, president of Syntro Corporation, the La Jolla biotechnology firm that co-sponsored the conference.

Potential advantages of *B. subtilis* over *E. coli* are fourfold:

- *B. subtilis* normally secretes the proteins it makes, whereas *E. coli* keeps most of its product inside the cell. Currently, even if they can force *E. coli* to produce a desired product, scientists must burst (and hence kill) the cells to get it out after a fairly complicated filtering process, whereas the protein products of *B. subtilis* could be harvested without disturbing the bacterial colony.
- Unlike *E. coli*, *B. subtilis* grows best in soil and moldy hay, and can't survive in the human body. Hence, even the remote risk that a runaway bug might trigger human illness is extremely small.
- The membrane coat of *E.coli* is studded with chemicals that can be toxic to humans, and must be carefully removed in productions of any medicines. *B. subtilis* does not carry such toxins.
- Several strains of *B. subtilis* lack cell walls, and therefore might provide a good source of digestible protein for human or animal consumption if they were produced in large quantities.

That's the good news. The bad news is that, up until very recently, researchers have had a tough time coaxing *B. subtilis* to incorporate foreign genes into its DNA. Enticing the organism to "overproduce" proteins that it was born to make has already been accomplished, but prompting it to produce desirable foreign proteins, such as insulin or interferon, has

Guidelines for chemical abusers established

Chemical abusers should be firmly steered into monitored treatment programs, according to guidelines recently accepted by the Medical Board.

Approved by the board was a 6 1/2-page document for handling chemical dependency among health care professionals.

Major features of the plan include development of a system of intervention counselors who would confront the chemical abuser with his or her problem and recommend treatment.

Persons—including doctors, nurses and other medical employees—who refused treatment would be required to sign a contract with the Hospital or School of Medicine agreeing to randomized chemical screening at the individual's expense.

Intervention counselors would vary, but would include both supervisors and colleagues. Provisions would be established to monitor progress of the individual after initial treatment. Coworkers or colleagues would be notified of a chemical abuser's problem when necessary for safety.

The guidelines provide that no chemical abusers would lose privileges or their jobs before being offered treatment. The guidelines stress that chemical abuse is a disease which should be treated like any other health problem. They also state that personnel should be encouraged to

Ruth Shanahan of SUH Personnel Health tries out the new "fitness cluster" at the Medical Center. PHOTO BY ED SOUZA

Jogging course, exercise stations open near hospital

A new jogging course and cluster of exercise stations opened near Stanford University Hospital Tuesday, July 5.

The 1.5 mile jogging course and 32-foot square cluster of exercise stations begins at the corner of Quarry Road and Campus Drive on campus. The route follows Campus Drive to Palm Drive, bears left at Palo Road through Hoover Pavilion grounds to Quarry Road, then returns to the starting point on Campus Drive.

The course includes 20 phased warm-up, conditioning, strengthening, and cool-down exercises along the way. Sixteen similar exercise stations are grouped together in the "fitness cluster."

Colorful illustrated signs display instructions and cardiovascular information.

The hospital received a $5,000 grant from Wells Fargo Bank to install the Gamefield, which costs about $9,000 in addition to the grant.

The Gamefield fitness facilities, now installed in parks and schools throughout the country, were designed in consultation with the Stanford Heart Disease Prevention Program, Department of Athletics and School of Education.

A key element of the facility is cardiovascular conditioning. The jogging course includes two "pulse stations" with instructions to count pulse rate.

Sheldon King, executive vice president and director of Stanford Hospital, cut the ribbon opening the course, noting the "value of this program in helping to maintain a healthy and physically fit health care team for Stanford."

The course is designed for use by Medical Center personnel, but is open to the public.

Pediatrics playroom more than just fun: it's therapeutic

BY SHIRLEY KRAUS

Sue Emerson works four days a week as a programmer analyst at NASA-AMES. The fifth day, she volunteers at Stanford University Hospital, spending the morning with the children in the pediatrics playroom.

Seventy-one-year-old Evelyn Parsons has been coming to the playroom one morning each week for the last 10 of her 21 years of volunteer work at SUH. She's often told herself it's time to retire, but, she said, she just can't seem to tear herself away from the children.

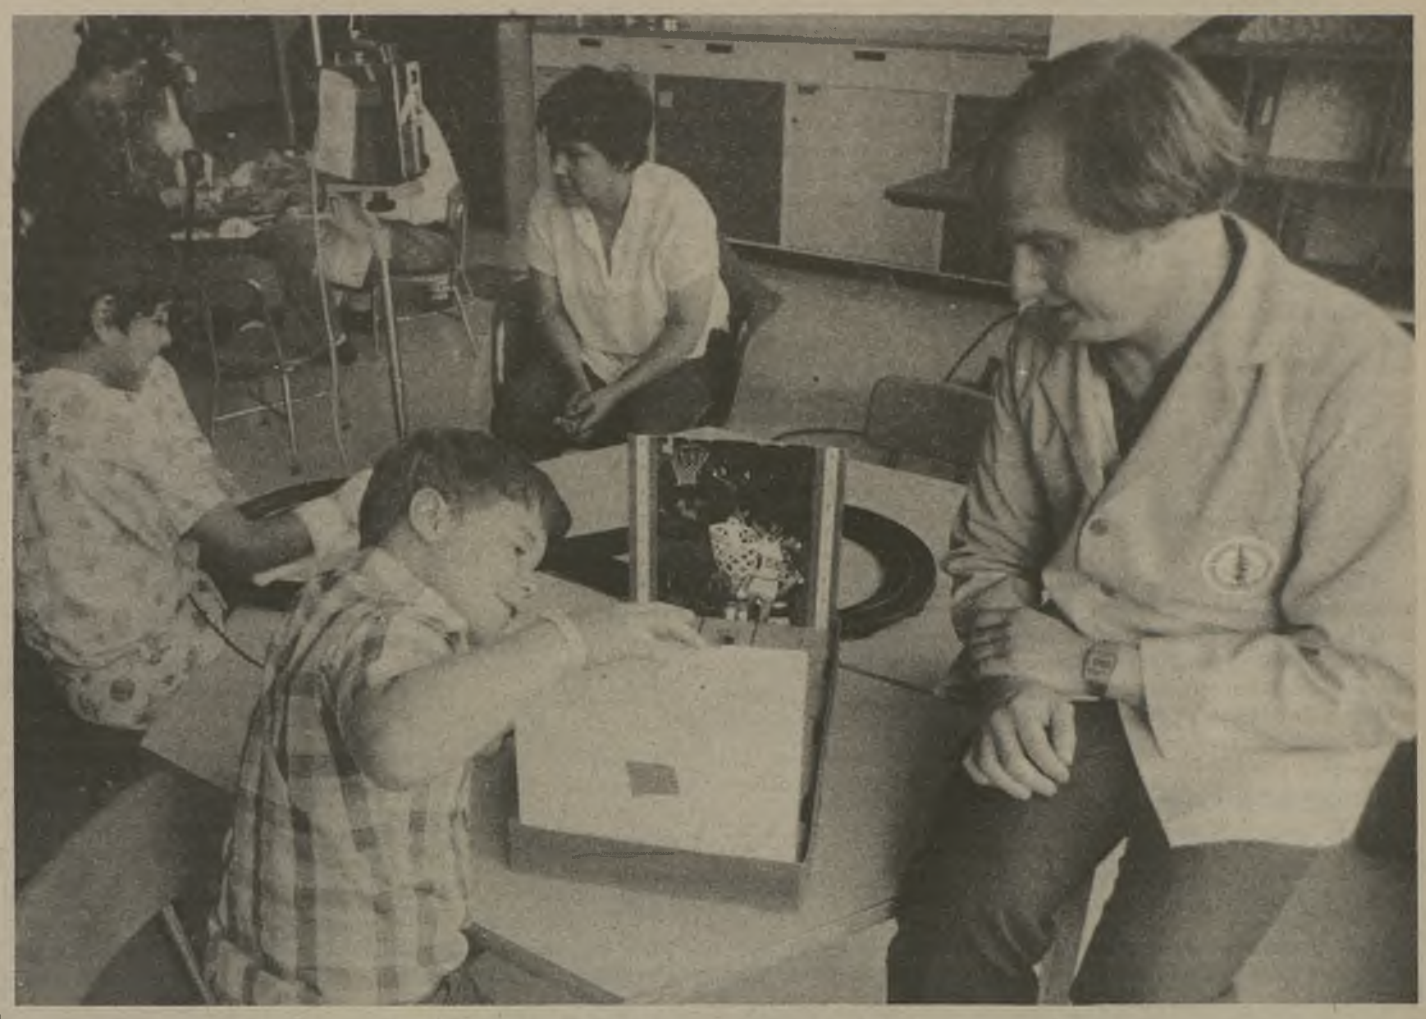
Like most Silicon Valley engineers, Gary Elston's workweek is rarely limited to 40 hours. Yet one evening each week, he too volunteers at the playroom.

Self-sacrificing? Perhaps. But these are just three of more than 60 hospital auxilary members, Stanford students, and candy stripers who donate their time to work in the pediatrics playroom, the most popular volunteer service at the hospital.

It's more than the natural appeal of children that accounts for their willingness to work there. Something special happens in the playroom, many volunteers say—something they'd be reluctant to miss out on.

"Most of the kids are pretty unhappy because they're in the hospital," said Jennifer Gray, a recent graduate of Palo Alto High School who's worked at the playroom for about a year. "Your goal is simply to make them laugh. If you can let down your guard, and act like kids, it really helps. If you can just make them smile, you're flying high."

"As many as 44 children, from birth to age 18, are on the unit at any time," said Colette Case, the recreational therapist who supervises the playroom and the play therapy program that includes it, as well as community education, inservice training for other health professionals, training for recreational therapy students, and networking with other health care agencies.



"Their illnesses are usually pretty acute. The goal is to make their stay in the hospital a positive, growing experience."

Case is aided in achieving this goal by, in addition to the volunteers, two other recreational therapists, Ellen VanderWilt, and Betty Lovelace, who developed the program nearly 10 years ago.

"We try to give a feeling for the sights and sounds of the hospital, and introduce the different people children are likely to meet," Lovelace explained.

It starts on Sunday afternoons, when the therapists show children scheduled to enter the hospital a slide show that takes them from admission to discharge. They also take the children on a walking tour of the hospital. And with a miniature hospital, puppets, and medical equipment, the therapists encourage the children to play out their experiences so they can grow more comfortable with them.

During the children's stay in the hospital, the playroom is the one "safe" place for them, Case explained. "The children can relax here. They know no procedures will be done here, so they feel they can talk about their fears and concerns. Often, children will do things in here, such as walk, or use an injured arm, that they won't do elsewhere. The playroom is therapeutic for them."

SUH volunteer Gary Elston watches as patient Scott Pringle gets engrossed in a game in the Pediatrics playroom. Part of a program to make kids feel more at ease, the room is one "safe" place where no procedures are done. PHOTOS BY LARS SPEYER

It's not just therapeutic, the playroom is a child's dream. Toys—most of which are donated by parents and community groups—are piled along the walls. Video games are available for the asking. A pool table occupies a large area, and an outdoor courtyard bears murals of forests filled with animals. The volunteers answer to nearly any whim, and the children are encouraged to play among themselves as well.

"We try to concentrate on the wellness of the children, and make the most of what they can do rather than focus on their limitations," Case said. It's often necessary to point out the wellness to the parents also, she added.

The children derive a lot of support and encouragement from one another. "We once had a boy who was an amputee," Case recalled. "He had a hard time dealing with it. Now he comes back often to visit other children and encourage them."

Much of the interaction with the children is on a one-to-one basis, Case said, in order to maximize their socialization and growth development considering their individual health status. Organized group activities are often held to help out individuals as well. "We have lots of parties in addition to regular holiday and birthday parties," Case explained. "If someone isn't eating well, for example, we'll have a cooking party."

Despite the appearance of just fun, there's a lot of subtle therapy that goes on in the playroom, Case pointed out. And this makes the selection and training of volunteers especially important.

Perhaps not quite understanding exactly what a toy telephone is supposed to do, pediatric patient Laticia Castro looks questioningly at Colette Case, head recreational therapist at SUH.

Many applicants initially request the playroom because of their love for children, Case said. But once they get through the two interviews and orientation sessions, they realize they may not be able to handle dealing with sick children. Even the ones who do end up working with the children, Case continued, are susceptible to "burnout."

"I was a bit hesitant at first because the children are so sick," Parsons recalled. "But you get attached to so many, and when you see them getting better, it makes it worthwhile."

Elston's commitment includes bringing a box of toys with him since the playroom's toys are locked up in the evenings when he comes. Even with his dedication, however, or perhaps because of it, he finds working with the children difficult at times.

"I had to stop coming for about three weeks once, because it just got too intense," he admitted.

But Elston and the other volunteers stay on at the playroom in spite of any problems the work may create.

"When I was young I had to spend some time in the hospital," Emerson recalled. "I know how much it helped to have people to talk with, to play with, and to pay attention to me. I'd like to do the same for these children."

Four SUMC studies seek volunteers for clinical trials

Exercise

Healthy, sedentary men between 40 and 60 years of age are needed to volunteer in a three-month study designed to compare the health benefits of low and high level exercise.

"Especially in sedentary people, low level exercise will produce the same training effects as high level exercise—it just takes a little longer," believes Dr. Robert DeBusk, director of the Stanford Cardiac Rehabilitation Program.

To confirm this, the three-month study will examine how slower paced activity like brisk walking compares to rigorous exertion such as running or swimming in contributing to cardiac health.

The study will involve three randomly-assigned groups of volunteers. One group will carry out their usual activities (control group); another will carry out low level exercise training such as brisk walking; and the third group will perform high level exercise training such as jogging.

Portable heart rate monitors will be used to help volunteers maintain the appropriate intensity of exercise, and individualized instruction will be given concerning the amount and duration of exercise training.

After initial telephone screening, volunteers will undergo a preliminary evaluation including medical history, physical examination, treadmill exercise test and measurement of blood fats. Participants will repeat the treadmill test at six and 12 weeks and will be asked to record their food intake and physical activity. They will also wear a heart-rate recorder at specified times during the study.

One potential benefit of participation in the project is thorough screening for latent (unrecognized) cardiovascular disease. Jeff Martin, a recent participant in a related pilot study for this project, said he was motivated to take part after a close relative died suddenly of heart failure. "My goal was really to find out if my heart was strong. I feel more comfortable now knowing that there's probably nothing to worry about."

On completing the study, which is funded by the Pepsico Foundation, participants will be given an individualized "prescription" for ideal long-term exercise conditioning.

Participants must be free of cardiovascular disease and cannot have participated in any sort of regular exercise program for at least three months prior to the study.

Those interested should call the cardiac rehabilitation program at 497-6461 during regular business hours and ask for the "coordinator of the high/low study."

High blood pressure

Volunteers between the ages of 20 and 70 are needed to participate in studies to confirm the effectiveness of three different anti-hypertensive medications.

The drugs, which have already been through animal trials and clinical testing in Europe, offer potentially promising ways to treat high blood pressure, according to principal investigator Dr. Peter Rudd, assistant professor of medicine.

Each study preparation will be compared to either a placebo or a similar medication already on the market. The three separate studies are based at the Veterans Administration Medical Center in Palo Alto.

Volunteers are needed who have mild to moderate high blood pressure, and are willing to come in as often as weekly for blood pressure monitoring. Two of the studies last three months, and the third lasts a year.

Participants will be offered free comprehensive medical evaluations at the beginning and end of whatever study they join. Screening and follow-up laboratory tests will include urine, blood, electrocardiogram, and chest X-ray. Volunteers will also receive reimbursement for travel and any worktime missed.

Rudd said he and co-investigator Dr. Keith Marton, assistant professor of medicine, expect to demonstrate that the new medications are more effective with fewer side effects than those standardly used to control high blood pressure.

Anyone interested in volunteering or obtaining further information should call Valerie Vierra, R.N., at 493-5000, extension 5918, weekdays from 8 a.m. to 5 p.m.

Acne

About 20 volunteers, ages 16 to 30 with moderate to severe facial acne, are needed to participate in a study to test the effectiveness of a new topical treatment.

The three-month, double-blind study will compare a topical preparation of Acutane with another vitamin A derivative which has been used effectively for years in treating acne.

Dr. David Elbaum, a resident in dermatology and principal investigator for the study, said the topical preparation of Acutane is hoped to prove as effective as its recently approved oral form, while avoiding the side effects encountered.

Volunteers must be off other acne medications for at least two weeks prior to joining the study, and then for the duration of the study. They will come in for observation bi-weekly the first month, and monthly thereafter.

For further information or to volunteer, call Alice, weekdays at 497-6319.

Hormone therapy

Volunteers are being sought for a study at Stanford University Medical Center evaluating the effectiveness of hormone replacement therapy for postmenopausal women.

The researchers, headed up by Dr. Leroy Heinrichs, chairman of the department of obstetrics and gynecology, are recruiting women who are at least 47 years old, and are at least one year postmenopausal. The women should not have received hormone replacement therapy in the past six months. Women who have had hysterectomies, or who have their uterus intact, are eligible.

Specifically, the investigators plan to study the effects of estrogen, estrogen with progesterone, and estrogen with testosterone on psychological factors such as mood changes. They plan to study the effects on physiological variables as well.

Participants will receive laboratory tests and medication free of charge, and those who complete the one-year study will be paid a stipend.

For further information, contact Dr. Jean Dixen at 497-2432.

Construction Corner

Repaving of Blake-Wilbur Drive:

Blake-Wilbur Drive, from the incoming route of Pasteur Drive to the southern exit/entrance of parking lot F (diagonally across from the Administrative Annex Building), will be repaved from Saturday, July 16, through Tuesday, July 19.

Detour routes will be created for the duration of this project, for vehicles headed towards the Clinics parking lot or the front of the Hospital.

Additional security personnel will be on duty to assist in the re-routing of traffic. Signs will be visibly posted, and an additional supply of detour maps will be available at the Admitting Desk, Cashiers Office, Clinic and X-ray desks.

Everyone's cooperation, patience, and help in explaining the situation to patients, will be greatly appreciated.

Parking update:

The resealing and restriping of the parking lot at the south end of the Medical Center is essentially completed, affording more slots for vehicles than before.

The temporary lot in the Governor's Avenue area (adjacent to the Cancer Biology Research Building) is completed and accessible to vehicles needing to park there. However, employees are reminded that this lot has been constructed to accommodate construction workers for the Edward's Deck, Boswell Clinics, and Research Animal Facility (RAF)-I projects. This was done to assure that parking for construction workers would not impact the employee spaces.

With the above two projects completed, the parking situation during RAF-I construction, scheduled to begin around August 1, should be better than it has been over the past several months. The spaces necessarily blocked off during that time will have been more than compensated for by the recent construction.

Editor's note: Look for an up-to-date Medical Center parking map in the next issue of the Medical Center Memo *(July 27). Specifics of A versus C allotted parking spaces, as well as other details, will be available by that time.*

Chilled Water Loop:

The Medical Center chilled water loop around the center is completed and should cause no more traffic or disruption problems.

Boswell Clinics Renovation Update:

Work is progressing on the new balconies and the first floor south in the Boswell Building. This Friday, July 15, the present occupants of the second floor south will relocate to other areas of the Medical Center, primarily to the Edwards Building. Demolition activities on the second floor south are scheduled to begin July 18.

Remodel for the Department of Pathology:

An area on the second floor of the Edwards Building is presently under construction for the Department of Pathology. The remodeling project will provide a tissue culture room, equipment room, and five offices for departmental personnel.

Wells Hoeltje, project manager, and Gordon MacLachlan, construction coordinator, are the SUMC Facilities staff responsible for the coordination of this work.

Medical Center MEMO

Prepared as a section of the *Campus Report* by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Dr. Frank Stockdale, *professor of medicine (oncology) and biological sciences, has been awarded a Guggenheim fellowship for studies in protein characterization at Cambridge University in England.*

* * * *

Gale Mondry, *University staff counsel, has left Stanford effective July 8 to accept a position as legal counsel at Pacific Medical Center in San Francisco, announced associate director of SUH Carole Runyan Price.*

Mondry served for seven years at Stanford, dealing primarily with legal concerns at the Medical Center.

Michael Fossier *has been appointed to replace Mondry as staff counsel, effective August 1. Fossier is a graduate of Yale University and Harvard Law School.*

He has had three years of experience with Blue Cross-Blue Shield, in the Massachusetts legal office.

* * * *

Dr. Shirley Tom, *professor of gynecology and obstetrics, was given special commendation as "outstanding member of the clinical faculty" by the graduating residents of that department at their annual dinner, held June 27.*

Dr. Anna McHargue, *clinical assistant professor in gyn/ob, was named "most outstanding regular faculty," and resident* **Dr. Kimberly Harney** *was recognized by the students as "outstanding resident teacher."*

The graduating senior residents in gyn/ob are **Drs. Cliff Bochner, Daniel Kredentser, Barbara Peters, Frank Polansky, Paul Schroeder, and Candace Weinstein.**

* * * *

Lois Christopherson *has been appointed manager of patient relations for the Faculty Practice Program, a new position.*

Christopherson had served as chief clinical social worker with SUMC's heart transplant program from its inception in 1968 until 1981, when she left to pursue a master of science in management through Stanford Business School's nine-month Sloan program.

* * * *

Graduating residents in the Department of Anesthesia honored **Dr. C. Philip Larson, Jr.**, *professor of anesthesia, as most outstanding teacher of the year, at their farewell dinner June 29 at the Faculty Club.*

Larson was not present to accept the award, as he was then in the People's Republic of China leading the 1983 People to People International Anesthesiology Project.

The honoree was chairman of the department from 1972 to 1982.

* * * *

Sharon Beckham *has joined Stanford University Hospital as coordinator of Volunteer Services.*

Beckham, who assumed her new position July 5, served as coordinator of Volunteer Services at the University of California at San Francisco (UCSF) since 1977.

Beckham reports to the director of Community Relations and is responsible for working with hospital departments in the development and implementation of volunteer programs.

Her office is located in room P-3018, and her telephone number is 497-7424.

Goings on. . .

The **Palo Alto VA Rehabilitation Research and Development Center** *celebrated its fifth anniversary July 6 with an open house for the media.*

Dr. Larry Leifer, director of the Center and professor of mechanical engineering at Stanford, presented a new robotic arm that responds to 54 voice commands to perform household chores for quadriplegics and elderly persons.

Among other devices presented, with demonstrations by VA patients, were the "smart" wheelchair, omnidirectional wheelchair and ultrasonic head control.

* * * *

There is still room in the July 28 course, **"Clinical and Interpersonal Uses of Laughter in Health Care,"** *sponsored by the Human Resources Development Department. All Medical Center employees are invited to attend; clinical experience is not a prerequisite.*

Recent research and literature by Stanford's Dr. William Fry, Jr., associate clinical professor of psychiatry, and others has demonstrated that laughter has positive physiologic as well as interpersonal effects.

The workshop, to take place from 1 to 5 p.m. in the Eucalyptus Room at Oak Creek Apartments, will use small group exercises, discussion, and other learning techniques.

"A challenge of working at SUH is to provide excellent quality patient care and at the same time maintain our personal well being," said Elad Levinson, director of HRD. "Laughter and play are simple tools for easing the distress of patients' illness as well as aid in revitalizing our own health."

Registration deadline for the course is July 14. A fee is charged, and continuing education credit is available to nurses. For further information call 497-6868.

* * * *

Also this summer, HRD is offering a new two-day course entitled **"Computers Simplified: A Computer Literacy Workshop for Health Care Professionals."** *Today's topic (July 13) is an overview of microcomputer systems, and tomorrow's is microcomputer applications.*

The present session has no more room for participants, but those interested should watch for future announcements of the repeated course. Call 497-5233 for details.

A month for linen amnesty

The Hospital spends half a million dollars a year to replace linen, including $120,000 for scrub suits alone. Since these figures were disclosed by SUH director Sheldon King in April, a variety of linen conservation efforts have been launched.

In keeping with the theme, the hospital will sponsor a unique "Linen Amnesty Month," from July 25 through August 21. The idea is to make some of the lost linen reappear.

Several red and white striped containers will be placed in the main center and at Hoover Pavilion. All employees are asked to bring back any linen or scrubs inadvertently taken home and to drop them in the containers, which will be marked "Linen Return."

Hopefully, Linen Amnesty Month will add to the success so far of the linen conservation program. Already a reduction of 2.3 pounds per patient day has been achieved, according to Nursing Services. The cost savings to the hospital, at the current usage rate of 18.5 pounds per patient day, is $67,526.

Chemical abuse...

continued from page 14

seek treatment voluntarily but that self-recognition of an abuse problem is rare.

The rules were developed by the Medical Board's Committee on the Well Being of Medical Personnel, chaired by Dr. C. Philip Larson, Jr., professor of anesthesia.

In a background statement included in the document, the authors wrote that the guidelines were prepared because "chemical dependency is a relatively common and serious problem among health professionals and that Stanford University Medical Center is not immune to it."

The authors said nationally about 10 percent of physicians and eight percent of nurses become involved in chemical abuse at least once during their careers but that it was not known how those figures compared with Stanford's, since no survey has ever been taken.

The policy was implemented in June, and simultaneously sent to the Hospital Board for ratification.

Faculty opening

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

Stanford University invites nominations and applications for a newly endowed chair, the Edgar F. Kaiser, Sr. Professorship in Health Policy at the School of Medicine.

Needed is a creative researcher who has demonstrated outstanding scholarship in an area related to health services or health policy. The appointee is expected to be an innovative person who will assume a leadership role in interdisciplinary activity involving both research and teaching.

Substantive knowledge of medicine, public health or health services delivery, as well as strong quantitative and communication skills are essential.

Nominations or applications accompanied by a curriculum vitae should be submitted by October 15, 1983, to Thomas A. Gonda, M.D., Chairman, Health Policy Search Committee, Stanford Medical Center, Stanford, CA 94305.

Medical Center Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, JULY 13

Hematology support group: Support group meeting for patients with leukemia, myeloma, hemophilia, and other hematologic disease. Family members and significant others welcome. 10:30 a.m. to noon, room TF-122c. For further information, call 497-6961.

THURSDAY, JULY 14

Dept. of Medicine grand rounds: "Acetaminophen Toxicity"—Dr. Terry Blaschke. 8:30 a.m., Fairchild Auditorium.

FRIDAY, JULY 15

Dept. of Pediatrics grand rounds: "Tuberculosis in Childhood"—Dr. Moses Grossman (UCSF). Case presentation by Dr. Catherine Albin. 8 a.m., M106.

Dept. of Medical Microbiology seminar: "Genetic and Biochemical Aspects of Bacterial Hemolysins"—Dr. Werner Goebel (Institute for Genetics and Microbiology, University of Wurzburg, Germany). 1 p.m., D300, Fairchild Bldg.

Dept. of Gynecology and Obstetrics grand rounds: "Malpractice Issues in Ob/Gyn"—Dr. David Rubsamen. 8 a.m., A336.

JULY 18 through 22

Blood Bank celebrates fifth anniversary: Cake and punch served to donors at the blood bank, 800 Welch Road, all week.

WEDNESDAY, JULY 20

Dept. of Neurology epilepsy program research seminar: "Neuronal Synchronization in the Hippocampus: From Membrane to Network"—Robert Wong, Ph.D. (Univ. of Texas at Galveston). 5 p.m., C364.

Medical Center Auxiliary volunteer orientation: 9:45 a.m., W001. . For further information, call 497-6636.

THURSDAY, JULY 21

Dept. of Medicine grand rounds: "Newer Antiarrhythmia Drugs"—Dr. Donald Harrison. 8:30 a.m., Fairchild Auditorium.

Dept. of Pediatrics grand rounds: "Hepatitis in Pregnancy and the Newborn"—Dr. Saul Krugman (New York University). 8 a.m., M106.

FRIDAY, JULY 22

Dept. of Gynecology and Obstetrics grand rounds: "Antiviral Agents Used in Treatment of GYN Infections"—Dr. Nelson Teng. 8 a.m., A336.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

New regs on foreign students issued

Following is a June 23 memo to deans, department chairmen, and administrative assistants from A. Lee Zeigler, director of Bechtel International Center on new regulations affecting foreign students:

A final Rule was published in the *Federal Register* of April 5, 1983, which provides new regulations affecting all foreign students in the U.S. These new regulations become effective on Aug. 1, 1983.

I am bringing these regulations to your attention so that academic advisers, principal investigators of grants, and all others having direct contact with foreign students may be aware of some new restrictions.

1. Foreign students *may not accept any employment off the Stanford campus* during the first 12 months of study here. There are no exceptions to this rule. Employment after 12 months may be authorized by the Immigration and Naturalization Service (INS) District Office in San Francisco *only* if the student can show "financial necessity due to unforeseen circumstances arising subsequent to entry or subsequent to change to student classification."

NOTE: on-campus employment during the first and subsequent year may not exceed 20 hours per week, except for vacation or summer recess periods. No INS approval is required for on-campus employment; however, employment must be on student's own campus.

2. Foreign students are admitted to the U.S. for specific degree programs, or particular educational levels. If, after completing a degree or level the student wishes to continue study in pursuit of an additional degree, the student must request permission to do so from INS between 15-60 days before completing the first level. We have no reason to believe that INS will deny a request of a master's degree student continuing on for the Ph.D.; however, INS may question a second master's degree in a different major.

3. All foreign students must enroll for a "full course of study." Stanford's interpretation of this is: undergraduates must register for the full 12 units; graduate students who do not receive Stanford funding must register for 11 units or more; graduate students with Stanford assistantships must register for 9 units.

4. TGR foreign students *must register by the last day of registration* (unlike U.S. students who oftentimes register very late in the quarter). The INS will send computerized lists, based on information they receive from the student's visa certificates, to Stanford. A TGR foreign student whose name appears on this computerized list but who has failed to register by the last day of registration is considered "out of status" and subject to deportation. Therefore, it is important that TGR students register before the last day of registration.

5. Leaves-of-absence are not permitted by INS except for medical reasons. Foreign students who must take leave for other reasons are expected to leave the U.S.

Students and-or advisers who have questions on any of these new regulations are asked to consult an adviser at the I-Center, 7-1831 for more information.

Come help celebrate blood bank's 5th year

The Stanford University Medical School Blood Bank, located at 800 Welch Road, will be celebrating its fifth anniversary July 17.

Everyone is invited to come help celebrate next week by donating blood and enjoying a piece of anniversary cake.

Cake and punch will be served to donors at the blood bank Monday, July 18, through Friday, July 22.

Biotech race. . .

continued from page 14

proved a much greater problem.

In addition, *B. subtilis* produces enzymes that can "chew up" the desired protein before it can be extracted from solution. Several speakers at the conference reported encouraging progress along these lines in the race to build a better bug.

Vasantha Nagarajan, a researcher for Genex, a firm based in Gaithersburg, Maryland, reported her firm's ability to identify, clone and transplant into *B. subtilis* a gene that codes for "subtilisin," an enzyme used in the detergent industry to break apart unwanted proteins.

By stuffing multiple copies of the gene into each bacterium, the Genex researchers were able to increase the organism's production of the enzyme by 200-fold. "I'm sure we can increase the yield even more as we optimize conditions," Nagarajan said. "This was just a preliminary test to see if the procedure worked.

"Our method is very powerful," she said. "We were surprised and delighted that it worked."

Using a different procedure, which was also recently patented, James Wells of Genentech, a South San Francisco biotechnology firm, produced similar results. Industrial researchers are not as excited by the method as a new way to make subtilisin (plenty of the enzyme can already be made cheaply by conventional means) as they are about its potential as a model for producing scarcer proteins, said Wells.

The key to both the Genex and Genentech findings was the identification of a "promoter" and "signal sequence" that regulate production of the gene, he said. A promoter is a segment of DNA that controls the amount of protein each gene produces, while the signal sequence is an adjoining bit of DNA that allows the protein to escape the confines of the cell.

Researchers around the world are racing to identify and clone a good promoter and signal sequence from closely related bacteria that can be spliced to foreign genes and interpreted within *B. subtilis*. Unlike *E. coli*, *B. subtilis* is a very sensitive detector of alien DNA. Like a tourist who can't speak the native language, foreign DNA is left without an interpreter within the host cell. And if the message is not interpreted, no new protein can be made.

Mervi Sibakov, from the University of Helsinki, described similar efforts to construct an all-purpose bit of DNA that could prompt production of a wide variety of proteins. The Finnish group was successful in coaxing *B. subtilis* to produce three compounds valuable in the production of antibiotics, though the yield of each compound was very low. Nonetheless, their data fed the flames of enthusiasm over the potential use of the organism in industry.

Shing Chang, a scientist at Cetus corporation whose interest in *B. subtilis* centers on the production of human growth hormone and other compounds for medical use, is optimistic about the organism's potential value.

None of the hurdles discussed at the meeting are insurmountable, said Chang, who predicts that commercially viable compounds, produced by inserting mammalian DNA into the bacteria, may be possible within one year.

—Deborah Franklin

Ph.D. oral exams

FRIDAY, JULY 15

Richard L. Baker, electrical engineering, "Vector Quantization of Digital Images," 1:30 p.m., 450 Durand. **Anne Gardner,** computer science, "The Design of a Legal Analysis Program," 2:15 p.m, 252 Jacks Hall. **Li-Shing Lee,** physics, "Nonlinear Spectroscopy of $LaF_3:Pr^{3+}$ and Wavemeter for Pulsed Lasers," 2:15 p.m., Varian Conference Room. **Ying-Sheng Lee,** materials science and engineering, "The Preparation and Characterization of Metastable Metallic Alloys," 2:15 p.m., Room 550A. **Mark Sheldon Montgomery,** civil engineering, "Kinetics of Methane Fermentation in Anaerobic Biofilms," 2:15 p.m., Terman Engineering Center, Room M-33.

MONDAY, JULY 18

Leona Kay Sidman, education, "A Gateway to Lessons: The Call-to-Lesson," 12 noon, Room e114, Education Bldg.

WEDNESDAY, JULY 20

Mark A. Horowitz, electrical engineering, "Timing Models for MOS Circuits," 3 p.m., AEL 109. **Jeng-Heng Chen,** aeronautics and astronautics, "Helium Thrustor Propulsion System for Precise Attitude Control and Drag Compensation of the Gravity Probe-B Satellite," 3:15 p.m., Durand 301. **Muriel Y. Ishikawa,** aeronautics and astronautics, "A Fast Accurate Algorithm for Solving the Steady Three-Dimensional Equations for Inviscid Rotational Flow," 2:15 p.m., 450 Durand. **David Campbell Redding,** aeronautics and astronautics, "Optimal Low-Thrust Transfers to Geosynchronous Orbit," 10 a.m., 450 Durand.

THURSDAY, JULY 21

David Kyuyoung Ahn, education, "Loglinear and Markov Chain Models of Change in College Academic Major," 2:15 p.m., Room e114, Education Bldg. **Maurice P. Rehm,** drama and humanities and classics, 2:15 p.m., Memorial Auditorium m125.

FRIDAY, JULY 22

Terri L. Lomax, biological sciences, "Auxin Transport By Membrane Vesicles," 10 a.m., Herrin T-161. **Gerard Patrick Morgan,** physics, "Identification of CW Two-Photon Transitions in Na_2 and NaK," 2:15 p.m., Varian Conference Room. **Jeanine M. Schmidt,** applied earth sciences, "Geology and Geochemistry of the Arctic Prospect, Ambler District, Alaska," 10 a.m., Mitchell Bldg. 350. **Joseph Yao Yao,** education, "The Redistribution of Earnings in the Ivory Coast: The Role of Higher Education Finance," 9 a.m., Room e114, Education Bldg. **Faustin B. Mukyanuzi,** education, "The Political Economy of Educational Reforms in Tanzania: The Secondary Education Curriculum and National Development," 2:15 p.m., Room e114, Education Bldg.

For 20 years, Rulofson's duties grew with Earth Sciences

Nobody is indispensable, but some people are irreplaceable. One of those people is Trudy Rulofson, who retires on Sept. 1, as assistant dean for research in the School of Earth Sciences. During her 20 years of service, the School has more than doubled, and Rulofson's job has grown along with the School. When she retires, her many responsibilities will be divided among several people.

George and Trudy Rulofson came to Palo Alto in 1963, when George, a mechanical engineer with the firm of Aetron-Blume-Atkinson, started working on the Stanford Linear Accelerator. Trudy applied for work at Stanford because she was "bored and didn't know anyone in Palo Alto," she explains in an accent that still bears a trace of Tennessee, her native state.

"I was surprised that Stanford hired me," she recalls, "because I had't worked for 18 years." She had been rearing three daughters. As a new Stanford employee, she felt right at home among the students who peopled Prof. Ron Lyon's remote sensing laboratory. After three years as secretary to Lyon, she was transferred to the dean's office as executive secretary to Prof. Richard Jahns, then dean of the School.

Personnel records state that Rulofson became administrative assistant to the dean in 1970 and an assistant dean in 1980. In truth, she has been accountant, caterer, travel agent, housing consultant, impresario, editor, and the liaison between the School and outside organizations, such as the sponsors of contract research.

Assistant Dean Delores Warrington shared these responsibilities until her fatal illness began in September 1981.

Since 1966 the School of Earth Sciences has mushroomed in size: from 33 undergraduates and 107 graduate students in 1965-66 to 147 undergraduates and 208 graduate students in 1982-83; from 57 degrees awarded in 1965-66 to 162 in 1982-83. But while the student body tripled, the full-time faculty has remained about the same: 28 full-time professors in 1966 compared with 32 today.

The School, now headed by Dean Allan Cox, relies on consulting faculty and a staff of 31 employees to handle the work load. During the last 17 years, nearly every kind of administrative task has fallen on Rulofson's desk. Since 1981, however, the School has added two associate deans, Dudley Kenworthy for development and Ruth Sloan for administration. Little by little, Rulofson's many duties are being absorbed by other staff members.

Running the School's annual Job Fair has been one of Rulofson's "most" satisfying functions." In October of each year, industrial recruiters come to the School for two days to interview students. The recruiters represent petroleum, mining, and energy industries, and government agencies such as the U.S. Geological Survey. The next Job Fair will be held October 25-26.

Rulofson likes the idea of "making a match between employer and student." Before the recession and the oil glut, each graduate could expect several job

Trudy Rulofson

offers. The activity reached a peak in 1981, when 83 recruiters attended the Job Fair. Last year the Job Fair attracted only 53 recruiters, but nearly all the applicants found jobs. Occasionally a student who is disappointed by the job picture remains in school for an additional degree.

A recent survey shows that more than 55 percent of the School's M.S. graduates and 35 percent of its Ph.D. graduates go into industry. About 30 percent of its Ph.D.s become university teachers in the earth sciences. The rest choose careers with the U.S. Geological Survey and other government agencies or continue in postdoctoral research.

Working with the University's Sponsored Projects Office, Rulofson has seen the School's research grants and contracts increase from $210,000 in 1966 to $3.4 million today. Proposals written by faculty members pass through Rulofson's office on their way to such agencies as NASA, the U.S. Department of Energy, or the National Science Foundation.

"Government contracts and grants are declining," Rulofson reports, "but since most research is funded for a term of two or three years, the decline hasn't shown up on our books as yet." Many of the School's research projects are supported by industrial affiliates.

The School maintains active applied research and graduate training programs in enhanced oil recovery, reservoir simulation, geothermal engineering, exploration geophysics, rock physics, structural and stratigraphic field studies in the Western United States, petroleum geology, remote sensing, economic evaluation of minerals, groundwater optimization, and environmental and hazardous wastes geochemistry.

In basic research, faculty and students are investigating volcanology, micropaleontology, seismology, plate boundaries and the tectonics of accretionary terranes, the evolut n of midocean ridges, and the origin and formation of ores and petroleum.

A large percentage of Rulofson's time has been devoted to industrial relations. She maintains communications with the 13 companies who pay $10,000 a year to join the School's Industrial Associates, and with 21 distinguished members of the School's Advisory Board—11 from industry, three from government, and seven from other universities.

Rulofson has been the School's unofficial hostess. When the Advisory Board meets in March, when the Industrial Associates hold their seminar in April, Rulofson plans menus, orders meals, makes hotel and plane reservations, reserves meeting rooms, and then resolves the inevitable last-minute complications.

Although she says that writing is not her forte, Rulofson compiled a 225-page book in 1980 and has updated it each year since then. The "red-book" is an annual report to the Advisory Board on the state of the School and its four departments: Applied Earth Sciences, Geology, Geophysics, and Petroleum Engineering. The next text is now on computer tape so that revising the book will be an easier job for the next editor.

A brochure entitled "Faculty and Facts" also originated on Rulofson's desk. The booklet introduces the faculty and the School to prospective students, faculty members, donors, and other interested readers.

With so much variety, "It has been a very interesting career—for someone who never planned to have a career."

A shadow fell over Rulofson's retirement years on May 19, when her husband died, ending a marriage that had lasted 39 years. Two daughters and three grandchildren form the focus of her family now.

Rulofson will work half days from Sept. 1 through Dec. 31 to train her various successors. After that she will travel, play bridge, enjoy her grandchildren, and become a volunteer for the School of Earth Sciences.

Carol L. King

Gould sharply criticizes Reagan's NLRB appointees

President Reagan's appointees to the National Labor Relations Board have "done a grave disservice to the rule of law" in emasculating their general counsel's ability to represent the agency in court, according to Prof. William Gould of the Stanford School of Law.

Their action suggests "an eager readiness" to reverse much of the case law promoting union and employee rights in the past half century, he adds.

"Framers of the 1947 amendments to the National Labor Relations Act contemplated an independent general counsel appointed by the President. Short-run ideological motivation by the new Reagan Board means subversion of this principle."

The board's dissatisfaction and impatience with a general counsel appointed by President Carter led to this "short cut," Gould says.

The backlog of cases in Washington now is so bad that the Bureau of National Affairs was not able to publish an issue of NLRB decisions for one week in May. Only 16 unfair labor practice cases were issued in April.

For the first seven months of the current fiscal year, the NLRB has produced only half the number of cases as last year. The number of cases pending in Washington has doubled in the past two years.

"The image of a board at war with itself, unmindful of the modus vivendi between

William Gould

the general counsel and the board which has been the rule for 35 years, will not be forgotten by courts who are requested to defer to the board's expertise," Gould notes. "Even before this crisis, the courts were reversing the board without much consideration for the principle of deference."

Recent decisions have been heavily weighted in favor of conflict instead of cooperation between labor and management, he declares.

"Employee involvement in the product can and should be achieved through work group involvement in job design, suggestion boxes, quality circles and the like—and even worker participation before or on the board, as in the Chrysler-United Auto Workers relationship."

But this means that employees would have the interests of the company as well as themselves at heart, and this would divide their loyalties and undermine the adversarial model of labor-management negotiations.

Workers ought to be in a position to know the economic facts of life about their firms—not just in crises or "at the deluge," Gould believes.

"The Japanese have built a form of profit-sharing and concession bargaining into their wage system. . .In a good year, bonuses can consist of six months of normal wages and in a bad year nothing at all. We need to provide ourselves this kind of flexibility.

"Such a model assumes access to information that American unions do not have—a necessary prerequisite to the kind of responsible trade unionism for which so many employers claim to long. In that environment, labor, management, and the public will be the true winner."

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

42848-TC (JCC:8880) MISC PROFESSIONAL: Clinical Instructor teaches primary care associate program students; prov classroom clinical lectures, on-site visits to students in preceptorships; prov small group clinical skills & behavioral sci teaching; assist in the coord of clinical instruction & other program activities & research; QUALIFICATIONS: OR eligible to be certified as a FNP & PA; part-time clinical practice in the community; 2 yrs of clinical exp as a FNP; Masters degree in Health Services.; C07; $1333-1725.

20073-AW (JCC:1464) STU SERV OFFICER I: Act as Financial Aids Advisor; advise students & parents regarding eligibility for all types of financial aid; evaluate financial need using the Uniform Methodology of CSS, increasingly using computer terminal to interact w/ on-line data bases; formulte aid packages by determining amount & approp aid source to be offered to students; interview students on an indiv basis; recommend approp course of action to them; conduct indiv & group pre-loan interviews, etc; QUALIFICATIONS: must have successful financial aid exp at professional level; requires sensitivity & a proven ability to a wide variety of people; comfortable performing math calculations & capable of explaining them both orally & in writing; understand the policies & procedures which govern the aid programs.; C04; $1590-1983.

36401-JB (JCC:2120) ACCOUNTANT I: Respon for a variety of activities that contribute directly to the production of Univ's payroll & associated products (reports,etc); assure that all payroll jobs run in a timely & accurate manner; check outside tapes for accuracy before being put into the sys; data base errors must be corrected before entering the data into the data base master file; monitoring payroll updates & edit runs; working closely w/ CIT production staff to assist in processing the payroll properly; prep batches for processing; attend mtgs, etc; QUALIFICATIONS: Bachelor's degree in acctg or 4 yrs equiv exp; knowl of WYLBUR, SPIRES, EASY-MARK & other computer sys required or must be learned; good numerical, analytical & statistical skills & abilities; understand Univ policy.; C05; $1756-2202.

36396-JB (JCC:2254) FIN/MGMT ANALYST I: Perform analytical work supportive to the functions & respon of the Asst Controller & staff(5 people) involving primarily financial & other numerical data of acctg & reporting sys, operating & capital budget process, overhead allocation process, staff benefit & service ctr rate determination; gather & compile/analyze data fr a variety of sources; requires reading & understanding budget statements; expenditure & fund statements; G/L; invoices, charts & graphs etc; QUALIFICATIONS: ability to commu effectively w/ a wide variety of people; able to work in a support role to 6 people; numerical, analytical & statistical abilities incl calculations, extreme accuracy; close atten to detail; ability to understand Univ policy; some exp or ability to learn computer input/output & simple programming; equiv exp to bachelor's degree in acctg.; C05; $1756-2202.

31517-LL (JCC:3104) DEVEL ASST: Fixed term 9/1/83-6/30/85; Phone Appeal Associate coordinate phone appeals in approx 9 locations around the US; commu w/ volunteer chairmen to assure adequate enlistments & logistical preparations according to established program calendar; distribute prospect lists, rosters & other nec info to chairmen; train volunteers in tech of phone solicitation using Genl Appeal Program guidelines; determine that assignment cards are properly sorted; prep statistical summaries & report results; perform research on individuals fr public info sources, etc; QUALIFICATIONS: ability to travel away fr campus for long periods during fall & spring, incl wkends, & to work evenings of phone appeals; high energy level; exp in public speaking or training of small groups.; C05; $1756-2202.

42853-AW (JCC:4076) PROGR/ANALYST GEN II: 75%; fixed term 7/1/83-4/1/84; participate in the development & maintenance of admin sys; support production computing activities w/ broad programming skills, good user & peer working relationships; prov daily support on the admin of the PACNET sys; plan, design, document, code & test small projs; automatic Answering Feature; respon for documentation for ADMIN & CONTACT/EMS; QUALIFICATIONS: exp in a serv oriented production shop; familiarity w/ documentation & other admin procedures of the computer applications group; knowl of SPIRES & WYLBUR; excel oral & written commu skills; require 1-2 yrs programming w/ emphasis on business functions using SPIRES; exp w/ SPIRES subj & maintenance & record entry; some training in math; ability to write formats.; C06; $1461-1831.

39456-LL (JCC:6102) CLIN SOCIAL WORKER II: 50%; fixed term 9/1/83-8/31/84; provide brief counseling for the faculty, staff, & immediate families of Stanford Univ, Children's & Stanford Hospitals; develop edu'l workshops & facilitates support groups; QUALIFICATIONS: L.C.S.W. or equiv; requires demonstrated skill in above mentioned activities.; J03; $1051-1445.

42827-TC (JCC:6818) SOC SCI RES ASST II: Assist the Regional Dir of Stanford Area Health Edu Ctr & the Med Anthropologist in the Multicultural teaching program; proposal preparation & Regional report; assist the Regional contract w/ the Statewide Offc; collect & compile med edu data, target area info & health manpower data; compile bibliography on computer/compile patient info on computer; compile info on proposal for designation of National Health Serv Corps sites in AHEC target areas; QUALIFICATIONS: knowl of data processing & computer facility; interpersonal skills & exp in compiling & organizing data.; C04; $1590-1983.

30575-TC (JCC:8880) MISC PROFESSIONAL: Program Coord for Program in African & Afro-American Studies (AAAS); asst the Dir in the development & implementation of AAAS programs & activities; serv as liaison w/ participating faculty & other depts, Dean of Students Offc, Registrar etc; prov publicity for course offerings, lectures & other AAAS activities; monitor operating budget expenditures & prepare cost estimates for special programs & activities; also Program Coord for the Committee for Black Performing Arts (CBPA); asst in the planning, execution, fiscal monitoring of all events; serv as liaison w/ Dance Division, etc; QUALIFICATIONS: prev exp in academic environ; excel commu & organizational skills required; knowl of production requirements & performing arts events; familiarity w/ history & 1 trends in Black performing arts.; C04; $1590-1983.

33247-LL (JCC:5986) NURSE EDUC (PATIENT CARE): 80%; Clinical Nurse Specialist receives initial referral fr MD's, PHN's, etc in relation to services to be provided for all potential patients & families by Birth Defect Ctr staff; attends 3 clinics together w/ clinic nurses; evaluation of nursing needs; plans for discharge of BD patients, advises parents; maintains liaison w/ community agencies, refers & receives info fr agencies providing treatment & rehabilitation, etc; serv as consultant to agency staff, under supvn of BD Dir, for screening patients; participates in a consulting capacity for sch'l personnel in definition & implementation of Indiv Edu'l Program for child followed in BD Ctr Clinics, etc; QUALIFICATIONS: Master degree desirable, but not required; bkground & exp w/ children w/ developmental disabilities; knowl of genetics & genl pediatrics is valuable.; K06; $2009.

Bargaining unit

43704-TC (JCC:5638) LIFE SCI TECH I: TMS Unit; 50-62%; working w/ mice & rats, surgically removing spleens & other organs, making buffers & drug solutions; familiar w/ sterile tissue culture tech; QUALIFICATIONS: 1yr's exp in a res lab or equiv course work in biology or other lab science; must be willing to learn new res tech; must possess manual dexterity.; A18; $ 7.50.

42431-VW (JCC:5644) LIFE SCI TECH II: TMS Unit; 50%; involves work w/ mammalian cells in tissue culture; treatment of cells followed by measurement of protein & lipid content & composition, enzyme assays, receptor binding; measurement of survival by clonogenic assay; use of radioisotopes, gel electrophoresis, membrane isolation tech, spectrophotometric & fluorimetric assays & other tech related to the biochemistry & biophysics of cellular membranes; analyse data & prepare graphs; QUALIFICATIONS: exp w/ tissue culture & biochemicl assays, esp for proteins & lipids; will train in some tech if nec.; A24; $ 8.65.

22960-TC (JCC:5786) LAB ASST I: Work involved in the purification & assay of monoclonal antibodies for use in experiments carried out by others; ordering & maintenance of chemicals, media & plasticware for tissue culture; keeping records; making simple solutions; QUALIFICATIONS: 1 yr's exp in basic lab tech or equiv course work in a lab science; work will be closely supv'd; requires manual dexterity, habits of cleanliness, neatness, the ability to follow carefully detailed instructions & make clear, well ordered records.; A13; $ 6.68.

26757-JB (JCC:7654) CUSTODIAN: TMS Unit; 7:30-4pm; works under direct supvn; daily cleaning, mopping, waxing, vacuuming, cleaning restrooms, etc; washes walls & woodwork by hand or using industrial eqpt; spot clean, shampoos, waxes, dusts & oils furniture; QUALIFICATIONS: knowl of cleaning & waxing methods & mat'ls used in light cleaning; knowl of related safety procedures.; A13; $ 6.68.

40487-JB (JCC:8586) HEAT VENT A/C MECH MAINT: TMS Unit; 8-4:30; inspects, troubleshoots, repairs, & maintains refrigeration as it applies to food prep & storage, lab & res eqpt; all types of air conditioning units & their related eqpt; all bldg heating & cooling temperature control sys incl pneumatic, electric & electronic; all ventilations & air distribution sys incl fans, filter, belts, ducts, dampers, etc; all types of heating sys incl hydronic, radiant, warm air, gas, steam & electric; perform air balancing on the above sys, etc; QUALIFICATIONS: practical skills required, soldering, brazing, cutting; ability to read & interpret blueprints & wiring schematics; piping & plumbing tech; knowl of refrigerants & their proper application; knowl of special instruments & tools used extensively in HV&AC trade.; A35; $11.22.

New employee orientation

The next orientation session for new employees will be held at 9 a.m. Tuesday, July 19, in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

SLAC

94115-AW (JCC:7600) Contract Administrator: Prep, negotiate & administer SLAC subcontracts for design, construction, alteration, maintenance & installation of conventional & experimental facilities & eqpt; prep, coord & transmit to DOE required reprts for subcontracting activity & assure that required safety & fire prevention reviews are made; QUALIFICATIONS: college edu in Business Law, Economics & Accting or equiv; ability to read construction blueprints & specs exp in construction contract admin involving Govt procurement rules, policies & procedures; ability to commu orally & in writing.; C08; $2464-3000. APPLY AT SLAC

95773-AW (JCC:2058/2070) Admin Asst I/II: Supv clerical staff & operation of offc; procure computer related eqpt; administer computer maintenance contracts; expedite orders & process invoices; interact w/ SLAC personnel & vendors to resolve problems; prep DOE reprts; QUALIFICATIONS: AA degree in Business or equiv exp; 2 yrs admin level exp; good commu skills, both orally & in writing; good interpersonal skills; knowl of business procedures; purchasing & acctg skills desirable; knowl of computer terminology & ability to use terminal desirable; AAII performs above w/ extensive independence.; B16/C05; $1593-1671/1670-2100. APPLY AT SLAC

95616-JM (JCC:8880) Civil Engineer: Will do design work, develop schedules, write specifications, estimate costs & coordinate construction; QUALIFICATIONS: BS degree in Civil Engrg or equiv plus several yrs exp as a Structural Designer or Proj Engr; bkground should incl some or all of the following: drafting, designing, specification writing, cost estimating, field inspection & change-order negotiation; excel commu skills required.; C99; $2400-2800. APPLY AT SLAC

94908-JM (JCC:2596) SECY II-SPEC: Type genl corresp, tech reprts & papers; operate computer terminal for word processing; type purchase reqs, work orders & maintain files for them; perform various genl offc tasks; receive visitors; answer phones; arrange mtgs; make appts; QUALIFICATIONS: typ 60; ability to type physics & engrg papers on IBM Sel; good knowl of spelling, English grammar & punctuation; ability to operate computer terminal for word processing.; B12; $1310-1373. APPLY AT SLAC

95730-JM (JCC:8940) Misc Clerical/Offc Sys Spec: Input & format corresp, reprts, forms, on-line User Notes, VM Notebooks & VM Memos; develop, institute & maintain a training program for staff on use of various computer terminals; add modify & delete accts, etc in SPIRES; prepare computer sys graphs on a monthly 1 basis; asst in testing new sys features; route calls to approp staff; update on-line documentation files (DOCTEXT, INDICES & VTOC using XEDIT); QUALIFICATIONS: typ 55-60; several yrs job-related exp or equiv edu/training; ability to work independently; exp interfacing w/ a variety of persons; knowl of English spelling, punctuation, syntax; comprehensive knowl of data processing terminology; ability to use & understand WYLBUR, XEDIT, SCRIPT & TOPDRAW; ability to use VM & SVS; some programming training desirable.; B14; $1440-1514. APPLY AT SLAC

95729-JM (JCC:5284) COMPUTER OPR TRNEE: TMS Unit; rotating shift; 15 month training program; operate peripheral units such as tape drives, disk drives, card readers, printers, monitor & reprt eqpt malfunctions & output errors; fulfill admin reporting requirements; QUALIFICATIONS: high sch'l or equiv; some exp in computer facility working in dispatch, disk, tape area; must know how to clean eqpt, change printer ribbons/papers; good reading, oral & arithmetic skills.; A00; $1300. APPLY AT SLAC

94640-JM (JCC:6492) LAB MECHANICAN III: TMS Unit; machine tool repair & rebldg; do complete reconditioning of worn machines, incl scraping & aligning of slide ways & spindles; do troubleshooting & repair serv of machine tool clutches, gear boxes, hydraulics, electrical control circuits & similar components; QUALIFICATIONS: completion of machine shop accredited 4 yrs apprenticeshlp or equiv schooling & exp; extensive exp in applied machining; ability to operate lathes, mills & grinders; exp in machine tool rebldg, erection & installation.; A41; $2250. APPLY AT SLAC

95075-JM (JCC:6564) SAW SHOP ATTENDANT: TMS Unit; maintain machine shop tool crib which incl inventory control, writing of reqs for cutting tools or supplies; use of pickup, forklift & 20 & 50 ton shop cranes; clean eqpt; QUALIFICATIONS: knowl of machining & machine shop practices; high school machine shop course or machine shop helper bkground desirable; basic math required; ability to write legibly; bkground in storekeeping, warehousing, etc helpful; forklift & rigging exp needed; ability to qualify for govt driver's license.; A26; $1577. APPLY AT SLAC

94641-JM (JCC:6564) SAW SHOP ATTENDANT: TMS Unit; maintain machine shop toolroom & stockroom; order & cut to size metal stock & material; check out tools & eqpt & maintain inventory; keep tools in good working order; respon for all housekeeping in order to meet OSHA standards; asst tool crib customers; QUALIFICATIONS: have demonstrated mechanical aptitude & good working knowl of basic math incl ability to read blue prints & do simple layouts; good knowl of machine shop tools & practice; ability to lift heavy weights; ability to qualify for govt driver's license.; A26; $1577. APPLY AT SLAC

95514-JM (JCC:6646) SR S&E TECH - ELECTRON: TMS Unit; troubleshoot, repair, modify, inspect & do preventive maintenance of installed RF drive sys eqpt; build, install & test new electronic & microwave eqpt; document & keep records; QUALIFICATIONS: AA degree in electronics or equiv; 1 couple yrs exp in microwave/electronics industry; basic knowl of microwave practice, analog & microwave test instruments; good skills in use of hand tools; some drafting skills desirable.; A34; $1901. APPLY AT SLAC

Nonexempt

28843-PM (JCC:8940) MISC CLERICAL:

28847-PM (JCC:8940) MISC CLERICAL: 75%, fixed term 9/15/83-6/30/84; asst in clerical & course-related tasks in Human Biology Program; attend lectures & wkly course assistant mtgs; conduct 3 sections/wk; hold wkly offc hrs; write rough draft exams; grade exams & assignments subj to professor's approval; coord course handouts, room scheduling, & spec events; reserve readings, prep review sheets & sessions, & problem sheets; QUALIFICATIONS: prev teaching exp is desirable but not required; familiarity w/ Human Biology Program; send appl/resume to R. F. Thompson, Bldg. 80, Room 81.; B12; $983-1030.

40339-PM (JCC:2596) SECY II-SPEC: Serv as sec to both the Administrator of the Heart Disease Prevention Program & the Proj Coordinator for the Five-City Proj; typing in final form fr dictation corresp, manuscripts for publication, reports, proposals, forms, etc; edit various proj mat'ls; reconcile budget statements for several Univ accts occasionally; schedule mtgs; maintain a record of proj decisions & activities, & a Heart Health Proj Lib; QUALIFICATIONS: typ 55; sec'l of offc exp w/ med terminology preferred; good vocabulary & knowl of grammar; ability to use or willingness to learn WYLBUR, SU word processing sys, & Apple computer programs; send appl/resume to Lillian O'Toole, HRP Bldg, Room 114, 497-6145.; B12; $1310-1373.

27189-LL (JCC:5940) CLINICS STAFF NURSE IV: A six-year research proj is to be initiated to determine the effects of cardiovascular risk reduction on the progression of coronary atherosclerosis; help conduct the patient edu & treatment program & assist w/ med evaluations; duties incl patient recruitment, development of edu program & mat'ls, patient counseling cardiovascular risk assessment & maintaining patient records; limited supvn of med assistants or technicians required; QUALIFICATIONS: A RN degree required w/ specific training & exp in the care of patients w/ cardiovascular disease; prior res exp required; counseling, patient edu & cardiac rehabilitation skills preferred; high level of respon for proj coord; job sharing may be a possibility.; K04; $2061-2229.

Palm, Hoover Institution, Stanford, CA 94305 or call 497-3563.; B14; $1440-1514.

Jeannie Thomas reports identities of alternatives to TIAA-CREF

Starting in September, Stanford faculty and exempt staff will have a choice of four alternatives to TIAA-CREF (Teachers Insurance and Annuities Association-College Retirement Equity Fund) for the investment of their basic retirement plan monies.

The alternatives being added are:

Fidelity Distributors Corporation

The Prudential Insurance Company of America

Scudder, Stevens, and Clark Investment Counsel

The Vanguard Group of Investment Companies

Selection followed careful analysis by members of the Personnel Department and Treasurer's Office, in conjunction with Dan White of William M. Mercer, Inc., an expert consultant in the pension field. Faculty members of the Ad Hoc Committee on TIAA-CREF Alternatives, whose report recommended the addition of investment alternatives, followed the selection process carefully.

The Fidelity Group is one of the oldest and largest financial services organization in the country.

Prudential is a mutual life insurance company which first began investing funds for group pension clients in 1928.

Scudder, Stevens, and Clark is an independent, privately-owned investment firm which formed the first no-load mutual fund in 1927.

Vanguard is an investment service organization which started its first mutual fund more than 50 years ago.

Detailed information about these four alternatives and TIAA-CREF will be sent to faculty and exempt staff in early September.

With the addition of these investment alternatives Stanford joins other universities, including Chicago and John Hopkins, in offering its faculty and exempt staff significantly increased flexibility in the investment of their retirement funds, according to Jeannie K. A. Thomas, manager of benefits and records.

Accidents and injuries

Campus housing listed

The Office of Housing Programs (105 Encina Hall) publishes a monthly listing of single family homes and condominiums for sale on the campus to members of Eligibility Pool I. Eligibility Pool I comprises members of the Academic Council and those senior staff whose positions are classified in the NA-11 curve range. Those members of Eligibility Pool I who are actively looking to purchase homes may receive this monthly listing by calling Molly Cleland (497-2239).

Program set on stepfamilies

The Stanford HELP Center will offer a lecture discussion on "Stepfamilies—Myths and Realities," from 12-2 p.m. Friday, July 15, at Tresidder Union room 282.

Participating in the discussion are Drs. Emily and John Visher, founders of the Stepfamily Association of America, Inc. They are authors of *Stepfamilies—Myths and Realities*, and *How to Win as a Stepfamily*.

Special emphasis will be given to the special characteristics of stepfamilies, common myths, the integration of two households, and challenges faced with the stepfamily.

All members of the Stanford community are invited to attend.

Saturday noon performances cancelled by Summer Theater Workshop

Saturday noon-time performances of the Stanford Drama Department's Summer Theater Workshop have been cancelled.

Performances will continue each week Wednesday through Friday at noon with evening performances at 8 p.m. on Friday and Saturday. All performances are in The Nitery, located in Building 590 of the Old Union. Each performance is approximately 45 minutes in length. Admission is free.

Steven Weeks directs Romulus Linney's *Tennessee*, a look at the life of a woman in the back country of North Carolina in the 1870s, July 13-15 at noon and July 15-16 at 8 p.m.

Christine Roum directs an original play by Stanford playwright Becky Smith, *Man Strapped to Bridge*, a romantic comedy, July 20-22 at noon; July 22-23 at 8 p.m.

(see story below)

An early one-act by Eugene O'Neill written in 1919, *The Rope*, will be performed July 27-29 at noon and July 29-30 at 8 p.m. Directed by Johanna Dickey, the play is an allegory of the prodigal son with an unusual twist.

Christopher Durang's brilliant comedy, *An Actor's Nightmare*, directed by Leigh Sealy, will be performed August 3-5 at noon; August 5-6 at 8 p.m.

The final show, *Summer's End*, directed by Lorne Buchman, is an original script and combines drama with song and dance. Performance dates are August 10-12 at noon; August 12-13 at 8 p.m.

New Stanford play presented July 20

Beginning at noon on Wednesday, July 20, in the Nitery theater, the Stanford Drama Department's Summer Theater Workshop will present a new play, *Man Strapped to Bridge*, by Stanford playwright Becky Smith.

Smith, a student in the Stanford masters program in film, has been active in the Ram's Head winter one-acts as both playwright and director. In 1982 she wrote and directed *The Lambchop Murders*, and in 1983, *Vinyl Highways Over Paris*.

Man Strapped to Bridge, a light comedy about love, is directed by Christine Roum, who received her B.A. in June with a double major in drama and in film. In September she will begin an M.F.A. program in film production at UCLA. She directed the successful productions of Mark Medoff's *The Wager* in the Drama Department's 1982-83 season. She was most recently seen in the role of the brassy, wisecracking May Daniels in *Once in a Lifetime*.

The cast of *Man Strapped to Bridge* includes Lisa Glass as Faith, Todd Salovey as Jean-Paul, and John Atthowe as Nick. Marta Carillo, Jim Glaser, Cynthia Williams, and Joshua Levy complete the Workshop ensemble. Undergraduate senior Tom Wood is both set and lighting designer; costumes are by Connie Strayer.

Performances are at noon Wednesday through Friday, July 20-22; and at 8 p.m. Friday and Saturday, July 22-23. Each performance is approximately 45 minutes in length. The Nitery theater is located in Building 590 of the Old Union. Admission is free.

Charlotte Mattax, a Juilliard graduate and D.M.A. candidate in Early music, will be giving a free harpsichord recital at 8 p.m. Friday, July 15, in Annenberg Auditorium. She will perform works by Sweelinck, Tomkins, Rameau, Bach, and Scarlatti.

Stan Getz

Richie Cole

Jazz legend Stan Getz to perform at Tresidder in exclusive appearance

Jazz legend, Stan Getz, will perform at 4 and 7:30 p.m. Saturday, Aug. 6, outdoors on the Upper Deck of Tresidder Union in an exclusive Bay Area appearance.

Joining Getz will be the other members of his quartet, Jim McNeely, Marc Johnson, and Victor Lewis.

Tickets are $7 with a student ID and $10 general admission, and are available through all BASS outlets and the Tresidder Ticket Office.

Getz, who has been called "the poet laureate of the tenor sax," has been a jazz artist for over four decades. He and his quartet will be in Palo Alto as faculty-in-residence for Week II (July 31-Aug. 6) of the Stanford Jazz Workshop.

Also in Palo Alto as faculty-in-residence for Week I (July 24-30) of the Stanford Jazz Workshop will be popular jazz saxophonist Richie Cole.

Cole will be appearing in concert at 7:30 p.m. Wednesday, July 27, in the Tresidder Lounge at Stanford.

Tickets are $4 with Student ID and $5 general admission and are available at BASS outlets and at the Tresidder Ticket Office.

Both concerts are presented by Student Arts at Stanford (STARTS) in conjunction with the Stanford Jazz Workshop.

CCRMA concert set for July 14

Computer music under the stars will be presented by the Department of Music's Center for Computer Research in Music and Acoustics (CCRMA) at 8:30 p.m. Thursday, July 14, in Frost Ampitheater.

Works by composers associated with CCRMA will include *The Digital Domain* (1983) by Elliot Mazer, Andy Moorer, and Loren Rush; *Dreamsong* (1978) by Michael McNabb; *Garden for Orpheus* (1979) by Paul Wieneke; *Call to the Spirits* (1981) by Janis Mattox; *Rhapsody for Flute and Computer* (1971) by Leland Smith; and *Colony* (1983) by Bill Schottstaedt.

Two of the pieces will feature live performers. *Call to the Spirits* is the first movement of *Shaman*—a four-part musical theater piece featuring percussionist George Marsh and computer-generated sound.

Music Prof. Leland Smith's work will feature flutist Yvonne Kendall, who is working towards her D.M.A. in music. He hopes to have a computer robotic arm in place by July 14 to give her time cues.

Tickets for the concert are $6 general, $3 students and senior citizens, available at Tresidder Ticket Office (497-4317) and the door. The audience is advised to bring blankets.

50-plus, five-mile fun run set July 17

A "50-plus fun run," open to all runners over 50, will start at 8:30 a.m. Sunday, July 17 at Foothill College, according to organizer Donald Carpenter, adjunct professor of electrical engineering at Stanford.

The five-mile run includes slight grades. A $1 donation is requested for refreshments. Further information may be obtained from Carpenter at 327-8043.

Harlan Hokin

Devotional vocal music at Mem Chu

The Department of Music will present a free concert of devotional vocal music of the Middle Ages at 8 p.m. Wednesday, July 27, in Memorial Church under the direction of Harlan Hokin, lecturer in early voice.

Hokin will be joined by early music doctoral students Patricia Halverson, Vera Kochanowsky, and Ruth Van Baak-Griffioen in music primarily from 14th-century France.

Featured work on the program will be *Le Lay de la Fonteinne* by Machaut—a long narrative poem. The four singers will also perform an unstaged version of the 14th-century anonymous miracle play, *Planctus Mariae*.

Art Gallery show memorabilia of the Red Barn, now set for renovation

In conjunction with the renovation of the Red Barn on campus, an exhibition of paintings, drawings, prints, photographs, and memorabilia related to Leland Stanford's interest in breeding and training fine trotting horses will be shown in the Art Gallery through August 14.

Stanford's Palo Alto Stock Farm was once the finest stable in the country and was known throughout the world. In operation for 27 years, it was at its peak between 1880 and 1891.

Jockeys' silks, boots, bits, bridles, and other paraphernalia removed from the stables and stored in the Museum's basement will be on view together with 19th-century tools from the blacksmith's shop.

A feature of the exhibition will be the historic photographs taken of Stanford's horses during the 1870's by Eadweard Muybridge. Among these photographic experiments was the development of the zoopraxiscope, a machine that projects images from rotating glass disks in rapid succession.

The Art Gallery, on the Stanford campus next to the Cummings Art Building, is open Tuesday through Friday from 10 a.m. to 5 p.m.; Saturday and Sunday, from 1 to 5 p.m. It is closed on Mondays. Admission is free.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the two weeks in which the events occur. The next deadline is Wed., July 22, to cover the two weeks of Mon., Aug. 1, through Sun., Aug. 14. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

THURSDAY, JULY 21

Drama Dept Summer Theater Workshop: "Man Strapped to Bridge" by Becky Smith. An original play by a Stanford playwright, directed by Christine Roum; a romantic comedy. Noon. The Nitery. Free.

STARTS-Jazz Workshop Speaking Jazz Lecture Series: "The Creation of Music"; composer, vibraphonist, living jazz legend Bobby Hutcherson speaks on creating jazz. 7:30 p.m. Tresidder Lounge. $3.

FRIDAY, JULY 22

Drama Dept Summer Theater Workshop: "Man Strapped to Bridge" by Becky Smith. An original play by a Stanford playwright, directed by Christine Roum; a romantic comedy. Noon, 8 p.m. The Nitery. Free.

SATURDAY, JULY 23

Drama Dept Summer Theater Workshop: "Man Strapped to Bridge" by Becky Smith. An original play by a Stanford playwright, directed by Christine Roum; a romantic comedy. 8 p.m. The Nitery. Free.

SUNDAY, JULY 24

The Lively Arts at Stanford: Midsummer Mozart Festival, directed by George Cleve. Program: Symphony No. 27 in G, K. 199; Piano Concerto No. 22 in E-flat, K. 482, Jean-Philippe Collard, piano; Flute Concerto No. 1 in G, K. 313, Maria Tamburrino, flute; Symphony No. 31 in D, K. 297, "Paris." 2:30 p.m. Memorial Auditorium. $12, $9, $7; students: $10, $7, $5.

Children's Health Council: 24th Annual Summer Symphony. Benefit with Mitch Miller conducting the San Jose Symphony Orchestra with guest artist Rosemary Clooney. 5 p.m. Frost Amphitheater. $13, $11(students, seniors: $10.50, $8).

TUESDAY, JULY 26

Stanford Museum Lunch Hour Tour: "The Stanford Legacy." 12:15 p.m. Stanford Art Museum. Free.

STARTS-Jazz Workshop Speaking Jazz Lecture Series: "Latin Jazz: A Discussion and Concert with Canoneo," Paul Potyen and Michael Spiro. 7:30 p.m. Tresidder Lounge. $3.

WEDNESDAY, JULY 27

Drama Department Summer Theater Workshop: "The Rope" by Eugene O'Neill. Directed by Johanna Dickey, this early one-act play by O'Neill is an allegory of the prodigal son with an unusual twist. Noon. The Nitery. Free.

Stanford Museum Lunch Hour Tour: "The Stanford Legacy." 12:15 p.m. Stanford Art Museum. Free.

Aero-Astro-NASA-ASEE Seminar: "Expanding Horizons of Cosmology"; Robert V. Wagoner, Dept of Physics, Stanford. Open to the public. 8 p.m. Terman Auditorium. Free.

Music Department Concert: Devotional Music of the Middle Ages; Harlan Hokin, singer and director, with singers Patricia Halvorson, Vera Kochanowsky, and Ruth Van Baak-Griffioen. 8 p.m. Memorial Church. Free.

THURSDAY, JULY 28

Drama Department Summer Theater Workshop: "The Rope" by Eugene O'Neill. Directed by Johanna Dickey, this early one-act play by O'Neill is an allegory of the prodigal son with an unusual twist. Noon. The Nitery. Free.

FRIDAY, JULY 29

Drama Department Summer Theater Workshop: "The Rope" by Eugene O'Neill. Directed by Johanna Dickey, this early one-act play by O'Neill is an allegory of the prodigal son with an unusual twist. Noon, 8 p.m. The Nitery. Free.

SATURDAY, JULY 30

Drama Department Summer Theater Workshop: "The Rope" by Eugene O'Neill. Directed by Johanna Dickey, this early one-act play by O'Neill is an allegory of the prodigal son with an unusual twist. 8 p.m. The Nitery. Free.

SUNDAY, JULY 31

The Lively Arts at Stanford: Midsummer Mozart Festival, directed by George Cleve. Program: Overture, Trio and Quartet from "Lo Sposo Deluso," K. 430, with soloists Nile Norton and Baker Peebles, tenors, and Evelyn de la Rosa, soprano; Sinfonia Concertante for Violin and Viola in E-flat, K. 364, Daniel Kobialka, violin; Robert Levine, viola; Two Marches in D, K. 335-320a; Serenade No. 9 in D, K. 320, "Posthorn." 2:30 p.m. Memorial Auditorium. $12, $9, $7; students, $10, $7, $5.

Music Department Concert: Summer Choir; William Ramsey, director. Program: Mozart's Coronation Mass and Schubert's Mass in C. 8 p.m. Memorial Church. Free.

EXHIBITS

The Stanford Quadrangles: Design Construction. An exhibition of materials relating to the early planning development and construction of the university; compiled from the resources of the University Archives. Second floor gallery, Green Library. May 23-July 28.

"Propaganda Posters of Two Revolutions." Features over 40 posters from the Russian Revolutions and Civil War, 1917-1922, as well as the German Revolution of of 1918-1919 and the German elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover Memorial Exhibit Pavilion. June 8-Jan. 31.

The Stanford Horse Show. In conjunction with the renovation of the Red Barn at Stanford, the exhibit contains paintings, photographs, and Currier and Ives prints of Leland Stanford's celebrated trotting horses, bred and trained in Palo Alto. T-F 10-5; S-S 1-5; closed Mondays. Stanford Art Gallery. June 28-Aug. 14.

Paintings by Liz Cheney. Atmospheric style and designs by a student of the Stanford Fine Arts Dept. Upper Lobby of Tresidder Union. July 3-Aug. 1.

Photographs by Aurangreb Khan. Coffee House Gallery, Tresidder Union First Floor. July 3-Aug. 1.

Batik by Sharon Chacko of Kingston, Jamaica. International Center. July 4-Aug. 14.

Boston, MIT to try TVI with Gibbons

Starting this fall, a Stanford engineering professor will begin work with Boston high school teachers and MIT students to bring courses to high school students via tutored viedeotaped instruction (TVI).

Based on 10 years experience and evaluation, Prof. James Gibbons believes TVI is at least as good as live classroom instruction for subjects ranging from math, physics, and engineering to drug rehabilitation and poetry.

When TVI is properly used, students can—and have—outperformed those taking identical material in a regular classroom setting. TVI can greatly extend the reach of scarce professionals at very low cost, he adds.

TVI uses unrehearsed, unedited videotapes of regular lectures, recorded directly in a live classroom.

The tapes are viewed by groups of four to eight students, who are encouraged to ask questions and interrupt the tape frequently by a tutor.

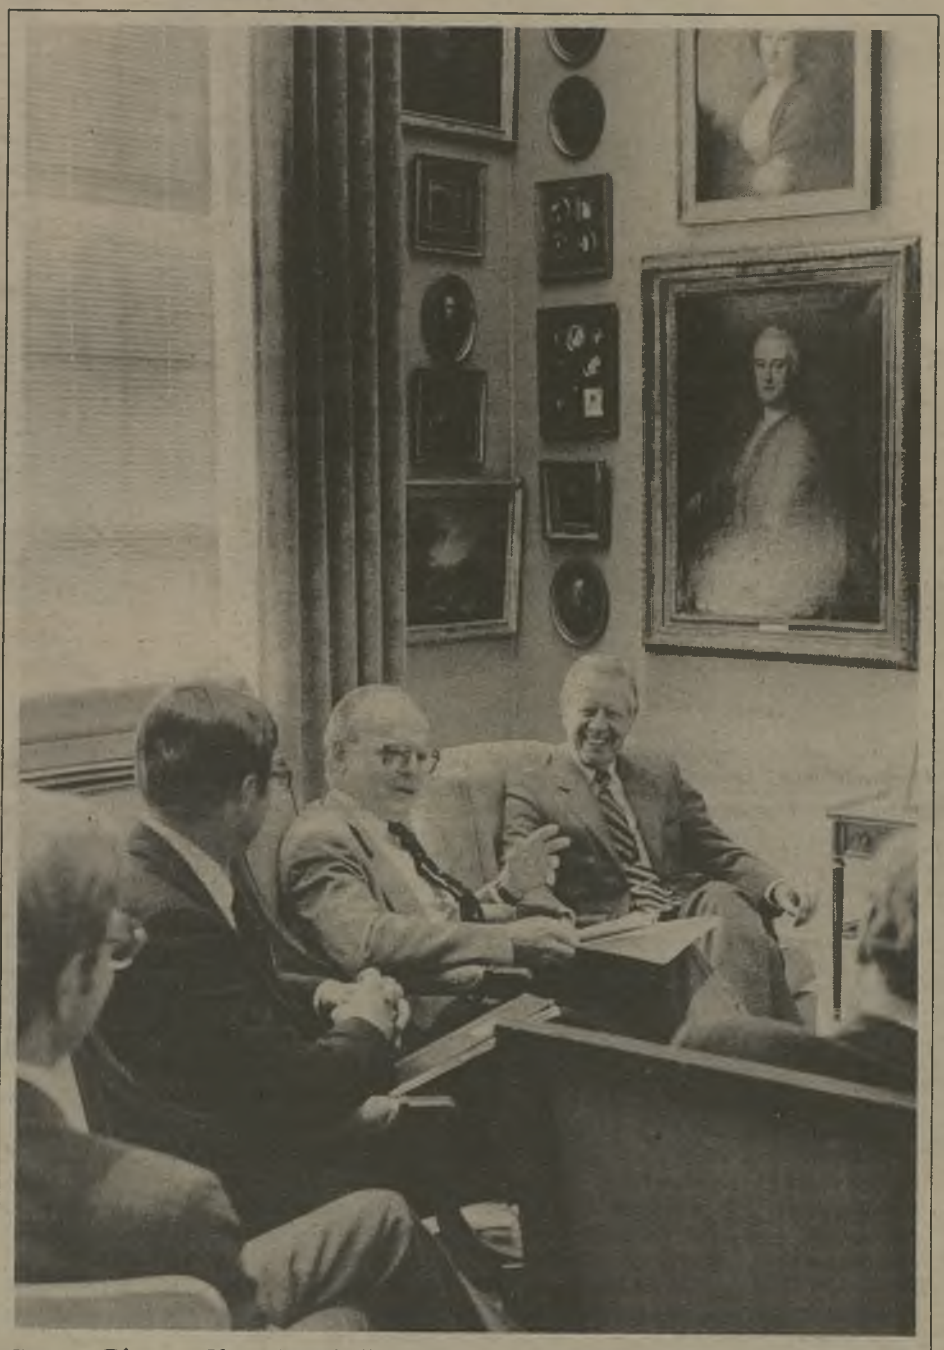
"The tutor cannot and should not be expected to teach the course in any way," says Gibbons. She should want to review the subject herself, help stimulate discussion, and call the instructor when help is needed in answering questions.

"Straight-A students from MIT and Stanford have proven to be acceptable tutors. But some of our best tutoring has come from students who may not have taken the course or who had difficulty with it. They are interested in learning the material and often can identify more readily with problems their students are having."

For engineers, experience as a TVI tutor appears helpful for becoming project managers.

Instead of providing answers, the tutor helps a group of colleagues think about a problem and develop the broadest range of perspectives they can.

In difficult lectures, the videotapes may be interrupted every five or 10 minutes for about five minutes of class discussion.



Gibbons has experimented with TVI using math, physics and electrical engineering courses at Hewlett-Packard since 1972, and with several other companies since then.

TVI has been used at Stanford for classes in electrical engineering, engineering and economic systems, and English.

It also has been used to provide Stanford courses to Japanese engineers and to provide family rehabilitation of Eskimos with drug-related problems.

Currently TVI has been applied at Harvard Medical School, the University of Massachusetts at Amherst, Aston University in Birmingham, England, the

Academic freedom abridged by ASSU in McCloskey class

Stanford University has officially apologized to former Congressman Paul N. (Pete) McCloskey for violations of his academic freedom as a guest professor of the Associated Students this spring.

The apology was sent to McCloskey July 25 by Provost Albert Hastorf, following a faculty review of the written record of events surrounding McCloskey's three-unit course on "The Congressional Decision-Making Process, 1964-83."

Finally, "please accept my personal apologies and those of Stanford University for the infringements upon your academic freedom here, as well as the academic freedom of your students," Hastorf wrote McCloskey.

"I also apologize for any public embarrassment that this might have caused you.

"Perhaps it will be of some compensation to you to know that the lessons that have been learned from this case will cause us to revise our policies and procedures so that future (ASSU) guest professors and other instructors at Stanford will without question enjoy the special protections that their positions warrant. You have therefore—albeit inadvertantly—participated in the teaching process at Stanford above and beyond Political Science 7."

Hastorf said the University would not authorize academic credit for any course proposed by the Associated Students'

Rare reversal

Hastorf backs Freedman for tenure

Stanford Provost Albert H. Hastorf will recommend Assistant Prof. Estelle Freedman of the History Department for tenure.

An award-winning teacher, Freedman played a central role in developing the feminist studies program at Stanford. Her case has attracted wide interest within the academic community nationally.

"We're really delighted," commented Prof. Barbara Babcock of the Stanford Law School, who coordinated her support.

In a telephone interview, Freedman said "I'm relieved that the waiting is over, pleased at the recommendation of the Provost, and grateful for the support of friends and colleagues. Now, I'd like to just work."

Winner of the Dinkelspiel award, the University's highest honor for contributions to undergraduate education, she currently is on leave with a National Endowment for the Humanities fellowship.

Hastorf's action, announced Thursday, July 21, follows the recommendation of Vice Provost Herant Katchadourian, who served as appeal officer in a grievance by Freedman.

Hastorf said his decision was made "with great difficulty" because "a most careful consideration" had been given the case by Dean Norman K. Wessells of the School of Humanities and Sciences.

Following the advice of the School's Appointments and Promotions Committee, the dean had recommended against tenure. Reversals at the provostial level are quite rare.

Hastorf stressed that "no evidence of sex-based discrimination" had been found, but that his provostial responsibility was "to take a view that gave recognition, where appropriate, to University programs such as the Center for Research on Women and the Feminist Studies Program."

He explained that Freedman's case now

Alexander George to share MacArthur prize with wife

Prof. Alexander George, 63, Stanford political scientist specializing in U.S.-Soviet relations, Wednesday, July 20, was named one of 14 MacArthur Prize fellows.

George will receive totally unrestricted awards amounting to $295,200 over the next five years from the John D. and Catherine T. MacArthur Foundation of Chicago.

(Previous recipients of the MacArthur prize at Stanford include Profs. Bradley Efron and Persi Diaconis, statistics; William Durham, anthropology; and Charles Bigelow, computer science and art. Another newly announced recipient, Prof. Richard Schoen of UC-Berkeley Department of Mathematics, will teach at Stanford during 1983-84. A total of 95 prizes have now been awarded.)

George said he was "stunned with the good news" when the foundation notified him of the award Friday. "It's just wonderful. I wish more people could be so honored. Many of my colleagues at Stanford and elsewhere are more deserving."

The award will enable his wife, Julie, to continue their collaborative work on President Woodrow Wilson, first published in "Woodrow Wilson and Colonel House," (1958) widely regarded as a classic study of the role of personality in politics.

"During the past five years, Julie's research has led to an interesting and productive collaboration between us and Dr. Michael Marmor of the Stanford Medical School. Now the Wilson project can go full speed ahead," George notes.

George's continuing effort to bridge the gap between theory and practice in foreign policy will focus on managing Soviet-American rivalry and on using historical cases to develop theories relevant to foreign policy makers.

Winner of the 1975 Bancroft prize for his book on *Deterrence in Foreign Policy*, George warned earlier this year that the steady deterioration in U.S.-Soviet relations has created "dangerous instability and uncertainty."

While both sides may be drifting toward a second Cold War, "they continue to have a common interest in managing their rivalry in order to avoid war threatening crises," he wrote in his latest book, *Managing U.S.-Soviet Rivalry: Problems of Crisis Prevention.*.

In a book on *Force and Statecraft: Diplomatic Problems of Our Time*, coauthored with Stanford history Prof. Gordon Craig earlier this year, George said moral perfectionists in foreign policy "provide a useful safeguard against the tendency of practical men to engage in moral self-deception."

Alexander and Juliette George

Craig and George developed the book from extensive case histories in 19th and 20th century diplomacy for a course they taught jointly.

"Teaching is an integral part of research," George said. He will divide his time this fall between a seminar on managing American-Soviet relations and working with Prof. John Lewis at the Center for International Security and Arms Control under a grant from the Hewlett Foundation.

He is working as an informal consultant with Dr. David Hamburg, president of the Carnegie Corporation and former Stanford professor of psychiatry, on new research initiatives on problems in American-Soviet relations.

George will participate in a study of regional conflict management with scholars from the Soviet Academy of Sciences and others at the Dartmouth conference, sponsored by the John F. Kettering Foundation. He also is working with the John F. Kennedy School of Government at Harvard in a study on avoiding nuclear war with the Soviets.

A Stanford faculty member since 1968, George was designated the first holder of the endowed Graham H. Stuart professorship in international relations in 1978. A native of Chicago and holder of two degrees from the University of Chicago, he worked 20 years at the RAND Corporatiopn before coming to Stanford.

The University has provided "a really supportive environment" for long-range research, he notes. The opportunity to teach in collaboration with Gordon Craig has been "a great pleasure." George plans to continue teaching an advanced seminar to show how case studies from diplomatic history can contribute to modern foreign policy.

"Friday was a good day. It was almost too much," George said. Besides the MacArthur call, he learned that a Stanford-Berkeley joint proposal for a new center to stimulate research and training in the study of Soviet foreign policy would receive $1 million from the Rockefeller Foundation.

On Tuesday, he and his wife spent four hours with a crew moving his mother into a new apartment. "That brings you back to reality in a hurry," he said.

His only regret is that he cannot personally thank his benefactors at MacArthur, since those who made the selection remain anonymous. "It's hard to thank an institution without conveying appreciation to individuals."

But if his long-term interest in U.S.-Soviet relations reduces the risk of conflict between the two superpowers, a lot more people may have reason to be grateful.

—Bob Beyers

Mary Lou Allen heads cable TV group

Mary Lou Allen, director of the Stanford Instructional Television Network, will head the Stanford Cable Television Steering Committee.

Her appointment, effective immediately, was announced by Robert L. Street, vice provost for academic computing and information systems.

The Steering Committee will provide policy guidance in the University's dealings with Palo Alto, Santa Clara County and potential cable vendors, and in the development of internal procedures for cable television on campus, according to Street.

An assistant dean in the School of Engineering, Allen serves as general manager of a four-channel TV network broadcasting 50 courses in engineering and the sciences each academic quarter to 150 Bay Area high technology companies. The network has a full-time staff of 15, reaches about 1,500 students, and has an annual income of about $3 million.

Faculty openings

Electrical engineering professorship

The Department of Electrical Engineering seeks a professor or associate professor (teaching). Primary responsibilities are for undergraduate and first-year graduate teaching and for supervision and development of undergraduate curriculum. Experienced college or university teacher preferred. Record of text writing desirable.

Send resume and names and addresses of references by Dec. 1, 1983, to Prof. Robert L. White, chairman, Search Committee, Department of Electrical Engineering, Stanford University, Stanford, Calif. 94305.

Stanford University is an Affirmative Action, Equal Opportunity Employer and welcomes applications from women and minority groups.

Linvill honored with AEA medal

The American Electronics Association has given its 1983 medal of achievement to Prof. John Linvill of the Stanford Department of Electrical Engineering.

The award recognizes "significant contributions to the advancement of electronics."

A Stanford faculty member since 1955, Linvill was chairman of the Electrical Engineering Department for 17 years. He currently serves as codirector of the Center for Integrated Systems.

Paul Kirkpatrick remembers when top scientists had to clean up their own laboratories

After 52 years on campus, one of the grand old men of physics looks back on a career in which he did it very much his own way. (First of two articles.)

Two old friends: Emeritus Prof. Paul Kirkpatrick, 89, with Danny K., the family's 17-year-old male cat.

PHOTOS BY CHUCK PAINTER

BY DONALD STOKES

After four decades of research in x rays Paul Kirkpatrick can remember the time when research was often an orphan in academe. Since then, he feels, research has tended to dominate teaching.

Kirkpatrick, with his student Albert Baez, was the first to call attention to a method of making x-ray images by optical reflection. He was also an innovator of holography in the U.S.

He recalls the time when distinguished scientists had to do their own washing-up chores as there was no budget to pay the necessary 25 cents an hour to cleaning people.

Now entering his 90th year, Kirkpatrick has always regarded teaching as of equal importance to research in universities.

Kirkpatrick is a familiar figure on the Stanford campus, where he cycles every day. Tall, erect and outspoken, he is tart in his views on many aspects of modern education. Having gotten his start in a one-room schoolhouse, he sees little evidence that modern students can spell or express themselves much more adequately than during his schooldays.

In view of his long acquaintance with x rays he was asked to comment on the recent flight on spacecraft Challenger by Stanford alumna Sally Ride, whose doctoral thesis had been on x rays in interstellar space.

"Sally Ride shows what may and probably does happen to whatever x rays there are in interstellar space," he said in a campus interview. "She is a theoretical physicist who draws mathematical conclusions from the known properties of x rays and the great variety of atomic particles thought to be distributed through galactic space."

He agreed that 19 years ago he had been elated to hear that the photon-catching assembly other scientists had built and launched had sent back the first information on x rays from outer space. "I am just an interested spectator, that's all" he said.

Kirkpatrick believes that studies of x rays from outer space have already revealed information of importance. He maintains an interest in the latest developments though he does not read enough about them to feel that he can contribute anything important.

Kirkpatrick and Mary Rose, his wife of almost 60 years, live on Santa Teresa Street, Stanford, in an attractive house which they designed themselves five years after they arrived on campus 52 years ago. Their property includes 14 different fruit trees and a 100-foot redwood, which Kirkpatrick planted himself.

The swing that hangs from an ancient oak in the garden has borne many generations of children, including those of Kirkpatrick's students and their offspring. There is a huge clamshell from the Philippines which measures two feet across. Mrs. Kirkpatrick is the horticultural authority and the planner of the densely-planted half-acre.

Kirkpatrick has been a life-long vegetarian, non-smoker and non-drinker. "I have never felt the need to conform" he says,"whether in the cut of my clothes, the accoutrements of my bicycle, fads of speech, the momentary aversions and enthusiasms for current songs, women, car models, or recreations.

"This independence or obstinacy is traceable from childhood through college and World War II experience, and possibly clear up to date, though I have mellowed somewhat since passing the age of 50.

"When boys began experimenting with tobacco I saw no reason for going along with what even then was suspected of being an unhealthy habit. When alcoholic beverages became fashionable instead of slightly disgraceful in middle-class American life I continued my teetotalism, perhaps because it would have been embarrassing to acknowledge that I was changing a lifelong habit solely because others were doing it.

"It was the same with sexual abstention and language habits when I suddenly descended from a teaching post in a highly proper college to the rear ranks of the U.S. Army.

"It would be very easy to claim that this personal consistency had something to do with virtue, or that it was maintained through heroic struggle. Nothing of the kind. I did as I felt disposed to.

"It would be pleasant to suggest that these oddball characteristics at an early age were premonitions of the great originality later to be manifested in scientific research. But I did not turn out to be a great originator in science. I have never been more than a journeyman scientist.

"In science I made the big leagues but certainly did not come in as a bonus baby, or go out to the Hall of Fame."

The Kirkpatrick story began on July 21, 1894, when he was born to homesteaders in South Dakota, in a rough shack that had no amenities and was only a bare improvement on the prairie

continued on next page

Kirkpatrick/continued from page 3

sod-house which his father had originally erected.

He attended a one-room schoolhouse where 20 or so pupils, ranging in age from six to 12 were all taught by the same teacher. "The education wasn't bad," he smiled. "I can still spell better than my children."

His parents decided to give their three sons a chance of further education, and moved to southern California. Here the boys went to high school, and in due course young Paul entered Occidental, which was then a Presbyterian college.

During his senior year a recruiter came to the college looking for a qualified person to teach physics at an American mission college in China.

"I had lived at home all my life, including when at college, so I accepted at once," said Kirkpatrick. "I spent two years in Hangchow, and had some rewarding experiences there."

He returned to the U.S. during World War I and saw service in the Army. On his return he went to UC-Berkeley to work for a graduate degree in physics. He decided to concentrate his research on x rays; a study he was to continue intermittently all his life. He received his Ph.D. in 1923.

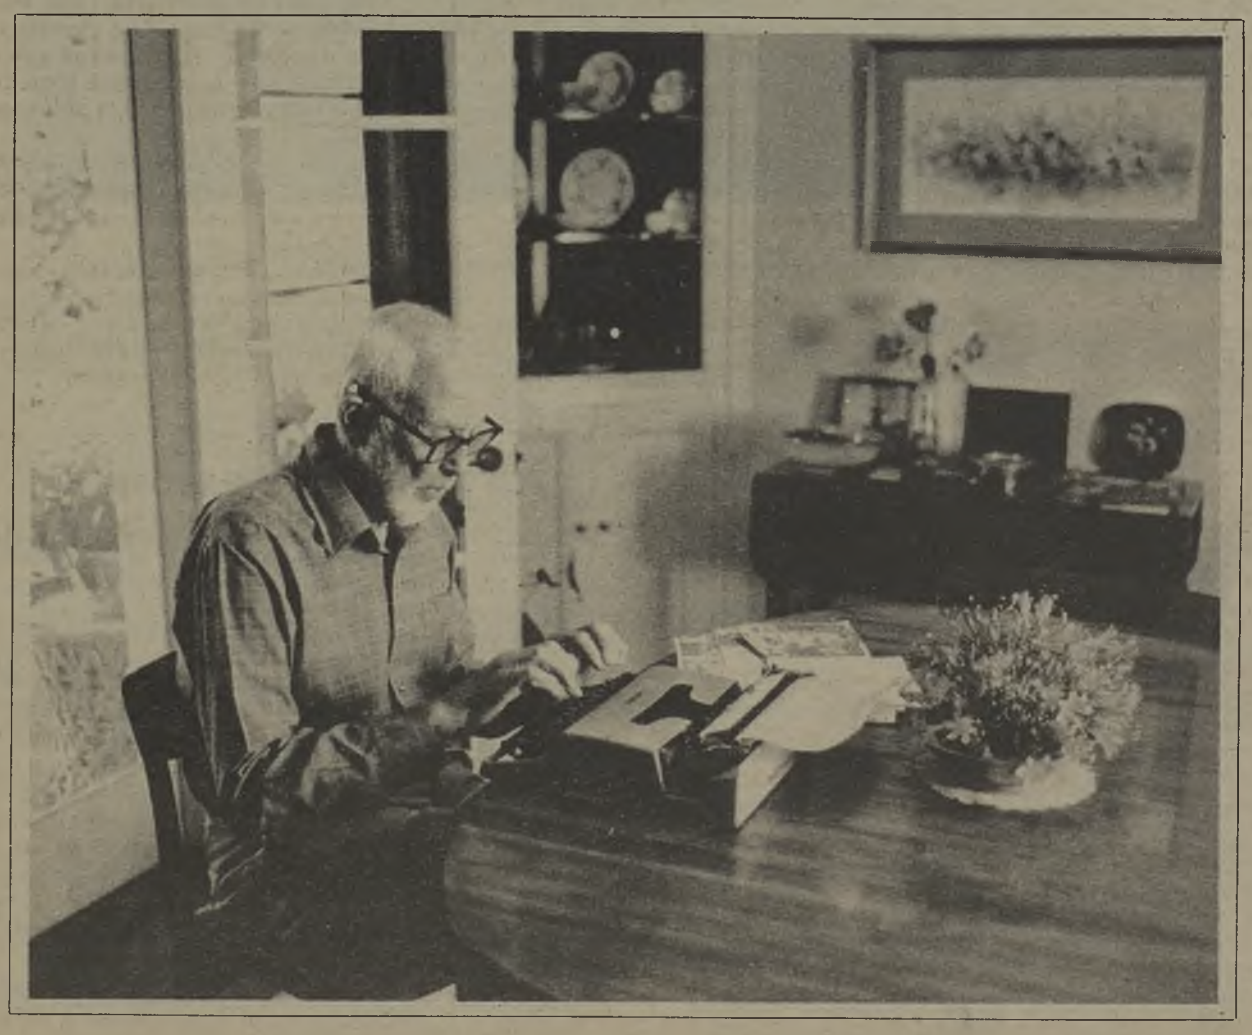
"Early in my Berkeley experience I had decided, as a matter of insurance, to qualify for the California high school teaching credential. There was a chance; I thought, that I might flunk out of the graduate program, or run into difficulty, or even decide to marry.

"The last eventuality never became acute because, influenced by my father's words and my brothers' experiences, I had decided never voluntarily to accept a dependent until I had a good job and $5,000 in the bank. This marital timidity would look ridiculous to today's students, but it looked rational to me."

His experiences with research at Berkeley convinced him that the concentration by most scientists on pre-selected ends often causes them to pass blindly by great opportunities along the road. His favorite example is of Rontgen discovering x rays at a time when at least 100 other laboratories possessed the means to make the same discovery.

In his own experiments with successive reflections of x rays from two crystals he employed the elements of the two-crystal spectrometer, an instrument later to be of great value.

"I observed reflections in the parallel and antiparallel positions, noted and understood the great differences in the widths of these maxima but passed on without realizing the superior spectroscopic resolution that two crystals make possible. Not much later the papers of many others were to appear and make manifest the great possibilities."



He was offered a post by the University of Hawaii, which was looking for a physicist to operate their one-man Physics Department. He became the youngest professor in the young university.

The professor who is not too self-satisfied feels his own education promoted by association with students such as William H. Hansen and Frederick Seitz.

He found that there were almost no facilities for x ray research in Hawaii. However, he discovered some pieces of disused hospital radiological equipment, and with these continued his investigations into the polarization factor found in expressions of the intensity of reflection of x rays by crystals.

While this crude experiment was in progress he was visited by Prof. David Webster, head of Stanford's Physics Department, who was in the Islands as a tourist. The two men discussed x-ray physics earnestly. This meeting was to affect the major part of Kirkpatrick's subsequent professional life.

"I still did not have the $5,000 I considered necessary as a basis for marriage," said Kirkpatrick. "However, I was getting there. I had three fine prospects under consideration when I left Honolulu in 1924 to fill a summer quarter's appointment at UCLA."

Entering his 90th year, Paul Kirkpatrick is still busy on various projects.

On the return trip he met a Los Angeles girl, Mary Rose Clark, who was on her way to a teaching post in Maui. "The confinement of a small and slow passenger ship led to our marriage," he said.

After six years in Hawaii he spent a year at Cornell doing research. A year after his return to Hawaii he received an offer from Webster at Stanford of a one-year appointment in the Department of Physics. He accepted and moved to Stanford with his family, which now included two daughters.

That one year's temporary appointment was to stretch to 28.

At the request of the American Institute of Physics, Kirkpatrick later made notes on his career. Writing about his time at Stanford he said:

"The Stanford Department of Physics in 1931, though far surpassing that of the University of Hawaii by any criterion, was a petty operation by the standards which came to prevail 30 years later, either at Stanford or at a score of other respected institutions. The instructing force consisted of four professors, two instructors and six part-time assistants.

"The assistants were supposedly pursuing the doctoral degree but the Depression was on and none of them cared to be handed the diploma which might operate as a walking-paper to the jobless outer world. So tenure records were set that would look ludicrous today.

"As with all tuition-charging schools, Stanford suffered from shrinking enrollment and relaxed entrance standards. Most of the professors sought to do research and to direct graduate students, but the total annual budget of the Physics Department, excluding salaries, was $5,000, so the choice of research fields and projects was sharply limited.

"The failure of a vacuum pump or precision meter was an occasion of crisis.

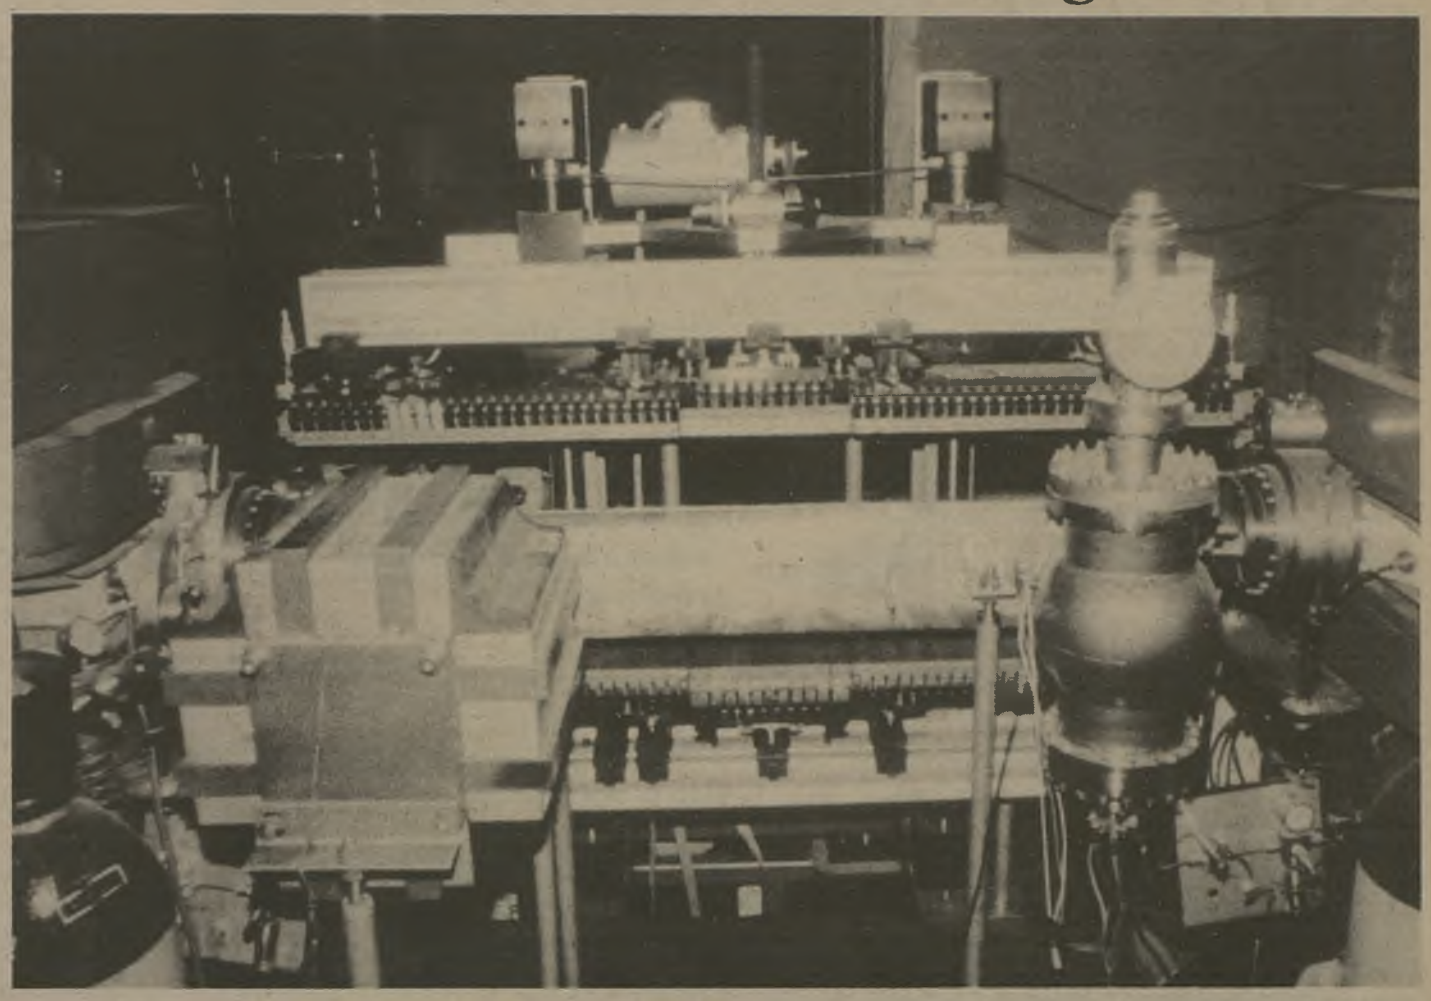
"The chairman, David Webster, who was by any odds the best informed and mentally endowed of the professorial group, spent hours soldering up his own circuits, cleaning out diffusion pumps, and doing other chores which a student might have performed for 25 cents an hour, had such financing been available.

"The undergraduate instruction was half-heartedly supported, and generally criticized by the students subject to its operations. The undergraduate laboratory courses were in awful shape, desperately needing money and a little tender care.

"In addition to their fixed tuition fees, students who took laboratory courses were required to pay certain additional amounts, under the justification that lab instruction was particularly costly and that the extra expense should be borne, at least in part, by those who were to benefit from it.

"These lab fees brought to the department each year several hundred extra dollars, but few of those dollars ever came to the support of the impoverished labs. These funds were regarded as general departmental resources and for the most part were devoted to research.

"I felt that the undergraduates deserved better service than the department was rendering, and that the department was treated in a niggardly fashion by the higher administration."



When he was in his thirties Kirkpatrick joined a young organization which had been launched to represent the needs of physics teachers. The need for such a group was plain. "The American Physical Society had long been, and still is, the leading organ of that discipline in this country," he recalls, "but research has always been its central concern. Its journal *Physical Review*, has never offered any help to physics teachers as such.

"But many members of the Society were also teachers, and back in the 1920's a few of them

continued on page 6

World's most powerful lasers in prospect

Scientists link free electron laser, accelerator ring

Stanford free electron laser was attached to French accelerator, as shown above.

Scientists in France and at Stanford have produced a working free electron laser connected to an accelerator storage ring, proving technology that could lead to the world's most powerful lasers.

The lasers could be used for industrial, medical, and military applications.

The device "lased" at 11:31 p.m. French time on June 21, producing a brilliant red beam for a half an hour.

The laser, only the second high energy free electron laser in the world, was developed by a team of Stanford researchers led by Prof. John Madey of the electrical engineering department, a team from LURE in Orsay, France, led by Yves Petroff, and by Stanford consultant David Deacon. The world's first high energy free electron laser fired up at Stanford in 1977.

The laser uses the energy produced by linear accelerators, converting relativistic electrons (electrons moving at almost the speed of light) into photons, the constituent of light. Because of the power that can be produced in accelerators, the potential for the laser is considerable, Deacon said.

"You may even been able to shoot down planes or missiles," he said.

The first free electron laser was run on Stanford's superconducting accelerator at the High Energy Physics Laboratory on campus. A beam of electrons was fired down the acclerator and mirrors extracted a very small portion of their engery which was pumped into the laser.

Because of the nature of the accelerator only .03 percent found its way into the laser.

"The purpose of the experiment was to demonstrate the idea, so .03 percent was an astonishing success," Deacon said. "Once it operated, the clear idea was, we have to increase the efficiency and increase the power."

The logical way to do that, the Stanford scientists decided, was to attach the laser to a storage ring, a round tube that can store the electron beam for a long period of time.

The French volunteered the accelerator and storage ring at Orsay, and Deacon, who had just graduated from Stanford, went over. He was eventually joined by French scientists and colleagues from Stanford.

One limitation to the Orsay experiment was that the laser needed a straight section in the storage ring to extract the electrons and the longest straight section at Orsay was one meter. This reduced the gain, the amount of energy emitted in excess of the energy put in.

The experiment was ready to go last year but problems with the mirror delayed the work. The high quality mirrors were darkened by the spontaneous radiation from the stored electrons. The damaged mirrors absorbed light instead of reflecting it.

The problem was avoided by reducing the electron energy, although the resulting gain of the laser was .07 percent, the smallest gain ever used by a laser.

Because the laser operates in the visible part of the spectrum, the scientists could see the red beam. The first free electron laser which operated in the infra red, was invisible, Deacon said.

"It's really great working in the visible. The eye is a much more versatile tool than helium-cooled solid state detectors," he added.

The beam produced a beautiful, multicolored image on the wall. The various colors were produced by the Doppler effect on the red beam.

Deacon said the next stage of the experiment will be to build a storage ring here especially for the free electron laser with a straight section of 20 meters.

"There are three different ways to make high power in storage ring lasers. None of them has been tested," he said. The new ring "is designed to test these three different techniques."

He said there are many possible future applications for this technology.

"Probably the most important is industrial processing of materials and that means using photons to cause the molecules to jump through the hoops that you want them to jump through.

"For that you need to have a defined wave length, you need to be able to set the wave length to where you want it (which means tunable), you need high power so you have lots of photons to make lots of molecules do what you want, and efficiency to make it cheap.

"Isotope separation is another possibility. That's really an example of the general class of materials processing.

The free electron lasers also could be used for surgery, Deacon said.

"The medical application requires that we change the frequency, the intensity and the pulse length of the laser that you're using. Adjusting the light frequency changes the penetration depth, and allows use of the new cancer-cell-specific drugs such as the hematoporphyrin derivatives.

"You need to change the pulse length according to the size of the element that you're irradiating. If it is a cell you can have a long pulse length; if it is something inside a cell you need a very short pulse length.

"Standard lasers just have a single pulse length, and you can't change that around. Free electron lasers have an adjustable pulse length."

Deacon said free electron lasers will not hit the market for another five years.

Funding from the research came from the U.S. Air Force and the French government, he said.—**Joel Shurkin**

Sohio provides $2 million for oil reservoir forecasting

Stanford University will receive $2 million over five years to improve forecasting oil reservoir performance, the Standard Oil Company (Ohio) announced Monday, July 25.

The Stanford program, headed by Prof. Khalid Aziz, petroleum engineering, is one of five chosen from nearly 1,000 applicants in the company's $10 million Center for Scientific Excellence competition.

Other recipients and their fields include: University of Cincinnati, membrane technology; University of Illinois at Urbana, crop molecular genetics and genetic engineering; MIT, offshore engineering; and Pennsylvania State University, mining technology.

Other faculty involved in the Stanford project will include Profs. Henry Ramey, petroleum engineering; Steve Graham, petroleum geology; Andre Journel, geostatistics; and Amos Nur, rock physics.

Formerly at the University of Calgary, Aziz has developed computer-based methods for simulating and forecasting reservoir performance. A professor of chemical engineering at Calgary for 12 years, he was manager of the computer modeling group there for five years before coming to Stanford in 1982.

Criteria for the national competition included academic excellence, support and training of scientists, collaboration with Sohio, and innovative research.

Frank Press, president of the National Academy of Sciences and judge in the competition, cited the broad response and cooperative effort as "precisely what this country needs at the present time.

The Sohio program has real significance in that it may be a model for many other industrial sectors or companies to follow."

Other outside judges included Glenn T. Seaborg, Nobel laureate in chemistry at the University of California at Berkeley, and physical chemist Bruce Hannay, retired vice-president of research at patents for Bell Laboratories.

Glenn R. Brown, Sohio senior vice-president for technology and planning, said "we asked institutions to be innovative, to ponder the long-term future, and to direct their thinking to goals and objectives which they felt would be critical to the nation's future."

The center's program will represent about one-third of Sohio's funding for educational support during the year.

Kirkpatrick/continued from page 4

organized the American Association of Physics Teachers and started putting out a journal. That few has now grown to between 10,000 and 15,000 thousand members.

"I joined the Association shortly before I came to Stanford, worked on AAPT committees, wrote for its journal, served as a national vice-president and president, and in 1959 was awarded its Oerstad Medal for notable contributions to the teaching of physics."

His acceptance speech on that occasion received considerable acclaim and was reprinted in several publications in the U.S. and abroad.

In his address he said that although instruction and research operated as an established partnership in American universities there were many aspects of competition and interference between them. The impressive growth of research to a dominant activity at universities was in part at the expense of the teaching function.

Kirkpatrick went on to urge that it was no longer necessary to nurture research by depressing the interests of instruction, and it would be well for the universities and their students if the preference which research had been enjoying were to be yielded, at least temporarily, to the teaching activity.

He recalls his words on that occasion: "It does seem that is is high time to swing the protective tariff back from the researchers to the teachers. . . .

"The switch I suggest to the aid of teaching is due at the several levels of physics teaching because no one seems to want to teach physics in the high schools, because the instruction offered in colleges and universities is not attracting enough specializing students to meet the public need, because recruitment of well-qualified physics teachers for colleges and universities has become very difficult against the competition of better-playing employers, because universities are unable or disinclined to train teachers for colleges, and because industries are now able to recruit physicists right out of university faculties."

On the day after the presentation of the medal Kirkpatrick saw the secretary of the American Physical Society who told him: "I wish we could take a whole page of the *New York Times* and put your address on it." Kirkpatrick felt that the historical unfriendliness of the Society to the Association had been resolved and dissolved.

Apart from the reservations he had expressed, Kirkpatrick found much that was novel and enjoyable at Stanford. "I relished the weekly colloquium at which topical subjects were discussed. I liked the small group of graduate students who struggled with their research in relative independence.

"The professor who is not too self-satisfied feels his own education promoted by association with students such as William H. Hansen and Frederick Seitz."

Kirkpatrick came to Stanford intending to continue a particular line of research which he had developed. He soon came to the conclusion that it would be more useful to the department if he helped on some of its current problems. This he did. Later he again took up his independent research.

"The department chairman, David Webster, was investigating the probabilities of K-ionization of atoms by electron impact, working back from the observed data of K spectral line intensities," Kirkpatrick observed in his notes for the American Institute of Physics.

"P. A. Ross, much more the skilled instrumentalist than the physical theorist, had just completed construction of a two-crystal spectrometer of novel design and was on the point of deciding what to do with it. It was not his method to devote himself to a particular field of knowledge or ignorance and solve its problems by whatever means might be indicated, but rather to proceed from the method to the problem.

"The strategies of science are infinitely varied and it behooves no one to prescribe obligatory thought patterns for another. It is not easy for today's physicists to realize that there was a time when the investigator's first question was 'What have I got or what can I get to work *with*?'

"Webster, who had been brought to Stanford right after World War I to build research into the physics program, asserted that an early step was his inspection of the University storehouses and junkyards to find materiel that might be turned into research equipment. Having cased these resources he was ready to choose his problem.

"Ross and I had discussed the unsettled problems associated with the Compton effect, a field of study in which he had done early and important experimental work.

I had decided never voluntarily to accept a dependent until I had a good job and $5,000 in the bank. This marital timidity would look ridiculous to today's students, but it looked rational to me.

"The early spectrometer observations had been crude and we felt that the resolving power of the two-crystal spectrometer was needed to answer the outstanding questions about the shape, breadth, and spectral location of the shifted band, and the dependence of all of these characters upon angle of scattering and material of the scatterer.

"But the sensitive radiation detectors of today were unknown and we were always laboring with the limitations of simple ion chambers and home-made quadrant electrometers, trading off speed for precision or *vice versa*, and cultivating the virtue of patience.

"We were ever in the need of more powerful x-ray sources, and in this necessity I devised a new geometrical arrangement which we called the ring-target tube. It gave us ten times as much target area as we were accustomed to without broadening the range of simultaneously observed scattering angles.

"Ross and I discovered that the magnitude of the Compton shift is measurably less than the value given by Compton's formula.

"We traced the shift defect as function of wavelength and of scatterer composition, and we correctly (as it developed) ascribed the effect to atomic binding of the scattering electrons.

"Felix Bloch, a newcomer to our department, showed interest in the matter and in short order elaborated a theory of the effect of electron binding. Neither Ross nor I could possibly have formulated the kind of sophisticated argument that Bloch constructed, and as a matter of fact neither of us ever really understood the compact paper he published, but we were gratified by his good agreement with our observations.

"Ross and I continued our collaboration until his unexpected death in 1938. He was a mild man, devoid of the prides that sometimes poison scientific partnerships. Although I was much his junior he was content to let me decide the tasks to be pursued and for me to write all the papers. Unlike most physicists I took a certain pleasure in committing research results to paper, and I always finished such a task understanding my own work better than at any earlier stage of its progress.

I felt, and still do feel, that most research reports are badly written, with little enough expository skill and often with indifference toward the mental states and difficulties of the reader. These faults have their counterparts in the utterances of the teacher or lecturer and even in the products of textbook authors.

"Belatedly, being then in my thirties, I began to pay conscious attention to the arts of writing and speaking. I had finally recognized, as I never had when a student, that in science these were first and always techniques of communication and not of entertainment or literary display.

"This does not mean the necessary elimination of graceful form or—shall I say?—salesmanship; it means that in my view that speech or article is well presented which communicates its points with emphasis, economy, and acceptability without drawing attention to itself as the vehicle of transfer."

Kirkpatrick's research was by no means confined to x rays. Another great interest of his has been holography (a scientific word which has nothing to do with the word 'holograph' as found in a dictionary). Scientific holography is a field of optical study and phenomena which was first outlined in the British journal *Nature* in 1942.

"When I first read about it then it seemed improbable enough to merit some experimentation, which I gave it," Kirkpatrick recalls.

"Most people, including scientists, think holography is an offshoot of the laser, but the dates do not permit that idea. The pre-laser doctoral dissertation of my student Hussein El-Sum was the world's first book on holography. It was little noticed and could be found in few libraries until lasers appeared, emitting the ideal form of light for holographic effects.

"Suddenly the loan demand for the Stanford Library copy of the El-Sum book shot up, and exceeded anything in that library's experience, so I was told. The volume became worn out and was replaced."

Kirkpatrick believes that although he contributed nothing to the theory of holography, he was its earliest practitioner and innovator in America.

But Kirkpatrick is a modest man, and is uncomfortable with any praise of his distinguished career. He told one interviewer: "You have a friendly tendency to make your subject look better than he deserves."

Juilland reports more petition names

To the editor:

Please find below an additional list of Stanford faculty who have signed the counter-petition on Hoover, "In defense of academic freedom." Their endorsements reached me after the original list of 131 signers was published in *Campus Report*, May 25.

Alphonse Juilland

"In defense of academic freedom"—additional signers: Ronald Ariagno, associate professor, pediatrics; Franklin Ebaugh, professor and associate dean of medicine; Stephen Harris, professor, electrical engineering and applied physics; Sullivan Marsden, professor, petroleum engineering; Dayton S. Misfeldt, assistant professor, medicine; Kurt Meuller-Vollmer, professor, German; Inder Perkash, associate professor, surgery; Guy Marshall Pound, professor, materials science engineering; David Powell, professor, aero-astro engineering; Gerald Silverberg, associate professor, medicine; Thomas Stamey, professor, surgery; George Thompson, professor, geophysics, earth science; Peter Wood, professor, medicine; Leslie Zatz, professor, radiology.

President Donald Kennedy, who served as commissioner of the Food and Drug Administration during 1977-79, met with his former boss, President Jimmy Carter, in a not-so-oval office July 15.

Carter returns to campus amid 'debategate' controversy

Smiling and relaxed, Jimmy Carter returned to Stanford Friday, July 15.

The former President came to discuss university-industry ties and plans for his new Carter Policy Center at Emory University.

From all accounts, he did just that.

But Carter's visit coincided with national news interest in "debategate" and the possibility, as one wag put it, that the 1980 Reagan campaign and transition archives at the Hoover Institution might prove to be a bipartisan collection.

In his first public comment on what he called the "purloined" papers, Carter told a San Francisco audience early Friday afternoon that "the materials that have been revealed were the most politically sensitive documents we had. They encompassed the essence of our campaign."

Repeatedly questioned by news media at Stanford, Carter replied, "the papers were very valuable. I think I've said enough already."

About 100 reporters, photographers, and well-wishers awaited the arrival of the former President's motorcade on Inner Quad at 3:20 p.m.

After posing briefly for pictures with President Donald Kennedy, Carter paused to help nine-year-old Laura Clark fix her camera, then held her briefly for some campaign-style photos.

"It was neat to be bolded by the used-to-be president," Laura later told reporters. She was accompanied by her mother, geology graduate student Joyce Clark, a Libertarian.

Briefed by engineers

For the next hour and 45 minutes, Carter was briefed in the President's Office conference room by Kennedy, Engineering Dean William Kays, and Engineering Profs. James Meindl, codirector of the Center for Integrated Systems; Warren Hausman and Charles Kruger, codirectors of the new institute for manufacturing automation.

"He's a smart man with a lot of engineering savvy," Kennedy observed. Former commissioner of the Food and Drug Administration, Kennedy said Carter quickly asked "the canonical question" about CIS—what it could achieve in the next decade that a large firm like IBM could not do by itself.

Carter was "very relaxed" in "a pretty fast-paced" discussion "mostly on academic subjects," Kennedy added.

He accompanied Carter on a briskly paced walk to the Hoover Tower, where Director W. Glenn Campbell greeted them at the front door promptly at 5:15 p.m.

Asked if "debategate" had been discussed, Campbell said "not really . . . Mr. Carter is a perfect gentleman."

When Campbell mentioned that Reagan's gubernatorial papers were among the more than 4,000 archives at Hoover, Carter "smiled," the director said. (During the 1980 campaign, Democratic Party researchers checked the Reagan gubernatorial archives extensively.)

Carter was "very interested" in the organizational structure of the Hoover as a possible model for the Carter Policy Center at Emory.

"He obviously had done a lot of study and thinking about it," Campbell said. In April, Campbell counselled an official planning the Carter center on the organizational structure, staffing, and operating policies of the Hoover.

Rita Ricardo-Campbell, a Hoover senior fellow who attended the Carter briefing, said she was "surprised and very pleased with his sense of humor."

Even though the conversation was very serious, Carter appeared "quite relaxed," she added. "I think he's gotten 10 years younger since I last saw him on television."

Eluding the press and well-wishers in front of the Tower, Carter slipped quietly out a basement level back door of the Institution about 6 p.m. and drove away.

After talking with a few reporters on the other side of the building, Campbell prepared to leave the same way by himself.

About 50 yards away, the entrance to the archives remained locked and unlit, as it had been since 5 p.m. The FBI agents had apparently left soon before Carter's arrival.

Carter's first visit to Stanford attracted very little notice. In the very early stages of his campaign for the 1976 Democratic Party nomination, Carter spoke with about 100 students and other supporters on the patio behind Bowman Alumni House.

Footnotes on the visit: t:

Jimmy Carter is believed to be the fifth President to visit the Hoover Institution. The others are Herbert Hoover, Richard Nixon, Gerald Ford and Harry Truman.

Carter's visit to Stanford was arranged by Assistant Dean Anthony Macias of Engineering and Steven Jackson, director of development for the Carter Policy Center, who are personal acquaintances.

Stanford Public Affairs Vice-President Robert Freelen briefed reporters on Carter's discussion with the engineering faculty members. These talks were extended for an hour when Carter cancelled an off campus trip.

Those accompanying Carter to Stanford included James Laney, president of Emory University; James Brasher, campaign director for the Carter presidential library and Carter Policy Center; and Jackson.

Among those attending the discussion at Hoover were John Moore, associate director of the Institution, and acting archivist Charles Palm. —**Bob Beyers**

FBI takes charge of search in Reagan campaign archives

The Federal Bureau of Investigation Wednesday, July 13, took charge of the search of the 1980 Reagan campaign and transition archives at Stanford's Hoover Institution.

"The search is now fully in their hands," said Charles Palm acting archivist.

About 10 agents from the San Francisco FBI office came to the archives late Wednesday morning.

"All of our requirements concerning the integrity of the archive's materials are being met," Palm said.

Hoover staff members have remained on the site to be available to the FBI.

"We are cooperating in every way to make this material available," he added.

He indicated any further comments about the search should come from the FBI.

Speaking briefly with reporters, Palm said he would have no comment on materials found, if any, in the search to date.

He said the FBI agents "may make whatever copies they want of anything they want" in the archives. "They have requested only copies at this point," he added.

He said "it is difficult to estimate how long (a search) will take," especially since large parts of the collection remain unprocessed.

Palm said the Hoover had temporarily closed access to part of its other archives soon after the agents arrived at 10:30 a.m. Normal operations were expected to resume about three hours later.

Asked how he felt personally about fielding a barrage of news inquiries on the campaign and transition archives, Palm replied "it's not the typical experience of an archivist." But he quickly added "it's not the first time archives made national news."

Many journalists were "quite knowledgeable" about archives, he observed.

The Hoover Institution has about 4,000 archives. The majority are open to scholars without restriction. Some collections are accepted with restrictions, since "they contain other people's mail" and "we're mindful of their sensitivity," Palm said.

The Reagan 1980 campaign and transition collection includes 550 linear feet of material shelved in manuscript boxes. Collected over six weeks in December, 1980 and January, 1981, it was left with a letter of deposit at the Hoover Institution. Reagan retains ownership of the documents.

On July 12, Palm said the Hoover Institution had received a letter from Edwin Meese, a trustee of the collection, "authorizing us to provide representatives of the Department of Justice access to the materials and to permit copying of any documents the Department of Justice deems relevant to the inquiry."

Freedman...

continued from page 1

has been returned to regular status and will be considered by the Advisory Board of the Academic Council during their normal course of business this fall. The board is an elected group of seven faculty members who must approve and recommend to the president all faculty appointments, reappointments, and promotions.

Babcock believes it is "unlikely" the board will reverse the provost's recommendation. "We never lost heart. I believed all along the University would do the right thing," she said.

The case brought "an unprecedented amount of mail," including many small financial contributions, some from parents of graduate students taught by Freedman, she noted.

Babcock said it was "very wise" for Freedman to keep a low public profile in the case, since news media comments could be "subject to misinterpretation."

Prof. Carl Degler, nationally prominent scholar in women's history, said "I'm delighted, and glad to see a mistake rectified.

"This is great for the University and for the department. It's a nice vindication of our processes of internal evaluation."

A 1969 graduate of Barnard College, Freedman received her Ph.D. at Columbia in 1976. She received a dean's award for distinguished teaching at Stanford in 1978 and the Dinkelspiel award in 1981.

The University of Michigan Press presented her its Hamilton award for the best scholarly manuscript on women for her first book, "Their Sister's Keepers: Women's Prison Reform in America, 1830-1930." Her NEH fellowship is for a study of "Gender and Deviance: The Treatment of Female Crime and Mental Illness, 1920-1960." She is an associate editor of *Signs: Journal of Women in Culture and Society*, based at the Center for Research on Women.

The Appointments and Promotions Committee of the School of Humanities and Sciences recommended unanimously against tenure in March, 1982 and took a similar position earlier this year, though no vote was disclosed. At that time, the School required that a faculty member be judged "very good" in both teaching and scholarship and "excellent" in at least one. Freedman was rated "excellent" in teaching but only "good" in scholarship, according to independent news reports.

In a letter published in January, Dean Wessells noted that "Being a faculty member of physics, classics, economics, Latin American studies, human biology or other administrative unit is not a criterion for tenure.

"For many years it has been practice in the School of Humanities and Sciences to make the decision about investing a tenure position in a particular field or discipline at the time an initial search is authorized to a department and an appointment is made.

"Thus when a person is hired as a medieval historian, a development psychologist or an organic chemist, the individual is free to work as effectively as he or she can as a scholar or teacher. The young person does not work for six years under a cloud of uncertainty about whether the field itself may be judged inappropriate at the time of tenure review, with the result that tenure could be denied irrespective of the person's qualifications. In other words, we do no include an 'administrative' factor in the tenure equation.

"Those who argue for tenure on the basis of academic field or of service to some unit of the University are asking that such an administrative factor be used. But

Estelle Freedman

if it is, it can be used for or against candidates.

"At present, being a critically important participant in Latin American studies or feminist studies, being Stanford's only teacher of a rare language, or whatever, is not held for or against the person up for consideration.

"Similarly, whether the person is a Marxist, a member of the Moral Majority, or has behavioral quirks is irrelevant. By placing the administrative factor 'up front' at the time of searching and hiring, we allow the tenure process to focus where it should, on the individual as scholar and teacher."

In a report to the Faculty Senate in May, Wessells suggested a future tightening of tenure standards. He said demonstrable excellence in research "should be recognized as our primary criterion. . . .

"No person should be granted tenure here who is not demonstrably excellent as a research scholar. We must continue to emphasize that high quality teaching is critically important, but we should embrace the concept that first-class university type teaching is sustained by, and is directly dependent upon, continuing scholarship of the first rank. The two are inseparable."

Dave Dorosin dies after heart attack; his family establishes memorial fund

Dr. David Dorosin, director of counseling and psychological services at Stanford since 1972, died at Stanford University Hospital Sunday afternoon, July 17, following a heart attack at his Palo Alto home. He was 51.

A faculty member in the Stanford Department of Psychiatry since 1962, Dorosin built a network of 150 student peer counselors and a highly diverse professional staff. Together, they provided counseling for eight to 10 percent of Stanford's 13,000 students annually.

Last year Dorosin told a campus interviewer that in all his years at Stanford "I have not seen any change in people's desire to have somebody they can count on. In the psychological life of young people 'loyalty' and 'fidelity' are still important words. Even in this period, which is often believed to see the heights of sexual freedom, that is still true."

Dorosin was widely known and respected for these qualities himself. Stanford President Donald Kennedy described him as "a wonderful person."

Memorial Services have already been held.

Survivors include Dorosin's wife, Edith, vice-president of the Santa Clara County Manufacturers' Group; their son, Daniel, a Stanford graduate and staffer for Senator Alan Cranston, headed for law school this fall; two daughters, Abigail, a UC-Davis student, and Alicia, who will enter Stanford this fall; and three brothers: Allan, of Santa Cruz; Norman, of Berkeley; and Leon, of Mill Valley.

The family prefers donations to the David Dorosin memorial fund, 525 University Ave. Suite 1320, Palo Alto, Calif. 94301.

Dorosin was born Dec. 31, 1931 in Marshalltown, Iowa. A member of Phi Beta Kappa, he received his B.A. degree from the State University of Iowa in 1953 and his M.D. there in 1956.

After serving as an intern and fellow at

David Dorosin

the UC Medical Center in San Francisco during 1956-58, he was a resident at the New York Hospital-Cornell Medical Center in New York City and at the Psychiatric Institute of New York State and Columbia-Presbyterian Medical Center.

He came to Stanford in 1962 as director of the consultation service in the Department of Psychiatry. He was named director of Psychiatry at Cowell Student Health Service in 1968 and director of the combined counseling and psychological services there in 1972. Rising steadily through the academic ranks, he was named clinical professor of psychiatry and behavioral science here in 1975.

He received a career teacher award from the National Institute of Mental Health in 1964-66 and was elected a fellow of the American College Health Association in 1976.

Ann Bilodeau named director of Annual Fund

Ann Bilodeau, a Stanford staff member since 1970, has been named director of the Stanford Annual Fund.

Her appointment was announced by John Hays, head of individual giving in the University's Development Office.

The Annual Fund currently raises in excess of $10 million per year, mainly in unrestricted gifts from more than 35,000 alumni.

Starting at the Graduate School of Business in 1970 as a coordinator of case development, Bilodeau went on to establish a program to help MBA candidates improve their writing. She became a development officer in the school in 1974, and director of the Engineering Fund in 1977.

In 1979, Bilodeau was named head of the general appeal program, which contacts over 100,000 alumni each year by either mail or telephone to seek gifts for Stanford. She has served as acting director of the Annual Fund since September, 1982.

Bilodeau received her undergraduate

Ann Bilodeau

education at Pitzer College in Claremont, Calif., where she majored in English and psychology. She earned her M.A. in English at Stanford.

Bilodeau has served as a member of the Pitzer College Board of Trustees since 1976, and was a participant in the Stanford Management Development Program in 1980-81.

A Palo Alto resident, she is married to Kenneth R. Bilodeau, Jr. They have one child.

Mosher appeals grievance again

Steven W. Mosher has filed another appeal in his continuing battle to win reinstatement as a Ph.D. candidate in anthropology at Stanford.

The appeal was received Thursday, July 21, in the office of Vice-Provost Gerald J. Lieberman, dean of graduate studies and research, who currently is on vacation.

Mosher was terminated as a Ph.D. candidate in anthropology by an 11-0 vote of the department faculty Feb. 24.

After Mosher filed a grievance, Dean Norman K. Wessells of the School of Humanities and Sciences asked three prominent scholars to review his case.

The scholars—Profs. Gordon Wright and Ernest Hilgard of Stanford and Ward Goodenough of the University of Pennsylvania—unanimously found his termination "justified." Wessells denied Mosher's grievance July 1.

If he is not satisfied by Lieberman, Mosher may request a review by President Donald Kennedy.

At a news conference following the faculty decision Feb. 24, Mosher promised to "use every resource at my disposal" to contest the outcome.

Nurturing young post-graduates

SLAC hosts 11th annual summer institute

The Stanford Linear Accelerator Center (SLAC) is hosting its 11th annual Summer Institute for 330 elementary particle physicists.

Participants from 13 countries are attending a "summer school" from July 18 to July 29 to review advances in high-energy particle physics. Immediately following the summer school will be a two-and-a-half day topical conference where the most recent experimental findings at the major research centers will be presented.

According to David Leith, a SLAC faculty co-coordinator of the Institute, the summer school is geared towards young post-doctorate experimentalists who are often overwhelmed by the elaborate theoretical presentations that dominate most conferences.

"The Institute encourages people who would not normally get exposed to the changing frontiers," he said.

The SLAC Institute is the only annual workshop of its kind in the United States. "There is a heavier tradition of caring for and nurturing the young post-graduate community in Europe," Leith noted.

The need for conferences like the SLAC Institute has grown, Leith stressed, because the increasing cost and complexity of experimental tools has forced research into a few isolated high-energy physics centers.

The Institute enables participants to exchange ideas with colleagues at other research centers. This is especially important because the field changes so quickly and no up-to-date textbooks are available, said Fred Gilman, the other faculty co-director.

The proceedings of the Institute have become a major reference work on the current status of particle physics, Leith added.

Studying 'jets'

A topic for the summer school is chosen each year from the forefront of scientific research. This summer's program, entitled "Dynamics and Spectroscopy at High Energy" focuses on the study of "jets".

Jets are the showers of particles that are detected when two elementary particles such as an electron and its anti-matter particle, a positron, are made to collide at very high energies. Physicists believe that the collision produces a pair of basic building blocks called quarks.

The quarks are then thought to combine with, or "dress themselves" with other quarks from the environment, thereby creating a series of new particles that form the jets observed in experiments.

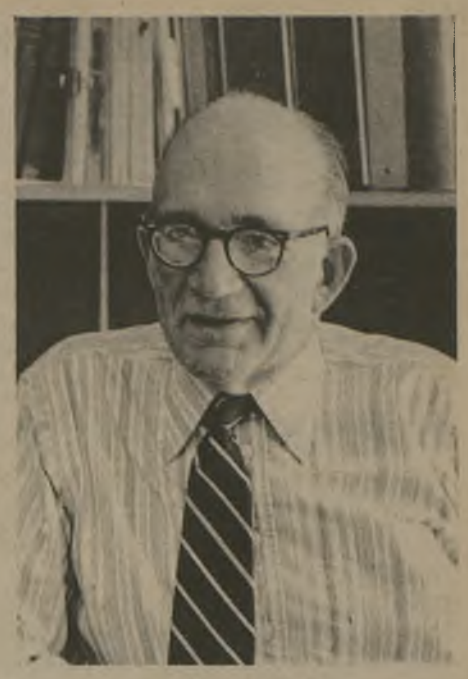
While scientists have never seen an isolated quark, the study of jets has indirectly confirmed their existence. Steve Ellis, a theorist from the University of Washington and the first lecturer at the summer school, compared jets to the Cheshire cat—by seeing the smile (jets) we know that the cat (quarks) exist.

Through a series of lectures and in-depth discussion sessions, participants review the current theoretical treatment and experimental evidence for jets. Since the concept of jets is fairly new and experiments don't always produce cascades of particles that are clearly identifiable as jets, physicists have difficulty in accurately describing them. "Like true love," Ellis said "a jet is impossible to define precisely. But you know it when you see it".

Since jets are easier to see at higher energy collisions, Gilman and Leith noted that research will be improved by the upcoming generation of accelerators built for higher energies such as CERN's SPS Collider which collides protons with anti-protons at 540 billion electron volts (GeV) and the Stanford Linear Collider which will collide electrons and positrons at 100 GeV when it is completed by 1987. The next step for experimentalists, they said, is to design detectors that measure the jet as a whole rather than detecting the collsion by-products one at a time.

In addition to the seminars, the 187 non-SLAC participants have been invited to tour the SLAC facilities, located in the foothills west of Stanford.

Highlights of the topical conference following the summer school include the recent discovery by researchers at the CERN laboratory near Geneva of three particles that "carry" the nuclear weak force, one of four basic forces in nature. The observation of these particles, named W, W-, and Zo, in part supports what is known as the Unified Field Theory, the belief that the four forces are intrinsically related.



This presentation at SLAC and a concurrent report given at the European Physical Society in England constitute the first announcement of the particles at a scientific meeting.

Researchers from SLAC will also report to the Institute on recent measurements of the decay lifetime of a particle called the B-meson which consists of a "bottom" quark and its anti-particle.

Dotted line shows path of new linear collider (see story, next page)

Sidney Drell

Drell to talk about ICBMs

Sidney Drell, deputy director of the Stanford Linear Accelerator Center, (SLAC) will speak on the future of intercontinental ballistic missiles at 7:30 p.m. on Thursday, Aug. 4, in Cubberley 133.

Drell opposes the planned deployment of the MX missile because it's a highly valuable target and if deployed in silos as planned, it would not be survivable—"It looks like a first strike weapon."

He would endorse the proposed Midgetman missile in limited deployments under an overall ceiling that represents a reduction in total destructive power. "They have the advantage that with only one warhead, they are not valuable enough to be vulnerable because they are not worth attacking."

Drell received an open letter this spring from the Russian physicist, Andrei Sakharov, who is in internal exile in Gorki. Sakharov expressed agreement with Drell's assessment of the danger of nuclear war—a calamity of indescribable proportions, and Drell's basic tenent that nuclear weapons only make sense as a means of deterring nuclear aggression.

In this letter, Sakharov suggests that if it is necessary to spend a few billion dollars on MX missiles to achieve Soviet agreement to limitations on silo-based missiles, then perhaps this is what the West must do.

The free public program is sponsored by the Stanford Arms Control and Disarmament Forum.

Stanford receives $2 million IBM grant for engineering

Stanford is one of five universities receiving $2 million grants from International Business Machines Corp. to establish a new program for graduate-level engineering education in manufacturing systems.

The grant will go to the newly-formed Stanford Institute for Manufacturing and Automation.

The other four schools are Lehigh University, Bethlehem, Pa.; Georgia Institute of Technology, Atlanta; Rensselaer Polytechnic Institute, Troy, N.Y.; and the University of Wisconsin at Madison.

"As these selected schools move forward with their new teaching programs, we hope that many other universities will share in their experiences and benefit too," said IBM chairman John R. Opel. "The more opportunities young people have to learn about the new manufacturing technologies, the better prepared industry will be to compete in world markets and to provide, at competitive cost, the products people need and want."

IBM said that the grants are the second phase of a $50 million IBM grant program of cash and equipment to help universities develop and update manufacturing engineering education. Last month IBM awarded computer systems valued at $40 million to 20 universities.

Beginning this fall and over the next four years, the five universities named will develop curricula leading to advanced degrees in manufacturing systems. The courses will integrate the disciplines of engineering, computer science, and business planning.

Emphasis will be on subjects such as designing products for automated assembly, computer-aided design and manufacturing, resource management, and the use of robotics and other automation systems to improve quality and productivity.

Soviet commitment in Afghanistan may not run very deep

The Soviet commitment in Afghanistan does not appear to be as firm as is commonly assumed, Anthony Arnold concludes in a new book, *Afghanistan's Two-Party Communism*, published by the Hoover Institution Press at Stanford (260 pages, paper $10.95).

A former intelligence officer in Afghanistan, Germany, Sweden, Burma, Japan, and England, specializing in Soviet affairs, Arnold wrote "Afghanistan: The Soviet Invasion in Perspective," published by the Hoover Institution Press in 1981.

"No communist party can survive in Afghanistan without a Soviet military occupation," he declares. "The overwhelming majority of the population views communism as an alien ideology imposed by Afghan traitors and their Russian masters."

Arnold emphasizes that the U.S. "should maintain a proper distance from all resistance politics," no matter how much sympathy it might feel for a particular political trend in the resistance.

"American aspirations for Afghanistan's future should be confined to the country's international orientation and conform to the Afghans' own desires—a return to a truly neutral, nonaligned, self-determining status.

"Within these parameters, the country's political system should be the Afghans' choice and theirs alone."

Withdrawal not intolerable

Most Western analysts feel Moscow will judge the costs of retreat from Afghanistan as "intolerable," Arnold notes. But he questions this view.

Where the Soviets may fear a "domino" effect on other socialist states, Arnold notes that "if anything a Soviet pullout in Afghanistan—which has never been an invasion route into Russia—would be accompanied by even tighter control by Moscow over the well-beaten military paths heading east from Europe.

"Unlike the situation in Afghanistan, there is tacit Great Power agreement to Soviet hegemony in Eastern Europe."

Soviet fears of a possible Islamic thrust from Afghanistan into Soviet Central Asia have little basis in history, he adds. "Once the Afghans have expelled an invader, they do not exact vengeance, even when clear opportunities present themselves."

In 1857, 15 years after the first Anglo-Afghan war, the Afghans refused to join rebels in the Indian Mutiny. In 1915, less than a generation after the second Anglo-Afghan war, they declined Turko-German pleas to join the Central Powers in a jihad against Britain. In the early summer of 1940, with Britain apparently on the brink of defeat, the Afghans rejected a Nazi offer to restore Afghanistan's 18th century borders, mostly at the expense of British India, in return for inciting rebellion against the British in the North West Frontier territories.

As a practical matter, no Afghan government could risk provoking a new invasion by fomenting insurrection in Soviet Central Asia. Moreover, the border now is relatively easy to control and police from the Soviet side.

No stonewall position

The Soviets have not taken a "stonewall" position on the occupation of Afghanistan, Arnold notes. Following official and unofficial Soviet proposals for a political solution to the problem in 1980 and 1981, as many as 40 percent of the People's Democratic Party of Afghanistan members may have taken steps to collaborate with the resistance, one 1982 defector estimated.

"The Afghan temperment is molded by Afghan topography, and neither lends itself easily to alien conquest," Arnold notes. "Afghanistan's defiles and gorges defy modern technology."

So long as the Afgans have sanctuaries in the fellow Muslim states of Pakistan and, to a lesser extent, Iran, "the fighting will continue and will remain at a relatively intense level," he predicts.

Only such measures as sealing the Pakistan border, committing four or five times as many troops, forcing the resisting population into urban areas, or politically annexing part or all of Afghanistan would crush the resistance, he notes. "Few if any of these gambits are cheap, most are damaging to Soviet prestige, and none is either swift or sure.

"If the price that Moscow had to pay for its aggression was heavy initially, it has continued to mount steadily in succeeding years. The pressures on the Kremlin to find some different solution have increased in step with the costs."

Reagan approves $32 million to start linear collider

A new kind of machine for studying subatomic physics has been approved for construction at the Stanford Linear Accelerator Center (SLAC).

The new machine, called the SLC for SLAC Linear Collider, was included in an appropriations bill that was recently signed into law by President Reagan. The $112 million faciliity, which will be built within the present site, is scheduled for completion at the end of 1986.

Stanford University operates SLAC under contract with the U.S. Department of Energy through the Department's San Francisco Operations Office in Oakland.

The appropriations bill signed by President Reagan provides $32 million for the first year of construction.

The appropriation follows a complete and favorable series of reviews by the government and the scientific community over the past two years. SLAC Director W.K.H. Panofsky noted, "The SLC is the only new major construction project in science authorized this year. I am extremely happy that the project can now go ahead full speed."

In this new machine two powerful beams from the center's two-mile-long electron accelerator will be bent around and focused into a microscopic spot. One of the beams will contain electrons; the opposing beam will be composed of positrons, the anti-matter twins of the electrons. When these opposite charges collide, the original particles are annihilated in a burst of energy from which new combinations of subatomic particles appear.

Successful technique

Electron-positron colliding beam machines have been one of the most successful techniques of particle physics in the past decade. Although the SLC will produce these collisions with the highest energy in the world, this machine is equally significant for its new way of making the beams collide.

The traditional method for producing these collisions has been with storage rings, in which magnets keep the two beams circulating in a racetrack pattern, passing through one another millions of times each minute. The linear collider fires its beams into one-shot collisions a thousand times less frequently, but makes up for this by squeezing the beams through a collision spot thousands of times smaller than possible in the storage ring.

The storage rings have been the most economical path to colliding beams at the lower energies. At higher energies, however, the storage rings must be made dramatically larger to compensate for the energy lost by the beams when they are bent into a circular path. A practical storage ring of the same energy as the SLC would be more than 15 miles around and would cost more than $500 million. The much less expensive SLC, by contrast, fits comfortably on the present site.

At the higher energies being thought about for the next generation of electron-positron machines, the linear collider technique will almost certainly be required. It is the study of this growth of accelerators with energy that led Nobel laureate Burton Richter, technical director of SLAC, to the ideas of the linear collider and to the SLC project.

The experimental program of the SLC will include the most exciting topics of high-energy physics. In the collisions at this energy, the weak force will overshadow the electromagnetic force that has been dominant at lower energies. The recently discovered carrier of the weak force, the Z, will be directly produced in these collisions. Thousands of these will be recorded each day, allowing a detailed study of this new particle.

Energy boosted

Much of the project involves modifications to SLAC's existing linear accelerator to increase its energy by about 60 percent. New computer controls will steer the beam precisely. Two small damping rings, which shrink the beam size before acceleration, will be placed underground at the beginning of the linac.

The biggest apparent new piece will be the underground arcs of magnets that will guide the positron and electron beams to the final collision point at the far end of the site. A substantial part of the construction work will be done by local industry and by subcontracts without large permanent increases in the laboratory staff.

The impact of the new construction on the neighborhood and environment has been carefully considered. Over the past two years several meetings were held with neighbors from nearby communities and with representatives of environmental organizations. The initial planning on the location of the new experimental hall was modified, to a large part in response to these concerns.

During the wait for final approval, research and planning has gone ahead. The modifications that would improve the normal operation of the linac have begun, and one of the damping rings has been completed. The project is ready to begin in earnest.

According to SLC project director John Rees, "We have a large construction bid package ready to start at the beginning of October. The project staff is enthusiastic and we're ready to go."

Slight drop seen in summer students, ending a six-year enrollment uptrend

Summer session enrollment at Stanford may decline slightly this year, reversing a six year trend.

After four-weeks, total enrollment was 3,354 compared to 3,443 at the same time a year ago, a 2.6 percent drop.

The only significant increase was in nonmatriculated graduate students, whose total rose to 257 from 236, a 9 percent gain, according to Kristen Harrison of the Summer Session Office.

The largest drop came in nonmatriculated undergraduate students, where enrollment fell from 252 to 191, a 24 percent decline.

While there was a 30 percent increase in the number of requests for the summer session bulletin, only 48 percent of the applicants actually registered. In past years, this proportion has remained stable around 65 percent.

Summer session enrollment by matriculated Stanford students declined about two percent at both the graduate and undergraduate level.

Summer session enrollment dropped markedly from 1967 to 1976, but then increased steadily through last year, when the final total was 3,657.

Engineers honored

Profs. Henry E. Riggs and Modesto A. Maidique have been honored for their service and teaching, respectively, by the Departments of Industrial Engineering and Engineering Management.

Both received departmental awards from Prof. Warren E. Hausman, chairman, at commencement. Student awards went to John R. Wilson, for undergraduate academic achievement; Christopher Badger, for graduate academic achievement; and Peter Stamats, for student service.

Remodeled Cubberley needs a piano

Is there someone who has just bought a new piano and hasn't decided what to do with the old one? Is there someone who would like to be immortalized on a brass plate? Is there someone who would like to be instrumental in bringing music to the newly beautified Cubberley Auditorium?

Our remodeled stage will accommodate an upright or grand piano, new or used. We will acknowledge the donation on a brass plate affixed to the instrument.

Please call Shirley Stein, School of Education, 497-0127.

Good discussion leaders key to TVI achievements—Gibbons

continued from page 1

Open University in Britain, MIT, the University of Florida and the University of Lowell.

TVI uses videotape as a recording medium—not for broadcast, Gibbons emphasizes. "A lot of educational value is lost by a presentation that is too slick.

"Similarly, we want to avoid, where possible, having an instructor talk to a TV camera, without a live class to question what is being presented."

When the material covered is difficult, students may take as much as 100 minutes to finish a 50-minute videotaped lecture. When there are frequent interruptions and discussion, TVI students consistently outperform those attending the live classroom presentation.

When the tutor simply answers questions that are asked and does not encourage discussion, the performance of TVI students is not noticeably better than those in the regular class.

"TVI student performance is less dependent on the standard academic measures," Gibbons notes. "In particular, it decreases the importance of high verbal ability, compared to regular classroom performance."

The TVI students can "manage" the lectures optimally for their own benefit, without the normal academic constraints of time and the natural fear of asking "stupid" questions in the presence of the instructor, he adds.

Performance compared

During 1973-74, Gibbons compared the performance of 302 students taking three graduate level courses in electrical engineering in regular classes with an identically qualified group of 55 who viewed the same teachers on closed-circuit TV at Hewlett-Packard, six students who studied the videotapes of the classes with no tutors, and 27 who used TVI.

When given the same exams in the same on-campus setting, the TVI group averaged nearly 3.7 on a 4.0 scale, compared to less than 3.4 for those in the regular classroom (used for both the closed circuit broadcast and the videotapes), less than 3.2 for those taking the course on closed circuit TV, and 3.1 for those studying the tapes without a tutor.

TVI students who would have very low qualifications for admission to graduate programs at Stanford have still done "acceptably well" with TVI, Gibbons reports.

While results over then past 10 years have not been as uniformly good as the initial experiment, students whose tutors encourage class discussion consistently outperform those in the regular lectures.

The ability to stop or repeat the videotape and the more relaxed atmosphere and interaction with other students are the most frequently mentioned advantages of TVI. The principal disadvantage, as seen by students, is that they can't ask the instructor questions directly.

With one exception, undergraduates who took an advanced graduate-level course on 20th century British and American poetry with TVI achieved the same grade distribution as graduate students who took the course live, while it was being videotaped.

The sole exception was an undergraduate who said "her family didn't pay the kind of tuition Stanford requires for her to take a course by videotape," according to Gibbons.

Jim Gibbons

He believes TVI has potential for greatly enhancing faculty productivity, even though resistance to its adoption remains quite strong.

"The only way is to build it bolt by bolt, so you know it works," he says. "Then you may be able to get others to do it, provided they don't have their own agenda."

Currently, Gibbons is working with colleagues at the Universities of Arizona and Florida on the use of TVI for a course in integrated circuit processing. The course was taped with Prof. Douglas Hamilton at Arizona and is being offered with TVI tutors at Florida under Prof. Gene Chenette's sponsorship. His load was so great that TVI was the only way he could offer the course.

Florida is interested in TVI's potential for increasing faculty productivity.

Whether other institutions will qualify the course for academic credit remains uncertain.

Gibbons, widely honored for excellent classroom teaching, hopes that Stanford may become more receptive to such course exchanges. On a long-term basis, this may offer one of the best means of increasing faculty productivity while maintaining high standards of quality.

Gibbons insists on working within the academic framework, giving host scholars a chance to judge the academic quality of TVI for themselves.

In the introductory physiology course at Harvard Medical School, TVI records three lectures by each of 10 instructors. "The faculty blasted the material out, and the course was regarded as a zoo," Gibbons said.

After 250 to 300 students heard the lectures, they divided into 13 sections of about 20 students each, four of which used TVI.

"Students ate it up, and did extremely well," he says. But comparisons were difficult because the TVI students went to both the live and videotaped lectures, "really nailing the material and looking for an edge" over their classmates.

In Alaska, a drug counselor working "live" with two families, was videotaped. The tapes were then distributed with Head Start volunteers who worked with extended families in their homes, calling the counselors for advice when needed.

He's tried to use TVI to teach prisoners skills needed in industry, without success.

"It nets down to a simple set of courses, but after some encouraging startups, we have been barred from further visits—some say because the prisoners were learning more than the guards," he explains.

"The guards could become tutors, helping the prisoners."

Industrial support

With statements of support from Hewlett-Packard, Rolm and Intel, Gibbons has proposed to develop basic courses in science, math and English for use in the videotape format at juvenile hall at San Jose.

Lacking the funding for this project, he'll head to Boston this fall with a similar package for high school students. MIT President Paul Gray has shown great personal interest in TVI and MIT is under court mandate to help improve the Boston schools.

Working at Mario Umana High School, Gibbons plans to have the area's best teachers in basic science and mathematics videotaped in regular classroom presentation, then enlist MIT students and others as tutors for TVI groups in the schools.

"There's always a management problem. Every constituency has to work out a compromise,"Gibbons says. "It may be easier to solve the problems of training juveniles in the subjects needed by Silicon Valley industry in Boston, where they recognize there's a problem.

"Stanford's losing a lot of opportunities. We have everything we need to really make this work—the faculty, the course materials, the facilities, the techniques.

"But the desire to try it out and make it work has to come from within the faculty."

Improved faculty ties

Gibbons believes that TVI can actually improve faculty ties with students, providing many more opportunities for participation in class discussions.

"But no faculty wants to believe you can learn as much or more from watching videotapes in small groups with a tutor as you can from sitting at their feet and listening to an hour-long lecture," he concedes.

"Western culture would be miraculously better if students had lecture material they could reflect on available in the residences," Gibbons believes.

As shown by the reaction to Stanford Prof. Diane Middlebrook's course in poetry, "in any subject where discussion is essential for learning, TVI is loaded for bear," Gibbons says. Students would still go to live lectures, but with videotape players and a few tutors in the dorms, Western culture course materials could be extended through four years, instead of limited to one year-long sequence.

"The discussions should be current," he emphasizes. "The tapes shouldn't be saved." After taking two quarters their freshman year, students might take one quarter sequences of TVI in Western culture over each of the succeeding three years.

Gibbons also sees art as an especially fertile field for TVI.

While many believe engineering and science offer the greatest potential for TVI, Gibbons disagrees. "The people who have the hardest time making dollars inside the universities—the historians, artists, and poets—are the ones most wanted by alumni and others off campus," he says.

—Bob Beyers

EDUCOM conference here Sept. 20-22

Four top university executives will discuss how information technology affects higher education at Stanford Sept. 20.

Stanford President Donald Kennedy, San Jose State President Gail Fullerton, and University of California Vice-President Ronald W. Brady will address the opening session of the 1983 EDUCOM conference at 9 a.m. in Dinkelspiel Auditorium. Harvard Vice-President Robert Scott will moderate.

About 400 persons are expected to attend the three-day conference,which is hosted by Stanford, UC, and the California State University system, and cosponsored by the American Council on Education.

EDUCOM is a non-profit consortium of more than 400 colleges and universities, founded in 1964 to promote the use of computing, communications, and information technology in higher education.

Stanford coordinators for the conference include Sandelin, Jane Marcus and Ruby Lai of the Center for Information Technology, Roberta Calloway of the Business and Finance Office, and Lois Fariello of the Conference Office.

Registration is $245 for individuals from EDUCOM member institutions, $345 from nonmember institutions, and $50 for students. For those registering by Sept. 1, the fees are $195, $295, and $25, respectively.

Further information and registration materials may be obtained from the conference registrar, EDUCOM, P.O. Box 364, Princeton, N.J. 08540. Phone (609) 734-1915.

Patients and doctors explain need for animal research

Patients who have benefited from animal research called on California lawmakers Monday to defeat proposed legislation that would bar scientists from using abandoned animals sold to laboratories by shelters and pounds.

The bill, SB 883, pushed in Sacramento by an increasingly powerful lobby, has been passed by the senate, and is scheduled for a hearing before the Assembly Committee on Government Operations August 17.

The patients were joined by scientists and officials from Stanford and the University of California Medical Center in San Francisco at a press conference held on the UCSF campus.

"Senate Bill 883 must be opposed," said Stanford heart transplant patient Bill Boxberger.

Boxberger, 39, of Madera, California, has suffered from a lifelong heart condition. "My whole life is like a history of research," said Boxberger. He pointed to a young patient seated nearby who received his latest heart surgery last Wednesday.

"When I was that age, these procedures just didn't exist," said Boxberger, referring to Albert Lamb, 12, Modesto, California, who sat in a wheelchair beside his father, Albert Sr.

Dr. Julius Krevans, chancellor of UC—San Francisco, said the purpose of the joint conference was "to share with you some of our understanding of why this (animal research) is important, and why some of the legislative issues which are under way at the present time are, potentially, extraordinarily disruptive."

Krevans sat beside Dr. Norman Shumway, chairman of Stanford's cardiovascular surgery department, who emphasized that SB 883 would seriously impede medical research in California. The proposed law would prohibit the use of pound animals in California, and the importation of pound animals from other states after 1986. The bill is sponsored by Senate President Pro Tem David Roberti, (D—Hollywood).

"For reasons that are difficult to understand, it (SB 883) has gained momentum," Shumway said. He attributed the bill's apparent momentum to the "pleas of Hollywood persons who know nothing about research."

Shumway said that the acquisition of vast amounts of knowledge will continue to require the use of pound animals. He pointed specifically to the search for new and improved heart valves, and better anti-rejection drugs for use by transplant patients.

"There are so many avenues ahead of us, it is ridiculous to say that we have researched to some level of perfection and now we can just stop," Shumway said. In Britain and other European countries, where animal legislation is much tougher than in California, there have been "no significant advances" in research in cardiovascular surgery in these otherwise highly sophisticated nations, he said.

Krevans noted that all public and private health science schools in California spend a total of about $900,000 a year on the dogs and cats used in medical research. He estimated this figure could rise as high as $20 million for the University of California system alone if only specially bred dogs were used.

Among those arguing for animal research at Monday's news conference was Stanford's Norman Shumway (above, second from right), internationally acclaimed heart surgeon and transplant pioneer. Later, SUH heart-lung transplant patient Charles Walker (insert, second from left) and UCSF veterinarian Joseph Spinelli (right) responded to further questioning by members of the press.

PHOTOS BY ED SOUZA

In addition, Dr. Joseph Spinelli, a veterinarian and director of UCSF's animal facility, said that specially bred animals are sometimes inadequate because they do not contain the genetic diversity important in some types of research.

Spinelli also emphasized that research institutions and researchers are anxious to work with the public to help identify pets and their owners and to help insure that only stray dogs become involved in research.

Krevans said that issues of inhumane treatment of animals or the use of animals for capricious research obscured the issues behind the pending legislation. "If the concern is that animals are used capriciously," concern should hone in on those specific cases rather than advancing support that would suppress legitimate biomedical research.

Dr. Saul Robinson, clinical professor emeritus of pediatrics at UC—San Francisco, referred to the continuing treatment required by young Lamb, and said, "There is no doubt in my mind, with all sincerity, that these things would have been hindered and probably would not have been possible without animal research." Robinson has been Lamb's cardiologist for nine years.

Also opposing the legislation, and pointing to their own survival as a testament to the value of animal research, were heart transplant recipient Cynthia Jelkman, 26, of Los Angeles, and Charles Walker, 32, of Mountain View, who was Stanford's second heart—lung transplant patient.

"I see the entire bill as an atrocious mistake," Jelkman said. She referred to what she called the wastefulness of breeding dogs specifically for the laboratory, while nationally, 15 million unwanted dogs and cats are killed annually in pounds.

Emphasizing that research is an ongoing, constantly evolving activity, Walker said, "They could not do anything for me until I was 13 years old." He noted that research has now made treatment possible at a much earlier age for many people born with heart defects.

—Mike Goodkind

Turning off genetic sources of disease

Researchers at Stanford have moved one step closer toward their goal of turning immune diseases off at the source by learning to genetically control the symptoms of a chronic disease of the nervous system.

Although his work has focused on a disease in mice that mimics myasthenia gravis, Dr. Lawrence Steinman, assistant professor of neurology, said that other diseases linked to the immune system—such as multiple sclerosis, juvenile diabetes, and rheumatoid arthritis—might be treatable in the same way.

Graduate student Matthew Waldor, Dr. Subramaniam Sriram, research associate, and Dr. Hugh McDevitt, professor of medicine/immunology, collaborated with Steinman on the study published in the May *Proceedings of the National Academy of Sciences*.

The fatigue and weakness in muscles of the eye, face and throat that are symptoms of myasthenia gravis, are thought to arise from an overactive immune system. In healthy patients, nerve cells relaying messages from the brain to muscles use several chemicals to transmit the message between cells.

The protein on the muscle that recognizes and "receives" one of these chemical messengers, called acetylcholine receptor, or AChR for short, plays a central role in myasthenia gravis.

Because of a defect in their genes, the 8,000 Americans who have myasthenia gravis produce antibodies that destroy the terminals that receive acetylcholine in the muscles, short-circuiting the body's electrical system and triggering disease.

Conventional treatments for the illness act by increasing the number of receptors available, or by slowing their breakdown. But Steinman and his team have found the gene in mice that "tells" cells in the immune system to produce the offending antibodies. Going one step further, they have developed tailor-made proteins, called monoclonal antibodies, that latch onto such genes and turn them off, much like turning off a faucet.

In the mice studied, once the "faucet" was turned off, normal cell communication returned, and the symptoms of myasthenia gravis disappeared.

The next step is to attempt the same

SUH proposes Blue Cross contract: response expected within days

Stanford University Hospital submitted a proposal earlier this month to join Blue Cross of California's new Prudent Buyer Plan (PBP), said David Sakai, director of finance.

He added that a response from the insurance carrier is expected by the end of July. The specifics of the hospital's proposal were formulated based on discussions with Blue Cross, which covers about 13 percent of SUH's patient revenues.

The PBP is Blue Cross' Preferred Provider Organization (PPO), a recently mandated innovation in medical care reimbursement. PBP provides that physicians sign contracts to accept Blue Cross-established fees as full payment for services (except for deductibles or supplementary insurance).

Only physicians who have privileges at a hospital under PBP contract would be eligible to join. Reimbursement for physicians will likely be less than current levels, Blue Cross announced.

California's largest health insurer, Blue Cross has already reached agreement with 42 hospitals in its initial target areas of the state. SUH is in the second group of hospitals to negotiate with Blue Cross. Blue Cross has said it hopes to enroll 20 percent of its California membership in PBP during the first year of operation.

The intent of the program is to negotiate reduced rates with hospitals for PBP members, and to pass these savings on in the form of premiums that are lower than those for comparable standard coverage.

"Blue Cross will offer financial incentives for members of the PBP to use participating hospitals and physicians," said Leona Butler, director of provider contracting for Blue Cross. "Because this 'channelling' will enable participating hospitals to operate more efficiently, they have been able to offer Blue Cross a considerably reduced rate."

Blue Cross members will retain their free choice of provider hospitals and physicians; however, when a member receives care from a non-participating provider, he or she will be responsible for at least 20 percent more of the cost of care.

The medical staff of SUH is being surveyed to assess their willingness to participate in the PBP, and Chief of Staff James Silverman has emphasized that all staff members—including those in faculty, group and independent practices—would be equally entitled to participate if SUH accepts such a contract.

In seeking contracts for the PBP, which by the end of the year will be available in most areas of the state, the Blue Cross has approached hospitals in each area only to the extent required to meet estimated bed need during the first-year implementation.

Blue Cross emphasizes that it intends to continue its long-term "standard contracts" with hospitals not participating in the PBP. Members of other Blue Cross plans will still be able, as always, to receive care on a fee-for-service basis at almost all hospitals in the state by presenting their Blue Cross cards.

The *Campus Report* will keep readers informed of the status of SUH's contract negotiations with Blue Cross of California.

Gloria Linder, head reference librarian at Lane, conducts a computer search of literature for a Stanford physician. Now clinicians trained to conduct their own searches will be able to do so on five terminals soon to be placed throughout the hospital.

New terminals to make possible more independent computer searches

Five computer terminals that can give doctors direct access to a national library of medical literature in a matter of minutes will be placed throughout Stanford University Hospital next month, funded by a $10,000 grant from the Henry J. Kaiser Family Foundation.

The terminals represent the Medical Center's goal of giving clinicians access to the computer search opportunities currently used most by academic researchers, said Dr. Richard Lenon, the clinical assistant professor of medicine who helped engineer the program.

Physicians have had access at Lane Medical Library for over a decade to "MEDLINE," a computerized tie to all the medical book and journal listings in the National Library of Medicine. But until recently, with only a few reference librarians trained to use the system, the fairly time-consuming computer searches were more practical for scientists researching papers than for doctors seeking answers to treatment questions, Lenon said.

To help alleviate the problem, Lenon and Gloria Linder, head reference librarian at Lane, have taught several three-hour seminars on the computer since November, training about 70 physicians, nurses, and others interested in conducting their own searches. The five new terminals, Lenon said, will be located in Lane and the departments of Medicine and Pathology libraries, as well as in the oncology day care center and East 1A in the hospital, and should greatly facilitate independent searches.

Anyone interested in signing up for a free upcoming training seminar can call Lenon at 327-3487 or Linder at 497-6831.

The foundation that made the purchase of the terminals possible is based in Menlo Park, Calif., and was founded in 1948 as a charitable trust by the late industrialist Henry J. Kaiser.

In 1982, the foundation authorized grants of more than $15 million to support efforts in the field of health and medicine.

Med faculty openings

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

The Division of Cardiology is seeking an assistant or associate professor willing to make a major commitment to both clinical activities and research; demonstrated research productivity is essential. The selected individual will direct electrophysiology laboratory; invasive laboratory skills are mandatory.

Applicants should send curriculum vitae to: Edwin L. Alderman, M.D., Search Committee Chairman, Cardiology Division, Stanford University School of Medicine, Stanford, CA 94305.

* * * *

Applications are invited for junior and senior faculty positions in the Department of Anesthesia. Candidates must have completed two years of clinical anesthesia training and one or more years of research in a related field, specialty training in another discipline of relevance to anesthesia, or additional training in a subspecialty of anesthesia.

They must be Board certified or eligible, and eligible for California license.

Applicants should submit curriculum vitae to: John P. Bunker, M.D., Professor and Acting Chairman, Department of Anesthesia, Stanford University Medical Center, Stanford, CA 94305.

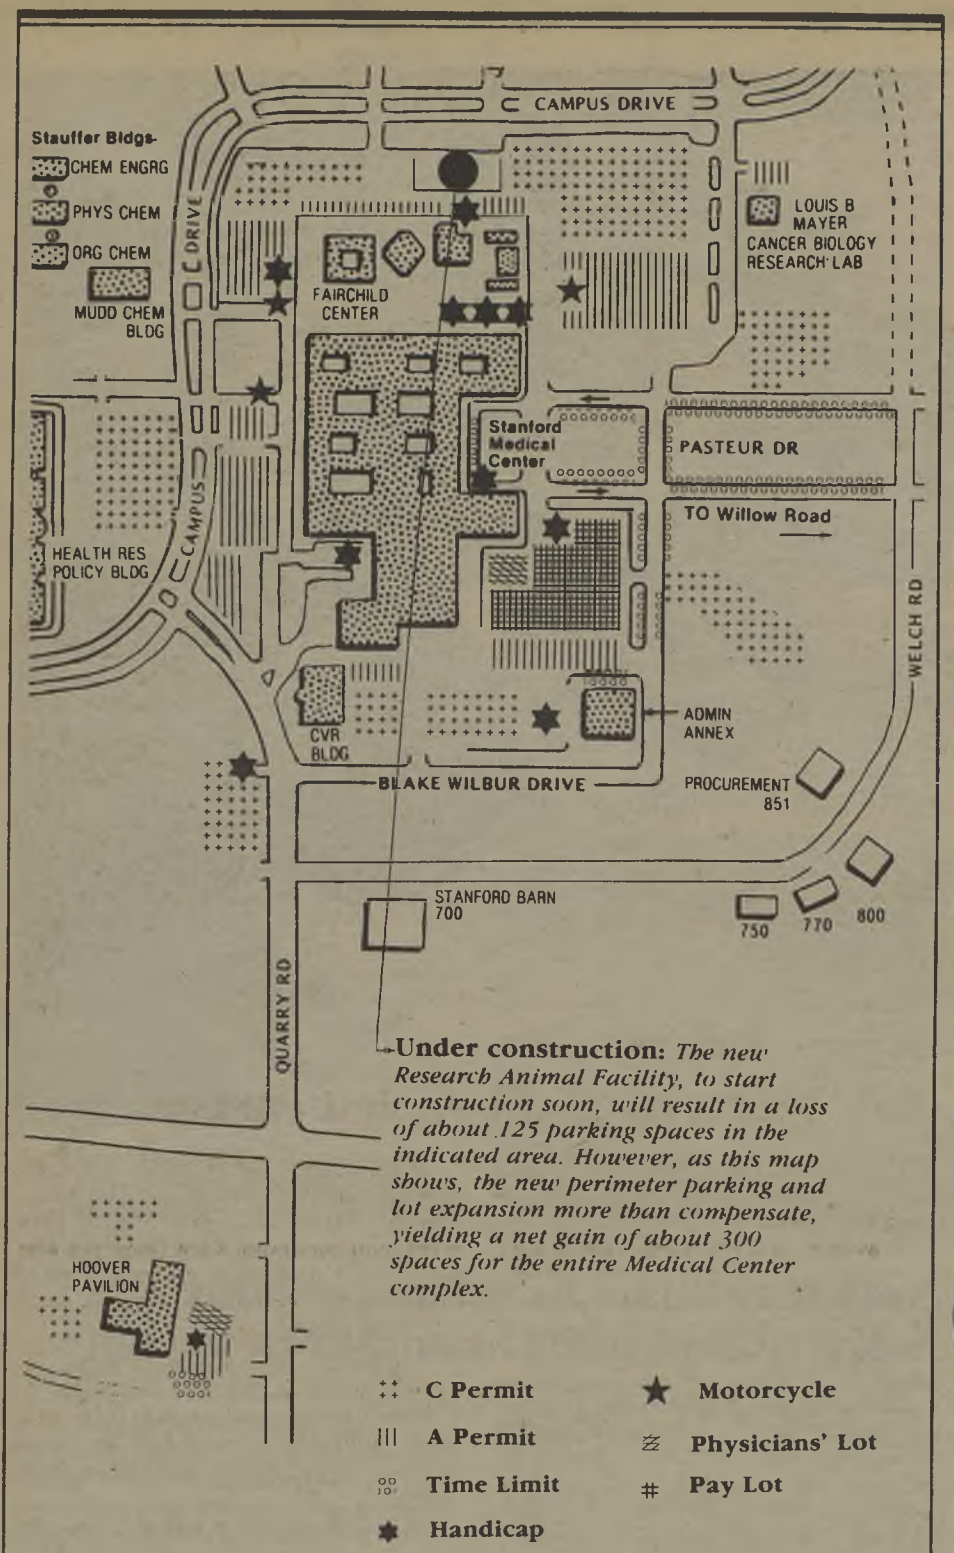
* * * *

The Department of Obstetrics and Gynecology seeks a full-time assistant professor. The tenure track position requires someone certified by the American Board of Obstetrics and Gynecology and board eligible in Maternal-Fetal Medicine.

The selected individual must be an experienced ultrasonographer; have documented expertise in prenatal diagnosis and genetic amniocentesis; have experience in Perinatal Outreach and in clinical research specifically relating to parturition and fetal-neonatal and maternal cardiovascular dynamics; and have demonstrated teaching abilities.

Applicants should send curriculum vitae and names of three referees to Kent Ueland, M.D., Chairman, Search Committee, Department of Gynecology and Obstetrics, Stanford University Medical Center, Stanford, CA 94305.

Medical Center MEMO



Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Building for the Future

Several hospital equipment companies have been invited to exhibit selected products this week for review by hospital departments, administration and architects planning new equipment as part of the Hospital Modernization.

The equipment on display consists of six different wall monitor systems for patient rooms, and five typical samples of case work and cabinetry for laboratory use.

The exhibits are located in room P-1096, across the hallway from the HMP office. Viewing times have been scheduled by the HMP office for departments involved. Others wishing to view the exhibits may contact the HMP office at 497-6005.

Under construction: *The new Research Animal Facility, to start construction soon, will result in a loss of about 125 parking spaces in the indicated area. However, as this map shows, the new perimeter parking and lot expansion more than compensate, yielding a net gain of about 300 spaces for the entire Medical Center complex.*

Parking at the Med Center

The Medical Center has recently expanded its overall parking capacity, although certain specific areas may experience a loss in spaces.

The biggest gains were made by restriping the southern lots—which has increased the amount of compact spaces from 33 to 57 percent—and building the temporary C lot for construction workers, adjacent to the Cancer Biology Research Building.

Latest figures indicate that space in the Clinics lot (adjacent to the A lot between Campus and Pasteur Drives) has decreased by about six slots, but overflow patient traffic will continue to be accommodated free of charge in the pay lot.

Please note that handicap and motorcycle parking are by permit only, and violators will be fined for parking in these zones.

Philip Rector

Rector to leave for Arizona post

Philip Rector, director of Facilities at Stanford University Medical Center since May of 1979, has been named director of the University of Arizona's Division of Physical Resources.

His effective date of resignation at Stanford is October 3, 1983.

Rector first joined Stanford University in January of 1979, as associate director of service operations for Utility Systems. Prior to that he had worked as physical plant director at the California Institute of Technology in Pasadena, and at Georgia Institute of Technology in Atlanta.

Rector is a graduate of Georgia Tech, where he earned a mechanical engineering degree in 1955. He is a registered professional engineer. He was an Air Force pilot and later worked for the Southern Railway System before assuming his subsequent managerial posts.

He was given the Concern Award in 1974 by the Southern California Gas Company for recognition of energy conservation at Cal Tech. He served as president of the Northwest Atlanta Business Association for two years, and as a member of the Pasadena Chamber of Commerce Energy Committee.

He received the Meritorious Service Award in 1975 of the Association of Physical Plant Administrators of Universities and Colleges. He is now serving a second term as chairman of the long-range planning committee for the APPA.

In his role at the Medical Center, Rector has been in control of a department responsible for the maintenance of buildings, grounds and equipment throughout the complex, as well as management of major construction projects, including, for example, the Boswell Building Renovation.

At the University of Arizona, he'll be responsible for managing all engineering operations, maintenance and renovations for the 131-building, 320-acre campus, which includes the Arizona Health Science Center campus. There are about 600 employees in the division.

Rector will be succeeding Bill Varney, who has served as acting director of the division for the past 11 months.

Construction Corner

Boswell Building, second floor south:
As forecast in the July 13 "Construction Corner," the demolition phase of the Boswell Building Renovation, second floor south, has begun.

The entire south corridor of the building is barricaded to allow for construction procedures. Horizontal patient traffic through the second floor of Boswell is being rerouted through the third floor.

The corresponding areas on both the first and second floors are blocked by construction barriers.

The length of time for the barricades depends on when the areas become ready for occupation by the surgery, urology, and cardiovascular clinics on the second floor, and by the general internal medicine and medical specialties clinics on the first floor.

Women's Bathroom Shutdown:
Due to the upcoming remodel of rooms C050, C052, C052A, and C056 for the Department of Radiology, hyperthermia facility, the women's ground floor toilet room, lounge, and locker room in rooms C052, C052A, and C056 will be closed for an extended period of time starting 7 a.m. Saturday, July 30.

Provisions for temporary locker space and lounge have been made with the appropriate department heads.

Everyone is asked for cooperation with this renovation project. The Facilities Department will attempt to keep staff informed of its progress throughout construction. Alternative toilet rooms and lounges have been identified, and floor plans to illustrate them are being distributed.

Blake Wilbur Drive:
The discovery that a build-up of water from the winter's heavy rains had seeped through the road caused an unforeseen delay in reopening the Blake Wilbur Drive section under reconstruction last week.

Workers had to dig about 18 inches down, remove the wet soil and replace it with dry, before they could put down asphalt and complete the job.

Study seeks volunteers

Members of the community are reminded that volunteers are still needed to participate in a three-month study at the Cardiac Rehabilitation Program, to compare the health benefits of low and high level exercise. Researchers headed by Dr. Robert DeBusk are looking for healthy, sedentary men between 40 and 60 years old.

After phone screening, volunteers will undergo a preliminary medical evaluation. On completing the study, they will be given an individualized "prescription" for long-term exercise.

Those interested should call 497-6461 during regular business hours and ask for the "coordinator of the high/low study."

Physical therapy faculty awards

Two faculty members from the Division of Physical Therapy were recognized last month for their outstanding performance in the field at the 1983 American Physical Therapy Association Annual Conference in Kansas City, Mo.

Barbara Kent, professor, and Sarah Semans, associate professor emeritus of physical therapy, both received the Lucy Blair Service Award, which honors APTA members who have made exceptional contributions to the Association.

Barbara Kent

Kent has been a researcher and author for more than 30 years, with an outstanding reputation in the area of kinesiology. Her writings on functional anatomy of the shoulder and anatomy of the trunk, and editing of an international meeting of Orthopaedic Physical Therapists, have drawn nationwide acclaim. In 1972 she received the Golden Pen Award.

Kent's expertise includes many educational activities. She has served in an advisory capacity for both physical therapy and physical therapy assistant programs. She has held many state and national positions of the APTA.

Semans has served the profession for more than 50 years and was nominated for the Award "because of her exemplary service to students and teachers of physical therapy and her exceptional mastery of, and devotion to, the art and science of patient care."

Sarah Semans

Semans, an alumna herself of Stanford's division, is currently director of physical therapy at the Mid-Peninsula Health Center in Palo Alto.

She has continuously investigated new ideas in the area of neuromuscular disabilities, leading to the development of concepts and patient management.

In her years at the Spalding Crippled Children's School in Chicago, and the many summers she spent in poliomyelitis epidemic areas, Semans carried out research in treatment procedures.

Semans has shared her knowledge and expertise, particularly in the treatment of cerebral palsied children and adult hemiplegia. She was a pioneer in introducing the neurodevelopment approach to treatment in this country.

The Lucy Blair Service Award was established by the Board of Directors of the APTA in 1969 to honor the contributions of Lucy Blair, an outstanding clinician, supervisor, consultant, and former executive director of the Association. The first Award was presented to Blair at the annual conference in 1969.

Selection is made each year by the Board of Directors based on recommendations of the Mary McMillan and Lucy Blair Service Award Committee.

Sylvia Hupman at work in the eye clinic

Longest-term FPP staffer looks back on varied career

Sylvia Hupman started work here partly because "I love people" and partly because she wanted a 19-cubic-foot freezer.

It was nearly 33 years ago when Hupman, who had been raising vegetables at her Mountain View farm, found work outside the home to buy the freezer. "We just (recently) threw it away after it wore out," said the 61-year-old licensed vocational nurse who admits she feels so youthful, "I tell my (seven) grandchildren to call me 'aunt.' "

Hupman currently works in the Stanford University Clinics eye clinic and was honored at a recent Faculty Practice Program awards banquet as the employee with the most years of service.

That record of longevity began with a display of tenacity which began even before she was hired on Nov. 23, 1950, to work at Palo Alto-Stanford Hospital, the forerunner of the Medical Center.

"I would come in once a week to see if there were any positions available. Then between visits I would call up to ask. I think they hired me out of frustration," she said in a recent interview.

That first job was as a ward helper, a position which involved some housekeeping duties, running errands and a variety of miscellaneous chores.

She took about six months off in 1952 for the birth of her son Victor, who currently is supervisor at the hospital print shop.

Hupman was eventually promoted to nurse's aide, and she particularly remembers many of the celebrity patients who came to the hospital.

Among the famous patients Hupman counts on her list is comedian Joey Brown. "I put him to sleep with a good back rub," Hupman recalls.

Finally, however, in 1958 frustration again became an issue—this time for herself.

"It was total frustration," Hupman said, which led her to take a one-year leave of absence to attend San Mateo Junior College to become a licensed vocational nurse.

"I wanted to do so much (medically) for the patients, but that was not possible without further training," she explained. So with the encouragement of several faculty members and colleagues, Hupman was given one of the first leaves of absence granted at Stanford for a member of the nursing staff to upgrade her qualifications.

For several years Hupman served in a variety of units doing what she had dreamed of doing—helping to care for patients.

In 1963, after pulling a ligament in her hip, Hupman was transferred to the clinics where the physical demands appeared less hectic, she said.

Now Hupman works in the ophthalmology clinic where she assists with a variety of procedures, including anesthesia, ultrasound and laser treatments.

While work duties have changed through the years, much of Hupman's home life has grown as well. She still lives in the same Mountain View house she and her husband of 41 years, Addison, lived in when Hupman started hospital work more than three decades ago.

The family, which now includes two daughters, Elsie Louise and Ann Marie, in addition to son Victor, has seen their rural home gradually surrounded by commercial developments and subdivision houses.

"We stick out like a sore thumb," she said.

Hupman, a Los Angeles native who grew up next door to Addison in Berkeley, has no plans to retire. Her husband, however, retired recently from an engineering job with the Whisman School District in Mountain View.

The couple enjoys travel, most recently a vacation in Europe.

Her hobbies include lapidary work.

New home for the printed word

There's good news in the news department!

Now it will be easier for you to find extra copies of the *Campus Report* and other publications of interest to the Medical Center community, since five custom-made wooden dispensers were installed last week.

Four of the dispensers are located in the hallways near the escalators on each floor of the main hospital. One is in the main lobby of Hoover Pavilion.

The dispensers are hoped to help facilitate publications distribution at the Medical Center. They are designed to accommodate approximately 150-200 *Campus Reports*, 50 or more *Facts* booklets, 100 *Overviews*, 50 *Stanford Medicine* or other magazines, and about 100 other future newsletters or publications. Overflow will be accommodated on the lower shelves of the dispensers.

The dispensers were paid for by SUH employees with proceeds from the November, 1982 jewelry sale.

Please—now that the dispensers are here, help yourselves to their offerings, on a regular basis or whenever they catch your eye in passing. All publications are free for the taking, and you might just find some useful information!

Matthew Waldor exhibits *Torpedo californica*, a member of the stingray family. Researchers are using proteins from the stingray as part of their strategy for a new kind of treatment for diseases of the immune system.

Steinman. . .

continued from page 12

sort of disease regulation in non-human primates, Steinman said, before any testing in humans might be done. Even after studying the mice for up to a year after the experimental treatment, no negative side effects have been detected, Steinman said, though toxicity will continue to be closely followed in further research.

Primate studies are scheduled to begin in Europe and the United States within the year he said, perhaps prompting studies in human patients within three to five years.

Prednizone, a steroid that induces a blanket suppression of the immune system, is one of the current popular treatments for myasthenia gravis that "work quite well," Steinman said, though side effects such as high blood pressure, weight gain, and increased vulnerability to infection make the drug less than ideal.

But another disease linked to an immune defect, multiple sclerosis, has no effective treatment at all, and might be the first target illness to be treated by the new therapy, if animal studies confirm early promise, he said.

In patients with multiple sclerosis, the fatty sheath that provides insulation for nerve cells is slowly eaten away by misguided antibodies.

For 20 years, scientists have searched without success for the mysterious m.s. antigens—the protein molecules that send up the alarm in the human body and bring the full power of the immune system to bear against the nerve cells.

"That may be telling us something," said Steinman. "There may not be a specific m.s. antigen, but instead a variety of antigens that trigger the disease. We've taken a different tack and decided that if we're not going to get anywhere looking for the antigen, let's take the next available clue and try to devise a therapy for the disease based on that clue."

The "clue" Steinman speaks of is the gene that scientists have identified that serves as a blueprint for the offending antigen. Identifying and "turning off" the gene would permit physicians to focus on the specific, defective part of the immune system that instigates disease, rather than suppressing all aspects of the body's ability to fight infection.

"It's a new and different type of immune regulation," said Steinman. "There's no certainty that it will work in humans, but it could be a major change from the fairly brutal types of immunosuppression that have been done in the past—hit the immune system with a crude chemical sledgehammer and hope for the best."

—**Deborah Franklin**

Becker dies in San Francisco

Dr. George Becker, a 1921 Stanford Medical School alumnus, died this month in San Francisco.

Becker, who practiced internal medicine in San Francisco, had established with his wife the George E. and Lucy Becker Professorship in Medicine at Stanford in 1979. Named in honor of Becker's late parents, the endowed chair is for "the alleviation and prevention of disease."

Becker was director of the Bureau of Communicable Diseases of the San Francisco Department of Public Health, vice president of the Independent Order of Foresters with responsibility for their tuberculosis hospital and aged residents' home, and a member of the Irwin Memorial Blood Bank Commission.

He was also a diplomate of the American Board of Preventive Medicine and Public Health, and a fellow of the Royal Society of Health in Great Britain.

...News Notes...

You should know. . .

All **Hospital employees** *are reminded that the month of August is the annual* **open enrollment period for health insurance plans.**

SUH employees who wish to change from one health plan to another may do so during August without a physical examination. Spouses may also be enrolled under the plans during August. Changes will be effective Sept. 1.

Employees are encouraged to carefully consider their personal needs and choose the plan that best suits them, since open enrollment takes place only once a year.

To assist in the decision, employees should refer to the benefits booklet for details of each plan. Minor rate changes will go into effect Sept. 1.

Anyone who has not received an information packet or who has further questions should contact Pension and Benefits, room E009, 497-5734. To change medical insurance, visit the office or complete the recently distributed forms and return.

* * * *

The annual **Summer Sale** *at the Hospital gift shop is currently in progress.*

* * * *

Dr. Peter Wood's lipid laboratory has moved, effective July 18, to a new location near his office, at **730 Welch Road**. *The phone numbers are 497-7820 and 497-6254.*

Jo Ann Hattner, R.D., M.P.H., and Dr. John Kerner, Jr., have coauthored a chapter in the recently released **Manual of Pediatric Parenteral Nutrition**, *edited by Kerner, an assistant professor of pediatrics.*

The chapter addresses "nutritional assessment of the pediatric patient." The book is available at the Stanford Medical Bookstore in Palo Alto.

* * * *

One **Haemonetic Cell Saver III**—*an automated blood recovery device which collects blood from a bleeding patient during surgery, filters out the debris, washes it, concentrates it and returns it to the same patient—was approved this month for funding by the SUH Auxiliary.*

The gift is by request of Dr. J. Kent Garman, associate professor and medical director of the Anesthesia Department, who said that the blood thus saved would otherwise be discarded during surgery. The system is especially appropriate for certain types of surgery.

There is currently only one of these devices in the Operating Room, and it is in heavy use and demand. It adds to safety by cutting down on the amount of transfused blood a patient would need during surgery.

A second device will be purchased with the trade-in of an outdated cell saver, plus the Auxiliary's gift of about $19,000.

Medical Center Calendar

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, JULY 27

Hematology Support Group: Support group meeting for patients with leukemia, myeloma, hemophilia, and other blood disorders. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

THURSDAY, JULY 28

Dept. of Medicine grand rounds: Lecture to be announced—Dr. Gary Gray. 8:30 a.m., Fairchild Auditorium.

FRIDAY, JULY 29

Dept. of Gynecology and Obsetrics grand rounds: "HCG Quantitation for Gestational Trophoblastic Disease: A Method for Detection of the Free B Subunit"—Dr. Alan Shapiro (fellow, reproductive endocrinology). 8 a.m., A336.

TUESDAY, AUGUST 2

Registration deadline for Nursing Educational Services Critical Care Course Level II: "Circulatory Assistance," to be held Tuesday, August 16, 8 a.m. to 4:15 p.m., 900 Welch Road, conference room 15. For further information or to register, call 497-6366.

Registration deadline for Nursing Educational Services Critical Care Course Level I: "Selected Topics in Medical and Surgical Critical Care," to be held Tuesday, August 9, 8 a.m. to 4:30 p.m., 900 Welch Road, conference room 15. For further information or to register, call 497-6366.

WEDNESDAY, AUGUST 3

SUH Dept. of Pensions and Benefits: "Pre-Retirement Counseling Program." First of a series on Wednesday evenings through August 24. 6 to 9:30 p.m., M112. Advance registration necessary. Priority will be given to employees within 10 years of retirement. For further information or to register, call 497-5734.

Dept. of Psychiatry and Behavioral Sciences lecture: "Opiate Receptor Regulation of Adenylate Cyclase in Neuroblastome/Glioma (NG108) Hybrid Cells"—Dr. Ping Yee Law (UCSF). 3 p.m., M108.

THURSDAY, AUGUST 4

Dept. of Medicine grand rounds: 8:30 a.m., Fairchild Auditorium.

SATURDAY, AUGUST 6

SUMC Auxiliary Volunteer Orientation: 9:45 a.m., W001. Call 497-6636 for further information.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear.

GSA proposes broad expansion of censorship for unclassified research

A key Stanford official has sharply criticized federal efforts to impose government ownership and censorship over information developed in unclassified contract research.

Proposed patent and "rights in data" provisions of the Federal Acquisition Regulations (FAR) "jeopardize this country's progress and leadership in science and technology," Vice Provost Gerald Lieberman, dean of graduate studies and research, said on behalf of the University.

As proposed, the FAR regulations would require "prior written censorship by government officials. . .for the dissemination of research results in any. . .copyrighted form such as books, monographs, seminars, unpublished papers, graduate student theses, and other informal means of scholarly exchanges," Lieberman said.

The proposed regulations would permit copyrighted publication without prior government approval only of "scientific and technical articles. . .in an academic or technical journal," he noted.

"The (proposed) regulations are poorly written: many of the provisions are vague; some appear to lack statutory authority, and by their sheer breadth they raise First Amendment questions."

The administrative burdens on both academia and the government resulting from such regulations would be "unmanageable," he added.

As drafted, the rules "could prohibit universities from discussing government-contracted research with their own students, visiting scholars, or other researchers if any of these individuals were not 'employees'—even if they were U.S. citizens—while allowing release of that data to resident aliens," he said.

"The proposed regulations single out computer software as items to be owned by the government and which may not be released by university contractors. However, our software is merely the embodiment of research data in a copyrightable medium.

"More and more research results are taking the form of computer software, much of which (is) frequently shared among research scientists and industry.

"Indeed, Stanford recently established, in response to demand for software developed at the University, a distribution center designed to insure timely and efficient dissemination of research software.

"FAR would prohibit such dissemination, without even giving government officials the discretion to authorize release."

The proposed provisions concerning patent and "rights in data" should be "discarded as written," and reformulated with participation from the university community, he suggested.

His views were contained in a July 19 letter to Lawrence J. Rizzi, director of the General Service Administration FAR project at Suite 700, Webb Building, 4040 N. Fairfax Dr., Arlington, Va. 22203.

Lieberman sharply criticizes draft of Federal Acquisition Regulations

Following is the text of a July 19 letter to Lawrence J. Rizzi, director GSA FAR Project, from Stanford Vice-Provost Gerald Lieberman on proposed patent and data provisions of Federal Acquisition Regulations (FAR):

I am writing to express the concerns of Stanford University regarding recently proposed patent and "rights in data" provisions of the Federal Acquisition Regulations (FAR). If adopted as currently proposed, these regulations would jeopardize this country's progress and leadership in science and technology.

In general, FAR seeks to impose government ownership and censorship over information developed in the course of contract research; it would inhibit the free and open dissemination of unclassified research results which is essential in order for the United States to maintain its scientific and technological progress. However, the value of free exchange of research results is not acknowledged in the proposed regulations, which appear to be primarily concerned with the "property right or other valid economic interest" of research contractors (Section 27.402).

Moreover, the regulations are poorly written: many of the provisions are vague; some appear to lack statutory authority, and by their sheer breadth they raise First Amendment questions.

For example, the regulations permit copyrighted publication without prior government approval *only* of "scientific and technical articles. . .in an academic or technical journal." Section 52.227-18 (c) (1) (i). Prior written censorship by government officials would thus be required for the dissemination of research results in any other copyrighted form such as books, monographs, seminars, unpublished papers, graduate student theses, and other informal means of scholarly exchanges.

Not only would such actions be detrimental to the educational and research missions of universities, the administrative burdens of both academia and the federal government in implementing such provisions would be unmanageable.

Another example of inadequate drafting of these regulations appears in Section 52.227-18f(d) (iii), which requires either the permission of the contracting officer or an export license to disseminate information "subject to export control laws and regulations," except to university contractors, "employees who are U.S. citizens," or resident aliens, or to the government. As written, this provision could prohibit universities from discussing government-contracted research with their own students, visiting scholars, or other researchers if any of these individuals were not "employees'—even if they were U.S. citizens—while allowing release of that data to any resident alien.

What data is, or ought to be, subject to federal export control laws and regulations is a troubling issue that experts from the government and universities have been discussing for several years. FAR is not an appropriate forum for proposed resolution of these issues. Further more, no statutory authority exists to permit contracting officers to authorize an export in the absence of an export license, should one in fact be required.

A related issue involves "controlled data" and "data containing restrictive markings from the government," neither of which could be disseminated by universities, according to Sections 52.227-18(d) (i) and iv). These terms are not adequately defined and, in the absence of precise statutory authority, guidelines or regulations, are subject to potential misuse by the many government procurement officials who are charged with implementation. We are gravely concerned that effective communication among scientists will be impaired substantially by uncontrolled use of such secrecy powers.

The proposed regulations single out computer software as items to be owned by the government and which may not be released by university contractors. However, our software is merely the embodiment of research data in a copyrightable medium. More and more research results are taking the form of computer software, much of which are frequently shared among research scientists and industry. Indeed, Stanford recently established, in response to the demand for software developed at the University, a distribution center designed to insure timely and efficient dissemination of research software. FAR would prohibit such dissemination, without even giving government officials the discretion to authorize release.

FAR also contradicts the objectives of the "University and Small Business Innovation Act of 1980," and OMB Circular A-124, which strive for uniform regulations in order to promote technology transfer (PL 96-517) and reduce administrative burdens (A-124).

Given the many problems associated with the draft regulations, we strongly urge that parts 52 and 27 dealing with patent and data provisions of the Federal Acquisition Regulations be discarded as written and that new drafts be prepared with participation from the university community.

Thank you for this opportunity to comment.

Kennedy responds to Rusk, again defends academic freedom for research

Following is a reply from President Donald Kennedy to Loren Rusk of the Department of English:

Your letter to me of June 8, published in *Campus Report*, urges me to prevent the possibility of "weapons research" at SSRL, and asks me in conclusion to "re-examine your conscience and truly represent the community that you head."

First, I want to dispel some confusion about my job. It is not to "represent the community." The University is a complex entity. On some matters—for example, the stewardship of the University's assets and property—I have a good deal of authority. I do not, and should not, exercise it in a representational fashion.

We are a public trust, and I am therefore accountable to trustees—who don't believe, for example, that real estate transactions should be evaluated by campus referendum. On other matters, particular constituencies of the University hold the authority. For example, by powerful and longstanding academic tradition, the faculty is responsible for university policies relating to academic inquiry.

This principle exists for the best of reasons. Academic freedom really *means freedom of inquiry*. To be able to probe according to one's own interest, knowledge, and conscience is the most important freedom the scholar has, and an undissociable part of that process is to state its results openly. The rules of universities are carefully structured to protect freedom of inquiry, and accordingly they have always turned aside from regulating faculty inquiry, even when strong political forces were in favor of it. It is these very same rules that insist, as a complementary defense of freedom of inquiry, that the work be done and published openly.

Thus the academic community has surrounded research with the same kinds of protections that a democratic society has more generally given to speech. That is because the two are really very much alike. When the theoretical social scientist, working alone and without benefit of any equipment beyond a library, generates a radical idea we seldom argue about the need to accord every protection to the author's right to produce and to publish that idea.

That is because in such cases the identity between research and speech is so obvious.

It might be argued that research in the physical sciences is different because it depends upon complex hardware, involves the development of "technologies" and not just ideas, and frequently is supported by outside entities. All that is true; yet I do not believe that the size of a project, the specificity of the products, or the source of the funding provides a valid basis for casting aside the principle that faculty members should be free to inquire according to the dictates of their own professional interests and conscience. What possible principle could be used to differentiate some forms of "hard science" from the rest of scholarly work, for the purpose of regulating it differently?

At Stanford the Committee on Research, the faculty's agent for establishing and monitoring research policies has frequently been called upon to make restrictions on research that are based on prospective end-use or on the source of funding. The Committee has consistently reaffirmed its belief, most recently in the case of the SSRL project, that such restrictions should not be made. Although I have stated my own personal agreement with that view, I have tried to remind everyone—and I do so again now—that this is clearly an area in which the faculty has the responsibility. Were the President of the University able to set aside that policy so as to prevent a faculty member from doing a particular piece of research—with or without the claim to "represent" some community or other—we would have sacrificed a central element in our tradition of academic freedom. But let me comment, for myself, on the arguments you and others have raised.

Some have contended that the SSRL project is different because it involves outside institutions and a large capital investment. As a matter of fact, the proposed capital investment will make possible a variety of different kinds of work, most of them having nothing whatever to do with nuclear weapons or testing. However, as Stanford's rules require, a Stanford faculty member (one who, by the way, deserves respect for his conscience as well as for his Ms. scientific distinction) will be the principal investigator on the project, and will be responsible for it. It is thus clearly in the same category as other investigator-initiated research projects.

Others, like yourself, believe that this case is different for another reason. Because, it is argued, the research is related to nuclear weapons, and because nuclear weapons have the potential for great human destruction, the entire matter passes to a different ethical zone. That kind of argument is regularly advanced whenever a good set of principles produces a result with which many disagree, or which seem threatening. It is frequently used, for example, in favor of martial law in times of civil unrest. It is a tempting argument, but it is one we should resist.

Your letter ends with a challenge very familiar to those of us who agonized our way through the late 1960s; "No neutral move is available to you. . . you can either add to the danger of annihilation, or you can join those of us who believe that the least we must do is not allow it to begin in our own backyard." I find that a disappointingly familiar specimen of rhetorical righteousness, but at least the first part of it is correct: I can indeed make no "neutral move." That neither surprises me nor leaves me particularly uncomfortable, because I've learned that the more difficult decisions I make nearly all have to do with collisions between competing values, each of which has great merit. In the present case, I cannot begin to predict whether or how much this research (or any of a number of other kinds of research) will add to the danger of annihilation; but the nuclear imperative you offer does not persuade me that we should suspend a central principle of academic freedom because there is some chance that it might.

Guest Professorship Board 'tended to disrupt' McCloskey class, faculty find

continued from page 1

Guest Professorship Board until its present rules are changed.

The provost's actions followed the recommendations of political science Profs. David J. Danelski, Heinz Eulau, and Robert Horn, who conducted the probe, and Humanities and Sciences Dean Norman K. Wessells, who agreed there were "serious abridgements" of academic freedom by the Associated Students.

When he requested the inquiry on his own initiative May 18, Hastorf noted that "following faculty approval of the teacher and the course syllabus, any alterations in the lectures and readings must be the decision of the teacher."

Wessells expressed hope the Associated Students would revise its procedures so that the student-financed guest professorship program could continue. Present student legislation "virtually guarantees that academic freedom of guest professors and their students will be infringed," he said.

Pete McCloskey

Master-servant relationship

The faculty investigating committee noted that "because the ASSU invites and pays guest professors, it takes the position that they are its employees who may not without its consent change reading assignments in courses or invite guest lecturers. In other words, it has a master-servant view of its relationship with guest professors. That view has never been accepted at universities like Stanford."

The written record indicates that the Associated Students Council of Presidents and Guest Professorship Board "went far beyond permissible student participation in instructional matters" with McCloskey, threatening to cut his compensation by $1,000 or even discharge him as guest professor if he would not agree to ASSU control over his reading list and guest lecturers, the committee said.

The ASSU "abridged the academic freedom" of students by possibly denying them "full and free discussion of matters originally planned for the course." The Guest Professorship Board's actions "tended to disrupt the course and hinder learning in it," they added.

After McCloskey acquiesced in the invitation of guest lecturer he said the Guest Professorship Board had demanded for the final session of the course, he and Board Chairman Seth Linfield negotiated the amount of time the lecturer would be permitted to speak while the guest was actually talking in class.

While Linfield had proposed a payment of $4,500 for the course to McCloskey in January, he was finally paid $2,000 by the ASSU on June 6.

The three political science faculty members recommended that the University pay McCloskey for out-of-pocket, course-related expenses, totalling $258.99, and that his compensation be increased by an unspecified amount to a level that is "fair." Wessells and Hastorf agreed this should be done.

Conditions for credit

The committee recommended that ASSU Guest Professorship Board courses not be granted academic credit unless:

1) A written contract between the board and the guest professor, stating the amount of compensation to be paid, and a statement of administrative costs for the course are filed with an appropriate University official;

2) The ASSU deposits in a University account the total amount of the guest professor's compensation and the total amount of administrative costs for the course; and

3) An academic department or program approves the course for academic credit. . .and assumes all administrative responsibility for it.

"We believe that students may solicit names of candidates for guest professorships, they may nominate such candidates to academic departments and programs for their consideration, they may decide the amount of funding they will provide for the course, they may publicize the course, and they may at the course's conclusion receive a report from the Guest Professorship Board on it," the committee said.

"But as a practical matter, student participation may go no further, for after academic departments or programs appoint guest professors, those persons become members of the Stanford faculty.

"Thus, like other faculty members, they have the right to determine without interference the content and conduct of their courses, and this means they may choose reading assignments and invite guest lecturers of their own choosing.

"In regard to changes of reading assignments after the beginning of a course, sound pedagogy often requires it, especially in new courses. Faculty members may, of course, discuss such changes with students, but the right to make such changes belongs solely to the faculty members."

The political science faculty approved a proposed three-unit lecture course by McCloskey Jan. 19 in a divided vote, but rejected credit for a proposed five-unit seminar. The faculty did not pass on each specific reading proposed by McCloskey, but generally approved the course outline and the appropriateness of the readings indicated.

Part of the course covered "the search for a Mideast peace," and a great deal of subsequent discussions between McCloskey and the Associated Students focused on readings and lectures on this issue.

McCloskey was approved as a guest professor by an 11-5 vote of the Student Senate Feb. 22, one more than the two-thirds majority required.

Readings reviewed

McCloskey refused to delete a "Foreign Affairs" magazine article by George Ball, former undersecretary of state, from his reading list at Linfield's request. But he did delete I.L. Kenen's work on "Israel's Defense Line: Her Friends and Foes in Washington" and agreed to add several American—Israel Public Affairs Committee arguments at Linfield's suggestion.

While he agreed to have the course meet an additional day each week to hear a guest lecturer with views different from his own, McCloskey understood it was his prerogative to choose the lecturers.

On April 28, ASSU President Cynthia J. Mathewson wrote McCloskey that any changes in readings "made without the express consent of the (Student) Senate or its agent (the Guest Professorship Board) would be inappropriate and unacceptable. . . .

"The right to invite (guest lecturers) resides exclusively with the Guest Professorship Board. The selection of dates of appearance resides with you as instructor."

In accepting the faculty committee recommendations, Wessells placed "no blame on individuals. Though the operating guidelines of the Guest Professorship Board are now judged inadequate, we must remember that the faculty has accepted them for many years. So we should use this opportunity to set the house in order." He said the School of Humanities and Sciences would "ensure that Mr. McCloskey's total compensation for teaching Political Science 7 is a fair one."

He strongly urged an official apology to McCloskey.

Wessells expresses hope ASSU will revise program for guest professorships

Following is a letter from Norman K. Wessells, dean of Humanities and Sciences to Albert H. Hastorf, vice-president and provost:

Enclosed is the report of an *ad hoc* committee formed to investigate alleged abridgements of academic freedom in ASSU Guest Professor Paul N. McCloskey Jr.'s course, Political Science 7. The course, entitled "Congressional Decision-Making Process, 1964-1983," was offered in spring quarter of 1983. Heinz Eulau, the chairman of political science, formed the *ad hoc* investigative committee at our request and in response to your letter to me dated May 18, 1983.

As you will see, the committee centered its investigation upon written material, not including newspaper accounts. Direct testimony was not taken, since most of the concerned parties were not available on the Stanford campus. You will also see that the committee presents powerful arguments that serious abridgement of Mr. McCloskey's academic freedoms, as well as those of students, did occur.

In good part, the enabling legislation of the ASSU Guest Professorship Program, as well as the modifications to it in the so-called 1983 Reorganization of the Service Sector, virtually guarantee that academic freedom of guest professors and their students will be infringed.

I have reviewed the statements submitted on June 27, 1983 to the *ad hoc* Committee by Mr. Seth D. Linfield, director, ASSU Guest Professorship Bureau, and agree with the committee that they do not change any of the conclusions that they reached.

In accepting the *ad hoc* committee's recommendations, I mean to place no blame on individuals. Though the operating guidelines of the Guest Professorship Bureau are now judged inadequate, we must remember that the faculty has accepted them for many years. So we should use this opportunity to set the house in order, not only with respect to the GPB procedures, but also to any other instructors appointed by departments of the Schools.

Though such teachers may not be members of the Academic Council, they and their students deserve the same guarantees of academic freedom espoused by the *ad hoc* committee for regular professorial faculty.

First, I endorse the first recommendation of the *ad hoc* committee. At the beginning of the autumn quarter 1983-84 our office will inform all departments and academic programs that the current ASSU Guest Professorship Bureau guidelines are not in conformance with principles of academic freedom at Stanford and that sponsorship of ASSU Guest Professors, under existing guidelines, will not be approved by our Office.

Second, I endorsed the second set of recommendations of the *ad hoc* committee report and recommend that you urge revision of the ASSU Guest Professorship guidelines in accordance with those recommendations. In particular, we should ensure that any academic unit agreeing to sponsor an ASSU Guest Professorship accepts the responsibility for supporting and administering all aspects of that person's activities as a teacher.

Third, I endorse the third recommendation of the *ad hoc* committee. I believe we are obliged to reimburse Mr. McCloskey for any personal expenses he incurred while teaching the course. We will also ensure that Mr. McCloskey's total compensation for teaching Political Science 7 is a fair one.

In addition to the recommendations of the *ad hoc* committee, I would enter my strong personal plea that an official apology should be extended to Mr. McCloskey and to his students for the infringement of academic freeom that they suffered.

Perhaps it may be some small compensation to Mr. McCloskey that this case will cause us to revise our procedures so that future Guest Professors and other instructors at Stanford will enjoy the special protections that their positions warrant.

Finally, I hope sincerely that the ASSU will see fit to revise the Guest Professorship Bureau procedures so that the program may continue to exist at Stanford. Departments and Programs in humanities and sciences, have benefited from the Guest Professors in the past—we look forward to being able to join once again with ASSU in this valuable effort to bring teachers with special experiences and talents to Stanford classrooms.

Faculty probe finds McCloskey freedom abridged by ASSU leaders

Following is a report to Norman K. Wessells, dean of the School of Humanities and Sciences from David J. Danelski, Heinz Eulau, and Robert A. Horn, of the Department of Political Science Committee to Investigate Possible Abridgements of Academic Freedom in ASSU Guest Prof. Paul N. McCloskey, Jr.'s course, Political Science 7, The Congressional Decision-Making Process, 1964-1983.

On May 18, 1983, Provost Albert H. Hastorf wrote you expressing concern about the circumstances surrounding the political science course that Paul N. (Pete) McCloskey, Jr., taught as ASSU Guest Professor last quarter. Particularly concerned about possible abridgements of Mr. McCloskey's academic freedom, Provost Hastorf wrote:

Courses are offered for credit in this university when both the teacher and the course content are endorsed by the faculty—in this case the Department of Political Science. Following the endorsement, the precepts of academic freedom apply.

Certainly a professor is free to explore the course program with the students who will be taking the course and with any group of students who may be interested, but following the faculty approval of the teacher and the course syllabus, any alterations in the lectures and readings must be the decision of the teacher. The Guest Professorship Board may well feel that they did not breach Mr. McCloskey's academic freedom, but there have been enough public statements in regard to this controversy that I would like you to ask the Department of Political Science to look carefully into the matter and report to you. It is my understanding that the Political Science faculty appointed Mr. McCloskey to the academic staff for this spring quarter and endorsed his course syllabus. They are therefore the responsible faculty unit. I shall appreciate receiving a copy of their report.

The faculty are responsible for appointing instructors and then for approving their proposed courses. This is a crucial responsibility and I want to be assured that there were no violations of this fundamental process.

This is the report that Provost Hastorf requested from the Department of Poltiical Science. We base it on relevant primary documents obtained from the Associated Students of Stanford University (ASSU), Mr. McCloskey, and various offices in the University.[1] We do not rely on press reports of the events covered.

I. Factual narrative

On July 1, 1982, a member of the ASSU Guest Professorship Bureau (GPB) informally invited Congressman McCloskey to teach a lecture course and a seminar—both to be designed by him—as a Guest Professor for one quarter during the 1982-83 school year. About two weeks later, Mr. McCloskey accepted the invitation.

Under ASSU by-laws then in effect, formal invitations to Guest Professors involved a three-step process: 1) solicitation of names of candidates, 2) nomination of candidates by the GPB, and 3) confirmation of candidates by a two-thirds vote of the ASSU Senate.

In addition to soliciting names of candidates and nominating candidates, the GPB was also responsible for making arrangements for sponsorship of candidates by academic departments and programs in the University.[2] In December, a GPB member began making arrangements with the Department of Political Science for sponsorship of Mr. McCloskey and approval of his proposed courses for academic credit.

Early in the Winter Quarter, Mr. McCloskey submitted to the members of the Department of Political Science descriptions of a course on Congress he proposed to teach as a Guest Professor during the Spring Quarter and asked for advice in regard to reading assignments. Mr. McCloskey described his proposed course as follows:

This course will consist of a series of case-studies of specific congressional decisions made during the past 20 years, starting with the Gulf of Tonkin Resolution in 1964. Reference will be made to historical antecedents, but primary emphasis will be placed on the *manner* in which each modern decision was made, and the part played in that decision by four outside factors: the White House, the press, lobbyists, and public opinion. Relevant Supreme Court decisions of the past 20 years will be part of the assigned reading and discussion.

Four dominant themes will be explored:

1) the function of the Congress envisaged in the Constitution, compared with its actual workings today;

2) the evolution of the strong Presidency-weak Congress relationship following World War II into the weak Presidency-strong Congress relationship of the 1970s with the temporary reversal of that trend during the first two years of the Reagan Administration; the current question as to whether the Reagan Administration has now lost its momentum;

3) the importance and impact of specific constituencies and lobbying groups;

4) the current challenges of budget deficits, Social Security reform, nuclear arms issues, and the search for a Mideast peace.

Lectures will center on question and answer discussions of the assigned reading materials. The final grade will be based 25 percent on class participation and occasional quizzes, 25 percent on midterms, and 50 percent on the final examination.

On Jan. 18, 1983, Heinz Eulau, chair of the Department of Political Science, believing that the ASSU Senate had already formally invited Mr. McCloskey as a Guest Professor, circulated to Department members Mr. McCloskey's academic resume, a letter from him describing the lecture course he proposed to teach, and a syllabus and reading list for the course. In a covering letter, Prof. Eulau stated that the GPB had requested approval of two courses to be taught by Mr. McCloskey for political science credit during the Spring Quarter—a three-unit lecture course and a five-unit seminar dealing with the same subjects but in greater depth.

On Jan. 19, the Department of Political Science met to discuss the GPB's proposals.[3] The minutes of that meeting show that "the question of granting political science credit for the proposed course to be taught by Paul N. (Pete) McCloskey was discussed at length." By a divided vote, the Department approved the proposed three-unit lecture course but not the proposed five-unit seminar.

In taking this action on the lecture course, the political science faculty did not pass on each specific reading proposed by Mr. McCloskey; it approved generally the course outline and the appropriateness of the readings indicated. Although individual members of the Department were willing to help Mr. McCloskey in revising the course syllabus if he sought their advice, it was understood that this was a matter for his judgment.

As a result of the Department's decision approving the lecture course, papers recommending McCloskey's appointment as a lecturer in political science were prepared, and the Dean of the School of Humanities and Science, the Provost, and the Board of Trustees approved the recommendation.

On Jan. 25, Seth Linfield, director of the GPB, "moved that the (ASSU) Senate approve his resolution to negotiate the guest professorship of McCloskey." The Senate minutes show that a "lengthy debate ensued on the possibility of McCloskey using the classroom as a sounding board for his political thinking. The director pointed out that we had to protect academic freedom, but on the other hand we (the ASSU) control the purse strings and could cut off remuneration if things seemed to be going out of control." After the debate, during which several students voiced their objections to inviting Mr. McCloskey, the Senate passed Mr. Linfield's motion.

Mr. Linfield then met with Prof. Eulau to ascertain the meaning of the political science faculty's approval of McCloskey's proposed course. "Specifically," Linfield wrote on Feb. 14, "it is the understanding of the GPB that a majority of Political Science faculty believe that, first, Rep. McCloskey is an adequate scholar in the subject matter he proposes to teach, and second, Rep. McCloskey is possessed of sufficient pedagogic ability to convey his expertise to students." In the margin opposite that statement, Prof. Eulau wrote "Yes" and returned a copy of the letter to Mr. Linfield.

Before the GPB formally nominated Mr. McCloskey to the Senate for a Guest Professorship, it met with him on Feb. 17 to discuss his syllabus, reading list, and course requirements.

The GPB saw itself as Mr. McCloskey's prospective employer negotiating the course syallabus and readings so that it could later certify to the Senate that the course was "academically rigorous" and that its syllabus and assigned readings were "both relevant and balanced." Mr. Linfield and others on the GPB read the material on the reading list and made notes indicating deletions and additions.

Mr. McCloskey later said he understood those "notes on each lesson to be suggestions, not demands." Mr. Linfield thought, however, he had negotiated an agreed syllabus and reading list from which Mr. McCloskey might not depart without the GPB's permission.

Although Mr. McCloskey rejected Mr. Linfield's deletions of George Ball's *Foreign Affairs* article, "The Coming Crisis in Israeli-American Relations," and a chapter entitled "The Arab-Israeli Conflict" in Cecil V. Crabb, Jr. and Pat M. Holt, *Invitation to Struggle*, he later said that at Mr. Linfield's request he did delete I. L. Kenen's *Israeli's Defense Line: Her Friends and Foes in Washington*. Mr. McCloskey also said he supplemented his original materials "with several AIPAC (American-Israel Public Affairs Committee) arguments which were submitted by Seth Linfield."

Concerned about balanced presentation of views in Mr. McCloskey's course, the GPB proposed that the course meet an additional day each week to hear a guest lecturer whose views differed from Mr. McCloskey's and made available $2,000 ($200 a guest lecturer for 20 weeks) for that purpose. Mr. McCloskey agreed with the proposal, but understood that it was his "prerogative" to choose the guest lecturers. Finally, apparently at the request of GPB to make the course "academically rigorous," Mr. McCloskey agreed to add the requirement of a term paper in addition to a midterm and final examination.

At the ASSU Senate meeting on Feb. 22, Mr. Linfield endorsed Mr. McCloskey "for the position as Association Guest Professor this Spring to teach *Congressional Decision-Making 1964-1983*."

After saying that the "GPB and a majority of the Political Science faculty members believe that . . . McCloskey is an adequate scholar on the subject matter he proposes to teach . . . and . . . that McCloskey . . . is possessed of sufficient pedagogic ability to convey his expertise to his students," Mr. Linfield added: "Last Thursday, GPB and McCloskey reached agreement in principle on the syllabus; thus, we certify the syllabus as both relevant and balanced."

After extensive discussion, the Senate narrowly confirmed the GPB's nomination of Mr. McCloskey as a Guest Professor. At that meeting, the GPB set forth the standards it followed in selecting Guest Professors during the year. "First and foremost," it stated, "the GPB considers itself bound by the Principles of The American Association of University Professors and any relevant standards of Stanford University."

. . . we believe that the ASSU, through the GPB and the COP, abridged academic freedom in Mr. McCloskey's course.

. . . like other faculty members (guest professors) have the right to determine without interference the content and conduct of their courses. . . .

Because a large number of students expressed interest in Mr. McCloskey's course, the GPB expected an enrollment of more than 300 students and thus scheduled it to meet in Bishop Auditorium. As it turned out, 51 students enrolled in the course.

By the second week of the course difficulties developed between Mr. McCloskey and Mr. Linfield. On April 6, Mr. McCloskey complained about the lack of syllabi and course materials for the entire class and Mr. Linfield's assertion that he was to select the guest lecturers.

"This," Mr. McCloskey told him, "is not in accord with our agreement. Thus far, acting on your assurance that this was my prerogative, I have asked David Harris to speak on April 14, John Ehrlichman on April 28, and Dennis Hayes on May 5, assuring each of them as stated by you to me several weeks ago, that they would receive a check for $200."

Having heard that a member of the GPB had approached two members of the Hoover Institution to speak, Mr. McCloskey said he was scheduling their lectures in the course and told Mr. Linfield that if there were any other guest lecturers he wanted Mr. McCloskey to consider, he should let him know immediately.

Soon thereafter, Mr. McCloskey, believing he could not deal with Mr. Linfield, sought to obtain the names of the members of the GPB so that he could meet with them. When Mr. Linfield refused to disclose the names, Mr. McCloskey wrote Prof. Eulau on April 8, asking for help. Among the things Mr. McCloskey raised with Prof. Eulau was his compensation for teaching the course, saying the GPB had given him three different figures, the most recent being $3,500.

On April 13, Prof. Eulau answered Mr. McCloskey's letter saying he wished he could help, but the ASSU, not the Department, had administrative responsibility for the Guest Professorship and suggested that Mr. McCloskey seek help from Laura Selznick, head of the Undergraduate Special Program. Ms. Selznick in turn suggested that Mr. McCloskey

McCloskey/continued from page 19

contact the Ombudsman. On April 18, Mr. McCloskey made public his complaints against Mr. Linfield.

On April 19, Prof. Hubert Marshall, a member of the Department of Political Science, sent a statement to one of the students in Mr. McCloskey's course, saying the student might use it in connection with a meeting Mr. McCloskey was to have soon with the GPB. In that statement Prof. Marshall said: "In my experience the degree of ASSU involvement in this instance is unprecedented and is a violation of Mr. McCloskey's academic freedom."

On April 20, students in Mr. McCloskey's course wrote to Mr. Linfield that they were disturbed about the continuing controversy because it hindered their work in the course.

"(W)e feel," they went on to say, "that the ASSU Guest Professorship Board's 'review' of Congressman McCloskey's syllabus, assigned readings, and selection of guest lecturers is an unprecedented and intolerable act of infringement on Congressman McCloskey's academic freedom." In a later document, the students specified what they believed to be the infringements of academic freedom as follows:

The GPB has removed from the required reading list *Israel's Defense Line, Her Friends and Foes in Washington.*

The GPB has attempted to remove from the required reading list, "The Coming Crisis in Israeli-American Revolutions."

Although the GPB has "allowed" the class to read the foreign policy textbook, *Invitation to Struggle* by Crabb and Holt, it has attempted to "disallow" us from reading Chapter 4 of that book, which deals with the Arab-Israeli conflict.

On April 21, Mr. McCloskey, in response to a request to meet the ASSU Council of Presidents (COP), raised four issues he wanted the COP to decide:

1) The selection, timing, and compensation for the Thursday "Guest Professors,"

2) The mechanism and responsibility for printing the syllabus materials.

3) My own compensation and the time and conditions of payment, and

4) The matter of whether or not Mr. Linfield has the right to control what will or will not be printed in the supplementary reading syllabus or to delete textual materials previously approved by the Political Science Department for inclusion in the course.

The final issue, Mr. McCloskey stressed, concerned academic freedom.

On April 22, Mr. Linfield wrote Prof. Eulau saying that the GPB was "very proud of the manner in which we exercised our discretionary jurisdiction pertaining to (Mr. McCloskey's course) in the best educational interests of the students and the instructor and in accord with our discussions prior to the extension of a teaching invitation to Mr. McCloskey." Nonetheless, Mr. Linfield went on to say, if, in response to complaints Mr. McCloskey raised in the media, the Department of Political Science wished, "by virtue of its accreditation of the course, to assume all of the rights and responsibilities of the course, we (the GPB) would be happy to discuss an expedient process for quick changeover of administrative and academic responsibility." Prof. Eulau, believing it inappropriate to interfere in the administration of the course so late in the quarter, did not respond to Mr. Linfield's letter.

. . . the students on the GPB and the COP seriously misunderstood the permissible limits of student action in instructional matters in the University.

On the same day—April 22—members of the GPB and the COP met with Mr. McCloskey and submitted to him a document entitled "Memorandum of Understanding," in which they stated their version of the terms and conditions of McCloskey's Guest Professorship. Among its provisions were the following:

1) Mr. McCloskey is to be employed as an "Instructor" by the GPB for the Spring Quarter, 1983.

2) "GPB may discharge Instructor for just cause, and thereby terminate this agreement; provided, that instructor must be notified of the cause or causes for discharge and given the opportunity to appear before the ASSU Council of Presidents (COP) for a formal hearing prior to any action. Cause for discharge shall consist of conduct seriously prejudicial to Stanford University and—or ASSU through conduct in violation of law or commonly accepted standards of morality, failure to cooperate within the bounds of acceptable standards, unprofessional conduct reflecting great discredit on Instructor or the position of Guest Professor, neglect of duty, inefficiency, or incompetence, or other cause substantially prejudicing effective performance of the duties of the position."

3) "The textbooks, papers, and other readings and study aids shall be those which were agreed to by GPB and Instructor, so that the education of students and effectiveness of Instructor would be mutually enhanced on Feb. 17 (set out in detail in what the parties refer to as 'the lists' and attached as Schedule A). Changes in the selections may be made with the mutual consent of GPB and Instructor."

4) The GPB shall invite guest lecturers for each Thursday session of the course. Such invitations shall be made after consultation with Mr. McCloskey, and a written request by him not to invite a given lecturer "will create a presumption that GPB will not invite that (l)ecturer."

5) Mr. McCloskey's "compensation shall be in the amount of $2,000 payable on May 6, May 20, and June 3, 1983, in equal amounts. In addition, GPB will move the ASSU Senate to authorize an additional payment of $1,000."

Mr. McCloskey refused to sign the document on the gounds that it was not in accord with his earlier discussions with the GPB. He wrote to the COP on April 25 that he believed the execution of the document would violate an obligation to the students in Political Science 7 and the commitment the GPB had made to the Department of Political Science. He then added:

I was glad to accommodate the Guest Professorship Board's request for a third class each week with a different viewpoint to be expressed from my own. I was also agreeable to several additions or deletions in the reading syllabus which the Board suggested.

On others I was not. The syllabus readings which the Board printed for Lessons 1 through 10 reflect my final decisions. Seth Linfield, Board member who controlled the printing, made no protest whatsoever to the final materials that were sent to the printer on March 17, nor to those in Lessons 7 through 10 on or shortly after April 6. I understood his notes on each lesson to be suggestions, not demands. Your new proposal demands control of the syllabus, and to this I have not agreed and cannot agree.

After citing an example of an addition and two deletions of readings sought by Mr. Linfield, Mr. McCloskey concluded:

Both this addition and the two deletions are of course your privilege to request, but to *impose* them would be repugnant to a most important principle—Stanford's tradition of academic freedom. I hope you will reconsider and override the Board's position on this point.

As to his compensation for teaching the course, this was Mr. McCloskey's proposal:

I would suggest the $4,500, as originally proposed by Seth Linfield in January, to be paid on June 2, 1983, but *only* if either three-fourths of the class's 51 students or the Political Science Department certifies to you on that date that the class has been conducted fairly, professionally, and in keeping with the highest academic standards of Stanford University. If such certification is not provided, no compensation will be payable. The ASSU would cover my actual costs incurred in telephone calls, mailing, and duplication of materials, upon presentation of vouchers therefor.

On April 28, ASSU President Cynthia J. Mathewson answered Mr. McCloskey's letter. The most important statements in her response are as follows:

(A)ny changes (in course standings) made without the express consent of the Senate or its agent (GPB) would be inappropriate and unacceptable. . . .

(T)he right to invite visiting professors (guest lecturers) resides exclusively with the GPB. The selection of dates of appearance resides with you as instructor of the course. . . . Without GPB approval . . . you may neither invite guest lecturers nor promise payment on behalf of the Associated Students of Stanford. . . .

I do not feel that it would be advisable to promise you more than the $2,000 originally agreed upon and approved by the Senate. If, however, we can manage to come to agreement on most of the issues in question, the GPB and Mr. Linfield have already suggested moving another $1,000 on the Senate Floor. I am in agreement with the Bureau on this matter. Additionally, you may rest assured that all reasonable expenses which you incur as a Guest Professor will be paid for by the GPB, provided that it receives adequate documentation. . . .

I feel it is absolutely necessary for us to reach an agreement by (May 2, 1983). Failure to do so may result in Bureau actions affecting your status as Guest Professor. It is my genuine desire that such actions prove unnecessary.

Mr. McCloskey and the GPB and COP reached no agreement. He notified COP, however, of guest lecturers he invited to the Thursday sessions, and he reported a breakdown on tbe grades for the midterm examination. He also informed the COP that he had dropped the term paper requirement because of the heavy reading assignments in the course.

On May 3, the GPB reported to the ASSU Senate that it was Mr. McCloskey's employer and that it was "the Stanford University agency vested with plenary jurisdiction over the administration of Congressional Decision-Making 1964-83." The GPB further reported that as "an explicit condition precedent of receiving an invitation from the ASSU Senate, (Mr. McCloskey) agreed to the use of a syllabus which was worked out in consultation with him."

On May 24, the new Co-Directors of GPB—Nathan Brostrom and Enrique Lerner—wrote Mr. McCloskey saying they were "rather disappointed by the developments of the past week. Our main grievance is in the contents of the readings. . . . (T)here were some drastic departures from the agreements."

Referring to one of the lessons, the Co-Directors wrote: "Unfortunately for the class there were some obscure sources such as three articles that appeared in the Arab News, authored by Grace Halsell. Some students enrolled in the Political Science 7 commented that such articles had no place in a college level course and even less in a Stanford classroom." Despite the Co-Directors' disappointment, they said they would keep their word and reimburse the students for the last packet of readings.

Also on May 24, the Senate enacted legislation called the 1983 Reorganization of the Service Sector which affects a number of ASSU organizations, including the GPB, and supersedes the previous by-laws concerning the Guest Professorship Program. Section 7G, which sets forth the nomination and approval process for Guest Professorships, provides:

1) The Core Committee shall specify all administrative and financial requirements of a course, and shall be empowered to set academic criteria for all courses supplementing those in these By-Laws.

2) For each proposed course a three member select subcommittee of the Core Committee shall be formed to review the academic soundness of the course. The subcommittee shall insure that the course meets the academic criteria of the Bureau. The Director shall appoint the members of this subcommittee, of which at least one shall be a Core Committee member and at least one shall be a member of the Academic Council. The Director shall be an ex-officio member of this subcommittee.

3) Although informal consultation with the Senate is encouraged, a formal nomination must include the following information:

a) The name and academic-professional background of the nominee.

b) The complete plan of the coruse, including, but not restricted to, a description of lecture format, an outline of lecture contents, a complete reading list, and grading criteria.

c) Specification of all administrative arrangements for the course, including, but not limited to, expected enrollment and accreditation information from other departments-programs.

d) The complete budget for the course.

4) Nominations shall be approved by a two-thirds vote of the Senate at any meeting after the presentation of the formal nominations.

5) The formal nomination, as approved by the Senate, shall be considered a formal contract between all parties involved in the course, and specifically between the Association and the Guest Professor. The Director shall draft appropriate legal instruments to effect this contract.

6) Modifications to this contract may only be made through the following procedures.

a) The course plan may be modified upon the joint agreement of the Guest Professor and the appropriate select subcommittee of the core Committee, subject to a veto by the Core committee or any department-program accrediting the course.

b) Administrative arrangements may be modified by the Director in consultation with the Guest Professor, subject to the approval of the Core Committee.

c) The course budget may only be modified by the Senate upon the recommendation of the Core Committee, made in consultation with the Guest Professor.

7) Violation of contract.

a) The Director shall monitor compliance with the contract, and shall report any breaches to the Core Committee.

b) Upon breach of contract, or with just cause, the Core Committee may take any remedial action available to it including, but not limited to, revoking the title of, adjusting the salary of, or dismissing a Guest Professor. At least 48 hours written notice must be given to the Guest Professor, and he-she shall be given an opportunity to speak before the Core Committee.

c) The Guest Professor may appeal any action of the Core Committee to the Council of Presidents within 48 hours of written notice of the action from the Core Committee. The Council shall be the final arbitrator in any dispute arising under the contract.

8) The Director shall submit a final report and evaluation

continued on page 21

McCloskey/continued from page 20

of each Guest Professor to the Core Committee and the Senate at the end of each Guest Professor's service.[4]

In response to a mailogram sent by the GPB on may 27, Mr. McCloskey acquiesced in the invitation of a guest lecturer which he said the GPB demanded for the last session of the course. While the guest lecturer spoke, Mr. Linfield and Mr. McCloskey negotiated the amount of time the lecturer would be permitted to speak. Mr. Linfield wanted 25 minutes; Mr. McCloskey granted 10 minutes and then took questions from students.

On June 6, Mr. McCloskey received a check for $2,000 from the GPB in payment for teaching Political Science 7. As of that date, he had not been reimbursed for out-of-pocket, course-related expenses amounting to $258.99.

II. Conclusions

The above narrative indicates that the students on the GPB and the COP seriously misunderstood the permissible limits of student action in instructional matters in the University and the constraints the guarantee of academic freedom imposes on student action.

The nub of their misunderstanding is their view of the relationship between the ASSU and Guest Professors appointed to faculty positions in academic departments or programs. Contrary to the GPB's assertion at the ASSU Senate meeting on May 3, the GPB was not Mr. McCloskey's employer "with plenary jurisdiction" over the administration of his course. The ASSU, through the GPB and the COP, went beyond the traditional limits of student participation in instructional matters and in the process abridged academic freedom.

A. The Limits of Student Participation in the Guest Professorship Program

Provost Hastorf correctly points out that the "faculty are responsible for appointing instructors and then for approving their proposed courses." That responsibility, as he says, is "crucial" for the reasons set forth in the American Association of University Professors 1966 Statement on Government of Colleges and Universities:

> The primary responsibility of the faculty for such matters is based upon the fact that its judgment is central to general educational policy. Furthermore, scholars in a particular field or activity have the chief competence for judging the work of their colleagues; in such competence it is implicit that responsibility exists for both adverse and favorable judgments.
>
> Likewise there is the more general competence of experienced faculty personnel committees having a broader charge. Determination in these matters should first be by faculty action through established procedures, reviewed by the chief academic officers with concurrence of the board. The governing board and president should, on question of faculty status, as in other matters where the faculty has primary responsibility, concur with the faculty judgment except in rare instances and for compelling reasons which should be stated in detail.[5]

Student participation in instructional matters is necessarily limited, for the obstacles to such participation are great: "inexperience, untested capacity, a transitory status which means that present action does not carry with it subsequent responsibility, and the inescapable fact that components of the institution are in a position of judgment over the students."[6]

Yet there are some areas in which limited student participation is permissible. We believe that students may solicit names of candidates for Guest Professorships, they may nominate such candidates to academic departments and programs for their consideration, they may decide the amount of funding they will provide for a course, they may publicize the course, and they may at the course's conclusion receive a report from the GPB on it.

But as a practical matter student participation may go no further, for after academic departments or programs appoint Guest Professors, those persons become members of the Stanford faculty. Thus like other faculty members they have the right to determine without interference the content and conduct of their courses, and that means they may change reading assignments and invite guest lecturers of their own choosing.

In regard to changes of reading assignments after the beginning of a course, sound pedagogy often requires it, especially in new courses. Faculty members may, of course, discuss such changes with students, but the right to make such changes belongs solely to the faculty members.

Although we believe that student participation in the nomination of Guest Professors is permissible, we view the ASSU Guest Professorship as anomalous in the University's program of instruction in three respects:

First, in the procedures for selection of Guest Professors;

. . . the provisions of the 1983 Reorganization . . . puts in jeopardy the academic freedom of all future Guest Professors and their students.

Second, in the funding of instructional costs and budgetary procedures for paying those costs; and

Third, in the terms and conditions of employment that the ASSU through the GPB and COP has sought to impose on Guest Professors.

Because the ASSU invites and pays Guest Professors, it takes the position that they are its employees who may not without its consent change reading assignments in courses or invited guest lecturers. In other words, it has a master-servant view of its relationship with Guest Professors. That view has never been accepted in universities like Stanford.

Although faculty members are paid by the University, they are not, in the ordinary sense of the word, employees. In 1954, Judge Charles E. Wysanski, Jr., then President of the Board of Overseers of Harvard University, explained the relationship between faculty members and their universities in these words:

> A University is the historical consequence of the medieval *studium generale*—a self-generated guild of students or of masters accepting as grounds for entrance and dismissal only criteria relevant to the performance of scholarly duties. The men who become full members of the faculty are not in substance our employees. They are not our agents. They are not our representatives. They are a fellowship of independent scholars answerable to us only for academic integrity.[7]

The Board of Trustees' appointment of Mr. McCloskey as a lecturer upon the recommendation of the Department of Political Science made him a member of the Stanford faculty with the same rights, privileges, and responsibilities as other faculty members, and thus neither the Department of Political Science nor any other body in the University had the right to require its approval for changes in his course readings or invitations for guest lecturers in his course.

In regard to his teaching, Mr. McCloskey was accountable, like other Stanford faculty members, "only for academic integrity." We believe that the ASSU's view of its relationship with Mr. McCloskey and Guest Professors generally is contrary to the longstanding tradition of academic freedom and that the ASSU's attempt to require him to obtain its approval of changes in readings and invitations to guest lecturers in a course approved for University credit went far beyond permissible student participation in instructional matters.

B. Academic Freedom

Academic freedom is an important value in society as well as the university community. As Justice Brennan said in *Keyishian v. Board of Regents*, 385 U.S. 589, 603 (1967): "Our Nation is deeply committed to safeguarding academic freedom, which is of transcendant value to all of us and not merely to the teachers concerned." The ASSU shares that commitment, but some students in the ASSU seriously misunderstood the meaning of academic freedom. Thus we begin with an accepted definition of the concept:

> Academic freedom consists in the absence of, or protection from, such restraints or pressures—chiefly in the form of sanctions threatened by state or church authorities or by the authorities, faculties, or students of colleges and universities, but occasionally also by other power groups in society—as are designed to create in the minds of academic scholars (teachers, research workers, and students in colleges and universities) fears and anxieties that may inhibit them from freely studying and investigating whatever they are interested in, and from freely discussing, teaching, or publishing whatever opinions they have reached.[8]

Using this definition, we believe that the ASSU, through the GPB and the COP, abridged academic freedom in Mr. McCloskey's course.

First, we believe that the ASSU abridged Mr. McCloskey's academic freedom by threatening sanctions if he did not agree to ASSU control over the course reading list and invitations to guest lecturers. The clearest evidence of such threats is ASSU President Mathewson's letter of April 28, portions of which we quoted above. The meaning of the letter is obvious: if Mr. McCloskey did not agree to most of the ASSU demands, it was certain that he would receive $1.000 less in compensation for teaching the course and he might even be discharged from his Guest Professorship.

Second, we believe the ASSU abridged the academic freedom of the 51 students who took the course because the GPB's attempts to control the readings and invitations of guest lecturers and Mr. McCloskey's acquiescence in some of the GPB's actions may have deprived those students of full and free discussion of matters originally planned for the course. Furthermore, we believe that the GPB's attempts to control the readings and invitations to guest lecturers tended to disrupt the course and hinder learning in it.

We find the provisions of the ASSU 1983 Reorganization of the Service Sector dealing with the ASSU Guest Professorship Program as troubling as Mr. McCloskey's case, for that legislation, we believe, puts in jeopardy the academic freedom of all future Guest Professors and their students.

For the reasons we have given above, we believe review and monitoring of courses contemplated by the legislation goes beyond the limits of permissible student participation in instructional matters. Further, we believe that the ASSU assertion of authority to adjust the salaries and dismiss Guest Professors upon breach of contract—e.g., modifying a course plan without consent—"or with just cause" as determined by the Core Committee of the GPB, will lead inevitably to abridgements of academic freedom at Stanford.

Academic freedom is not only the absence of pressures and threats of sanction affecting the teaching and learning process; it is also protection from such pressures and threats. Faculty members and students whose academic freedom is in jeopardy have a right to institutional protection, which in the first instance is to be provided by the academic department sponsoring the faculty member and course.

In regard to Mr. McCloskey and his course, the Department of Political Science had that responsibility. Indeed, a member of the Department, Prof. Marshall, was the first to point out, in a letter of April 19 to a student in Mr. McCloskey's course, that in his experience "the degree of ASSU involvement in this instance is unprecedented and is a violation of Mr. McCloskey's academic freedom."

Although Prof. Marshall did not formally request a departmental investigation at the time, and although many of the crucial facts concerning the matter were not known to the Department until they were disclosed by this investigation, we nonetheless regret that the Department did not initiate an investigation at the time Prof. Marhsall first raised the issue.

III. Recommendations

We have three recommendations.

First, we recommend that the University make it clear that so long as Section 7 of the ASSU 1983 Reorganization of the Service Sector remains in force, the University cannot and will not grant credit for any course in the ASSU Guest Professorship Program. Whether such a statement would come most appropriately from the President, the Provost, or the Senate of the Academic Council we leave to others in the University. As a practical matter we realize that such action must result either in abandonment of Section 7 by the ASSU or the end of the Guest Professorship Program. It is best to be candid about this so that Stanford students and their chosen representatives understand exactly what is at stake.

Second, we recommend that ASSU Guest Professorship courses not be granted academic credit by the University unless:

a) a written contract between the GPB and the Guest Professor stating the amount of compensation to be paid and a statement of administrative costs for the course are filed with an appropriate University official,

b) the ASSU deposits in a University account the total amount of the Guest Professor's compensation and the total amount of administrative costs for the course, and,

c) an academic department or program approves the course for academic credit after the ASSU has agreed to invite the Guest Professor to teach it, and such a department or program agrees to assume all administrative responsibility for it, including the provision of course materials, the payment of compensation to the Guest Professor, and all other administrative costs in accordance with regularly prescribed University budgetary procedures.

Third, we recommend that the University pay Mr. McCloskey his unreimbursed, course-related expenses and increase his compensation for teaching his course.

Footnotes

[1]Copies of those documents are in Appendix A.
[2]The relevant ASSU By-Law provisions are in Appendix B.
[3]Only one member of this Committee—Prof. Eulau—was present at the meeting. Robert A. Horn is an emeritus professor who normally does not attend departmental meetings. David J. Danelski was at the time teaching in the Stanford in Britain Program at Cliveden.

□ **Aug., Sep., Oct.:** Yale & NYU grad stud. on sabbat. avail. for HOUSESIT. Nonsmoker, local refs. Call 454-5002.

□ **Beg. July 16 thru end of Aug.:** Grad stud. studying for oral exam avail. for HOUSESIT. Refs. avail., good w/plants, animals. Call 328-7947.

□ **Beg. Aug. 21 for 3 to 6 wks:** Professional cpl. & dghtr. wish to HOUSESIT in Stanf. area. Call 857-1641 or 325-6366.

□ **Beg. Aug./Sep.:** New Stanf. prof. seeks cheap, lrg. 1BR loft or cottage in attrac. surroundings. Good nghbrhd, local refs. avail. Call 848-4978.

□ **Beg. Sep. 1 for 9 mo.:** Visit. scholar, wife, 1 child seek 2-3BR furn. hse. or apt. nr. campus. Nonsmokers, clean living, homeowners. Will care for plants, pets. Local refs. Call (314) 875-2858 COLLECT eve.

□ **Aug. 1 to Oct.-Jan. '84 (flex):** Prof. cpl. (recent Stanf. grad.) seek apt. or hse. in Palo Alto area. Xclnt refs avail. Call 494-1310 eve.

□ **Sep. '83 up to 1 yr:** English visit. scholar on sabbat. seeks to rent rm. or hse. on or nr. campus. Write Dr. Roger Giblin, Electronics Dept., University College, London WC 1 ENGLAND.

□ **Beg. Aug. or Sep. to indef:** Female postdoc. & dghtr, 12, seek quiet, inexpensive apt. or shared hse. r. campus. Write J. Carey, 805 W. Stroughton Ave., Urbana, IL 61801.

□ **Aug. '83 to Aug. '84:** Visit. Prof. fr. Norway, wife, 2 children, seek 3BR, furn. hse on or near campus. Responsible, nonsmokers. Up to $1000/mo. Call 497-2040.

□ **Aug. for 2 wks or more:** UCR Prof. & wife would like to HOUSESIT for above time period—very flex. Will care for pets, plants, garden. Call parents on campus, 493-5198.

Carpools

Driver needed for existing carpool from SF (Noe Valley area) to Stanford, M-F, 9-6. Call David Thompson, 7-2454.

Carpool partner wanted, Oakland-Stanford. Leave Oakland 8:30 a.m., leave Stanford 6 p.m., M-F. Times somewhat flexible. Call Jon Bendor, 497-4480.

Carpool forming from SF (Bernal Heights) to Stanford, M-F, hours somewhat flexible. Share driving. Call Julia, 497-3811 (days), 648-4835 (eves.).

Ride sharing between Santa Cruz and Stanford Tues. and Wed. 9-5 (flexible), call Andy Carman at 497-6341.

Would like to form (or join existing) carpool from Los Gatos to Stanford, M-F, 9-6. Call Tom Holt, 7-2454 or (408) 354-6040.

Ride share between SF and Stanford M-F, mornings and eves (times flexible), call Jennifer at 346-6411 after 8 p.m.

Ride needed from Sharon Heights Shopping Center to Stanford, in exchange for gasoline. My hours are 8 a.m. to 5 p.m. Please call Dixie Dodson at 497-9150.

Accidents and injuries

Accidents and Injuries Occurring During Week of July 11-22

Type of Accident or Injury	Number of Incidents	Days Lost
Cut/puncture	3	(0, 0, 0)
Squeeze/crush	3	(0, 0, 0)
Animal/insect caused	3	(0, 1, 0)
Biologically caused	1	0
Fall from same level	1	0
Fall from height (incl. stairs)	1	1
Chemical inhalation	2	(0, 0)
Lifting	4	(0, 7 +, 3, 8)
Other	3	(0, 30 +, 0)
Stress related	1	20
Temperature related	1	0

Ph.D. oral exams

WEDNESDAY, JULY 27

Dwright Nishimura, electrical engineering, "Processing Methods for Improved Blood Vessel Imaging," 2:15 p.m., McCullough 134. **Dennis Alden Yao,** business, "Three Essays on Regulation with Application to the Automobile Industry," 2:15 p.m., Room 243, GSB.

FRIDAY, JULY 29

James J. Anton, economics, "Contractual Paradigms, Rational Expectations and Seniority Rules in the Theory of Long-Term Contracts," 9:15 a.m., 414 Encina. **Kathleen M. Gilbert,** education, "Mathematical Problem Solving in Cooperative Small Groups and Whole Class Instruction," 2:15 p.m., Room e230, Education Bldg. **Alicia Rodriguez-Castro,** economics, "A Subsidy Incidence Analysis of the Manufacturing Sector of Puerto Rico," 2:15 p.m, Encina 414.

MONDAY, AUGUST 1

Marie Sophia Tisak, education and psychology, 3:15 p.m., Room e114, Education Bldg.

TUESDAY, AUGUST 2

Joan A. O'Brien, education, "An Educational Personnel Planning Model for School Districts," 2:15 p.m., Room e114, Education Bldg.

WEDNESDAY, AUGUST 3

Charles E. Bethell-Fox, education and psychology, "Visual Networking as a Learning Strategy," 3:15 p.m., Room e114, Education Bldg.

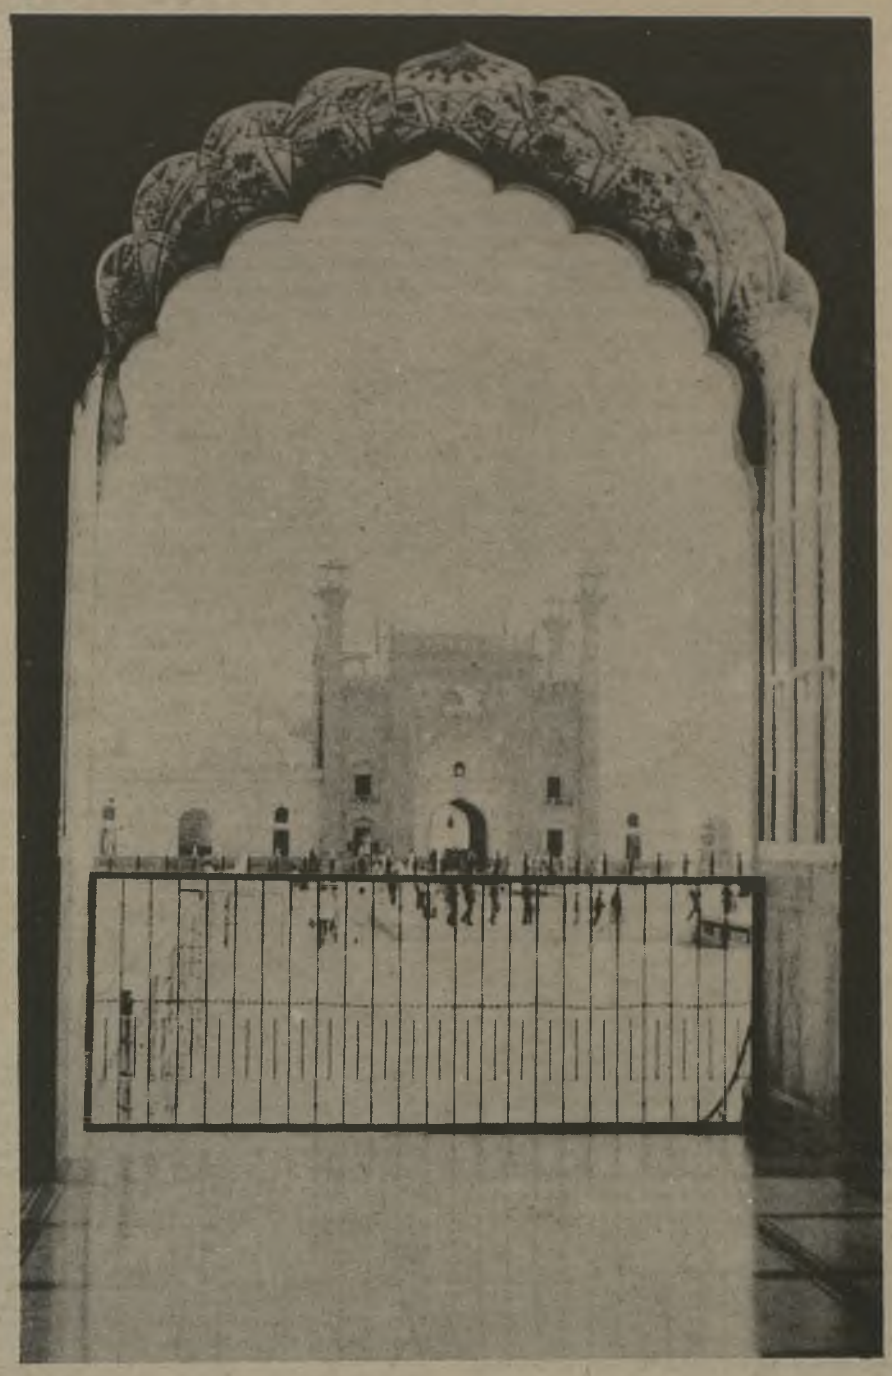
THURSDAY, AUGUST4

Margaret Crosbie-Burnett, education and psychology, "Assessment of Stepfamily Adjustment," 2:15 p.m., Room e114, Education Bldg.

FRIDAY, AUGUST 5

Steven L. Flint, business, "Q-Ratios and Property-Liability Insurance Companies," 2:15 p.m., 243 GSB. **Stuart Angus Macmillan,** education, "User Models to Personalize an Intelligent Agent," 2:15 p.m., Room e114, Education Bldg. **Guaning Su,** electrical engineering, "Signal Subspace Algorithms for Emitter Location and Multidimensional Spectral Estimation," 3 p.m., Durand Bldg., Room 450.

TUESDAY, AUGUST 9



Timothy Scott Hayes, applied earth sciences, 2:15 p.m., 350 Mitchell. **Ross D. Schlueter,** mechanical engineering, "Study of Nonuniform Electrical Behavior of MHD Generators by Influence Coefficient Techniques," 9 a.m., Room 520G, Bldg. 520.

WEDNESDAY, AUGUST 10

Janet Lynn Collins, education, "Self-Efficacy and Ability in Achievement Behavior," 3:15 p.m., Room e230, Education Bldg. **Nesim K. Erkip,** industrial engineering, "Approximate Policies in Multi-Echelon Inventory Systems," 2:15 p.m., 363 Terman. **Kenneth Scott Feldman,** chemistry, "Cyclization Studies on Diene Epoxides Directed Toward the Synthesis of the Cardenolides," 2:15 p.m., Chemistry Gazebo. **Patrick C. Kyllonen,** education and psychology, "Information Processing Analysis of Spatial Ability," 9:30 a.m., Room e114, Education Bldg. **Harriet Andrea Neves,** education, "Children Talking in the Classroom and Second Language Acquisition," 2:15 p.m., Room e114, Education Bldg.

THURSDAY, AUGUST 11

Lauren Edelman, sociology, "The Social Foundations of Due Process in Organizational Governance: Grievance Procedures and Compensatory Justice," 1:30 p.m., Room 250, Bldg. 120. **Patrick John Maveety,** art, "Chinese and Southeast Asian Ceramics Discovered in Indonesia: Twelfth Through Sixteenth Centuries," 2:15 p.m., Room ar103. **June H. Schmieder,** education and psychology, "Women and the Elementary Principalship: Does Discrimination Exist at the Pre-Interview Stage of the Employment Process," 3:15 p.m., Room e114, Education Bldg. **David B. Wolf,** education, "Setting Goals in a Large Community College District," 9:30 a.m., Room e114, Education Bldg. **Eliahu Roth,** electrical engineering, "Multiple-Energy Selective Contrast Material Imaging," 10 a.m., Room 450, Durand Bldg.

Badshahi Mosque in Lahore, Pakistan—from an exhibition of photographs by engineering graduate student Aurangzeb Kahn in the Stanford Coffee House through July.

Campus crime report

July 11-25

Burglary/residence	2	Phone harassment	1
Burglary/nonresidence	3	Controlled substance	0
Burglary/Vehicle	3	Felony arrest	0
Theft/under $400	10	Misdemeanor arrest	18
Theft/over $400	4	Adult booking	15

Residential Burglary:

Date	Time	Location	Property Lost
7/14-18	Unkn.	Lagunita Court	Radio
7/21	Even.	Florence Moore Hall	Jewelry (ring)

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

42853-AW (JCC:4076) PROGR/ANALYST GEN II: 75%; fixed term 7/1/83-7/1/84; participate in the development & maintenance of admin sys; support production computing activities w/ broad programming skills, good user & peer working relationships: prov daily support on the admin of the PACNET sys; plan, design, document, code & test small projs; automatic Answering Feature; respon for documentation for ADMIN & CONTACT/EMS; QUALIFICATIONS: exp in a serv oriented production shop; familiarity w/ documentation & other admin procedures of the computer applications group; knowl of SPIRES & WYLBUR; excel oral & written commu skills; require 1-2 yrs programming w/ emphasis on business functions using SPIRES; exp w/ SPIRES subj & maintenance & record entry; some training in math; ability to write formats.; C06; $1461-1831.

15007-LL (JCC:5588) LIFE SCI RES ASST I: Processing of spleen & other tissue to a cell suspension; genl tissue culture procedures; prep of serum & tissue extracts using isopycnic gradients, rotary evaporation chloroform extraction, & thin-layer chromatography; testing of extracts in tissue culture using microtiter wells & PHA stimulation of cells ; analysis of supernatants fr human hybridoma cultures, using protein determination, acrylamide electrophoresis, RIA & SLISA assays, radioactive labeling of proteins & sugars; prep of antigens using tech of cell membrane extraction column chromatography, & liposome prep; QUALIFICATIONS: knowl of genl biochemical lab tech; some tissue culture exp; must be able to evaluate results & proceed to next step of prep; evaluate & interpret results of assays; become familiar w/ literature related to various aspects of the work.; C05; $1756-2202.

28292-BP (JCC:2070) ADMIN ASST II: Admin Mgr of Computer Sys Lab; determines own procedures for ensuring that Lab functions smoothly, solvently, efficiently; administrator of 15-20 research grants; monitors budget statements; prep Purchase Reqs for capital eqpt of lab-wide use; administer clearing acct for lab copy machine; prep cost projections w/ detailed commentary; prep time/salary changes of all Lab citizens; maintains res assistantship records; conducts interviews for sec'l positions; attends CSL faculty mtg to interpret Univ police; QUALIFICATIONS: knowl of Stanford admin procedures & Stanford admin personnel helpful; send appl/resume to Beverly Yates, AEL 107.; C05; $1756-2202.

36402-JB (JCC:2160) ACCOUNTANT II: Forecast cash requirements for govt. grants & initiate cash requests when approp, based on analysis of expenditures & knowl of applicable govt regulations reconcile cash receipts to awarding agency records; maintain accurate record of cash position for each agency; report cash transactions; monitor cash position on non-govt grant to insure timely receipt of funds; supv 2 acctg assistants; review & approve acctg documents; prep mgmt reports as needed; QUALIFICATIONS: BA/BS in acctg or equiv work exp, plus 3 yrs of professional acctg exp; analytical ability & familiarity w/ computerized acctg sys essential; knowl of microcomputer applications & govt regulations helpful; supvry exp desirable; requires good oral & written commu skills, tact & sound judgment.; C06; $1948-2441.

27479-AW (JCC:3280) INFO EDITOR II: 75%; fixed term 8/1/83-8/31/84; Editor Analyst in Sponsored Projs Offc; respon for editing & preparation of reproducible copy for offc publications; prov support to SPO staff in prep for revisions to procedures manuals & handbook, & in researching/analyzing/-deve loping comments to proposed Federal Regulations; asst staff in analyzing, developing & preparing recom. on a broad range of technical & admins problems relating to regulatory policy & procedures; update & prov mat'ls for dept administrators grants & contracts training courses, etc; QUALIFICATIONS: ability to type/use terminal-accessed info & word processing sys to prepare, edit & revise text & info; WYLBUR knowl particularly helpful; knowl of or willingness to learn SPIRES demonstrated command of English usage: grammar, spelling, punctuation, basic editing skills; knowl of basic lib tech; exp/knowl of Univ organization, functions.; C05; $1317-1652.

27433-JB (JCC:1472) STU SERV OFFICER II: Assistant Director; entails travel, meeting w/ high sch'l students, parents, sch'l officials, conducting interviews & info sessions, maintaining application files, evaluating applications, corresp & representing Univ in a variety of capacities; QUALIFICATIONS: bachelor's degree or its equiv; should have an interest in & share the academic values of Univ; be sensitive to & tolerant of students fr various bkgrounds; be confident in speaking before large audiences; able to write well; be perceptive & knowledgeable in making critical judgment, & evidence both maturity & integrity; a respect for the academic values & goals of the Univ.; C06; $1948-2441.

27432-JB (JCC:1472) STU SERV OFFICER II: Assistant Director; entails travel, meeting w/ high sch'l students, parents, sch'l officials, conducting interviews & info sessions, maintaining application files, evaluating applications, corresp & representing Univ in a variety of capacities; QUALIFICATIONS: bachelor's degree or its equiv; should have an interest in & share the academic values of Univ; be sensitive to & tolerant of students fr various bkgrounds; be confident in speaking before large audiences; able to write well; be perceptive & knowledgeable in making critical judgment, & evidence both maturity & integrity; a respect for the academic values & goals of the Univ.; C06; $1948-2441.

30155-VW (JCC:2044) ADMIN SERVICES MGR III: Develop, maintain & update plans for academic computing; interface w/ academic senate committees & subcommittees; act as division genl mgr & administrator respon for personnel, budget, financial, & facilities mgmt; study new concepts; coord w/ sub-division directors; develop new ideas & strategy for their implementation; QAULIFICATIONS: combination of edu & exp in an Info Sys environ totalling 10 yrs; demonstrated mgmt/leadership exp w/ personnel and/or budgets; knowl of & ability to use computer as a means of commu; effective & persuasive commu skills, orally & writing; willingness & availability to travel.; C08; $2590-3313.

30047-AW (JCC:7542) FACIL ENGR/COORD III: Prov tech guidance & directions to proj mgrs relating to wide range of bldg sys projs; commu w/ clients; prep definitive proj scopes for all proj requiremts incl HVAC, lighting, plumbing, fire protection, & other engrg sys that may be reqd; work w/ consultants to obtain designs which satisfy Univ's requiremts & meet all applicable codes & standards; prov engrg direction as reqd during construction & activation; capable of performing mechanical engr design on small projs incl prep of design drawings; QUALIFICATIONS: BS in Mechanical Engrg; exp equiv to B.S.M.E.; good commu skills; requires appreciation of cost acctg & budget control procedures; proven exp in engrg design & design disciplines, codes & standards; C08; $2590-3313

33795-DS (JCC:8880/8880) Assistant Trader: 7am-4pm; involved in the cash & fixed income investing of Univ funds; collection & preparation of financial data & reports for decision making; daily maintenance of trading ledgers & liaison respon between the trading desk & investment operations; will serv as bkup in cash trading area, determining liquidity needs of the portfolio & structuring investments accordingly; QUALIFICATIONS: knowl of, education in basic acctg, statistics, economics & investment markets; C06 requires some brokerage or securities clearing exp; ability to work in an 'intense' enviornment.; C05/C06; $1756-2202/1948-2441.

41658-JB (JCC:2128) ACCOUNTANT II: Develop, enhance & oversee CIT cost acctg sys incl all feeder sys; work w/ CIT Mgr's & other staff to insure transactions & procedures in the cost area are in accordance w/ organizational & Univ policies; prep complex cost acctg studies to support the setting of over 60 indiv rates for products & serv offered to user clients; prep monthly usage & variance reports & prov detailed cost data for financial reporting; QUALIFICATIONS: BS or BA w/ acctg emphasis or equiv combination of exp & edu; knowl in areas of cost acctg, variance analysis, financial reporting, statistical analysis, budgeting; have demonstrate superior organizational & analytical capabilities required for complex problem solving; familiarity w/ electronic data processing, mgmt info sys, knowl of Univ acctg sys helpful.; C06; $1948-2441.

40569-LL (JCC:2262) FIN/MGMT ANALYST II: 8:30-5:30; Faculty Practice Program Sr. Financial/Market Analyst is responsible for analysis of the health care market environ as well as genl financial analysis; development & maintenance of a patient demographic data base, current & proposed serv analysis, & analysis of the impact of marketing efforts; participation in preparation of the annual FPP budget, budget/performance analysis, & long-term financial planning; computer models used; analyses presented both orally & in writing; QUALIFICATIONS: bachelors degree in business or economics w/ 6 yrs exp in finance or marketing; MBA highly desirable; highly developed analytical skills; excel verbal & written commu skills; knowl of data processing concepts; computer modeling skills.; C07; $2221-2875.

41661-JB (JCC:2270) FIN/MGMT ANALYST III: Financial Mgr; respon for all aspects of the CIT billing sys; maintenance & reporting on user accts, accts receivable & cost acctg tech & procedures; supv the collection, analysis, interpretation & reporting of a significant area of the financial activities of the organizations; supv 2 professionals & several clerical members; design, development & supvn of complex acctg documents & procedures that incorporates federal indir cost tech as required by various govt policy regulations that apply to the pricing of computer serv; serv as proj leader in the design & development of an automated cost acctg sys; QUALIFICAITONS: MBA or MS degree in a related field, or equiv combination of exp & edu; possess knowl in areas of cost acctg, financial analysis, mgmt tech & budgeting; demonstrated outstanding organizational & supvry capabilities for complex problem solving; familiarity w/ EDP, MIS & Univ Acctg Sys helpful.; C08; $2590-3313.

95732-JM (JCC:5158) COMPUTER SYSTEMS SPEC: Manage admin data processing group; perform some analysis & programming tasks; prov production support; make proj assignments, monitor development & production & assist in proj definition, priority setting & estimation of costs; hire & review professional & production staff; QUALIFICATIONS: proj mgmt exp; requires bkground as business programmer/analyst w/ specific exp in PL/1, systems design, production support, control langs or EXECS & utilities; knowl of acctg & genl business practices; exp w/ VM-CMS, data base development, interactive programming, selection of vendor supplied software & use of personal computers desirable.; C09; $3200-4000. APPLY AT SLAC

42633-LL (JCC:5588) LIFE SCI RES ASST I: Respon for prep of dissociated cell cultures derived fr mammalian neural tissue dissections; maintain fully stocked tissue culture lab; maintain cell cultures according to outlined res protocols, involving e.g. altered growth medium; optimize culture conditions, drawing upon both an understanding of principles involved & info in the literature; prep electrodes & solutions for cellular electrophysiological experiments; QUALIFICATIONS: prior lab exp w/ cell culture tech, preferably in dissociated mammalian neural cell culture; BA or BS degree or equiv edu & exp required; some exp w/ histologic tech & photographic methods desirable; special consideration given to indiv w/ prior exp in electrophysiological tech or w/ demonstrated ability to work independently on assigned projs.; C05; $1756-2202.

42778-VW (JCC:5588) LIFE SCI RES ASST I: Perform independent res based on the following specific skills: radioimmunoassay for cyclic GMP; process previously set-up RIA daily; calculate data fr prev RIA; perform guanylate cyclase assay; perform automated protein assay; asst postdoc res fellows in specific lab tech & procedures; work independently setting own priorities & proj standards as periodically reviewed by faculty member; helpful to have exp w/ protein phosphorylation - studies of smooth muscle; two dimensional gel electrophoresis; smooth muscle tissue bath studies measuring contraction & relaxation; set up experiments on effect of drugs on cyclic GMP in smooth muscle; QUALIFICATIONS: BS or equiv exp in closely related res fields; familiarity w/ eqpt & tech used in lab.; C05; $1756-2202.

1246-LL (JCC:5596) LIFE SCI RES ASST II: Recombinant DNA methodology; RNA, DNA isolation, generation of cDNA libs, gene cloning in plasmid & phage vectors, transfection of L cells, generation & screening of 'fusion' proteins encoding differentiation antigens; Northern & Southern analyses; In vitro translation of mRNA & immunoprecipitation; Oocyte translation; genl lab mgmt, incl ordering, budget, etc; respon for training new grad students & postdoctoral fellows; will design & carry out their own proj; involved in writing of manuscripts; QUALIFICATIONS: BS in biology, chemistry or equiv exp; exp w/ gene cloning in both lambda phage & plasmid vectors, & w/ the analysis of the structure & expression of genes using Northern & Southern blots.; C06; $1948-2441.

27068-VW (JCC:6818) SOC SCI RES ASST II: Fixed term; 1 yr appt fr date of hire w/ possibility of extension; res asst in Public Affairs Offc of Hoover Institution; maintaining forum of Hoover speakers & following thru on engagements; organizing program of news-clipping compilation & distribution; drafting press releases; excerpting & editing articles for media dissemination; assting in gathering info for & drafting/editing annual printed report & board report; supv student hrly employees; managing genl files & files on scholars; QUALIFICATIONS: prev public affairs & res exp desirable; some public policy bkground useful; requires writing/editing skills & a high degree of independence, judgment, & tact; ability to learn & willingness to use word processing eqpt; send appl/resume to George Marotta, Hoover Institution, Stanford, or call 497-0603.; C04; $1590-1983.

Nonexempt

32635-PM (JCC:8940) MISC CLERICAL: System Control Assistant assists Computer Operations Mgr in all phases of billing sys operation; providing offc support related to computer sys operation; schedules & prints sys output files; maintains production logs & provides status reports on production & sys problems; inventory maintenance & eqpt repair serv duties; updates & verifies changes to online database; trains new personnel in proper operation of computer sys; orders & monitors commu eqpt, etc; QUALIFICATIONS: typ 35-40; 2 yrs of directly related exp working w/ business computers, incl exp w/ basic data entry & in-depth database operation; some exp in healthcare field & familiarity w/ med terminology; flexibility in working hrs; word processing exp desirable; good organizational & mechanical skills; contact: Joseph Bayus, Systems Analysis Mgr/FPP, 525 Univ Ave.; B14; $1440-1514.

29367-AW (JCC:1972) UNIV MANAGER II: Manager of Housing Programs; works w/ Dir, Associ Dir & other members of the staff in executing housing & transportation programs for SU; principal functions are brokerage, escrow & transportation; QUALIFICATIONS: bkground in real estate, banking, financial analysis, economics or planning; college degree, preferably an MBA, JD or advanced degree in acctg or planning, or relevant work exp equiv to such advanced degree; computing exp desirable.; C08; $2590-3313.

New employee orientation

The next orientation sessions for new employees will be held at 9 a.m. Tuesday, Aug. 2 and 9, in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

27480-BP (JCC:2596) SECY II-SPEC: Respon to 2 contract officer/analyst teams; proofreading & editorial work, 60-80% time working w/ word processing eqpt, primarily preparing routine corresp; learn about the contract & grant field; commu to Principal Investigators Info about the status of their proposals & awards; maintenance of appt calendars & arrangement of mtgs; screening of phone calls; coord of travel arrangement; transcription of corresp, etc; QUALIFICATIOINS: typ 65; accurate typing skills; thorough knowl of English grammar, punctuation & spelling; prior exp w/ client-oriented environ helpful; proficiency in word processing & data processing entry tech (or willingness to learn); good oral commu skills; send appl/resume to Mary Chandra, Encina Hall, Room 40, or call 497-2883.; B12; $1310-1373.

43086-BP (JCC:2630) SPECIALIST TYPIST: Operates Lexitron eqpt providing typed copies of contracts, purchase orders, invitations to bid, letters, memos & other mat'ls as required; maintains current files on mat'ls stored on diskettes; proofreads & edits all work; QUALIFICATIONS: typ 65; thorough grasp of good grammar, punctuation, spelling & working knowl of printer's marks and/or proofreading symbols; send appl/resume to B. Leans, 851 Welch Road.; B12; $1310-1373.

17045-TC (JCC:6188) PATIENT TEST TECH II: Involves monitoring of physiological parameters during sleep; these parameters incl electroencephalogram, electro-oculogram, electromyogram, respiratory & heart rate, arterial oxygen saturation, endoesophageal pressures & pH; expected to be familiar w/ sleep disorders at the technician level; activities will also incl reduction of data & routine data processing; routine maintenance & minor repair of eqpt; QUALIFICATIONS: prior patient contact; exp w/ the operation of a polygraph, data entry exp desirable; must have CPR certificate; bkground in social or biological sciences desirable.; B13; $1373-1440.

22845-BP (JCC:2462) OFFICE ASST III: Respon for Meal Ticket Procedures (selling meal plans, credit of board amounts, taking pictures, putting on labels on meal cards, checking of computer runs for accuracy of board purchased, typ letters regarding problems w/ meal tickets, etc); ordering of supplies for Food Serv Units & central offc; typing of menus & meat sheets wkly; use of copy machine, & mimeographing machine for various forms; answer phones; answer questions regarding board options & distribute meal both I.D. & U.S.; QUALIFICATIONS: typ 50; thorough knowl of standard offc procedures; effective verbal skills; working knowl of computers & CRT's helpful; send appl/resume to Kay Gaskin, 765 Pampas Lane.; B11; $1246-1310.

30705-PM (JCC:2462) OFFICE ASST III: Recruiting Asst; prov clerical/sec'l serv to Recruiting Coord & Recruitment Intern; understand the physical & academic profile nec for students to qualify as prospects for Stanford intercollegiate sports; learn & understand Univ life & culture to effectively promote Stanford to prospective athletes; utilize micro-computers to handle word processing & data base mgmt for recruit; transcribe letters & memos; edit copy & proofread for accuracy of all written documents; mass mailing of 500-1000 documents wkly during recruiting season; QUALIFICATIONS: typ 65; current Stanford exp preferred, involving heavy public contact & offc activities in promotions, fundraising, publicity, student organizations, athletics, or other related activities; excel verbal skills, English grammar/punctuation skills; prev exp on computer terminal; excel keyboard skills; available to work on selected Sat & Sun during football season (8/15-11/15) & during recruitment months of Jan & Feb.; B11; $1246-1310.

23597-PM (JCC:2462) OFFICE ASST III: Prov clerical & sec'l support to dept administrator & admin assistant; prep & follow-up on all Univ forms incl purchase reqs, interdept'l requests, expense reports, appt forms, work orders, telecommu requests, prep of various appt forms; petty cash custodian; maintain records of instructional handout & classnote costs & receive money for their sale; collect approx 30 Xerox auditron readings monthly & prep expense allocation of usage charges, etc; QUALIFICATIONS: typ 65; text-editing exp or willingness to learn

33007-JB (JCC:3682) OFFSET PRESS OPR I: 6am-2:30pm; operates microprocessor controlled Xerox 9400/9500 series duplicating sys that require microcomputer programming decisions to automatically collate, make image reductions, margin shifts, change density & lens adjustment control; operates other small copiers, stitchers & staplers in the ctr; perform compuferized self-diagnostics maintenance of the machines to pinpoint & resolve problems; plans jobs for efficient production; cleans & maintains entire sys; deals w/ customers & handles cash occasionally; QUALIFICATIONS: possess mechanical aptitude; worked in a high-volume, production oriented environment.; A15: $ 7.00.

40490-JB (JCC:6452) PLUMBER/STEAMFITTER: TMS Unit; 8-4:30, available for call backs; performs sewers maintenance; repairs all sewers on SU property; operates cable machine & street machine; order mat'ls required; installs clean-outs, sump pumps; checks sewage ejection pumps inside homes, etc; performs preventive maintenance for all outside sewers; operates a large street machine plus electric & hand operated springs; performs installation, maintenance & repair of domestic hot water & heating sys, boilers, heat exchangers, hot water storage tanks, etc; maintains baseboard radiators, convectors & radiators, steam tables, etc; QUALIFICATIONS: knowl of methods, mat'ls & tools used in plumbing trade; ability to do plumbing work as described ; training & exp equiv to approx 4 yrs in plumbing trade; performs work in; A37; $11.80.

Modern photographic works on display at Stanford Museum

"Photographs—1920s-1980s," selections from the Stanford Museum of Art's collection, will be shown there now through Aug. 14.

Some 60 prints by American and European photographers are included.

The modern temper in photography made its public appearance in Alfred Stieglitz's journal *Camera Work*, published in New York in 1916. He described the photographs of Paul Strand as "of and about the 20th century." Pictorialism, the art-photography that Stieglitz had championed since the mid-1880s, became a dead issue.

The introduction of "fast" hand-held cameras in the 1930s gave photographers the ability to extract moments of motion from ongoing time. There are examples of this in the exhibition, from Kertesz in Paris in the 1930s to Winogrand in New York in the 1970s.

Concurrently, photographers have used a large-format camera on a tripod to portray distillations of time: Edward Weston, Manuel Alvarez Bravo, Wright Morris, among them.

A third sort of photography heightens reality to such an extent, that it becomes surreal. The photographs of Minor White, Jerry Uelsemann, Danuta Otfinowski, and Lorie Novak are examples of this tendency.

The Museum is open from 10 a.m. to 5 p.m. Tuesday through Friday; from 1 p.m. to 5 p.m. Saturday and Sunday.

Frankfurt, Watching a Motorcycle Race, 1930 **by Ilse Bing. Gelatin-silver photograph from the exhibition:** ***Photographs/ 1920's-1980's Selections from the Museum's Collection.***

QUALIFICATIONS: must be pleasant over phone as well as person; knowl of typing; prev secl exp desired; contact Melanie Jones-Carter, Tresidder Union, Servomation Offc, 497-4324

Children's Dance to demonstrate work of summer classes Thursday at Roble

Children's Dance at Stanford will demonstrate the work of summer session classes at an open house from 4 to 6 p.m. Thursday, July 28, in Roble Dance Studio.

The informal showing will feature members of the Workshop on Dance and Microcomputers. Children between the ages of six and 12 will show their dances, exhibit the designs and dance notations which they made on the IBM PC, and demonstrate the creation of computer graphic designs inspired by dance and music.

The children's dance demonstration will begin with a Rhythms and Movement Class of three to five-year-olds. Next, the Dancing Outdoors class of six to 12-year-olds will show a piece they designed for the Roble courtyard.

Finally, the Workshop on Dance and Microcomputers will lead the group across Panama Street to S.M.I.L.E., (Stanford Microcomputer Instructional Laboratory Experiment) to demonstrate their use of IBM PC color graphics.

Children's Dance at Stanford is sponsored by the Dance Division within the Department of Athletics, Physical Education, and Recreation. S.M.I.L.E., a project of the Center for Information Technology, is cosponsor of the Dance and Computer Workshop.

For additional information, call Elizabeth Larkam, 497-4254.

Dance workshop plans new series

The Starts Summer Dance Workshop will continue with a second session of classes scheduled for weekday evenings through August.

Ballet classes will meet 7-9 p.m. Monday and Wednesday. Modern Dance will continue on Tuesday and Thursdays from 6:30-8 p.m. Modern Dance is preceded by Floor Barre, a class designed to increase flexibility, strength, and awareness of alignment.

All classes will meet in Roble Dance Studio for the first two weeks of August. During the last three weeks classes will meet in the Clubhouse Ballroom. Fees range between $4 and $5 per class.

All those interested in participating are asked to contact the instructors. For additional information and registration call Elizabeth Larkam, 497-4254, or Lisa Burnett, 854-4163.

Managers to learn about computers

The Stanford Alumni Association will sponsor a unique management training program in computers for executives with little or no computer background who are responsible for computer-based information systems on campus August 14-26.

According to program director Paqui Nelson, the course focuses primarily on management issues and covers such topics as "state of the art" hardware and software, database management, decision support systems, management information systems, networking, and personal computers.

An entire day will be devoted to anticipating the office of the future.

Called "Managing the Computer Potential" the course will draw on faculty from Stanford's School of Engineering, Graduate School of Business, and Department of Computer Science. Speakers will include Edward Feigenbaum, author of the best-seller, *The Fifth Generation: Artificial Intelligence and Japan's Computer Challenge to the World*.

The program includes time to chat with computer leaders of Silicon Valley. Space is limited to 50. Tuition, meals, and accommodations total $3,400.

Further information may be obtained by calling (415) 497-2021.

Barbara Allen

Piano concert set by Barbara Allen

The Department of Music will present pianist Barbara Allen in concert at 8 p.m. Friday, Aug. 5, in Dinkelspiel Auditorium. Allen founded the class piano program at Stanford, which she is teaching once again this summer.

She will perform Bach's *Chromatic Fantasie and Fugue, Sonata in B-flat minor, op. 35* by Chopin, and *Variations on a Theme by Paganini* by Brahms.

Allen received her Doctor of Musical Arts degree from Stanford in 1980 and subsequently was awarded a fellowship to study in Germany. She taught piano at Stanford for a year and now teaches and performs in the Boston area.

Tickets for Allen's Aug. 5 concert are $4 general, $2 students and senior citizens, available at Tresidder ticket office, 497-2551 and the door.

Ramsey to direct summer choir concert

The Department of Music will present the Summer Choir in a free concert under the direction of William Ramsey at 8 p.m. Sunday, July 31, in Memorial Church.

The choir will perform Mozart's *Coronation Mass* with chamber orchestra and soloists, and Schubert's *Mass in G* with strings and soloists.

The choir numbers about 130 this summer, and is composed of Stanford students as well as members of the community.

Five recorder players plan concert Saturday

The Department of Music presents Pentafluit—a quintet of recorder players—in a free concert at 8 p.m. Saturday, July 30, in Annenberg Auditorium.

Members of the quintet are Judy Linsenberg, graduate student in music at Stanford, and fellow faculty members of Cazadero Baroque Workshop at Dominican College: Frances Blaker, Vicki Lee Boeckman, Kit Higginson, and Lisette Rabinow.

They will perform works by Boismortier, Holborne, Quantz, Hans Ulrich Staeps, and Dornel for two, three, and five recorders.

Pentafluit will repeat this concert at 8 p.m. Sunday, July 31, at Trinity United Methodist Church in Berkeley.

Julianne Baird, soprano, guest artist for two concerts

The Stanford Department of Music will present guest artist Julianne Baird, soprano, at 8 p.m. Saturday, Aug. 6, in Dinkelspiel Auditorium with the Lydian Ensemble and again at 8 p.m. Tuesday, Aug. 9, in Kresge Auditorium with a Baroque ensemble under the direction of Prof. George Houle.

An internationally known performer, Baird is completing her Ph.D. in music at Stanford amid her many concert and recording dates. She has soloed with the New York Philharmonic, the Waverly Consort, Badinage, Pomerium Musices, and Concert Royal, among others, and is currently on the faculties of Rutgers and Princeton universities.

Baird has recorded for Columbia, Nonesuch, Music Masters, and The Musical Heritage Soceity. A *Washington Star* critic wrote of her: "By far the evening's strongest performance came from Julianne Baird, a soprano whose radiant singing bathed the music with warmth and expressiveness. . . .

"Baird has one of the most extraordinary voices in the service of early music that this generation has produced. More than that, she possesses a natural musicianship which engenders singing of supreme expressive beauty."

Julianne Baird

The Lydian Ensemble is composed of Randall Wong, countertenor; Margaret Panofsky, viol; and Kent Underwood, theorbo. All three are well-known to Bay Area lovers of early music.

Their Aug. 6 concert with Baird will include chamber duets, duo madrigals, and solo cantatas for Baird and Wong by Steffani, Handel, Monteverdi, Carissimi, and Strozzi. Underwood will perform a Suite of pieces for Baroque guitar by Pellegrini, and Panofsky a Sonata in A minor for gamba and continuo by Telemann.

Wong just completed a performing tour of Europe, where he was a featured soloist in the 18th-century opera *Ascanio* at the Festival of Vicenza. He also performed in Vienna with the vocal ensemble Chanticleer. This fall he enters Stanford as a doctoral student in music.

On Aug. 9 Baird will join George Houle, Baroque oboe; Charlotte Mattax, harpsichord; and Glenna Houle, viola da gamba, for a concert of French and Italian music of the Baroque period. On their program are works by Strozzi, Sammartini, Handel, Clerambault, and Bernier. Baird, Houle, and Mattax will all be featured soloists.

Tickets for the Aug. 6 concert are $4 general, $2 students and senior citizens, available at Tresidder ticket office, 497-4317 and the door. The Aug. 9 concert is free.

Midsummer Mozart Festival to continue July 31, Aug. 7

The Midsummer Mozart Festival, now in its ninth season, will return to Stanford's Memorial Auditorium for Sunday afternoon concerts on July 31 and August 7, at 2:30 p.m.

Under Maestro George Cleve, the Festival Orchestra will perform two different all-Mozart programs.

The July 31 program will include: "Overture, Trio, and Quartet from Lo Sposo Deluso, K. 430," with soloists Evelyn de la Rosa, soprano; Nile Norton, tenor; and David Malis, baritone; "Sinfonia Concertante for Violin and Viola in E-flat, K. 364" with Daniel Kobialka, violin, and Robert Levine, viola; "Two Marches in D, K. 335-320a"; and "Serenade No. 9 in D, K. 320, 'Posthorn.' "

Kobialka is principal second violin with the San Francisco Symphony and concertmaster of the Festival Orchestra. Levine is principal viola with the St. Paul Chamber Orchestra and the Festival Orchestra.

The Festival will conclude on August 7 with "Serenade No. 6 in D, K. 239," "Serenata Notturna"; "Piano Concerto No. 16 in D, K. 451" with Rudolf Firkusny, piano; "Horn Concerto No. 3 in E-flat, K. 447," Wendell Rider, horn; and "Symphony No. 36 in C, K. 425, Linz."

Firkusny is well known for his interpretation of the Classical repertory, including Mozart, and as an authority on Czech music. He has played with most of the world's great orchestras and conductors.

For ticket information, call Tresidder ticket office, 497-4317, and all other BASS outlets.

These three Stanford concerts of the Midsummer Mozart Festival are cosponsored by the Lively Arts at Stanford.

Kujawsky conducts Summer Orchestra

The University Summer Orchestra, under the direction of doctoral candidate in conducting Eric Kujawsky, will perform at 8 p.m. Wednesday, Aug. 10, in Dinkelspiel Auditorium.

The free concert will include the *Overture to Semiramide* by Rossini, *Prelude to Afternoon of a Faun* by Debussy, and Brahms, *Symphony No. 1.*

Over 80 musicians are playing with the orchestra this summer.

Librarian honored

SLAC Librarian Louise Addis has won the division award of the Physics-Astronomy-Mathematics Division of the Special Libraries Association. The 1983 award was given jointly to Addis and Stanford Prof. Edwin Parker for the development of the SPIRES High-Energy Physics Data Base.

This is the first year that an online computer database rather than a printed book was the basis of the award.

Stanford will briefly become center for world's leading letter designers

About 125 of the world's leading designers of alphabet letters will attend a week-long seminar at Stanford July 31 to Aug. 7, including five public lectures Aug. 1 through 5.

Hermann Zapf, German type designer, will discuss "Future Tendencies in Type Design: The Scientific Approach to Letterforms" at 7 p.m. Aug. 1 in Annenberg Auditorium of the Cummings Art Building.

Admission to the lectures is $7 each or $25 for the series of five. The others, scheduled for 7:30 p.m. in Room 040 Jordan Hall, are:

Matthew Carter, type designer in England and the U.S., "Galliard: A Modern Revival of Types of Robert Granjon," Aug. 2;

Charles Bigelow, typographer and Stanford assistant professor of art and computer science, "Typeface Design for Office Automation," Aug. 3;

John Benson, American lettering artist, "The Work of the John Stevens Shop," Aug. 4; and

John Dreyfus, typographical adviser and historian, England, "Edward Johnson-His Work as a Calligrapher and Type Designer," Aug. 5.

Series tickets may be ordered in advance by sending a $25 check payable to Stanford University to Charles Bigelow (ATypI lectures), Department of Computer Sciences, Stanford University, Stanford, Ca. 94305, together with return name and address.

Sponsored by the Association Typographique Internationale Committee for Education and Research in Letterforms, the seminar is the first held in the U.S. by ATypI. Its theme is "The Computer and The Hand in Type Design: The Aesthetics and Technology of Digital Letterforms.

The seminar will include a review of traditional lettering crafts, including punch-cutting and stone cutting. Working installations of computer systems will be available to bring designers and engineers together on type design.

Working seminar sessions will be given in English, with translators for German and French.

Biology seminar by John Kinsey

There will be a special seminar in the Department of Biological Sciences at 12:05 p.m. Friday, July 29, 1983, in Herrin Labs, Room 294. The title is "Transformation in Neurospora with the Cloned *am* gene" and the visiting guest lecturer is Dr. John Kinsey of the Department of Microbiology, University of Kansas Medical Center."

Musical program Aug. 7-8 to explore 18th Century version of *The Art of Love*

The Stanford Department of Music will present an unusual program at 8 p.m. Sunday and Monday, Aug. 7-8, in Dinkelspiel Auditorium. Entitled *The Art of Love—The Late 18th-Century in Words and Music*, the program is the brainchild of clavichordist Joan Benson, actor Fritz Brun, visiting director Geoffrey Reeves, and Laurence Maslon, who is directing the performances.

Combining music for the clavichord and fortepiano, songs, prose texts, and poetry, Brun describes the program as "the 20th-century equivalent of that 18th-century institution, the *salon*."

The two performers will portray love in all its facets—from wit and wisdom to sadness and sentimentality, using the words of Casanova and Voltaire, the rhymes of Blake, Johnson, and Bellman, and the music of C.P.E. Bach, Haydn, Field, and Mozart.

The program will be no less varied geographically, taking the audience on a tour of the forests of early America, the gardens of Georgian England, the canals of Venice, the harbor of Lisbon, the stately homes of Hamburg, and the lakes of Sweden.

Fritz Brun

Joan Benson

Benson is a vital force in the revival of the clavichord and early piano. She will conduct a workshop on the subject at Stanford Aug. 1-12 for the Department of Music. Benson tours internationally with her own 18th-century piano and clavichords and performs on original instruments in the museum collections of Europe and the U.S.

Brun is working toward his Ph.D. in directing and dramatic criticism at Stanford. He has taken many leading roles for the Drama Department, most recently as the great seducer *Don Juan*.

Brun brings to America a 20-year career in the Danish professional theater as actor, director, and producer. He did his early training at the Bristol Old Vic in England.

Maslon—no stranger to love and the 18th-century, having directed *Don Juan* at Stanford and *Candide* in New York—recently received his M.A. in drama from Stanford. He has also directed several original plays Off-Off Broadway.

According to Brun, the *salon* was the invention of learned ladies and a contributing factor in making the 18th-century an age of reason and *joie de vivre*.

"The program is meant to speak to the hearts and minds of our own time with the words and music of an era more gentle and sophisticated than our own, yet with a voice clear, close, and accessible," he says.

Tickets for each concert are $4 general, $2 students and senior citizens, available at Tresidder Ticket Office (497-4317) and the door.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the two weeks in which the events occur. The next deadline is Wed., Aug. 3 to cover the two weeks of Mon., Aug.15 through Sun., Aug. 28. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

TUESDAY, AUGUST 2

STARTS—Jazz Workshop Speaking Jazz Lecture Series: "Freedom vs. Structure: Influences of Trane, Konitz, Etc," Steve Heckman, followed by a concert with the Summer Jazz Workshop. Tenor and soprano saxophonist Heckman has played with such diverse artists as Slam Stewart, Jimmy and Tommy Dorsey, and Eddie Henderson. 7:30 pm. Tresidder Lounge. $3.

WEDNESDAY, AUGUST 3

Drama Dept Summer Workshop: "An Actor's Nightmare" by Christopher Durang. A hilarious comedy, directed by Leigh Sealy. Noon. The Nitery. Free.

Green Library Book Sale: Gift and Exchange Division, SU Libraries. Books and periodicals in many fields: hardbound $1.50 and up, paperback 25 cents and up, periodicals 10 cents. 11 am-1:30 pm. Green Library, West Wing, 1st floor, Rm 101.

STARTS—Jazz Workshop Speaking Jazz Lecture Series: "Jazz: Then and Now," Stan Getz. Getz talks about changes and similarities between today's jazz scene and when he played professionally in 1942. 7:30 pm. Tresidder Lounge. $3.

Aero-Astro—NASA—ASEE Seminar: "Coalinga and Akita: New Challenges to Earthquake Prediction"; Prof. Richard J. Jahns, Earth Sciences and Geology, Stanford. Open to the public. 8 pm. Terman Auditorium. Free.

THURSDAY, AUGUST 4

Drama Dept Summer Workshop: "An Actor's Nightmare" by Christopher Durang. A hilarious comedy, directed by Leigh Sealy. Noon. The Nitery. Free.

Stanford Arms Control and Disarmament Forum: "The Future of Intercontinental Ballistic Missiles," with Dr. Sidney Drell. Showing footage from Bill Moyer's program on the MX missile with discussion to follow. 7:30 pm. Cubberly, Rm 133. Free.

STARTS—Jazz Workshop Speaking Jazz Lecture Series: "Improvising Music: The Psychological Experience," with Danny Zeitlin. A lecture with musical demonstration by the internationally renowned pianist-composer-psychiatrist. 7:30 pm. Tresidder Lounge. $3.

FRIDAY, AUGUST 5

Drama Dept Summer Workshop: "An Actor's Nightmare" by Christopher Durang. A hilarious comedy, directed by Leigh Sealy. Noon, 8 pm. The Nitery. Free.

Music Dept Concert: Barbara Allen, piano. Program: Bach—Chromatic Fantasie and Fugue; Chopin—Sonata in B-flat minor, Op. 35; Bartok—15 Hungarian Peasant Songs; Brahms—Variations on a Theme by Paganini, Books I and II. 8 pm. Dinkelspiel Auditorium. $4, $2 .

SATURDAY, AUGUST 6

Music Dept Concert: Lydian Ensemble and Julianne Baird. Baroque cantatas and duets; music by Monteverdi, Handel, Steffani, and others, with Julianne Baird, soprano; Randall Wong, countertenor; Margaret Panofsky, viol; Kent Underwood, theorbo. 8 pm. Dinkelspiel Auditorium. $4, $2.

Drama Dept Summer Workshop: "An Actor's Nightmare" by Christopher Durang. A hilarious comedy, directed by Leigh Sealy. 8 pm. The Nitery. Free.

SUNDAY, AUGUST 7

Lively Arts at Stanford: Midsummer Mozart Festival, directed by George Cleve. Program: Serenade No. 6 in D, "Serenata notturna," K. 239; Piano Concerto No. 16 in D, K. 451, Rudolf Firkusny, piano; Horn Concerto No. 3 in E-flat, K. 447, Wendell Rider, horn; Symphony No. 36 in C, "Linz," K. 425. 2:30 pm. Memorial Auditorium. $12, $9, $7 (students: $10, $7, $5).

Music Dept Concert: Benson and Brun: "The Art of Love," words and music of the late 18th century. Joan Benson, clavichord; Fritz Brun, actor. 8 pm. Dinkelspiel Auditorium. $4, $2.

ASSU Sunday Flicks: "The Man With the Golden Gun." Roger Moore plays James Bond. 8 pm. Memorial Auditorium. $1.50.

MONDAY, AUGUST 8

Music Dept Concert: Benson and Brun: "The Art of Love," words and music of the late 18th century. Joan Benson, clavichord; Fritz Brun, actor. 8 pm. Dinkelspiel Auditorium. $4, $2.

TUESDAY, AUGUST 9

Hoover Institution TOWER TALKS: "British Trade Unions," Gerald Dorfman, Senior Fellow. 3:30 pm. Lou Henry Hoover Room, Hoover Tower. Free.

Music Dept Concert: Baroque Chamber Music. Sonatas and cantatas of the early 18th century by Handel, Bernier, and others. Julianne Baird, soprano; Charlotte Mattax, harpsichord; George Houle, Baroque oboe; Glenna Houle, viola da gamba. 8 pm. Kresge Auditorium. Free.

WEDNESDAY, AUGUST 10

Drama Dept Summer Workshop: SUMMER'S END—an original review. Directed by Lorne Buchman, this original production combines dance, drama, and song. Noon. The Nitery. Free.

Stanford Physicians for Social Responsibility: "The Last Epidemic." This film will be shown several times before the PSR-sponsored symposium in October. 8 pm. Common Rm, 3rd floor, Women's Clubhouse. Free.

THURSDAY, AUGUST 11

Drama Dept Summer Workshop: SUMMER'S END—an original review. Directed by Lorne Buchman, this original production combines dance, drama, and song. Noon. The Nitery. Free.

FRIDAY, AUGUST 12

Drama Dept Summer Workshop: SUMMER'S END—an original review. Directed by Lorne Buchman, this original production combines dance, drama, and song. Noon, 8 pm. The Nitery. Free.

SATURDAY, AUGUST 13

Drama Dept Summer Workshop: SUMMER'S END—an original review. Directed by Lorne Buchman, this original production combines dance, drama, and song. 8 pm. The Nitery. Free.

EXHIBITS

Propaganda Posters of Two Revolutions. Features over 40 posters from the Russian Revolutions and Civil War, 1917-1922, as well as the German Revolution of of 1918-1919 and the German elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover Memorial Exhibit Pavilion. June 8-Jan. 31.

The Stanford Horse Show. In conjunction with the renovation of the Red Barn at Stanford, the exhibit contains paintings, photographs, and Currier and Ives prints of Leland Stanford's celebrated trotting horses, bred and trained in Palo Alto. T-F 10-5; S-S 1-5; closed Mondays. Stanford Art Gallery. June 28-Aug. 14.

Paintings by Liz Cheney. Atmospheric style and designs by a student of the Stanford Fine Arts Dept. all building hours. Upper Lobby of Tresidder Union. July 3-Aug. 1.

Photographs by Aurangreb Khan. Coffee House Gallery, Tresidder Union First Floor. July 3-Aug. 1.

Sharon Chacko—Batik. International Center. July 4-Aug. 14.

Photographs—1920's-1980's: Selections from the Museum's Collection. Exhibit includes some sixty prints by American and European photographers, including Kertesz, Winograd, Weston, Bravo, Morris, White, Uelsemann, and Novak. T-F 10-5; S-S 1-5. Stanford Museum. July 5-Aug. 14.

The Art of Literature: California Authors and Their Printers. A retrospective look at California literature and fine printing, 1860 to present. On the occasion of the first American conference of Assn Typographique Internationale. Rotunda and Gallery: Green Library. Aug. 1-Oct. 5.

Photographs by Ann Sconberg. Coffee House Gallery, 1st. Floor of Tresidder Union. Aug. 1-Aug. 31.

"My Favorite City": Show and sale of paintings and lithographs from the Kamarov Gallery. Upper lobby Tresidder Union. Aug. 1-31.

CAMPUS REPORT

Volume XV, Number 42 | A publication for Stanford University faculty & staff | August 10, 1983

Financial aid students get draft warning

Stanford has resumed mailing statements of selective service registration compliance to an estimated 4,000 financial aid recipients.

Temporarily delayed as a result of questions raised by Stanford Against Conscription, a voluntary organization, the statements are required under the provisions of the Solomon Amendment.

In an accompanying document, the University notifies students that "you will not be eligible to receive federal financial aid if you do not complete this statement."

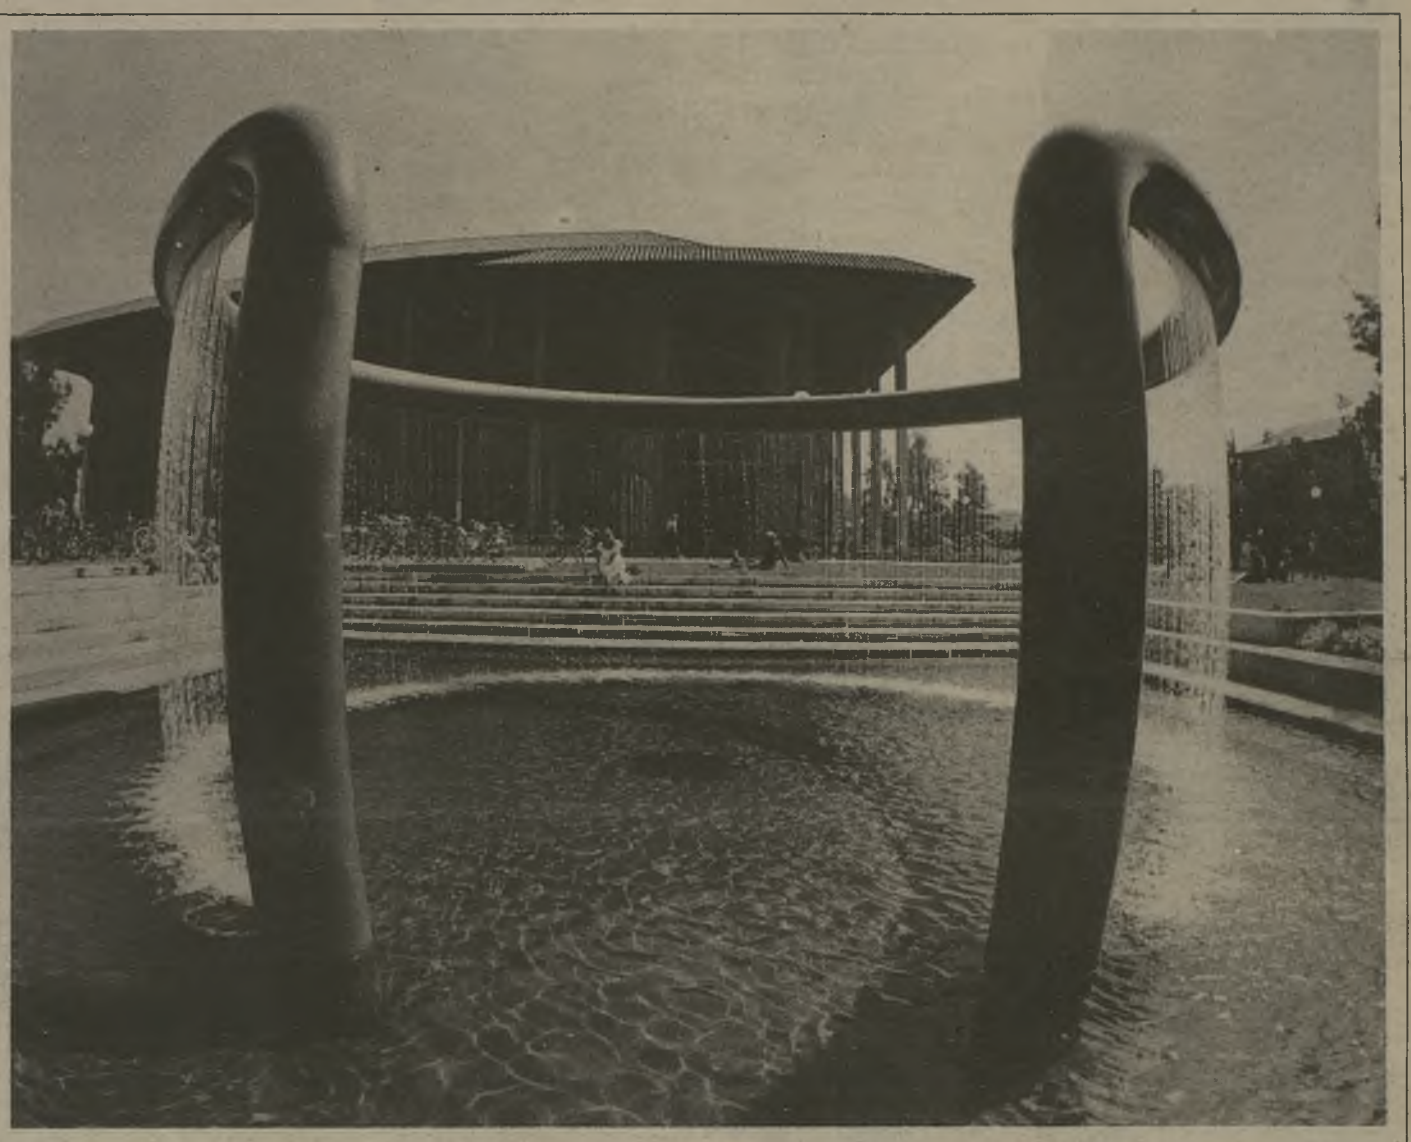
After two paragraphs explaining the law's applicability, the notice adds that "students who are not able to complete this statement may wish to contact the Financial Aids Office."

In March, the University announced it would apply its current financial aid policies to those not registering for the draft.

Students who decline or fail to apply for governmental aid are considered on an individual basis for long-term loans and jobs through the University. These loans are more costly to students and must be repaid within five years of graduation.

According to Financial Aids Director Robert Huff, about 46 percent of all Stanford undergraduates receive scholarships and grants-in-aid. When loans are included, the proportion rises to 71 percent.

In a statement on government student aid and selective service registration, published in March, the University said:



It has been University policy to award its own financial aid with the expectation that students will apply for and obtain any governmental assistance for which their financial situations make them eligible.

When students have declined or failed to apply for such governmental assistance, the University has been willing to consider replacing it with its own long-term loan and job resources. Decisions in such cases are made on an individual basis after consultation by the student with a member of the advising or senior staff of the Financial Aids Office.

It should be noted that the terms and conditions of University loans are less favorable—that is, more costly to the stu-

A beautiful sight on a hot day—Shumway fountain with its shimmering curtain of water

Fundraising begins for old Stock Farm stable

A campaign to raise $500,000 toward restoration of Stanford's historic Red Barn and stables will begin shortly after Labor Day, President Donald Kennedy has announced.

Heading the volunteer effort will be L.W. (Bill) Lane Jr., chairman of the board of Lane Publishing Co., publisher of *Sunset Magazine*, Kennedy said. Lane, a Stanford graduate, is an avid horseman and, along with his brother Mel and other members of the Lane family, owns a large horse breeding and cattle ranch.

Target date for completion of the fundraising drive is Oct. 31.

The University's Board of Trustees last February approved the concept of restoring the Victorian barn, the most significant building remaining from Leland Stanford's Palo Alto Stock Farm and one of the oldest buildings on campus. The Stanford Golf Course now surrounds the structure and its adjoining paddocks and outbuildings.

Archival records indicate the barn probably was built between 1878 and 1880. The University, founded in 1885, opened in 1891 on stock farm land Leland and Jane Stanford donated to form the nucleus of the University's endowment.

Final project approval is expected from trustees within a few weeks, paving the way for restoration to begin as early as mid-September. University officials hope to complete exterior work before winter rains begin.

Lane and University officials currently are selecting a fundraising committee to

What's happening at Hoover...

The Hoover Institution is the focus of much activity, over and above its normal research, this summer:

1) Three campus committees are looking into the proposal that a Ronald Reagan Presidential Library and Center for Public Affairs be located at Stanford.

2) Two faculty members are protesting that the proposal is being rushed without enough discussion.

3) FBI and other government investigators have spent several days going through Reagan campaign papers in the Hoover archives.

4) The study of the relationship between Hoover and the University continues.

Details follow.

Hoover study group

W. Glenn Campbell, director of the Hoover Institution, reported Aug. 9 that the Institution's Board of Overseers had "warmly endorsed" the proposal to locate the Ronald Reagan Presidential Library at Stanford University.

People

Catherine Milton

Jeanette Pitts

Laura Anderson

Larry Horton

Thomas McBride

Catherine Milton

Catherine Milton, a widely respected worker for victim's rights legislation in Washington, will study ways of encouraging public service by Stanford students, faculty, and alumni.

Her one-year, half-time appointment, effective immediately, was announced by President Donald Kennedy. A former commissioner of the Food and Drug Administration, Kennedy has consistently encouraged students to devote a portion of their lives to public service.

Milton will seek ways of integrating and strengthening several existing programs on campus, as well as considering new initiatives.

The public management program of the Graduate School of Business, the new public interest loan program of the Stanford Law School, the Action Research Liaison Office, and the Stanford-in-Washington program for undergraduates are several current examples.

While based at Stanford, Milton plans to continue as a consultant to the U.S. Department of Justice on victim's rights legislation. Working with the Senate Special Committee on Aging, she conceived and drafted the Omnibus Victims Protection Bill of 1982, subsequently signed into law. Her previous experience includes serving as senior adviser to the Assistant Secretary of the Treasury for Enforcement and Operations; director of the female offender resource center for the American Bar Association; assistant director of the Police Foundation; professional staff member of the Presidential Commission on Campus Unrest; and working as a reporter for *The Boston Globe*.

She is the author of books on *Women in Policing*, *Police Use of Fatal Force*, *Little Sisters and The Law*, and coauthor of a *History of the American Negro*. She is married to Thomas McBride, associate dean of the Law School. They have two children.

She can be contacted on campus at Owen House, 497-0859.

The tradition continues—employees invited again to San Jose State game

Yes, there is going to be an Employee's Day again this year with a Stanford Family Tailgater in Frost Amphitheater and free reserved-seat tickets to the San Jose State game on Saturday, Sept. 24.

As soon as plans for the Day's events are confirmed, President Donald Kennedy will extend a personal invitation to the faculty and staff to "Come Join the Band" and each other in having a good time.

There will be free frosty and foamy drinks, food on sale for those who don't want to pack a picnic basket, special live music in addition to a performance by the Leland Stanford Junior Marching Band in Frost, and then "Entertainment Guaranteed" in the Stadium.

Kennedy emphasized to the Employees' Day planners that they should encourage all departments and work groups on the University, SLAC, and Hopsital payrolls to join in the special pregame party.

Larry Horton

Larry N. Horton, Stanford's director of government relations since 1978, has been promoted to associate vice-president for public affairs, effective immediately, Vice-President Robert Freelen has announced.

Described by journalists as "both energetic and persistent. . .a man on the run, especially in the halls of the Capitol building," Horton has worked closely with Freelen and Stanford President Donald Kennedy on a wide variety of issues in Washington and Sacramento.

To help higher education institutions keep abreast of legislative and executive branch developments, Horton recently created an electronic mail network for the Association of American Universities, based in Washington and headed by Robert M. Rosenzweig, former Stanford vice-president for public affairs.

He was named associate director of government relations in 1977 and director the following year. During 1979-81, Horton was cochairman of the Stanford Commission on Investment Responsibility.

Thomas McBride

Associate Dean Thomas McBride of the Stanford Law School has been named to a newly formed Presidential Commission on Organized Crime, the White House announced Thursday, July 28.

Former associate Watergate special prosecutor, McBride served as inspector general of the U.S. Department of Labor before coming to Stanford last October. He also headed the President's computer matching project, a key element in the Administration's anti-fraud program.

Cited personally by President Reagan as one of three outstanding managers in government, McBride served as inspector general of the Department of Agriculture during the Carter Administration. He calls himself a registered independent politically.

During 1961-65, McBride served as a trial attorney in the Organized Crime Section of the U.S. Department of Justice. He was deputy chief counsel of the Select Committee on Crime, U.S. House of Representatives in 1969.

During 1973-75, he directed the largest of the Watergate special prosecutor's task forces, examining campaign contributions.

Previously, he served as staff director of the Police Foundation, associate director of the Urban Coalition, and deputy director of the Peace Corps' Latin American region.

Pitts, Anderson

Stanford senior Jeanette Pitts of Kansas City and junior Laura Anderson of Los Angeles are participating in the Medical Education Reinforcement and Enrichment Program (MedREP) at Tulane School of Medicine this summer.

MedREP is a ten-week session geared toward identifying, recruiting, and motivating minority or disadvantaged students whose enriched experience will help them complete medical school and succeed in a medical career.

The Kirkpatricks admire their impatiens, among the flowers from all over the world that adorn their garden.

Some strange quirks of geniuses recalled by Kirkpatrick

BY DONALD STOKES

Emeritus Prof. Paul Kirkpatrick of Stanford, aged 89, known for early work in x-ray spectroscopy, x-ray optics and holography, offers these reminiscences about physics at Stanford in the decades before World War II.

Second of two parts

A few striking characters stand out in my recollections of physics at Stanford in the 1930s.

The first was David Webster, a scientist of exceptional mental powers and eccentricities. He once told me that as a student he had planned to become a theorist but that accidents of fate had made him an experimenter. In his 70s he did become a theorist.

One of his distinguishing characteristics was an unfailing physical intuition; what physicists mean when they speak of getting a *feeling* for some area of study.

After tangling with him a few times on phenomenological matters or the prediction of consequences of some given initial conditions which neither of us had taken the time to analyze, I came off with distinct feelings of inferiority.

On such an occasion I was consoled by Bill Hansen, who said "Oh, there's no use bucking Webster when it comes to physical hunches. He's always right." (Hansen was later to have Stanford's W. W. Hansen Laboratories of Physics named after him).

Hansen's praise in this regard was as high as could be found, for he was himself a man of notable physical grasp, even as a student. In his first years at Stanford he was a worshipful disciple of Webster, but as his own knowledge grew, and at some times surpassed that of his teacher, the Websterian eccentricities and fabulous intellectual quirks moderated Hansen's adulation. Towards the end these contrasting individualists coexisted on a basis of civilized courtesy.

Hansen, the physical superman and amateur boxer, never saw his 40th year, being taken by a respiratory ailment perhaps related to his wartime exertions. His mental independence and originality were remarkable. His were the analytical brains that carried the klystron proposal to success.

Hansen was the only Ph.D. candidate whom I ever saw undergo the doctoral oral with obvious enjoyment and never a really wrong answer.

If, like Hansen, they have no possible stake in conformity as such they become known to the masses as "characters," or in advanced cases "crackpots." I take it that the advance of our species is in the hands of our crackpots, a view supported by the common practice of elevating crackpots to the pedestals of heroes after they are dead.

I now think of Hansen as, within certain bounded areas of activity, one of the greater minds of our time. But there were worthy fields of human effort which he consciously shunned, not because of any reasoned disrespect for them but because they called for other aptitudes than his. He thus combined a bounding self-confidence with a selective diffidence which found its best support in his association with Felix Bloch.

Bloch and Hansen were peers in the arena of physical science, with Hansen holding a clear advantage in experimental matters; but Bloch was at home in all human circles, could chat with the eminent in several languages or play in a trio with semi-pro competence.

What gained Hansen's admiration even more was Bloch's shrewdness in academic politics, and his ability to acquire and retain power. There were policy issues on which Hansen would withold his vote until he could talk it over with Bloch.

Assuredly he never took orders from Bloch, or from anyone else, but his respect for the practical wisdom of his friend generated a susceptibility which almost ensured agreement.

Another of Hansen's partnerships, and one of greater historical interest, was his friendship with Russell Varian. In my first year at Stanford, Hansen was a graduate student and Varian was a laboratory habitue of no definite status.

As a small boy in a Palo Alto school, Varian had been a slow learner and was considered retarded. Among his peers he was low on the pecking order. This drew the intervention of his kindly teacher, who adjured his more aggressive schoolmates not to expect too much from Russell.

Varian had, shortly before my arrival at Stanford, completed some low-energy observations of the Compton effect which had gained him a master's degree, but he had, it was said, been turned down as an unpromising candidate for the Ph.D.

Today, when Varian's inventiveness and physical insight have been internationally recognized, there is a tendency to recall with deprecating smile the Stanford action that denied a near genius even a chance to try to qualify for a doctorate.

While I had no part in the decision I believe that

continued on next page

Kirkpatrick/

continued from page 3

it was correct, and that Varian could never have survived the ordeal of the doctoral gauntlet. As he never learned to write his native language well, it is hard to believe that he could have gained the required proficiency in two foreign ones.

His oral communication was worth the listener's effort, but many were there who gave it up.

It is related that in one colloquium report he misspelled the same English word on the chalkboard in three different ways. Personally I think this was an exaggeration, but certainly the operation of his mind was like that of no other from which I have benefitted.

I have seen him stop in the midst of a public discourse and ponder silently for 30 seconds over a new idea suggested to him by his own words, while his understanding audience waited patiently for the programming of his brain to return to the previous question.

Although Varian's thinking led through involved logical and quantitative arguments he never acquired any mathematical skills or techniques beyond those of undergraduate calculus. One of his collaborators said, "Russ doesn't use logic. He has something better."

But Varian would have been the last to repudiate logic, and in his needs of its sophisticated expressions his friend Hansen supported him mightily.

Varian had more original ideas per day than any other man I have seen at work but, as Hansen came to recognize, they graded from brilliant to futile, and the sorting process called for the comprehension, criticism, and theoretical analysis that Hansen was well equipped to supply.

In the later 1930s this teamwork proceeded fruitfully, though I should certainly not like to convey that Hansen was not himself a distinguished originator.

It is reported that Maxwell was asked how he was able to bring to such elegant completion his work on the electro-magnetic equations, and that he answered simply, "By thinking about it all the time." This is surely the path of maximum achievement for minds of middling caliber as well as for those equipped with superior circuitry.

It is my impression that in the years before his marriage Hansen thought about physics all the time. This belief is supported by his productivity, his late hours, and his neglect of the conventional rites and responsibilities of academic citizenship.

Now Hansen and both the Varian brothers are dead, while their souls go marching on in the multi-million dollar ideas which they injected into the then exploding microwave science and industry.

Through the 1930s Webster's little research group had made many studies bearing on the probability of atomic ionization through electron bombardment. The fact and frequency of such ionizations were known from observations of the ensuing x-ray spectra, chiefly of the K series. Webster became dissatisfied with the range of bombardment energies afforded by his homemade high-potential power supplies. We formed a study committee to consider the possible ways of getting into higher energy ranges.

That committee was the first step on a path of progress which has brought us presently to the Stanford two-mile electron accelerator and is still leading on toward destinations unknown.

The first cyclotrons were functioning at Berkeley but we soon dismissed for cause the thought of circular electron accelerators. Hansen, however, did not forget the lesson that high particle energy does not necessarily mean great potential differences, and he started thinking about *linear* acceleration as a means of avoidance of the radiation energy loss.

Van de Graaff's electrostatic generators had not yet been announced and, as I remember it, we never gave a serious thought to possible static machines of any sort. Like other right-thinking physicists we would have dismissed them as impractical toys of the Franklin era.

The Stanford Electrical Engineering Department possessed a notable old set of high-voltage transformers capable of peaking at three million volts, and hurling 30-foot sparks across their huge sphere gap. It seemed obvious to us that no plans that engineers could contemplate for such a facility could compare in importance with our basic atomic investigations. Webster even had the audacity to invade the Electrical Engineering Department with such an argument.

That they did not speedily throw him out may be credited to the fact that they were indeed in some uncertainty about what to do next with their mammoth power supply. They were not admitting that the mammoth had evolved away its viability but Webster felt sufficiently encouraged to come back and start the planning of a budget.

It is easier to discover and accept the entirely new than to disarrange concepts that have become the habitual furniture of the mind.

—Paul Kirkpatrick

Paul Kirkpatrick cycles on campus every day.

It is easier to discover and accept the *entirely* new than to disarrange concepts that have become the habitual furniture of the mind. When we saw that our project was likely to cost $25,000 before the first datum could be read off we were about ready to give up.

Webster made a few calls on the president of the University and sent a number of letters in the direction of known coagulations of capital; the capital was there but not the interest, so the first high-finance research in physics at Stanford aborted in early gestation.

In present times, in the same department, sums like $25 *million* are mentioned with less awe than we accorded to a small fraction of that amount half a century ago.

In this atmosphere Hansen thought harder about electrons in fields and came up with the Rhumbatron and other cavity-resonant devices. Some of these were built and successfully tested, and plans were developed for linear electron accelerators employing the properties of microwaves, which Hansen and a few other physicists were beginning to understand.

Russell Varian, who was still about, became interested and conceived a tuned cavity device in which electron streams were bunched and caught in such a way as to perform signal amplifications and other vacuum-tube functions, but in the microwave frequency range. His original sketch, including original spelling, is still extant, and has become a valuable paper now that an industry has grown out of it.

Hansen was, of course, close to this development and was later named a co-inventor. Webster understood the idea perhaps better than did the originator, and a little later, after the tube had worked under laboratory conditions, he set forth the basic theoretical analysis in an elegant paper.

Following Webster's presentation of his theory to the local colloquium Hansen rose to praise it, but qualified his wonder by saying "I guess it's no surprise, considering who is doing it."

This was very handsome appreciation since a) Hansen was characteristically blunt in speech and not given to unnecessary politeness, b) he was no longer Webster's protege but had developed points of difference, both professional and social, which he took little pain to conceal, and c) Hansen almost without doubt was condemning himself for failure to achieve priority in the elucidation of the klystron.

This name (klystron) was the result of unusual interdepartmental cooperation. A deputation from Physics called upon the Department of Classic Languages and presented their terminological problem. They came back satisfied with the collaborative design of a word which, I am told, implies a relation between the flight of bunched flocks of electrons and the arrival of successive water waves on some Grecian shore.

Hansen was a great joker. Once he soldered a wood screw to a dime and screwed it into the hall floor outside his office door, where student traffic was often heavy. He, or his students, collected data on the considerable number of people who tried to pick it up.

Hansen was interested in sports, and particpated in some, and often discussed sports with graduate students. Some rivalry sprang up, which resulted in a challenge half-mile race between Hansen and one of the boys, Alex de Bretteville.

Hansen was easily beaten in the race, whereupon students with shop ability fashioned for Hansen an admirable lead medal bearing the Latin inscription: PLUMBUM EJECTA (roughly translatable as "Get the lead out").

Russell Varian's older brother, Sigmund, had had a varied career which I never understood in detail, though I knew him well. He had traversed the world, up and down and crosswise, partly as a Pan Am pilot. He brought to Stanford his family,

Two die, ten survive in dramatic rescue by CIT computer programmers

Before the terrified eyes of their parents, 10 of 12 quail chicks who had fallen through a grating into a five-foot deep culvert were rescued by some agile computer programmers around noon Tuesday, July 26, at the Center for Information Technology (CIT).

Before noon the proud quail parents had been seen parading around Forsythe Hall, followed by a row of 12 newly-hatched chicks.

The bigger-footed mother and father quail waddled across the grating with no problem, but their peeping babies tumbled blindly, one by one, down through the grid. Mother and father quail circled about ruffling their feathers, squawking piteously and peering down at their whole family imprisoned beneath the surface of the earth.

Out of Polya and Forsythe Halls poured the CIT staff eager to come to the rescue. Shirley Melen, manager of technical support services, organized this very special support service.

The grating was removed, everyone cautiously mindful of the distraught parents underfoot. Mark Lawrence lowered 110-pound Melen into the pit.

Other programmers fashioned cardboard triangles into miniature stretchers for the chicks so that they would be uncontaminated by the touch of human hands.

Very, very carefully Melen scooped up each little quail and delivered the miniscule stretchers and downy contents to waiting hands above. Cheers and applause broke out among the onlookers as the 10 chicks emerged. Two of the tiny chicks had apparently suffered mortal injury in the fall.

The 10 survivors were placed in a cardboard box laid on its side, the grating was covered with a screen, and everybody tiptoed away.

Next morning mother and father quail were spotted marching around Forsythe Hall followed by a row of 10 little chicks.

Peggy Lyons, CIT

SUL's Suzanne Moore featured in magazine

The current issue of *Country Home* magazine contains an article about the restoration of an 1870s Wisconsin farmhouse by Stanford University Libraries exhibits coordinator Suzanne Moore and Joel Wollum.

The farmhouse is only one of several old buildings restored by the two. Others include two schoolhouses, a country inn, and a post office. Moore not only did the designing, she also was involved in the actual construction, doing all the plastering necessary in the farmhouse.

At Stanford, Moore handles all the details of Department of Special Collections exhibitions. She discusses ideas for them, coordinates with researchers, and helps select the books to be shown. Her design for an adjustable book mount has simplified the exhibitions.

At Stanford since April 1, Moore also will be responsible for exhibition publicity and graphics, including posters and catalogs.

Alice Forbes— a 'walking encyclopedia' who prescribes over the phone.

Workshops help employees discover how to cope with administration maze

A new employee at Stanford may have to contend with unfamiliar expenditure statements, completing payroll-personnel forms and travel expense reports, preparing and administering grant proposals, or figuring out which procurement form he or she should use to get a nameplate.

Training Coordinator Alice Forbes bears in mind the needs of new employees as she designs and runs workshops to enable them to:

- better understand the Stanford accounting system;
- learn how to complete Controller's Office forms, when to use them, and where to send them;
- become familiar with Controller's Office resources for solving problems; and
- clear up misconceptions about Controller's Office policies and procedures.

Workshops on seven different topics are scheduled quarterly. A new employee who attended a workshop on each topic would emerge, 31 hours of instruction later, well-versed in Stanford's accounting system, travel policy, equipment administration, payroll-personnel policy and procedure, fund accounting, grant and contract administration, and procurement process.

In addition, this spring Forbes introduced update workshops, designed to give staff the opportunity to discuss problems, new issues, and changes in the accounting system.

The first two update workshops (one on payroll-personnel and one on grant and contract administration) have paved the way for sessions featuring different topics and guest speakers.

One new administrator who went through all of the workshops last year called Forbes "a walking encyclopedia." She works hard to present the most up-to-date information; she often team-teaches and tries to bring managers and supervisors into the workshops.

However, Forbes believes that presenting current policies and procedures is only half the key to a good seminar. Successfully communicating the information is the other half. So she establishes a relaxed, noncompetitive atmosphere "to enable maximum learning to take place."

She encourages participants to learn from each other by asking questions and sharing information. And the time she sets aside for participants to practice using the manuals and completing the forms that their jobs require reflects her view that "people learn best by doing."

Ideas for new workshops frequently germinate in Forbes's conversations with managers and with workshop participants. This spring, for example, she worked with Tom Keenan's Budget Control group to create a Budget Process workshop.

This workshop gave Forbes the opportunity to try a new strategy for allaying beginners' fear of computers: she allocated time for each participant to actually manipulate data at a computer terminal.

"It worked," she said. "People who had never touched a terminal before said, 'It's so easy.' "

Quantifying the dividends the workshops pay in terms of increased staff productivity and efficiency is almost impossible. But the constant stream of participants—1,233 in 1981, 1,072 in 1982—attests to the need the workshops fill.

Even when Forbes isn't designing and directing workshops, she spends most of her time addressing or anticipating questions about the Controller's Office.

Just as a good physician should know how the body works from the smallest molecule to the most complex system, the training coordinator needs to understand the Controller's Office on every level from the simplest procedure to the most general policy. Unlike most doctors, however, she is usually ready to prescribe a remedy over the telephone when an extraordinary question arises.

Forbes also practices preventive medicine. With the hope of answering questions before they come up, she has written manuals on how to read and use the Office's forms and statements.

Forbes continually revises these manuals to keep the information and examples up to date. She is now working on a new revision of the Forms manual.

Whether it's classes or manuals, Forbes works to keep Stanford's work flowing smoothly. A schedule of current workshops is available from her at ext. 7-4531. *Campus Report* also prints them before the beginning of each quarter.

Taxis help elderly, handicapped

Elderly and handicapped Stanford campus residents are now eligible for low-cost taxi services from the City of Palo Alto's "Project Mobility" program.

Trips may be taken from any point within Palo Alto and Stanford to Menlo Park, Mountain View, to Kaiser Hospital in Redwood City, or to medical facilities in Los Altos.

The extension of these services to eligible Stanford residents, including students, is made possible by an additional grant from the Metropolitan Transportation Commission requested by the city to expand the program's service area.

Participants may purhcase one book of eight tickets per month for $4.80. Tickets are paid to the taxi or chair-lift van driver in lieu of cash fare. For trips within the Palo Alto-Stanford area, one ticket is surrendered for each one-way trip.

The basic eligibility criteria are: residence in Palo Alto or on the campus; must be 18 years old or older; cannot drive or have access to transport by another member of the family; cannot use public transportation; and must be able to ride in a vehicle without causing danger to one's self or any other passenger.

Screening and enrollment of participants is being handled through the Palo Alto Senior Center at 450 Bryant Street, phone 327-2811, 9 a.m. to 5 p.m. Kathleen McConnell, director of individual services for the Senior Coordinating Council, is in charge of the enrollment of Stanford residents in the program.

It's the loose stuff that can hurt you

Experts estimate that more than 70 percent of the injuries in a major earthquake are caused not by building collapse, but by the movement of the building contents during the shaking.

Furniture and equipment can fall, topple, or slide, causing serious injuries and damage. This is a hazard that you can correct now, before an earthquake strikes.

You need only examine your surroundings with a critical observant eye to identify the hazards inherent in your building's contents.

In offices, book cases and file cabinets can easily tip over in an earthquake. In shops, machinery can tip over or slide across the room. In laboratories, bottles of chemicals and other apparatus can fall from shelves and break.

A few relatively simple and inexpensive measures can help alleviate these hazards. Furniture and equipment should be bolted down or secured to withstand shaking. Light fixtures can also be braced and mounted securely.

For detailed information on how to secure the contents of your building, contact Facilities and Services for the Quick Fixes manual.

In laboratories, contact the Department of Health and Safety for the Laboratory Earthquake Safety manual.

For other earthquake safety information, contact your department Health and Safety committee, or call Stanford Earthquake Information at 497-0569.

SLAC Summer Institute hears report on weakons discovery

The European winners of the race to find three crucial subatomic particles reported their discovery to their American competitors, Friday, July 29.

The experiments, which were the high point of this year's Summer Institute at the Stanford Linear Accelerator Center (SLAC), found the particles that are thought to transmit the weak force responsible for radioactive decay.

The discovery is expected by many physicists to earn a Nobel Prize.

The particles, collectively called "weakons" (or more technically, intermediate vector bosons) were first conceived in the 1930's and formally predicted by the 1979 Nobel Prize-winning "electroweak" theory which unifies two of the four basic forces of nature, the weak interactions and electromagnetism.

While physicists had been searching for the particles since the 1950's, it was only after the current generation of very high energy accelerators were built that scientists could create and detect the heavy particles.

Since confidence in the weakons' existence was high, the major particle physics laboratories over the globe competed to be the first to find the particles.

The winners were two groups of researchers, each working with different detectors, at the 12-country European Organization for Nuclear Research (CERN) laboratory located outside Geneva.

Late last year CERN scientists observed their first weakons, the charged W and W- particles, by making protons collide with their anti-matter particles at a total energy of 540 billion electron volts (GeV).

As a result of the collision, the particles annihilate, creating for a brief instant, a state of pure energy from which a large variety of complex particles, including the weakons, can be produced. These particles then decay, emitting a shower of lighter particles such as leptons (the family of particles to which electrons belong).

Computers reconstruct the paths of the emitted charged particles recorded by the detectors (called UA1 and UA2 for underground areas). Scientists must then sort through what look like still photographs of a fireworks display, hunting for the weakon "signature"--the unique pattern of leptons ejected in the weakon decay.

By screening billions of collision events, CERN researchers in the two groups have found to date a total of 78 W particles and 14 of their neutral counterparts, the Z weakon.

While the discovery of the particles was expected, physicists were surprised that the weakons were so easy to identify in the jungle of other particles born in the proton collisions.

Some scientists had believed that the weakons would be unambiguously visible only in experiments that annihilated electrons and positrons which are considerably lighter and less complex than protons.

Such an experiment has been planned by SLAC when its newly approved $112 million linear collider (SLC) is completed in 1986. Physicists are looking forward to SLC because it will be a veritable factory of weakons, producing millions of particles a year.

At the SLAC conference, the CERN researchers also announced their most recent estimates of the masses of the W and Z particles. The 138 member UA1 group, which has already published its results in the July 7 issue of *Physics Letters*, reported about 80.9 GeV for the W and 95.2 GeV for the neutral Z. The UA2 group, consisting of 61 scientists, has recently submitted for publication their values of about 81.0 GeV for W and 91.2 GeV for the Z.

All of the measurements are in excellent agreement with those predicted by the electroweak theory. **Stefi Weisburd**

Watch out for the superwoman syndrome

- To combat the "superwoman syndrome," women should:
- Recognize they can't be perfect in every dimension of daily life;
- Take care of themselves physically and emotionally;
- Determine what's central, and allocate effort accordingly;
- Schedule time for themselves, their partners, and each child; and
- Work together to change institutions to meet the needs of women.

These suggestions come from Marjorie Shaevitz, a Stanford-educated career counselor at the Institute for Family and Work Relations in La Jolla, Calif. She spoke at a recent corporate seminar arranged by Stanford's Center for Research on Women.

Since women "tend to take care of themselves last," those with families should recognize that "it's in your husband's and kids' best interest" to exercise, eat properly, and "do what pleases you," she advised.

SUPER WOMAN

Many women now are so overwhelmed that they can't even describe what really pleases them, she noted. But "lack of leisure time" was cited as the most serious concern of working women in one recent national survey.

Physical signs of the "superwoman syndrome" include difficulty sleeping, headaches, dizziness, menstrual irregularity, high blood pressure, and ulcers.

Psychological signs include feeling chronically tense and pressured, anxious and angry. Often, women may recognize these signs only after more than a week's vacation.

At work, the symptoms may include high absenteeism, chronic lateness, lower productivity, and more conflict with fellow workers.

At home, while husbands can rarely be singled out as the only source, women feel "incredible anger" that they are unfairly overloaded with household work.

"If you stay upset, you don't have a chance to change things," Shaevitz observes.

Conflicts with babies and teenagers can be common—not just in the U.S., but also in Scandanavian countries.

In trying to balance many different roles—wife, mother, homemaker, employee, volunteer—it helps to choose carefully before saying "yes" to anyone.

Older women generally come from more traditional families, and may find the changed expectations challenging. While middle and upperclass men may express intellectual support for women, "their behavior's not involved," Shaevitz said, citing research at UC-San Diego.

Women may find it difficult to lower their standards and delegate household tasks. Remaining a "one-woman band" may seem easier than getting helpers to meet your standards, but in the long run such perfectionism has a high personal cost, she noted.

Chronic low-level anger at a spouse may suddenly erupt in anger. "He doesn't help, so you cry and hope he changes."

Not feeling good about yourself—a constant feeling you should be thinner, taller, more assertive, etc.—is a sign of the syndrome. "If most of what you say to yourself about yourself is negative, watch out," she noted.

Women who work may find it useful to apply some of the organization skills they practice at work in their home environment.

Raised by "very traditional" Danish parents, Shaevitz and her husband coauthored *Making It Together as a Two-Career Couple* and have four children from two families.

"We're in a transition group," Shaevitz told her mostly female audience. "We have one foot in the past, another in the future. We need to change ourselves, and help men and institutions do the same."

"But there's status in being overworked," one listener responded. "If you have it all together, people think you're strange. They really resent it."

Newly discovered particle

SLAC physicists confirm existence of fifth quark

Physicists at the Stanford Linear Accelerator Center (SLAC) have measured the decay lifetime of a recently discovered particle called the "B-meson", thereby confirming the existence of the fifth quark and hinting at the existence of a sixth, it was announced Thursday, July 28.

The measurement, which is the first of its kind, was performed by two independent detectors at SLAC's Positron-Electron Project (PEP) storage ring. The announcement was made at the topical conference of the 11th annual SLAC Summer Institute.

The B-meson, which was first observed last year by scientists at Cornell University, is predicted by a theory called the "Standard Model."

In this model, the six basic constituents of matter, named "quarks" can combine in a variety of ways to create a whole zoo of more complex particles called "mesons" and "baryons." So far researchers have found experimental evidence for all but one quark, the "top" quark.

The B-meson is made from the "b" quark, and an anti-matter quark of a different type, or "flavor." Scientists at SLAC made B-mesons by colliding "bunches" of electrons and positrons, each traveling at energies of 14.5 billion electron volts.

When an electron collides with its anti-particle the two annihilate, thereby producing a photon of pure energy from which a myriad of particles, including the B-meson, can be created.

One of the more difficult tasks of the SLAC scientists was to identify those reactions which produced B-mesons, because the newly born particles quickly decay into showers of lighter particles. The B-meson is particularly short lived--so much so that the distance it travels is too small to be "seen" within the limits of the detectors used.

Marcello Piccolo, representing the MAC detector group, reported to the conference that by tracking the paths of its unique decay products researchers were able to reconstruct the trajectory of the B-meson. From this a lifetime of about 1.8 picoseconds was determined. (A picosecond is one thousandth of a billionth of a second).

SLAC physicist Nigel Lockyer, working with the Mark II detector, reported a lifetime of about 1.03 picoseconds. The two values agree well within statistical errors.

The lifetime experiments are important because they give physicists information about the "weak" interactions responsible for radioactive decay.

The lifetime is also related to the masses of quarks. Scientists are most interested in predicting the mass of the as-yet-undiscovered top quark.

In addition to the B-meson measurements, Lockyer also reported on the status of several other experiments at PEP:

- The lifetime of the neutral D particle (made from a charm and an anti-up quark) was measured using the PEP ring and agrees well with the world average found by other methods.

- A high precision measurement of the lifetime of the tau particle, a heavy cousin to the electron, produced results that support the idea that electrons, muons and taus (collectively known as leptons) all couple in the same way to the recently discovered W particle which carries the weak force between interacting particles.

- Physicists searched for the "selectron", a particle predicted by a popular theory called "supersymmetry", but were unable to find it at energies below 22 billion electron volts.

Experiments testing the coupling between leptons and the neutral Z particle (another carrier of the weak force) are almost complete and strongly support the Standard Model. Measurements of coupling between the Z and the b quark are beginning.—**Stefi Weisburd**

Bone grey powder in milk shake blender

Making mudpies is serious stuff for petroleum engineers

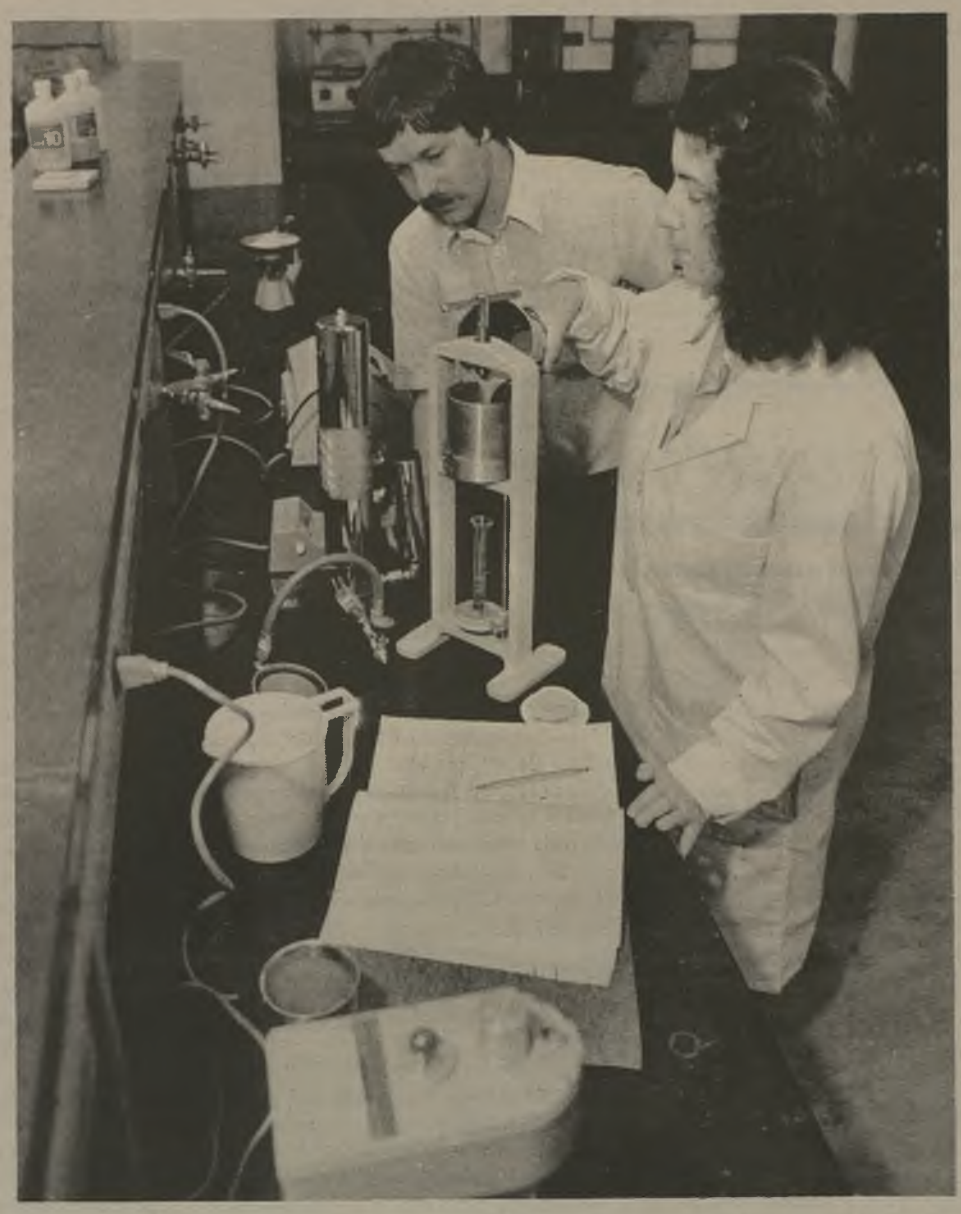
Esther Soelberg pours the bone grey powder into the milk shake blender and watches the thick liquid swirl and mix.

Like all good culinary artists, Soelberg measures her ingredients with care. She checks her recipe for the desired results. Does it have the proper consistency? Does it flow correctly? She tests for acidity, even weighs her creation. She does everything except taste it.

Soelberg, a senior petroleum engineering major, is making mud.

With such deliberate preparation however, it is clear that this is no ordinary mud. This carefully proportioned mixture of clay, water and chemicals is used by oil companies to facilitate the costly drilling process. Mud is one kind of "drilling fluid" that is made to circulate through the well in order to lubricate and cool the drill bits, control the pressure of the oil reservoir, and carry pieces of cut rock away from the bits up to the surface.

Soelberg is making this particular sample of mud for Petroleum Engineering 151C, a required laboratory course concerned with the fine-tuning and testing of drilling fluids, notably muds.



According to Dr. Louis Castenier, the research associate who teaches the course, the primary purpose of the "mud lab" is to "place students in the type of situation they can expect to encounter in the field."

Castenier notes that a student's first job experience will frequently require knowledge of drilling muds and a familiarity with the associated equipment.

"We try to give students the same tools available in industry," he says.

Research in drilling fluids started shortly after the advent of oil drilling in the eastern U.S. in the late 19th century. At that time engineers used water mixed with the dirt surrounding the well site as a drilling fluid until they discovered that some clays seemed to work better than others.

Castanier notes that today most of the research is done by oil companies which have developed other drilling fluids such as foams for high temperature drilling. Still, mud remains the most common drilling fluid and so it is the primary fluid studied in the drilling fluids lab.

Luis Castaneda and Esther Soelberg make mud

Adapting to conditions

Since actual well sites vary widely in terms of depth, temperature, and the composition of the soil and rock formations, it is essential that the students be able to design drilling muds for a variety of conditions.

But as Soelberg notes, choosing the correct composition of the mud can be hampered by a set of often conflicting requirements on the properties of the mud. The viscosity, for example, must be high enough to ensure that the cut rock debris, or "cuttings" are lifted away from the bits. Too high a viscosity, on the other hand, might make it difficult to pump the mud, especially if the circulation in the well has ceased.

Similarly, the mud's density must be selected carefully because the weight of the mud column in the well is used to balance the pressure of the underground oil or gas reservoir. If the density is too high, the reservior could become blocked by the drilling mud; too low and the reservoir can "blow out" of the well, resulting in an uncontrolled and environmentally hazardous loss of oil.

With these concerns in mind, Castanier has structured the class around the preparation and measurement of two mud samples, emphasizing several specific properties of the mud, including the viscosity and density.

In the first part of the lab, the 25 students are asked to prepare one gallon samples of mud given particular values of the viscosity. Two types of natural clays are used: bentonite from Wyoming and attapulgite, the most commonly used clay. By combining each clay with chemical additives, the mud is tailored to the desired specifications.

Castanier says that in spite of their preparation and sophistication, the students at the beginning of the lab are "very surprised when they see they're making actual mud. The clay looks just like dirt and water."

The students then measure the properties of the mud with a variety of instruments housed in the basement of the Mitchell building. Since ARCO donated $20,000 and the dean's office contributed $10,000 to the undergraduate labs two years ago, Castanier notes that the "lab equipment is brand new and in excellent shape—which is a nice change."

Students also work with older instruments that are still used for quick, although less accurate measurements in the field.

Measuring mud's properties

In addition to the viscosity and density, several other properties such as the acidity of the mud are measured. The students also pressurize the mud in order to replicate the thin layer of compressed mud, or "mud cake" that forms along the surface of the real well. This surface layer prevents the flow of water and clay to the oil formation. The best mud cakes are thin and highly permeable.

In the second part of the laboratory, students add salt to their mud samples since one problem frequently encountered in the field is contamination of the mud by impurities such as salt and cement. Since these contaminants can radically alter the properties of the mud, new measurements are made to determine how the desired properties have been degraded.

In the final section of the course, students restore the original properties by adding chemicals called thinners to the mud.

The theoretical part of the class includes lectures on clay colloidal chemistry, the physics of clays and non-Newtonian fluid theory. Besides muds, the latter is also applicable to the study of "everything from paint to chewing gum, cements," says Castanier.

While Stanford does not have a research program on drilling fluids, the petroleum engineering department keeps up with industry technology and findings in the Mud Lab.

"I think we are the only university which has this drilling program for undergraduates," Castanier says. **—Stefi Weisburd**

Financial aid...

continued from page 1

dent—than aid from governmental programs: Most University long-term loans bear an in-school interest charge and must be repaid within five years of graduation.

The University plans no change in this policy.

The reason for restating it at the present time is that, effective July 1, 1983, all men who are required by law to register with Selective Service and have not done so are ineligible for federal student aid under Title IV of the Higher Education Act. The specific programs included are Pell Grants, Supplemental Educational Opportunity Grants, State Student Incentive Grants, National Direct Student Loans, Guaranteed Student Loans. Auxiliary Loans to Assist Students (called CLAS in California) and College Work-Study jobs. It is estimated than 4,200 Stanford students are currently receiving assistance under one or more of these programs. Of this number, close to 2,000 are male students born after Dec. 31, 1959.

The University does not plan any addition to existing loan and job sources: no decision has been made about how these resources will be allocated should they prove insufficient.

O'Connor's loot to be auctioned off Sept. 17 at Stanford Police Department

In what appears to be the final resolution of the Robert Lee O'Connor cat-burglar case, Stanford Police Capt. Raoul Niemeyer has announced that an auction to dispose of thousands of dollars of unclaimed stolen property is set for Saturday, Sept. 17, in the Stanford Police Department parking lot.

Time of the auction will be announced at a later date.

Previously scheduled for July 9, the auction was delayed when O'Connor sought a court hearing claiming the property was his.

In an agreement worked out with Stanford Police, O'Connor was given all property he could satisfactorily prove belonged to him prior to his 1978 crime spree. Niemeyer, who "feels good about the settlement," said 90 percent of the items are clothes, shoes, and other personal effects.

The agreement "precludes lengthy lawsuits and appeals," Niemeyer said.

O'Connor, suspected of involvement in at least 181 Midpeninsula burglaries between 1978 and 1982, pled guilty to 21 counts of of burglary March 22. He leaves later this week to begin serving a 19 year sentence at Folsom prison.

Preview Sept. 16

A public preview of the items to be auctioned will be held from 10 a.m. to 5 p.m. Friday, Sept. 16.

Niemeyer said a closed preview is scheduled between 8 and 10 a.m. Sept. 16 to give burglary victims and others who have made legitimate claims a final opportunity to try to identify their property. It will be open only to persons who were burglary victims between 1978 and 1982 in Menlo Park, Palo Alto, Los Altos, and at Stanford.

Victims must make prior arrangements with the Santa Clara County Public Administrator's Office to attend the preview. A form provided by the Public Administrator's Office must be filled out in advance. Copies may be obtained by calling the office at (408) 279-6131. Victims also must provide a detailed description of stolen items and a copy of their police report.

O'Connor had been dubbed the "connoisseur burglar" and the "jogging burglar" because of the high quality of items he sought and his athletic method of scouting targets. Police recovered an estimated $2 million in furs, antique guns, violins, jewels, Oriental rugs, gold dinner plates, and other items following his Nov. 5 arrest in La Honda.

O'Connor was sentenced to prison in November 1973 for grand theft and receiving stolen property. He escaped in September 1974 but was recaptured in February 1976 during an Indian artifact store burglary. He was sent back to prison in April 1976 and then paroled in early 1978.

Since November Stanford Police have stored the recovered merchandise in two trailers and persons from more than 2,000 households have sifted through the items searching for their belongings.

Proceeds from the auction, which will be conducted by Neale and Sons, will be funneled through the Public Administrator's Office. Stanford Police are to be compensated for storage costs, which have totaled about $11,000.

Under terms of Prop. 8, the "Victims' Bill of Rights," persons who feel they were not fully compensated for their losses can file claims with the Public Administrator. Claims will be decided by the courts. If any money remains, it will be turned over to the Santa Clara County treasury.

Team physician Behling honored

Dr. Frederick L. Behling, team physician to all Stanford's sports teams, received the tenth annual President's Cup Challenge Award from the 8,000-member National Athletic Trainers' Association (NATA) in June.

Behling, a Stanford Medical School clincial professor of surgery and an orthopedic surgeon with the Palo Alto Medical Clinic, also is team physician to the San Francisco Giants, the annual East-West Shrine Games, and until recently the San Francisco Forty-Niners. He has been Stanford's team physician since 1961.

Behling is regarded as a leader in sports medicine. He has strongly advocated eliminating the use of the neck in blocking and tackling and has been instrumental in greatly reducing other hazards of the game.

Accidents and injuries

Accidents and Injuries Occurring During Week of July 25-Aug. 5

continued from page 4

including his wife Winnie, the daughter of a British Foreign Service officer.

Sig's body was never retrieved from his last flight—off the Mexican west coast—and Winnie shortly thereafter found grieving unbearable and abruptly terminated it.

The Varian brothers were credited equally for the early klystron patents, and I presume they shared alike in the rewards that lifted them both from near poverty to the higher income brackets.

Of course this surge of prosperity did not follow immediately from one bright idea but developed over a period of years through the good fortune, government patronage, and professional management of Varian Associates, a manufacturing enterprise built up by but not restricted to klystrons.

The respective contributions of the two brothers to all this were vastly different in kind and in importance. Russell was always the man of ideas, while Sig, a pretty good mechanic, was the implementor.

There is little in the slight amount of published literature on them, or in the journalistic and promotional prominence that came to their names, which indicates the great differences in their personal gifts and achievements.

I had never forgotten the unsolved problems of the continuous x-ray spectrum, and now seemed a time to take them up again, for at Stanford we had found out how to make thin targets and how to nurse them through series of observations without destruction.

It was clear that the *thick* target was never going to uncover explanations of radiation processes in terms of atomic events, for there is too much going on in such sources. What we mean by a thin target is one in which the bombarding electron will in all probability have either no productive collisions or just one, and that one while continuing in almost its original direction of motion.

I put four graduate students to work on measurements of spectral energy and polarization by the use of new methods, and all of them secured new basic data. In all cases these young experimenters found about what they expected to find, that is, their quantitative results were in rather good agreement with such theoretical predictions as were then to be found in the literature.

It is worth noting that most Ph.D. aspirants feel well satisfied with such an outcome, and never suffer the disappointment which Eddington said every experimenter ought to experience when his research merely confirms his opinions, and so teaches him nothing new.

In the area of continuous spectrum theory the papers of Arnold Sommerfeld and his students were highly respected but seldom read. It seemed that the only physicists capable of reading them with critical appreciation were theorists unsoiled by the laboratory. Certainly I was never capable of finding faults in these papers or of deriving logical conviction from their extended and admirable arguments, yet it was necessary for me at least to know what the papers had to teach us about the probable nature of the spectra.

What an experimenter would like to have from the friendly theorist is a set of curves, but the Sommerfeld papers stopped far short of anything so realistic. After considerable labor and much help from a friend who really understood the labors of the Sommerfeld school, I found that I could calculate one point (not one curve) by the performance of 1,200 operations on my desk calculator.

I felt sure that each point so secured put me in possession of knowledge never before possessed by anyone, and I was fortunate enough to find a collaborator willing to spend months on computation.

As a result, we published in *Physical Review* a paper which added not one new thought to the lore of the continuous spectrum, but which by its graphs and algebraic equations made it possible for any physicist to see what accredited theory really predicted.

Judging by the number of reprint requests received, this uncreative article was among the most popular papers I ever wrote. Today, of course, results of this kind can be whipped out in short order by electronic computers.

Kirkpatrick's reminiscences go on to cover the World War II period, and his subsequent acceptance of the chairmanship of the Physics Department, and how after six years he passed that responsibility to Leonard Schiff. He took a two-year leave to work in the Philippines, and returned to Stanford for the final year before his retirement.

Among the lighter moments, Kirkpatrick organized a "bottle orchestra" in which physics staff people took part. Each bottle was "tuned" to give the right note when blown across its mouth. Full harmonized music was performed. His hobbies included the writing of poetry and songs.

My University duties terminated before the present students were born. I find retirement a busy and pleasant status; some aging colleagues complain that it has no vacation, and others that it has too much.They need a variety of interests. My desk tends ever toward the high-entropy condition that marked it a quarter of a century ago.

Most of us die a little at a time. My judgment on the process of getting on has been put this way:

I was happy to find I could spare
my formerly flowing hair.
Though my vision is dimming somewhat
these spectacles help it a lot.
If I have a few bodily ills
there are always plenty of pills
My old adolescent agility
would have little present utility.
To afflictions like these I'm resigned,
But Oh how I do miss my mind.

John Metcalfe's retirement will allow full-time attention to new project

John D. Metcalfe, director of the Language Lab in Stanford's Meyer Library, will retire August 31, and it's a good thing.

Now he'll have plenty of time for his next project—a complete list of all the languages of the world, both ancient and modern, including geographic location and cross-indexing of names.

"The idea came out of this job," he admits. People asked questions he couldn't answer, and there were no references in which to find the answers.

Metcalfe is already 4,000 3x5 cards into his project, and he's only up to the Ds.

"I expect to spend about 10 years on it," he says, "and of course I'll have to travel to foreign libraries to do research."

Metcalfe's travel habit was firmly planted during his 22 years in the U.S. Navy, and he and his wife Jean have continued it since he left the service. They've managed to see a lot of Europe, the Orient, and Australia, sometimes using a trip to search for tapes or books on little-known languages.

Their most recent jaunt was a short one to France and Belgium. Longer trips are planned for Europe (Germany, Italy, Spain, and France in February 1984) and Australia (November 1984), where he'll give the Canberra Library some heavy use.

After his Navy career, Metcalfe spent 10 years—six of them at SRI—involved with electronics and computers in the Bay Area. He has done all the maintenance of equipment at the Language Lab as well as directing it.

The Language Lab consists of four rooms with small carrels where students listen to language tapes through earphones and record their own voices to compare accent and accuracy. Each room has a central monitoring machine so that instructors may listen and talk to students individually.

If you pass by the Lab when it's in use, you'll hear people quietly talking to themselves in various languages, pausing to listen, then speaking again.

Nearly 20 percent of Stanford's language tapes are made in the Lab's recording studio. A few years ago the collection was on reel-to-reel tape, but it all has been transferred to cassettes, for easier use.

There are more than 100 languages available on cassettes now, some of them searched out by Metcalfe on his travels. For at least one of them—Senufo, an Ivory Coast tongue—a long hunt ended when he found it in Stanford's own Green Library.

Besides directing the Language Lab, Metcalfe has taught a yearly course in language lab techniques, for people who want to manage similar operations. He also has functioned as a campus notary, handling an estimated 10,000 documents in his 11 years at Stanford.

While Metcalfe pursues the languages of the world, his successor, Carolyn Parks, will be the new director of the Language Lab.

Parks, who will start work September 12, comes to Stanford from the Language Lab at the University of Maryland.

John Metcalfe

New engineering institute starts up with a $2 million grant from IBM

The School of Engineering here is forming the Stanford Institute for Manufacturing and Automation (SIMA) to produce graduates who not only know how to run the manufacturing end of industry but can compete in the corporate offices with the lawyers and the MBAs.

The Institute will also engage in research in manufacturing processes and automation, linking several disciplines in engineering with computer sciences and artificial intelligence. SIMA expects considerable industry support.

The institute has received a $2 million grant from IBM to start up.

SIMA is expected to produce 30 students with a Masters of Science degree in Manufacturing Systems Engineering (MSMSE), according to Anthony Macias, associate dean of engineering for development.

"That degree really is supposed to be an alternative for someone who wants to be conversant in technology and equally conversant in the business aspects of manufacturing systems engineering," Macias said.

"We envision the candidates for this degree to be those who eventually find their way to the upper echelons of large companies.

"It's common to find at the chief operating officer position people with MBAs or people with law degrees, people who aren't necessarily trained during their educational programs to chat comfortably with the guy on the manufacturing floor, or the technicians or the researchers at the plant."

Three components

SIMA will have three components, Macias said.

The Center for Teaching and Research in Integrated Manufacturing Systems (CTRIMS) will be the degree-granting component. The Centers for Automation and Manufacturing Sciences and Design Research, will be the research components. Charles Kruger, chairman of mechanical engineering, and Warren Hausman, chairman of industrial engineering, who is also a professor by courtesy at the Graduate School of Business, will head CTRIMS.

Macias said other centers may be formed as the institute grows.

The Center for Automation and Manufacturing Sciences is already in existence under Robert Cannon, chairman of the Department of Aeronautics and Astronautics, combining some of the robotics research in engineering with research into automatic control projects in his department.

The Center for Design Research is under the directorship of Larry Leifer of Mechanical Engineering, and will center on design processes and developing advanced design manufacturing systems.

There are no plans for a building or separate facility for SIMA.

Macias said the program will be interactive with industry, following the model established by the Center for Integrated Systems in electronics.

During the four-year period of funding from IBM, he said, SIMA intends to seek support from other corporate participants. The goal is 20 sponsors.

Palo Alto Fire Department Capt. Ken Carleton tackles an unusual assignment—replacing the rope on the Post Office flagpole.

SIMA thinks about $1.5 million a year from corporations will keep the educational component funded and provide seed money for the research centers.

"We have presented a 'talking paper' to a number of companies and the uptake has been very strong," Macias said. "We even had one company come out a couple of months ago for a day's presentation . . . and we made the presentation to a vice-president for manufacturing and he was very, very high on this program.

"He said that not only would his company be very interested in participating in this program but he would think we would have no problem whatsoever in getting 20 other companies to participate.

"The only thing that he warned against was waiting too long."

He said it was widely felt that "the educational curriculum has to be put within a context of research, and the two research centers . . . enhance the activity of the masters program.

"It is the research that provides the underpinning for the state-of-the-art thinking that goes on at an institution like Stanford. It's the research component which will eventually be taking a lion's share of the gifts once we have the full complement of sponsors."

All but a small percentage of the IBM money will be going into the educational component.

The university will be offering six fellowships for the coming fall semester to start the program. The students will have undergraduate degrees in engineering. They will take a rigorous 45 credits for the degree.

The institute will be under the auspices of William Kays, the dean of the School of Engineering. The steering committee, made up of center chairmen, will select a chairman for the institute.—**Joel Shurkin**

Sierra Camp opening

The Sierra Camp seeks applicants for assistant director. Copies of the position announcement are available from Bowman Alumni House (497-2021) or the Camp itself.

Thomas A. Bailey, outspoken American historian, dies at 80

Emeritus Prof. Thomas A. Bailey of Stanford, nationally famed American historian, died Tuesday, July 26, at the University Branch Convalescent Home in Menlo Park, following a lengthy paralytic illness. He was 80.

He was the author of at least 17 books, including *The American Pageant* (1956), a high school and junior college textbook which sold well over one million copies in six editions, and "The Diplomatic History of the American People" (1940), adopted in more than 250 colleges and universities for more than 40 years through at least 10 editions.

Once regarded as the "bad boy" of the history profession because "I've always believed that history should be easy to read and fun to learn," Bailey walked from his campus home to his office daily and continued writing until a few months ago. "I expect to die in harness," he told a student interviewer four years ago.

A San Jose native, he commuted by interurban electric car from his parents' prune orchard to Stanford, enrolling as a freshman in 1920 and earning his Ph.D. seven years later. He joined the faculty in 1930, teaching until his retirement in 1968.

Books the key

He soon saw that the way to get to the top as a professor was "to publish books, not articles," he recalled in an interview last year. "The front office was evidently more impressed with scholarship embalmed within hard covers."

To reduce conflict of interest in requiring students to read his text on diplomatic history, he bought an adequate number of copies for those who could not afford the books and put them on reserve at the library.

"In apologizing to students at the first meeting of the class, I immodestly but truthfully remarked. . .that if they were taking this same course at some other institution, the chances were rather good that my book would be the one required," Bailey told Donald Stokes of Stanford News Service.

Thomas A. Bailey

While his lectures recast material in the book, "some students do not get the point even when it is presented both orally and in print," he added with a smile. For years, Bailey synchronized the sweep-second hand of his watch with the beginning class bell, leaving students awestruck when he finished a few seconds before the closing bell.

Noting that absenteeism could run as high as 30 percent in some classes, he observed that "education is just about the only salable item that many people are willing to pay millions of dollars for and make strong efforts not to receive."

Holder of the Margaret Byrne professorship in American history, Bailey told Stanford yearbook editors in 1967 that "students expect too much of the University; it's like monogamy: disenchantment is inevitable because of the general overestimates of the rewards."

His comments on politics were equally pithy. In 1956, Bailey told Stanford alumni: "we must learn to live with crisis. The cold war, if we are lucky, may go on for generations. . . .

"Modern wars are won in laboratories, and it is a chilling fact that the Soviets are making more spectacular progress than we are in selecting and training the best young minds. . . .

"Our democracy is on trial before the world. The best way to preserve it is to practice it."

Three years earlier, at the height of the Joseph McCarthy era, he told Stanford alunmni: "It is my considered judgment that McCarthy has done more harm to the democratic cause than all the so-called communists he has run out of government. What shall it profit a nation if, to preserve its democracy, it adopts tactics that destroy democracy?"

Extremely active as a scholar following retirement, he joined with Paul B. Ryan of the Hoover Institution to challenge widely publicized claims the ship Lusitania had been deliberately exposed to German submarines to provide an excuse for the U.S. to enter World War I. Reports that the ship carried 12 six-inch guns simply were not true, they wrote in "The Lusitania Disaster" (1975).

In 1976, following publication of his book on *Voices of America: The Nation's Story in Slogans, Sayings, and Songs*, Bailey suggested that the lack of catchy bumper stickers in the Carter-Ford campaign was a regretable sign of those times. "Personally, I hope they both lose," he added.

In a 1979 book coauthored with Ryan on "Hitler versus Roosevelt," Bailey concluded that Pearl Harbor was as much a surprise to the Nazi leader as it was to FDR.

In "The Pugnacious Presidents," published in 1980, Bailey said "no President or group of Presidents and no political party can be stigmatized as hell-bent for war."

Throughout his retirement, he averaged one new book or revision a year.

In 1939-40 he was one of the early members of the Institute for Advanced Study at Princeton. He headed the Stanford History Department in 1952-55 and again in 1957-59. He was elected president of the Organization of American Historians in 1967 and first president of the Society for Historians of American Foreign Relations in 1968.

He is survived by his wife, Sylvia Dean; their son, Arthur Dean Bailey, of Sunnyvale; and two grandchildren, James Arthur Bailey, of Sunnyvale, and Sylvia Luise Shirley, who lives in Southern California.

At his request, there will be no funeral and no memorial service. Inurnment is planned at Alta Mesa Cemetery in Palo Alto.

Memorial contributions may be made to the Thomas A. Bailey Book Fund, 301 Encina Hall, Stanford University, Stanford, Calif. 94305.

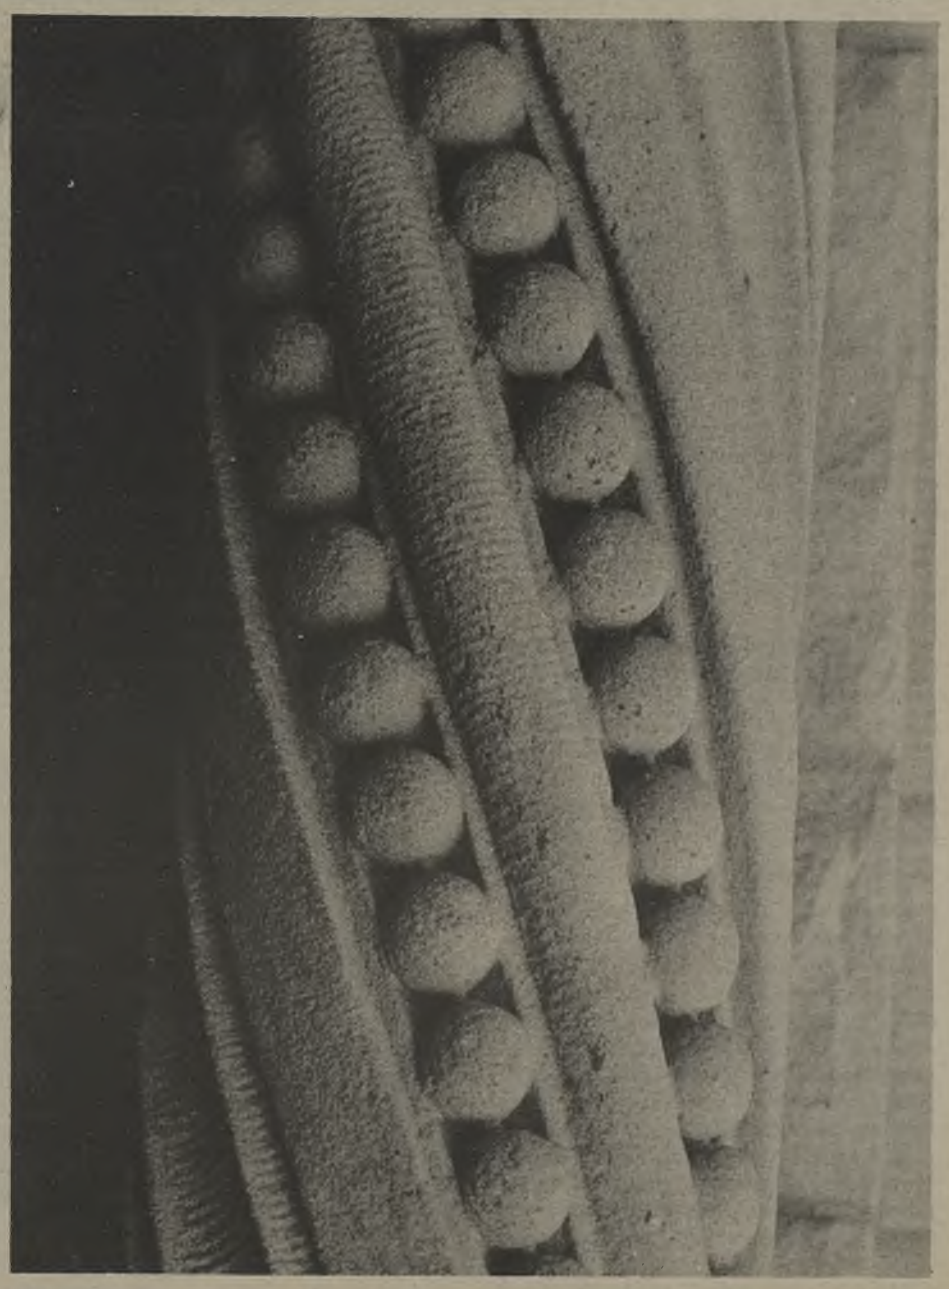
Chemistry Prof. Philip Leighton dead at 86; was early foe of air pollution

Emeritus Prof. Philip A. Leighton of the Stanford Department of Chemistry, widely known for his work on air pollution, died Tuesday, Aug. 2, at his home near Solvang, Calif. He was 86 and had been in declining health for several months.

Leighton, an early and outspoken critic of smog, was coauthor of a widely used monograph, "The Photochemistry of Gases" with William A. Noyes Jr. in 1941 (reprinted as a paperback in 1966) and wrote "The Photochemistry of Air Pollution" (1961), regarded as the Bible of its field for more than a decade.

Leighton received the 1961 Chambers award of the Air Pollution Control Association and the 1966 Air Conservationist of the Year award. In 1963, he received an honorary Doctor of Science degree from his alma mater, Pomona College. He received his bachelor's in chemistry there in 1920. He later went to Harvard, earning his master's in chemistry in 1925 and his doctorate in 1927.

After a year in Germany, he joined the Stanford faculty in 1928, rising through the ranks to full professor in 1937. He headed the department from 1939 until he took early retirement in 1954. In addition, he served as chairman of the Department of Physical Science from 1940 to 1942 and dean of the School of Physical Sciences from 1946 to 1950.



In 1945, he received the Legion of Merit medal for his work as director of technical operations for Dugway Proving Grounds in Utah during 1943-45. After World War II, he set up the Aerosol Laboratory at Stanford, funded by contract from the Chemical Warfare Service. In 1960, this separated from the University as Metronics Associates, with Leighton serving as a director and chairman of the board.

Following retirement, he continued studies of atmospheric pollution problems, consulting for the Air Pollution Foundation and writing books on *Man and Air in California* (1964) and *Earth, Life and Time.*

Services are planned later this week in Solvang.

Survivors include a son, Philip D., of Stanford; a brother, Wesley, of Claremont; a sister, Leisel Nixon, of Salinas; and a stepson, James Blaisdell, of Friday Harbor, Washington.

The family prefers donations to the Susan Leighton Memorial Fund, 301 Encina Hall, Stanford University, Stanford, Calif. 94305.

The arcade in front of Memorial Church boasts intricate carving.

The Red Barn (above) was the training stable for Senator Stanford's trotting horses.

Barn restoration planned...

continued from page 1

help with the ambitious undertaking. "We have already made contact with some individuals and organizations and are very encouraged by the acceptances," Lane said. "The committee will have a broad spectrum of faculty, staff, students, and local riding enthusiasts," he added.

Active in conservation and historic preservation projects, Lane said he has long been interested in the barn because of its "historical relationship to Senator Stanford's Palo Alto farm, which preceded the University and played a large part in making the latter possible."

The barn's restoration, now pegged to cost $950,000, will include constructing a concrete foundation, straightening the sagging walls, installing a new roof, replacing the electrical system, restoring architectural details, adding fire sprinklers, and rebuilding the interior to make it more functional as a stable. The exterior will be authentically restored and replicated.

A mix of funds from the University and from a prospective tenant, who will operate an equestrian training and boarding facility in the restored barn, will comprise the additional $450,000 needed to complete the project.

According to Lane, the growing popularity of pleasure riding has put pressure on local stable and training facilities. "The unique part about Senator Stanford's beautiful barn and adjoining riding facilities is that they are so accessible to Stanford students, faculty, staff, and friends of the University living in the area," he said.

When the restoration is complete, riding classes again will be offered to Stanford students through the Department of Athletics, Physical Education, and Recreation. The classes, which have been taught at the facility since the mid-1940s, were suspended last fall when unsafe conditions forced closure of the century-old barn and removal of the horses to smaller buildings.

Lane said he is "thrilled that the barn will be part of an educational program" and he expressed hope other improvements—including better roads and fences—could be made in the area surrounding the barn.

In the 1880s, Senator Stanford gained wide recognition for experiments he conducted in horse breeding and training at the site. He also commissioned photographic experiments by Eadweard Muybridge which proved Stanford's theory that at one point in its gait a horse has all four feet off the ground. The experiments gave rise to the idea of moving pictures.

The Palo Alto Stock Farm, in operation from 1876 to 1903, included a small thoroughbred (racing) department at what is now Escondido Village, but it was the Senator's trotting department—which extended from the current golf course to Lagunita—that was internationally famous. Nineteen world records were set by Leland Stanford's trotters.

The Red Barn was the trotting department's training stable.

Museum curator Carol Osborne and Sunset magazine publisher L.W. (Bill) Lane Jr. discuss a reprint of horse-related articles in Sunset dating from 1900 and 1901 during a recent tour of "The Stanford Horse Show," a display of Palo Alto Stock Farm memorabilia at the Art Gallery. Lane is heading a $500,000 fundraising effort to help restore the Red Barn. During the tour, Lane offered to loan Osborne a silver bridle, reported to be from the Red Barn, acquired by his father at a University sale in the 1950s. It was added to the exhibit last weekend. Sunday, Aug. 14, is the last day of the show, after which the gallery closes to the public for more than a month. The exhibit, however, will be left in place until mid-September for Lane's private use in fundraising.

Medical Center MEMO

"We must constantly keep pace, and our costs escalate even if the consumer price index remains relatively stable." —*Sheldon King*

Board to act on new budget and hospital room rates

The Board of Hospital Directors is expected to act today on a 1983-84 net operating budget of $174.4 million for Stanford University Hospital (SUH).

Also submitted by the hospital administration for approval by the board is a capital budget of $5.3 million. Major projects earmarked for the fiscal year beginning Sept. 1 are a renovated intensive care unit, $500,000; relocation and modernization of the tissue typing lab, $250,000; and modernization of the radio page system, $250,000.

The budget is based on projected net revenues of $182.9 million, which reflect an average price increase of 8.4 percent, said Sheldon King, SUH director and executive vice president. The revenue figures include $3.3 million for contingencies and future capital improvements.

Less than 1 per cent of the increase has been earmarked for the hospital modernization program, the project expected to bring the hospital up to modern standards in coming decades, King said.

Ancillary services, which account for 60 percent of the hospital's revenue and include all services (such as X-ray, operating room, drugs) except the basic room rate and professional fees, will increase an average of 7.5 percent effective Sept. 1.

Room rates, one of the largest single items for which hospitals must charge, will rise an average of 9.7 percent. Typical daily increases are from $205 to $225 per day for a well newborn baby; from $350 to $384 for a semi-private room for most medical/surgical patients receiving the services of housestaff. The highest rates—for a handful of patients receiving the maximum level of intensive care—will rise from $1825 to $1995 per day. (Forty separate rates are in effect).

Last year, SUH raised room rates 5.9 percent on May 15 and 13 percent on Sept. 1.

King said that while room rates are increasing, there is a mitigating tendency for the rooming portion of a patient's bill to decrease, because the average length of hospital stay is declining gradually.

"In past decades, when hospital care tended to be custodial, we charged patients for the room and hoped they got better," King said.

"Every year we are able to offer more specific services, which, realistically, result in higher costs.

"Hospitals are more vulnerable to inflation and rising costs than other segments of the economy," King said. "We cannot forego a new development or innovation simply because it is expensive. We must constantly keep pace, and our costs escalate even if the consumer price index remains relatively stable."

Despite economic pressures, King pointed to an ongoing cost reduction program which is expected to save the hospital $5.2 million in the next fiscal year. Areas targeted for savings include conservation of materials, inventory control, and selected cutbacks through attrition of personnel in areas now functioning with greater efficiency.

—Mike Goodkind

Hospital to participate in innovative Blue Cross plan

Stanford University Hospital has been selected to participate in Blue Cross of Northern California's preferred provider organization insurance plan.

"We are very pleased that our hospital has been selected to participate in this innovative program," said Sheldon King, director and executive vice president of SUH.

King announced Friday that agreement with the Oakland-based insurance provider had been reached and that a formal contract was expected to be signed this week.

"We are very optimistic that this new insurance plan will offer the probability that health costs will be economical for our patients while enabling us to continue to improve our high quality of health care," King said.

Under the PPO, which Blue Cross is marketing under the name Prudent Buyer Plan (PBP), hospitals agree to accept Blue Cross-established fees as full payment for services (except for deductibles or supplementary insurance). Physicians who have privileges at a hospital under contract would be eligible to join and receive reimbursement for their fees in much the same way as hospitals.

Dr. James Silverman, chief of staff, has said that all SUH physicians, including those in faculty, group or independent practice, would be equally eligible to participate.

Blue Cross has said it hopes to sign up 20 percent of its California membership in the PPO during the first year.

King said SUH is the largest Blue Cross provider in Northern California. Currently Blue Cross plans cover 15 percent of SUH's total admissions, including many referral patients from outside the Bay Area. Blue Cross also accounts for 13 percent of all patient revenue, King added.

SUH was one of only eight hospitals in Santa Clara County receiving a Blue Cross PPO. With a relatively limited number of hospitals participating, King said SUH has the potential to serve more patients and thus provide more economical care.

(Children's Hospital at Stanford has also been named a participating hospital in the PBP under a special agreement applicable to children's hospitals, said John Williams, executive director of CHAS.)

"Programs such as this are advantageous for everyone, because they streamline our administration, enabling us to concentrate more of our resources on medical rather than accounting matters," King said.

Blue Cross is the first insurance company to offer the hospital a PPO, although other insurers are reportedly formulating their own plans.

Bidding the linen return home

Linen amnesty bins abound these days at the Hospital and Hoover Pavilion parking lots. These red and white striped containers are marked "Linen Return," and are meant to make some of the bospital's lost linen reappear. Employees are asked to help SUH save money and conserve resources by returning linen or scrubs inadvertently taken home. The bins will be up through Aug. 21.

To combat the disease that took his son. . .

New fellowship honors contributor to kidney research

An Israeli citizen from Iraq has been named first recipient of the Delano Large Fellowship in Nephrology at Stanford, at ceremonies last week honoring a man who contributed widely to kidney disease research after his son battled renal failure for nine years.

This year's fellowship recipient, effective July 1, 1983, is Dr. Ovadia Shemesh, who received his M.D. at Hadassah Medical School in 1973, and later did research on leukemic tissue culture at the Weitzman Institute in Israel.

As a fellow at Stanford, Shemesh has dealt with many diabetic patients. Now he plans, with Dr. Bryan Myers, associate professor of medicine and director of clinical nephrology, to study patients with either of two types of kidney disease, trying to characterize in a quantitative way how the normal kidney functions and what precisely can go wrong.

The researchers hope, through mathematical analysis of data, to be able to distinguish and thus predict deterioration of the filtration process that characterizes kidney failure. This should help physicians determine early on the potential for thwarting the condition, through appropriate therapies. It should also help them judge the potential role of various new treatments.

Experimental methods involve infusing substances of known molecular size into the patient's bloodstream and, with unique analytic equipment, determining the kidney's ability to clear them from the patient's blood into the urine. The infused substances are meant to simulate proteins—to which diseased kidneys are abnormally permeable, allowing them to leak through into the urine while toxic materials remain clogged behind, causing protein depletion and kidney failure.

"Now that we can recognize the different phases of kidney disease," Myers said at the ceremony, "we will look at the early stages, with an eye towards prevention of renal failure. At least we might be able to prolong an ailing kidney's ability to function.

"This will all take a few years," he added. "But the first two will be the most critical, and with the help of this fellowship, Dr. Shemesh will be able to make important contributions to the research."

Upon completion of his work here, Shemesh plans to return to Israel for a career in academic medicine.

"The new fellowship serves two purposes," said Dr. Rex Jamison, professor of medicine and chief of nephrology at Stanford. "One is to honor Delano Large's memory; the other is to enable us to continue to train people to try to discover causes and treatments for the disease that felled his son Jeff."

Jamison and Dr. Norman Coplon, clinical associate professor of nephrology, hosted the August 1 event at the Faculty Club.

Large, who graduated from Stanford in 1937 and later received his M.B.A. at the Graduate School of Business, died of cancer on his 69th birthday June 16, 1983, at Stanford University Hospital. He and his wife Jean had become actively involved in fighting kidney disease when their son Jeffrey developed end-stage renal disease at the age of 24 in 1964.

Jeffrey became only the second Californian patient to undergo dialysis treatments at home, after being trained for the procedure by Dr. Belding Scribner, a Stanford alumnus, in Seattle. At that time there were few dialysis centers, Jean Large recalls, and none in this state.

Jeffrey also underwent four kidney transplants, only one of which succeeded—and that one lasted only six months. He spent eight years on hemodialysis, until his death in 1973.

A native of Monterey and longtime resident of Palo Alto, Delano Large helped found a Northern California affiliate office of the National Kidney Foundation, and in 1966 started the Mid-Peninsula Chapter, which is still active.

The new annual fellowship in his name is being sponsored by Satellite Dialysis Centers Inc. of San Jose, a non-profit organization which Large helped found With Coplon in 1973. Initial funding of the fellowship is for 10 years.

Large owned a construction contracting firm which he operated for nearly 40 years. He was helpful in the building phases of Stanford's hemodialysis unit, Jamison recalls.

Jean Large (above, left) spoke with Rex Jamison at last week's ceremony honoring her husband, Delano Large (inset).

"Delano Large was a warm, unassuming person, who listened carefully and gave sage advice," said Jamison. "He was a generous man with a fine sense of humor."

Jean Large was active in the Stanford University Hospital Auxiliary for about 20 years, up until this spring.

—Lisa Ames

Dr. Ovadia Shemesh, the first recipient, uses unique analytic equipment in his lab to examine the early stages of kidney disease, with an eye towards prevention of renal failure.

Medical faculty opening

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

Applications are invited for a dual appointment to Stanford Medical School and the Palo Alto Medical Foundation, as an associate or full professor of endocrinology. The position is based at the Research Institute of the Palo Alto Medical Foundation.

Candidates should have demonstrated ability to successfully develop an active, independent research laboratory and be prepared to establish a new endocrine research program at the Foundation. The individual will fully participate in the clinical and teaching activities of the Endocrinology Division at Stanford.

Applications are being reviewed jointly by the two institutions. Those interested should send a curriculum vitae and the names of three references to: David Feldman, M.D., Head, Division of Endocrinology, Stanford University School of Medicine, Stanford, CA 94305.

Stanford program featured in Harvard's anniversary show

The Stanford Heart Disease Prevention Program is star of "The Heart of the Matter," the final program in the *Faces of Medicine* television series honoring the 200th anniversary of Harvard Medical School.

"The Heart of the Matter" will be aired locally by KQED 9:30 p.m. Thursday, Aug. 18 on channel 32, and 7 p.m. Friday, Aug. 19 on channel 9. It follows SHDPP's director Dr. John Farquhar and his team, as they motivate participants to adopt into their daily routines various measures to improve circulation and lower stress.

John Farquhar

Each year, some 435,000 Americans lose their lives to heart disease. "Despite our colossal Gross National Product, our magnificent hospitals, even our trips to the moon, today's middle-aged adults cannot expect to live appreciably longer than their counterparts did in 1900," said Farquhar. "The dream of abundant good health and longevity has remained outside our reach. It need not. It is merely a matter of choices and priorities."

Farquhar is a veteran cardiologist who became.disillusioned with treating heart attack victims whose predicaments, he felt, were often avoidable. SHDPP seeks a preventive approach to cardiovascular disease, the nation's number one health problem.

SHDPP has launched a unique program in five northern California communities that not only investigates the presence of cardiovascular diseases, but tries to modify lifestyle patterns to minimize traditional cardiovascular risk factors: high blood pressure and cholesterol, cigarette smoking, obesity, physical inactivity and stress.

In "The Heart of the Matter," interviews with residents involved in the model project reveal steady improvements in the fight against the dangerous symptoms of heart disease.

Faces of Medicine, distributed to most public television stations throughout the nation, was made possible by a grant from the Johnson and Johnson family of companies. The half-hour weekly series examines the impact of modern medical developments on the lives of doctors, researchers, patients and their families.

The series offers a human perspective on the highly technical world of medical research. It is hoped to provide a deeper understanding of the rewards and risks of our rapidly advancing medical technology.

Each broadcast highlights a person or project that has significantly contributed to advancing medical science, including an eminent Boston surgeon with a unique teaching style, doctors who treat premature infants, bone marrow transplantation for leukemia patients, and artificial skin for burn victims.

Faces of Medicine, a production of Metromedia, Inc., is a co-presentation of WNET/New York and WGBH/Boston. Host and executive editor for the series is Dr. Timothy Johnson of Harvard, a leading medical communicator.

A jogger taking responsibility for her own health as prescribed by the Stanford Heart Disease Prevention Program, to be profiled in "The Heart of the Matter" on KQED.

Acne study

Interested members of the community are reminded that the Department of Dermatology is seeking volunteers, ages 16 to 30 with moderate to severe facial acne, to participate in a study testing the effectiveness of a new topical treatment.

Volunteers must be off any acne medications for at least two weeks prior to joining the three-month study, and then for the duration of the study. For further information or to volunteer, call Nicole at 497-6319.

Floyd Estess

Estess appointed to two new posts

Dr. Floyd Estess will become clinical professor of psychiatry emeritus this fall. He has accepted a post as medical director of the Mental Health Unit at Hoag Memorial Hospital Presbyterian in Newport Beach, Calif.

Estess, a psychiatrist and psychoanalyst, came to Stanford in 1973 to head the adult and child psychiatric clinics. He is noted for his interest in treating depression.

In addition to his responsibilities at Hoag, he will also maintain a private practice there.

Longtime staffer dies

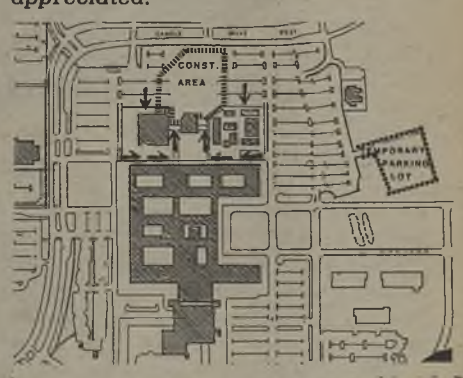
Buck

Elizabeth (Betsy) Buck, former secretary for the EEG Laboratory and its medical director Dr. Barry Tharp, died July 22.

Buck, who came to SUH in 1963, retired in 1981. Nominated for the Thomas A. Gonda outstanding hospital employee award in 1981, she was one of five persons chosen to receive a special commendation.

Construction Corner

Research Animal Facility-I:



Preparation of the construction site is under way. A construction fence in the parking lot area will be erected later this month, and is expected to cause some disruption with the necessary loss of parking space. But with the recent completion of the temporary parking lot, and the expansion and restriping of the south parking lot, it is hoped that inconvenience will be minimized, and ample parking slots will be available.

(The temporary lot, located adjacent to the Cancer Biology Research Building, is to be used by construction workers only; this is to ensure everyone's safety as well as adequate parking facilities.)

Excavation of the site is expected to begin in late August. Dirt trucks will be using Campus Drive West to Junipero Serra to mitigate conflict with Medical Center traffic as much as possible.

Utilities relocation work incidental to RAF-I construction is already under way. This work, being handled by Charles Byrnes of Stanford Utility Systems, includes moving steam and condensate lines to the Cancer Biology Research Building.

The accompanying map identifies the construction area for RAF-I and access points. Everyone's continued tolerance of disruptions caused by the project is appreciated.

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

...News Notes...

Spotlight on. . .

Daniel Lessler, *who will begin his third year of medical school at Stanford in the fall, has been awarded a Medical Student Research grant of $1,000 from the March of Dimes.*

Working in conjunction with Dr. Merton Bernfield, professor of pediatrics, he will study "Control of Pulmonary Vasculature Smooth Muscle Growth in the Fetal Calf" over a three-month period.

The grant is awarded by the March of Dimes Birth Defects Foundation to encourage gifted medical students to participate in such research.

* * * *

Arundell

Dr. Faye Arundell, *clinical associate professor of dermatology, has been appointed chairman of the Food and Drug Administration's Advisory Committee on Dermatologic Drugs.*

She has served on the committee for the past six years and is currently also vice-chairman of the Advisory Council of the American Academy of Dermatology, and an examiner for the medical license exams of the State of California.

* * * *

Three chaplains from East Germany *paid a visit to SUH last week, said Frank Geer, hospital chaplain.*

The three came to the U.S. to attend the third International Congress on Pastoral Care and Counseling, to be held Aug. 10-17 at U.S.F.

Geer, who will also attend the Congress, hosted their Stanford visit. "In state-run hospitals of East Germany there are no regular chaplaincy services," he explained. "But these are neither forbidden nor condoned in religious hospitals. There the chaplains prosper mainly because they have the support of doctors and nurses."

One visiting chaplain, Geer said, works in a crisis counseling center, where the effort is to move away from a "ministry of propaganda," towards a "ministry of care." The idea is to train chaplains to provide spiritual and human support, rather than try to convert or become politically provoked so as to upset the government.

"We face much of the same problem here, though not in a political sense, in trying to focus on pastoral care rather than religious argument," Geer said.

A Scottish pastor will be the next Congressional delegate to come visit SUH at the week's end. Chaplain Ernie Young will host that visit.

Walker

Duane Walker, R.N., M.S., *director of Nursing Services at SUH, was recently appointed to the California State Providers Task Force, a group of health professionals formed to provide input to state senators on health care policy.*

In appointing the task force, government leaders stated the group's primary objective as "developing suggestions which will contribute to the restraint of health care cost escalation and improvement of the health care delivery system."

* * * *

In the July 13 issue of Medical Center Memo, *the title of* **Dr. Shirley Tom** *was listed incorrectly. She is a clinical associate professor in the department of gynecology and obstetrics.*

We regret the error.

* * * *

During a recent several-week teaching stint in Europe and Asia, **Dr. Michael Bresler,** *associate director of the Department of Emergency Services, presented a series of lectures in Switzerland for the American College of Emergency Physicians.*

He also helped teach medical personnel in the Himalayas as a guest of the royal government of Bhutan.

Friedman

As of Aug. 1, **Steven Friedman** *has joined the Hospital as director of clinical engineering, announced Mary Catherine Krawec, associate director of SUH.*

Friedman, a biomedical engineer, comes to Stanford from a similar post at UC Irvine Medical Center. He will oversee the department responsible for the repair, operation and maintenance of medical, surgical and laboratory equipment throughout the Medical Center.

He will report to Krawec and can be reached in E006, or at 497-7131.

* * * *

Karen Axnick, R.N., *has been appointed director of Care Review/Risk Management, announced Carole Runyan Price, associate director of the Hospital.*

The promotion recognizes Axnick's coordination of the areas of risk management, quality assurance, utilization review and infection control at SUH.

Several changes have taken place in Patient Admitting Services, said Sandra Perkins, director of the department.

Barbara Bellucci, R.N., *has assumed management and supervisory responsibility for the Rooming Unit in Admitting. In this capacity, she oversees daily enactment of rooming policies and procedures. The rooming clerks and ICU rooming coordinator will report to Bellucci. She can be contacted at 497-6034.*

Debi (Savasta) Ecker *is now involved in various projects within the department, in addition to her management and supervisory responsibilities. She is at 497-7950.*

And effective Aug. 1, **Susan Taylor** *has assumed the role of acting assistant director of Admitting, during Judy Krakower's leave of absence. During that time, Bellucci will handle matters relating to the Medi-Cal Extension Unit.*

Taylor's phone number is 497-7930.

* * * *

You should know. . .

A self-help group for persons with **eating disorders** *is currently being formed in cooperation with the National Association of Anorexia and Associated Disorders (ANAD).*

Led by Drs. David Wexler, Michael Horne, and Melvin Gallen, all clinical faculty members in psychiatry, the group is designed to aid people suffering from anorexia, bulimia, and related disorders, to understand and control their eating patterns.

The sessions are free of charge and will take place at the Peninsula Psychotherapy Center in Menlo Park. Those interested in joining the group should call April Holman, M.A., or Jeannette Poumadere, Ph.D., at 325-9306.

* * * *

Third quarter **fire drills** *are being conducted throughout August on every work shift at the hospital and Hoover Pavilion, said Ruben Perez, assistant director of Safety/Security Services.*

Each department and nursing unit will be evaluated during the drills to prepare staff in the event of fire or other emergencies. Perez advises department managers to review the SUMC Fire Plan with their personnel.

* * * *

The Cellar Restaurant in Los Altos is sponsoring a **wine tasting** *Sunday, Aug. 28, to benefit the Intensive Care Nursery at SUH.*

Tickets for the event, scheduled to take place from 2 to 6 p.m., are $12.50 per person and can be purchased in advance or at the door. For further information, call 964-0220.

Med Center Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, AUGUST 10

Hematology support group: meeting for patients with leukemia, myeloma, hemophilia and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, room TF-122c. Call 497-6961 for further information.

Div. of Hematology Wednesday noon conference: presented by Dr. Carl Grumet, director, Transfusion Service. Noon, S102.

AUGUST 10 through 12

Dept. of Dermatology veterinary dermatology conference: 7 a.m. to 10 p.m., Fairchild Auditorium. For further information, call 497-7854.

THURSDAY, AUGUST 11

Dept. of Medicine grand rounds: "Interferons: A Case Study in Biotechnology"—Dr. Thomas Merigan, 8:30 a.m., Fairchild Auditorium.

FRIDAY, AUGUST 12

Dept. of Gynecology and Obstetrics grand rounds: "Toxic Shock Syndrome"—Dr. Patricia Duff (chief, OB division, Letterman Army Medical Center, San Francisco). 8 a.m., A336.

WEDNESDAY, AUGUST 17

Medical Center Auxiliary volunteer orientation. 9:45 a.m., W001. Call 497-6636 for further information.

Div. of Hematology Wednesday noon conference: topic to be announced. Noon, S102.

Physicians for Social Responsibility lecture: "Beyond War—What About the Russians?"—Dr. Harold Sandler (director, scientific research, Ames Research Center). 8 p.m., Medical Student Lounge.

THURSDAY, AUGUST 18

Dept. of Medicine grand rounds: "Recent Progress in the Management of Cancer of the Ovary"—Dr. Branimar Sikic. 8:30 a.m., Fairchild Auditorium.

FRIDAY, AUGUST 19

Dept. of Gynecology and Obstetrics grand rounds: Gynecologic Case Studies by Residents. 8 a.m., A336.

WEDNESDAY, AUGUST 24

Physicians for Social Responsibility film: "The Last Epidemic." 8 p.m., 3rd floor, Old Union Clubhouse, common room.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Teaching method features learning centers to train children in science

A Stanford School of Education program designed to develop thinking skills in math and science among language-minority children has won a grant of $72,882 from the Walter S. Johnson Foundation of Menlo Park.

The new approach was developed by Education Senior Lecturer Edward De Avila, who has been working with Education Prof. Elizabeth G. Cohen for several years in developing techniques of classroom management and implementation.

The grant will enable De Avila and Cohen to create an effective model whereby the new type of instruction becomes self-sustaining in schools and school districts.

Called Finding Out—Descubrimiento, and designed for second through fourth grade children in linguistically diverse classrooms, it features multiple learning centers that operate simultaneously during a 15-week curriculum. The learning centers represent concepts in math and science, such as the plotting of coordinates, latitude, and longitude, and physical principles of heat and light.

Each learning center has an activity card with instructions for the learning task in English, Spanish, and pictographs. Although each child must complete each learning center with its accompanying worksheets, the children also are trained to work in cooperative relationships.

This complex approach to teaching requires teachers skilled in management as well as a good deal of organizational support. The Stanford staff has worked out a model for such management and organization, which will serve as basis for installing this method of instruction in Bay Area schools and beyond.

Significant gains

Finding Out—Descubrimiento has been tested in nine San Jose classrooms, resulting in significant learning gains in standardized math achievement test scores, particularly the word problems section; reading achievement test scores; and in scores on a special content-referenced science test.

The Bilingual Consortium, an umbrella group of schools and districts in the San Jose Unified School District supporting education for language-minority children, has implemented Finding Out—Descubrimiento in 10 more schools in the San Jose area.

The Johnson Foundation grant will support the development of an implementation manual, evaluation and technical assistance for the Consortium and participating schools, and documentation and evaluation of the effectiveness of the model.

Education doctoral candidate Cecilia Navarrete, a teacher who worked on the development of the same approach with migrant workers' children in New Mexico, is working on the manual project. It will provide a source of practical information for schools using the new learning method.

Schools that wish to use Finding Out—Descubrimiento will be able to contract with Stanford, on a nonprofit basis, for the training and support services necessary for full implementation of the model.

After receiving training, they will be able to buy the learning activity cards and Teacher's Handbook from De Avila. Most of the activities call for common materials that can be collected by parents and schoolchildren.

Hispanic teachers don't get jobs in bilingual education

"Contrary to criticisms of government and union leaders, bilingual education funding has not resulted in a jobs program for Hispanics," says Craig Richards of Stanford University's Institute for Research on Educational Finance and Governance.

"To the extent that Hispanic teachers have been employed in public schools, they have been placed in highly segregated schools," he adds.

Richard's conclusions are based on a statewide study of public school employment and assignment practices in California. He was especially concerned with determing whether Hispanic teachers had benefitted from bilingual education programs as Black teachers had from the compensatory education programs of the 1960s.

"It is widely presumed that public schools in general, and bilingual programs in particular, have been a major source of employment since the early 1970s," says Richards.

"Indeed, 39 percent of all Hispanic teachers in California are bilingually certified. However, California's public schools have never been a significant employer of Hispanic teachers.

"A 1959 survey concluded that Hispanic teacher employment in California public schools was even lower than that of Black teachers. And in 1980, less than six percent of all California public schoolteachers were Hispanic."

California, with the largest and fastest growing Hispanic population of any state in the nation, also receives the largest percentage, 26 percent, of federal aid directed toward Hispanic students.

Additionally, California supports bilingual categorical programs from state resources. For the 1980-81 school year, the 18 California State Universities and Colleges received a total of 29 state and 14 federal bilingual grants specifically to train bilingual teachers, 1,299 of whom were enrolled.

"While Hispanic pupils now represent well over one-third of all California students," explains Richards, "only one out of every 20 teachers is Hispanic.

"By 1985, Hispanic students are projected to represent nearly half of the California student population, and indications are that the Los Angeles Unified School District may become entirely Hispanic in the next decade.

"Even so, the one to 20 ratio of Hispanic to non-Hispanic teachers is not likely to improve given current hiring practices. For example, of the 9,678 new teachers hired in 1980 in California's public schools, about 84 percent were Anglo and 10 percent were Hispanic."

In 1981, California had 810,605 students whose primary language was not English; of these, 612,362, or 76 percent, were Spanish speaking.

Among students who spoke Spanish, 136,689 could not speak English and another 148,875 had limited proficiencies in speaking English. But according to the California Commission for Teacher Preparation and Licensing, the supply of bilingually certified teachers is meeting only about 50 percent of the demand. Nor is the gap between supply and demand likely to close over the next few years.

Richards' analysis is contained in "Bilingualism and Hispanic Employment: School Reform or Social Control?" and is available for $2 from the Institute for Research on Educational Finance and Governance, CERAS 402, Stanford University. Phone (415) 497-2754.

Kennedy, Hastorf ask for help in finding outstanding freshmen for awards

Following is an August 4 memo to members of the faculty and teaching staff from Provost A. H. Hastorf and President Donald Kennedy concerning academic distinction among students completing the freshman year:

We are intruding on your summer to ask assistance. The information you might provide will be valued immediately but will be useful if it arrives—addressed to the Office of the Registrar, Old Union 133—by Friday, September 9. That is the Friday following Labor Day.

Recent discussions among the Undergraduate Cabinet convince us of two things: that we need to find more tangible ways to express how much we value academic excellence among undergraduates, and that we ought to recognize intellectual distinction as we find it throughout the undergraduate years and not simply wait until honors are conferred at Commencement. The Booth Prizes in freshman writing and in Western Culture have allowed us to make a beginning, but these prizes cannot reach the variety of academic distinction achieved by freshmen throughout the curriculum.

Consequently, we are making plans to honor some modest number of students whose freshman academic records have been particularly distinguished for a combination of overall merit and particular excellence. We expect to announce the roster of these unusual students at a Sophomore Convocation to be held at the beginning of autumn quarter.

To identify some of these students is the reason we need your help.The Registrar can give us a variety of analyses of the grade records of students who were freshmen during 1982-83. But only teachers and advisers will have encountered the intellectual energy and disciplined imagination that marks the most able students, those whom we should expect to encourage to special opportunities during the continuation of their undergraduate experience. Think of the kinds of students we should encourage to honors programs, for example.

Can you tell us who in your experience this past year seem to have the unusual students? You may have seen none or only one or two; on the other hand, you may have encountered several. Simply drop us a note with the names of such students, and a brief comment on what, in your view, distinguishes them. It may be that a particularly worthy student will be mentioned by only one of you and that others will be reported by several. Simply direct your replies to us, in care of Registrar Sally Mahoney, Old Union 133, no later than Friday, September 9.

Late in the summer the Undergraduate Cabinet will meet to review the overall records of freshman year achievement and whatever nominations you will have been kind enough to make to us.

Based on their review, they will select a group of students to be honored at the Sophomore Convocation. Their names, of course, will be announced in the various campus media, and we expect to find additional ways to encourage them throughout the year.

In addition to the two of us, the Undergraduate Cabinet consists of Vice-Provost Herant Katchadourian, Deans Cox, Kays, and Wessells of the three Schools with significant undergraduate programs, Dean of Student Affairs James Lyons, Dean of Undergraduate Admissions Fred Hargadon, Associate Dean of Humanities and Sciences for Undergraduate Programs Carolyn Lougee, Registrar Sally Mahoney, presidential assistant George Robert Hamrdla, the chairman of the Committee on Undergraduate Studies, and two students—one from the COP and a second representing the ASSU Senate.

Finally, we would welcome any additional ideas or suggestions about how we might recognize academic distinction among our undergraduates and by recognizing such achievement, encourage even more of it.

Letters to the editor

Robert Cohn details the limitations, mistakes of the women's movement

Editor, *Campus Report*:

A considerable amount of information has emerged of late to indicate that the women's movement has gotten us into grave difficulties and, probably for that reason (at least in part), has retreated radically.

The Dean of the Education School here reported a few weeks ago that the movement was the number one cause of the drastic decline in the quality of public schools. A national commission commented on that decline that our worst enemy couldn't have brought us low more effectively. Shortly before that, we learned from the U.S. Department of Education that the children of full-time working mothers score much lower on aptitude tests. Again, the basic *fabric* of culture which women have traditionally nourished has taken a beating through massive unwisdom abetted by the utopian presumption of the intellectuals.

We have learned that divorces have increased with devastating impact on the children (particularly boys). That husbands of working women are prone to heart attacks. That birth defects are up alarmingly (almost double) due to women's being exposed to toxic substances in the work place, smoking more, etc. And the new women age faster, are guilt-ridden, are dying younger, commit more crimes. The men are more insecure. And so on, depressingly.

What happened to the great claims of revolution which academics tended to endorse unanimously, or at least did nothing to counter? It seems, as stated in a *Campus Report* recently and confirmed by CBS news, that either there is no real change in the nature of women's jobs (except for a small percentage, almost token) or that when women occupy "unusual" positions they are often resented and tend to regret it. A subtle new kind of segregation arises *within* the position.

And then one notices that there is still, after many years of bold rhetoric, only a handful of women in Congress. The Army has had to give up training them with men (because of a forty percent disparity in upper arm strength, for example). Nothing really has changed in the domination of men in sports, chess, math, musical composition, etc.

None of the above has altered my belief that women are superior to men in the most important ways and are central on this earth. Nor am I surprised that individual women can outdo almost all men at almost anything. It has always been so, and one suspects a sort of bell-curve "crossover" of roughly ten percent. If there has been increased flexibility of opportunity in the job market to accommodate that natural fact, one can only applaud—that much is to the good. But to extend that ideologically to include a very broad spectrum of women has ben proven wrong. That is why many young women who are rising in "male" careers express total disinterest in feminism and see their careers as an individual matter. But even they have something to learn about limitations in this life, and one expects that many of them will give up some of their cockiness later on. There are basic impulses which one thwarts at one's peril. Sexual expression is one but, however hidden, the need to bear children is even greater, no doubt. And to nourish them spiritually. . . .

We seem to be returning, rather sheepishly, to these home truths. This is no sign of lack of sophistication, on the contrary. It is the "ultra-moderns" who have misled us for decades who are the true provincials.

Robert Greer Cohn
Professor of French

Fund drives helped by many—Skrove

At the beginning of June, I wrote to you via *Campus Report* to offer my help to those who needed information regarding the Combined Health Agencies Drive (CHAD) on the Stanford campus, and also to tell you that according to the latest figures I had received, we might well exceed last year's donations, which, at the end of December 1982, totalled $45,234.

Thanks to your generosity, I am happy to report that as of August 4, $46,307 had already been raised—an increase of $1,073 four months before the books are officially closed by CHAD at the end of 1983.

I am sure you are aware that the success of both CHAD and the United Way campaigns is made possible only by the teamwork of many individuals and departments within the University, the Hospital, and SLAC. Long before the actual campaigns commence, the preparations begin with my meeting with representatives of the two agencies. Then the various links of the chain begin to connect. And, for once, I would like to mention some of those links: Jim Smith, the University forms analyst, who designs the three pledge cards; Nina Absher and Lynne Vitero in News and Publications, who order the necessary envelopes; John Corales, Bernie Lighthouse, and Don Thomas of the Personnel Offices of the campus, SLAC, and the Hospital, who are responsible for providing the necessary sets of mail labels; Ann Keating in Mailing Services who undertakes the task of having the envelopes stuffed and mailing as many sets of materials as are necessary to all the employees; and last, but certainly not least, the two people who physically handle the actual donations—Dinah Osafo, the cashier, who receives the deluge of pink envelopes containing checks and pledge cards (both of which she has to keep an accounting of), and Shirley Smith in Payroll who has the arduous task of preparing the pledge cards for payroll deductions.

Without the cooperation and help of all these individuals, who undertake this extra work in addition to their regular duties, neither of the campaigns could take place. As it is, during the past several years both drives have been successful enough to well exceed the figures of the prior years.

On behalf of the University and CHAD, thank you all for your continued support and generosity.

Jan C. Skrove

Smith asks layoff option for SLAC workers involved in SSRL research

Following is an August 5 letter to President Donald Kennedy from United Stanford Workers President Patrick W. Smith:

It is important that it be clearly understood that I am not taking issue with the Weapons Research proposal at SSRL. To do so would greatly overstep my responsibilities and authority. It is my duty as President of the United Stanford Workers to represent the concerns of my constituents. In this instance I am writing on behalf of those workers who for reasons of conscience find it repulsive to participate in the weapons-related research that is being proposed for SSRL.

At an extraordinary faculty meeting held at SLAC on May 26, 1983, you indicated to me that the University would try its best to accommodate in other areas of the University those who refused to participate in weapons research. I assume this offer is not limited to those covered by the bargaining unit agreement but includes all members of the SLAC/SSRL community.

Frankly, sir, there are more individuals affected in this situation than I think you realize, and I don't believe the University has the capacity to absorb them all. Your lack of perception is exemplified in your continual references to the academic freedom of Principal Investigators. The truth of the matter, however, is that the freedom of the Principal Investigator is almost immaterial in a situation where the research being conducted requires the collaboration and participation of hundreds of individuals.

In my letter to you of July 7, 1983 . . . I addressed the issue of these workers. I particularly raised this question: if the University can offer no appropriate, alternative assignment, will the affected workers be offered the option of being laid off? That option at least affords them, through severance pay and unemployment compensation, a modicum of security while they seek other employment.

It could be argued that if people sincerely object to participating in weapons work, they should quit and seek employment elsewhere. I have witnessed such actions in the past, especially in circumstances where individuals came to realize slowly or suddenly, that the work they were doing was objectionable to their consciences. It is unfortunate when people must give up the pay necessary to survive in order to live according to their consciences, but it will be a very sad day indeed when people are willing to sacrifice their consciences for mere economic security and social position.

The situation here, however, is not like ones I have witnessed. The difference is that people are not accepting employment in full knowledge of its nature, nor are they slowly or suddenly realizing that they object to what they are doing. On the contrary, the terms of the employment they chose are being changed without their consent: they are being told that the nature of the work they hired on to do is going to change radically and that the understanding which existed regarding the nature of their work, dedicated to basic research, is no longer in effect.

As you must know, sir, many people have come to work at Stanford because they knew that weapons research was not done here. Indeed it has been a safe refuge for some from the many industries in the area where much military work is done. But now, if you bring to an end the era of strictly basic research at SLAC by initiating weapons-related research at SSRL, you are violating the consciences of those people and potentially of every employee at SLAC from the director's office on down.

The consciences of the workers who are expressing their growing concern to me are shaped by their religious beliefs. If, having changed the terms of their employment, you leave them only the options of working or quitting, you are violating their freedom to live according to their religious convictions. You are indeed instigating an institutional form of religious discrimination. Our freedom of religion is guaranteed in the Bill of Rights, and our equality of treatment—our guarantee against discrimination on religious as well as other grounds—is provided for in Article II section c.1 of the 1982 agreement. Changing the nature of people's work in such a way that they must resign their livelihoods and security to live with their consciences not only blatantly disregards their religious convictions but discriminates against them and in favor of those without such religious convictions.

In suggesting that you offer people the option of layoff, I hope you understand that I am trying to find a responsible solution to a problem which is basically religious in nature and therefore potentially volatile. I hope you will find the time in your busy schedule to address this issue.

Patrick W. Smith, SLAC
President, United Stanford Workers

Stanford/U.C.-Berkeley joint program wins Rockefeller Foundation funding

The Rockefeller Foundation has awarded $1 million to Stanford and the University of California at Berkeley for a new joint program on Soviet international behavior.

A similar grant was made to Columbia University following a national competition among all major centers of Soviet studies.

The new program links Stanford's Center for Russian and East European Studies and Berkeley's Center for Slavic and East European Studies.

It is designed to stimulate innovative, advanced research and collaborative graduate training, using relevant intellectual resources at both institutions. The program will not entertain applications for individual grants.

A joint committee overseeing the program will include Prof. Alexander George, holder of the endowed Graham Stuart professorship in international relations at Stanford; Prof. Alexander Dallin, history, chairman of the International Relations Program at Stanford; Prof. George Breslauer, chair of the Berkeley Center; and Associate Prof. Gail Lapidus, political science, former director of the Berkeley Center.

Others involved in the program at Stanford will include Coit Blacker, associate director of the Center for International Security and Arms Control, and Assistant Prof. Condoleezza Rice, political science.

Stanford ranks 3rd in research funding

Stanford ranks third nationally in federal research funding, according to a recent National Science Foundation report.

During fiscal 1981, federal obligations to the University for research and development totalled $106 million, excluding the Stanford Linear Accelerator Center.

Johns Hopkins ranked first, with $363 million, including $238 million for the Applied Physics Laboratory. MIT was second, with obligations totalling $146 million.

Three groups and faculty will study Hoover developments

continued from page 1

The action took place at the board's semi-annual meeting in July, he said.

Discussions regarding the proposed library, and a related Ronald Reagan Center for Public Affairs, at Stanford, have been going on for two years.

Campbell also announced the appointment of a consultative group of senior Hoover scholars to advise him on the proposed public affairs center.

Its members are Martin Anderson, chairman; Dennis L. Bark, Richard T. Burress, John H. Moore, Rita Ricardo-Campbell, Milton Friedman, Robert E. Hall, Seymour Martin Lipset, Henry S. Rowen, Thomas S. Sowell, Richard F. Starr, and George J. Stigler.

Last week, Stanford President Donald Kennedy named a faculty committee to provide guidance on the library and center proposals, and another group of Stanford administrators is exploring possible campus sites. Both are due to report to Kennedy by Oct. 2.

The Kennedy and Campbell groups will meet together later this month, Kennedy said.

Manley, Rebholz cool on Reagan library proposal

Members of the Stanford faculty have warned that plans for a Ronald Reagan Center for Public Affairs and a Reagan presidential library at Stanford may seriously divide the Stanford community unless provision is made for full and open campus discussion of the proposed Reagan center.

Political Science Prof. John F. Manley and English Prof. Ronald A. Rebholz, who led the drive last spring that gathered 84 faculty signatures on a petition calling for an investigation of relations between the Hoover Institution and Stanford University, said that "The Hoover Institution should not be allowed to bring the Reagan Library to Stanford without the opportunity for the Stanford community to discuss and debate the many complex issues involved."

Calling attention to the October 1 deadline for an ad hoc faculty committee report to Stanford President Donald Kennedy, and to Kennedy's announced plan to put the proposal before the University's Board of Trustees at their October meeting, Profs. Manley and Rebholz noted that such a schedule would present the Stanford community with a "fait accompli."

"If press reports are accurate, an October deadline would effectively preclude any meaningful public discussion at Stanford," they said. Noting that many faculty and most students are away from campus in the summer, and that the fall term does not begin at Stanford until late September, the professors said it would be a "grave mistake" for the University Administration "to appear to rush this proposal through before those who have legitimate questions and concerns about the deepening ties between Stanford, Hoover, and the Reagan Administration have a fair opportunity to be heard."

The professors noted that last spring over 1,500 students and 84 faculty members signed petitions raising questions about the political activities of the Hoover Institution, and the Faculty Senate in May voted overwhelmingly for a study into the allegations.

"We are not saying that there are no good arguments for locating the Reagan library here. What we are saying is that those members of the Stanford community who have questions about the University's links to the Hoover Institution and to the Reagan Administration should have a chance to air them before any final decisions are made."

"If this is not done," the professors warned, "it will look as if the proposal was rushed through without fair hearings." This, they said, could make the reassessment of relations between the Hoover Institution and Stanford "unnecessarily acrimonious."

Faculty group to help Kennedy decide

Stanford President Donald Kennedy has announced the appointment of a faculty consultative group to advise him on the prospect of the Ronald Reagan Presidential Library being established at Stanford University.

The committee's purpose, Kennedy said, is to "give me some consultation on the kinds of academic benefits that might accrue to Stanford through the possession of papers and presence of the Reagan library on campus." The main element of the committee's study, he added, is "to define and state the University's interest in having these presidential papers here." He called the papers "a valuable scholarly resource."

Informal discussions between the White House staff and Glenn Campbell, director of the Hoover Institution, about placing the library at Stanford have been going on for some time. An investigation of possible sites already has begun, but no decision has been reached.

Also proposed, as an adjunct to the Reagan Library, is a Ronald Reagan Center for Public Affairs, and the committee will investigate its "academic impact on Stanford."

This would be part of the Hoover Institution, and, according to Campbell, would "provide facilities to bring together scholars and academicians, journalists, legislators, government policy makers, and business men and women to discuss, debate, and analyze issues of domestic and foreign affairs critical to our nation's past, present, and future."

Cost of the library would be met through private fundraising, and Kennedy asked the committee to investigate "possible costs to Stanford." He noted that "we assume" this fundraising would be "noncompetitive" with ongoing Stanford fundraising. All operating and maintenance costs would be the government's responsibility.

"Stanford's direct costs," he said, "would consist of the value of the land lease plus administrative expenses."

The committee's chairman is Prof. James N. Rosse, economics, and director of the Center for Economic Policy Research. Members are Profs. Elie Abel, communications; Barton Bernstein, history; Carl Degler, history; Alexander L. George, political science; James L. March, Graduate School of Business; and Ezra Solomon, Graduate School of Business; Dr. Paul H. Mosher, University Libraries; and Dr. Charles Palm, Hoover Institution; and Fernando de Necochea, assistant provost.

Kennedy asked the committee to complete its report by Oct. 1.

FBI agents complete Reagan papers search

Federal Bureau of Investigation agents left the Reagan campaign and transition archives at Stanford's Hoover Institution Friday, July 22, Acting Archivist Charles Palm confirmed Thursday, July 28.

"As far as I know, they're finished," Palm said. No original materials were removed from the collection. "As expected, they did a good job of maintaining the integrity of the materials, from the viewpoint of a professional archivist," he added.

Ten FBI agents took charge of the search of the materials July 13.

At that time, Palm said the agents "may make whatever copies they want of anything they want" in the archives.

Now as then, he indicated any further comments about the results of the search should come from the FBI.

Another investigation...

A second group of investigators arrived at the Hoover Institution archives Aug. 4 to search through Reagan campaign files for documents stolen from the Carter White House.

A few weeks ago several FBI agents spent 10 days combing the files for any papers relating to the Carter documents which ended up in Reagan campaign staff hands prior to the presidential debate of 1980.

The new probers are from a House subcommittee, investigating the incident for Congress and General Accounting Office.

Board of Overseers pledges cooperation

The Hoover Institution Board of Overseers has pledged to cooperate fully with the Stanford Board of Trustees in a forthcoming study of relations between the Institution and the University.

At their July 21 meeting, the overseers said they were "deeply concerned by the recent unfounded charges by some members of the Stanford community which threaten academic freedom."

They thanked "the many distinguished professors at Stanford" who signed a petition organized by Profs. Alphonse Juilland, John McCarthy, and Oleg Sherby which opposed an investigation of alleged partisanship by the Hoover Institution as a grave threat to academic freedom.

The text of the motion concerning the Stanford-Hoover study follows:

"We, the members of the Hoover Institution Board of Overseers, are deeply concerned by the recent unfounded charges by some members of the Stanford community on the Hoover Institution which threaten academic freedom.

"In our judgment, the direction and operation of the Hoover Institution are, and have been, in complete conformity with the basic understandings and agreements that apply to the Hoover Institution and its more than 60 year relationship to Stanford University. We are proud of the Hoover Institution and its staff, and believe that their record of accomplishments and achievements has brought distinction and credit to the entire Stanford community.

"As Overseers we have a duty and a responsibility to both the Hoover Institution and to Stanford University. In fulfilling this obligation, we will, in every way possible, cooperate with and assist the Stanford Trustees."

An ad hoc group of four University trustees currently is considering how the study should be conducted. Its members include Board President William Kimball, Los Angeles attorney Warren Christopher, San Francisco attorney Frank "Sandy" Tatum, and Nancy Barry Munder, who also serves on the Hoover Board of Overseers.

The group plans several meetings this summer to recommend the composition and charge for a study committee to be appointed by the board this fall.

Campus crime report

July 25-Aug. 8

Burglary/residence	1	Phone harassment	0
Burglary/nonresidence	6	Controlled substance	1
Burglary/Vehicle	3	Felony arrest	3
Theft/under $400	10	Misdemeanor arrest	20
Theft/over $400	2	Adult booking	11

Stanford Industrial Park

First such research park in the U.S. still most successful

The Stanford Industrial Park was "the first university-related industrial park established in the U.S. and is widely considered the most successful," a new federal report declares.

Its success "hinges on the university's ability to combine encouragement of industrial interaction and community service with a continuing commitment to the highest standards of academic excellence," the report adds.

Titled "The Federal Role in Fostering University-Industry Cooperation," the study was prepared by the General Accounting Office for the House Committee on Science and Technology and the Senate Committee on Commerce, Science and Transportation.

"The most important role that the federal government has played in stimulating university-industry relations in research parks is indirect," the report notes. "By taking upon itself the stewardship of basic research in the U.S. and increasing support of applied mission-oriented research, the government has helped develop a research capacity in some universities that has made them a magnet for high-technology industries. . . .

"This federal support has led to creation of new firms founded by university researchers interested in pursuing commercial applications of their own work. These firms often secured considerable financial support in their early years from government research and development and procurement contracts.

"The availability of government research support protects the independence of university researchers and allows them to pursue only those industrially-sponsored research opportunities that also contribute to scientific progress in their fields of expertise."

The federal government has indirectly aided the formation of research parks through providing land, moving government facilities there, and funding innovation centers on the premises.

The Environmental Protection Agency is the largest single employer in North Carolina's Research Triangle Park, for example. The University of Utah Research Park's land was acquired from the federal government and the National Science Foundation funds an innovation center there.

A 1980 study by Ohio State University identified 27 university-related research parks started since 1951, the year Stanford's park opened. Of these, six clearly succeeded, 16 failed, and five were "in between."

North Carolina was among those regarded as a clear success, while Utah was "in between," in the Ohio State study.

Now filled, the Stanford Park has about 90 firms employing approximately 25,000 people, hundreds of whom are Stanford students.

"The most dramatic contribution to innovation appears to be made by the research parks," the GAO report says.

Close links between academics working at the frontiers of science and companies on the leading edge of technology are provided through industrial employment of faculty consultants, adjunct faculty appointments for industrial research specialists, shared laboratory facilities, part-time employment of graduate students, special graduate courses for industrial employees, and joint research projects and seminars.

The Stanford Industrial Park combines the best of academic and business qualities that has made it a magnet for high-technology industries.

"The most intense interaction we observed occurred at the Stanford Research Park, where we found that the philosophy of industrial collaboration has been fully integrated into the academic mission of the university," the GAO study observes.

"A major consequence is that communication and rapport between academic and industrial sections have reached a higher level than in any other research park we have reviewed (North Carolina and Utah).

"This interaction increases the flow of information and ideas that affect the research agendas of both sectors and increases academic sensitivity to the possible commercial sensitivity of emerging ideas and research findings. . . .

"The Stanford success can be attributed in large measure to an extremely favorable set of circumstances that prevailed for more than two decades during the creation and early development of the research park.

"Stanford owned many acres of undeveloped land that was available for long-term leases, but could not be sold; the federal government was rapidly expanding its funding of basic and applied research at universities; and Stanford had a leader (the late Fred Terman) with exceptional vision dedicated to the research park concept who was greatly respected by academic, industrial, and government sectors.

"Although it is unlikely that such an ideal situation will emerge again, we believe that. . .it is possible for other research parks to emulate many of the successful attributes demonstrated at Stanford."

Single copies of the report are available free on request from the U.S. General Accounting Office Document Handling and Information Services Facility, P.O. Box 6015, Gaithersburg, Md. 20760. Phone (202) 275-6241).

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

33127-BP (JCC:2070) ADMIN ASST II: Fixed term, 9/1/83-6/30/84; dir energy awareness & conservation programs in student residences; prep & present edu'l mat'l to student groups; meet w/ student groups to promote energy conservation; dir incentive program for student groups; maintain & analyze energy usage records & computerized data base; prep reports; conduct energy audits; train & supv 3-5 student employees; appt & train approx 65 students as energy reps in residences; administer Stanford Energy Conservation Proj Fund; QUALIFICATIONS: strong commu skills; exp in or knowl of energy conservation tech; limited tech knowl of heating & lighting sys; proven ability to motivate college students; send appl/resume to John Eaton, 859 Escondido Road, Stanford, CA 94305.; C05; $878-1101.

18064-AW (JCC:2068/2070) Admin Asst II/III: Data Base Coordinator; respon for creating & maintaining user specifications for all Benefits/Records projs; designing & organizing user testing required to implement benefit/records changes, corrections or additions to Payroll/Personnel sys; creating & maintaining user documentation for Payroll/Personnel sys; analyzing, debugging & researching tech reasons for incidents or any unusual sys behaviors; tech resource person for SU community & Benefits/-Records; primary resource person for reporting function; QUALIFICATIONS: familiarity w/ computer sys concepts; exp working w/ computer sys as a user; some exp in analytical problem-solving, such as that attained thru computer programming, data analysis, statistics, sys analysis or equiv edu'l bkground; good verbal & written commu skills; prior exp w/ software in use at SU on IBM/3081 (Wylbur, Spires & Mark IV); exp coordinating admin projs in a large complex organizational environ.; C06/C05; $1948-2441/1756-2202.

30155-VW (JCC:2044/2048) ADMIN SERVICES MGR III/IV: Develop, maintain & update plans for academic computing; interface w/ academic senate committees & subcommittees; act as division genl mgr & administrator respon for personnel, budget, financial, & facilities mgmt; study new concepts; coord w/ sub-division directors; develop new ideas & strategy for their implementation; QUALIFICATIONS: combination of edu & exp in an Info Sys environ totalling 10 yrs; demonstrated mgmt/leadership exp w/ personnel and/or budgets; knowl of & ability to use computer as a means of commu; effective & persuasive commu skills, orally & writing; willingness & availability to travel.; C08/C09; $2590-3313/3122-3846.

41552-AW (JCC:1069) ASST DEAN-ADMIN: 50%; organizing & supvg tutoring & counseling programs for minority students; recruiting minority grad students; coord fundraising activities for engrg minority projs & education programs; administering minority scholarships; advising directors of school outreach programs on Stanford policies & resources; preparing program budget & maintaining projs accts; QUALIFICATIONS: ability to write clearly & effectively; ability to define problems & propose effective solutions for all areas of respon; knowl of genl budgeting & acctg procedures; knowl of principles & practical aspects which form the basis of univ affirmative action program & objectives; exp in working w/ minority community; demonstrated admin exp.; C06; $974-1221.

29367-AW (JCC:1972) UNIV MANAGER II: Manager of Housing Programs; works w/ Dir, Associ Dir & other members of the staff in executing housing & transportation programs for SU; principal functions are brokerage, escrow & transportation; QUALIFICATIONS: bkground in real estate, banking, financial analysis, economics or planning; college degree, preferably an MBA, JD or advanced degree in acctg or planning, or relevant work exp equiv to such advanced degree; computing exp desirable.; C08; $2590-3313.

43507-TC (JCC:5588) LIFE SCI RES ASST I: 80%; perform research in genl area of virologic & cell culture; independently carry out experiments of viral propagation, cell fusion & hybridoma selection; familiar w/ techniques of solid phase radioimmunoassay, polyacrylamide gel electrophoresis, gel chromatography & ultracentrifugation; asst in planning & designing experiments & render judgment about the progress of the res; QUALIFICATIONS: BA or BS in science; 1 yr's exp in working in a res lab utilizing some of the above tech.; C05; $1405-1762.

26605-LL (JCC:6818) SOC SCI RES ASST II: Research Asst to one Professor; respon incl the conduct of res projs w/ children, analysis of data, preparation of experimental programs for implementation on microcomputers & assistance in preparation of literature reviews; QUALIFICATIONS: Bachelor's degree in psychology (or equiv) w/ strong bkground in statistics & experimental design; exp in res w/ childres & own transportation to schools; computer programming skills (especially Basic, Pascal, Logo) & ability to use statistical packages for data analysis.; C04; $1590-1983.

21695-JB (JCC:7526/7534) Facilities Engineer I/II: Maintenance Scheduler reports to Asst Mgr of Craft Shops; respon for work requirements in certain maintenance programs & in some craft shops; contact between various cost ctrs, supvrs, mgrs & customers to ensure that commitments & required completion dates are met; use data processing on a mini computer to design & generate reports; reviews all work orders for accuracy; maintains bldg number tables, space & surface inventories; asst shop supvrs w/ inventory control, produces reports & maintains files pertinent to the scheduling process; C07 level is expected to have demonstrated ability in proj or construction mgmt, & possess full range of engrg skill & knowl; QUALIFICATIONS: customer serv tech; genl understanding of computer & terminal operation; report writing; scheduling: critical path, short interval scheduling; estimating for construction or maintenance.; C06/C07; $1948-2441/2221-2875.

32036-DS (JCC:8880) MISC PROFESSIONAL: Training Dir for Ctr for International Security & Arms Control; supvsg & monitoring progress of ongoing fellows program; helping develop & recruit candidates for new fellows program; developing active undergrad program; serv as sr. teaching fellow or head teaching asst for 3 basic arms control courses offered thru Pol. Sci. curriculum; working w/ Ctr faculty & others to plan master's degree program in arms control & internat'l security studies; QUALIFICATIONS: advanced degree (preferably a recent Ph.D.) in internat'l relations or related field w/ strong interest & bkground in arms control/internat'l security; some teaching exp required, w/ interest & competence in full range of undergrad & postgrad training in arms control & internat'l security.; C05; $1756-2202.

41673-AW (JCC:8880) MISC PROFESSIONAL: 50%; fixed term 9/1/83-2/28/84; This is a one-half time position within CIT in support of the CIT directors' role in the compliance w/contractual & other legal obligations & the protection of CIT's interest through appropriate legal tools; responsible for analysis of requirements for software protection related to contract compliance & license restrictions; advise on the use of such legal tools as copyrights, trademarks, contracts, licenses, non-disclosure agreements, etc; QUALIFICATIONS: Law degree plus practice in computer law including software licensing, or equivalent combination of education & exp in computer related legal activities; BA in computer-related or tech field or equiv ed & exp; familiarity w/Stanford depts.; C07; $1111-1438.

20114-TC (JCC:1514) TEACHER: 11-6; asst in planning & implementing the program for young children, completing written developmental reports on children, setting objectives for teaching-learning activities for children; meeting & conferencing w/ parents, participating in res projs which are ongoing at Bing, & participating in school-wide activities & events; this opening is in the nursery school-age extended day program for 3-5 yr olds; QUALIFICATIONS: knowledgeable & exp'd in the field of Early Childhood Edu; BA in child-development, early childhood edu, or related field & at least 2 yrs exp teaching young children; a current Calif. teaching credential w/ emphasis in ECE desirable; waiver of the undergrad degree possible depending on prev exp.; T01; $1313-1702.

31515-LL (JCC:3150) DEVELOPMENT OFFICER III: Respon for development of Genl Appeal Program; coord dir mail & phone appeal fund-raising; develop new strategies & procedures; coord field staffing assignments & respon; monitor staff involvement in program w/ annual fund director & field staff mgr; perform genl program evaluations w/ staff & volunteers, prov feedback; prov staff support for volunteer chairperson of program & program steering committee; meet regularly w/ National Chairperson to review program performance & recommend action; develop budget for program &, allocate approp; supv Dir, Class Agents/Reunion Giving; Mail Coordinator, Phone Assoc, Report desk; QUALIFICATIONS: exp in univ admin, marketing, or gift procurement is required; field staffing exp essential; college degree or equiv exp helpful; good verbal & writing skills; budgeting skills; ability to use mgmt info sys.; C08; $2590-3313.

41666-AW (JCC:5000/5008) Programmer Analyst II/III: Prov guidance to programmer/analysts during development & installation of admin applications in a highly volatile tech environ; develop & maintain sys & procedures nec to install new & modified application components; perform quality control function on new & modified components; manage production & emergency libs; prov staff support to SSA Mgr; supv work performed by SAA clerical staff; QUALIFICATIONS: exp in IBM OS JCL, terminal usage (Wylbur, Spires) EXEC LANG programming; exp in a serv organization in a large-scale computing eqpt production environ, usually assoc'd w/ at least 4 yrs or equiv combination of edu & exp; knowl of SU, CIT in particular, is highly desirable; demonstrated skills in oral & written commu, interpersonal relationships, self-motivation, organization; level II would not necessarily have exp in all the desired qualifications but would demonstrate the potential for growth to a level III.; C06/C07; $1948-2441/2221-3545.

44500-AW (JCC:4084) PROGR/ANALYST GEN III: Join team of programmers charged w/ implementation & design of online sys which interacts w/ RLG's very large database; sys allows input/update & display of bibliographic & other types of variable records to facilitate the operation of RLG's collection development, preservation, & technical processing programs; primarily respon for development & maintenance of SPIRES-based RLG Special Databases & Sys; sys design; specifying programs; program module development; sys maintenance; serv as SPIRES consultant/trainer to other members of the team; QUALIFICATIONS: ability to develop & maint interactive sys using SPIRES DBMS & its assoc'd Formats & Protocols development tools; knowl of high-level structured programming lang; ability to commu effectively in speaking & writing; familiarity w/ interactive & batch processing; exp w/ large computing facility (CIT) helpful; knowl of PASCAL & PL/I.; C07; $2221-3545.

195-VW (JCC:5008) PROGR/ANALYST GEN III: Fixed term for 18 mos, might extend to 24 mos; direct, develop, & implement the expansion of dept'l computer operations; maintains a patient data base, uses microcomputers for cardiac monitoring, & runs statistical programs on an IBM 3081; make recommendations regarding an optimal configuration, evaluate & implement sys to asst w/ offc mgmt functions; define I/O requirements for statistical programs; patient scheduling, trends & forecasting; staff allocation; patient billing; QUALIFICATIONS: strong sys analysis bkground; ability to interview users & analyze existing procedures, prep design proposals, & make recommendations regarding sys configuration; posses a familiarity w/ software packages such as word processing & mail; good commu skills.; C07; $2221-2875.

27196-VW (JCC:5544) STATISTICIAN II: 50%; prov statistical consultation to members of biobehavioral res team regarding use of statistical packages for analysis of data; act as data analyst in certain biobehavior res projs; act in consultation w/ faculty & participate in development of new statistical methodology incl lib res as well as theoretical & empirical res; involve writing reviews & reports of data fr various res projs; QUALIFICATIONS: training in statistics, preferably MA level incl exploratory analysis, nonparametric & multivariate tech; exp in design & analysis in biobehavioral res & in the use of statistical packages; computer exp & programming skills nec.; C07; $1111-1438.

15008-TC (JCC:5588) LIFE SCI RES ASST I: Basic function is the production & assay of monoclonal antibodies; cell culture; solid state immunoassays; direct & indirect immunofluorescence; analysis of antibodies & antigens by immunoprecipitation & SDS-polyacrylimide gel electrophoresis; inoculation of rodents w/ hybridoma clones; harvesting & purification of hybridoma antibody fr rodent ascites fluid; testing of antibody prep for sterility & freedom fr pyrogens, etc; QUALIFICATIONS: BS degree or equiv in training & exp; at least 1 yr of lab exp as a lab technician; prepared to work on an intermittently irregular schedule.; C05; $1756-2202.

Bargaining unit

26109-LL (JCC:5638) LIFE SCI TECH I: Inject mice w/ hybridoma cells & harvest growing ascites; care for mice used to produce ascites; maintain hybridoma cells in tissue culture; monitor hybridoma activity using ELISA assay & fluorescent cell scanner; maintain accurate & detailed records; setting up apparatus, maintenance & cleaning of glassware, hoods, genl lab work areas & eqpt; asst w/ unpacking, order & inventorying lab supplies; QUALIFICATIONS: ability to follow detailed instructions & keep accurate records; some lab exp essential.; A18; $7.50.

42607-TC (JCC:5844) ANIMAL CARE ASST II: TMS Unit; Mon-Wed & Sat-Sun, 7:30-4pm; prov conscientious daily care & maint to a variety of lab animal species as assigned, such as dogs, cats, primates, rabbits, rodents, reptiles, fowl & farm animals; required to coop & collaborate w/ other animal care workers, res tech, investigators, veterinary staff & mgmt; prov food & water to assigned animals; changing cages; observing animals for signs of illness, disease, injury & complete required reports & forms; QUALIFICATIONS: prefer extensive prior exp in care & maintenance of lab animals in an academic/res environ; requires manual dexterity, personal habits of cleanliness, neatness & organizational ability; capable of handling & restraining all species of lab animals w/out undue fear; some mech ability; thorough knowl of lab animal care, husbandry & tech at a level consistent w/ that required for AALAS certification at the LAB ANIMAL TECH level; ability to lift 50 lbs or more; physical exam required; free of allergic reactions to animals.; A16; $7.16.

43676-JB (JCC:3690) OFFSET PRESS OPR II: TMS Unit; 7-4; work w/ a variety of complex offset duplicating machines to duplicate multi-color & black/white charts, graphs, brochures, etc; clean & maintain rollers & machines as required; QUALIFICATIONS: exp in duplicating black/white & multicolor charts, graphs, brochures, etc.; A20; $ 7.91.

Nonexempt

149-PM (JCC:2470) OFFICE ASST IV: 50%; act as bldg & serv ctr mgr for Sch'l of Earth Sci; monitor Mitchell Bldg use for efficiency, safety, energy consumption, security, & genl maintenance; manage photocopy, lapidary, electronics, machine & drafting/photography shops; QUALIFICATIONS: typ 40; supvry exp or training; ability to organize & order prior; willingness to get involved w/ all aspects of the work to be done; some knowl of tech matters helpful; some knowl of SU helpful; send appl/resume to Ruth Sloan, 101 Mitchell Bldg.; B14; $720-757.

The sessions are open to all new employees without preregistration.

SLAC jobs

95523-JM (JCC:6492) LAB MECHANICAN III: TMS Unit; perform a variety of unusually complicated tasks in fabrication of precision instruments & microwave components; QUALIFICATIONS: requires full model maker skills; ability to work fr blueprints & sketches; be familiar w/ copper machining techniques; ability to operate all machine shop tools; familiar w/ standard shop practices; NC exp desirable.; A41; $2250. APPLY AT SLAC

94199-JM (JCC:2462) OFFICE ASST III: Assemble & prepare Invitations for Bids & Requests for Proposals, Addenda, Modifications; prep legal reports for Dept of Energy; draft routine corresp; issue keys & coord lighting maintenance; maintain files & logs; QUALIFICATIONS: requires prev offc exp w/ demonstrated initiative & good basic knowl of genl offc procedures, practices & methods; good interactive skills; knowl of good grammar, syntax & punctuation; ability to work indepednently & under pressure; typ 60; exp on IBM Memory (75) typewriter & word processing preferred.; B11; $1246-1310. APPLY AT SLAC

95555-JM (JCC:3790) GRAPHICS TECH II: TMS Unit; prep of tech illustrations to be used in professional journals conference proceedings & other publications; drawing, inking & leroy lettering of charts, graphs, mechanical drawings & assorted diagrams; leroy lettering mandatory; QUALIFICATIONS: knowl of physics terminology helpful; some exp desired at similar level or demonstrated ability to perform work; ability to work under pressure; good interactive skills.; A20; $1371. APPLY AT SLAC

95516-JM (JCC:2562) SECRETARY III: Prov sec'l serv to large group of physicists, engrs & support staff; typ forms, corresp & manuscripts using physics/engrg terminology on IBM Sel III or word processor; keep time reports, prep payroll, process misc forms; arrange mtgs; make appts; file & keep records; compile monthly status report; QUALIFICATIONS: several yrs sec'l exp; exp w/ tech typing (Greek & math symbols); ability to work under pressure & handle a variety of complex respon; ability to use word processor or willing to learn; typ 60; knowl of punctuation, syntax & spelling; willingness to use dictaphone preferred.; B14; $1440-1514. APPLY AT SLAC

95604-JM (JCC:1988) UNIV MANAGER IV: Full mgmt respon for production serv of a large scale scientific computing sys & support for distributed printing & computing (VM/370 on large scale IBM 3081 computers); manage operations staff; develop training programs & syllabus & evaluations procedures; respon for budget & hiring; QUALIFICATIONS: MS or equiv in Computer Sci or related field; extensive exp w/ VM/370 or CP/67, IBM printers sub-sys, COM, graphics devices & network eqpt required; strong tech knowl of IBM or PCM mainframe hardware & peripherals; detailed installation planning required; exp in programming, Assembly lang, FORTRAN, PL-1 or PASCAL.; C10; $3494-4330. APPLY AT SLAC

94721-JM (JCC:2296) PROG PLANNER II: Develop a cost acctg sys approp to klystron production; develop & maintain required reports on status of subassemblies, mat'l flow, tube starts, acceptance yields, etc; review time cards for proper use & accuracy; process daily input of product movement thru assembly & test; prov nec input for critical path network (CPN) needs, incl task definition & duration estimates; QUALIFICATIONS: college training, preferably w/ completion of BA degree or equiv in economics, acctg, business admin or related field; ability to conduct studies, formulate conclusions & recommendations; familiarity w/ cost acctg & CPN scheduling; several yrs exp in proj monitoring in an electronics/mechanical environ desirable.; C07; $2113-2750. APPLY AT SLAC

95546-JM (JCC:6492) LAB MECHANICIAN III: TMS Unit; perform a variety of unusually complicated tasks In fabrication of precision instruments & microwave components; QUALIFICATIONS: requires full model maker skills; ability to work fr blueprints & sketches; be familiar w/ copper machining techniques; ability to operate all machine shop tools; familiar w/ standard shop practices; NC exp desirable.; A41; $2250. APPLY AT SLAC

95524-JM (JCC:6492) LAB MECHANICIAN III: TMS Unit; perform a variety of unusually complicated tasks in fabrication of precision instruments & microwave components; QUALIFICATIONS: requires full model maker skills; ability to work fr blueprints & sketches; be familiar w/ copper machining techniques; ability to operate all machine shop tools; familiar w/ standard shop practices; NC exp desirable.; A41; $2250. APPLY AT SLAC

95184-JM (JCC:8638) S&E TECH - ELECTRON: TMS Unit; repair of multichannel electronics of large spectrometer; locate channels & schedule repair; layout & minor design of cabling & electronics; do electrical drafting; QUALIFICATIONS: AA degree in electronics (some physics) or equiv knowl of math thru algebra or higher; exp w/ large scale multichannel electronics sys; ability to do troubleshooting & repair; exp w/ use of LSI microprocessor & CAMAC; some layout & electrical drafting exp.; A28; $1647. APPLY AT SLAC

95517-JM (JCC:6646) SR S&E TECH - ELECTRON: TMS Unit; asst engrs in the development, testing, maintenance & troubleshooting of new & existing RF drive & phasing sys; design, assemble, test & repair new & existing electronic, electro-mechanical & microwave eqpt; QUALIFICAITONS: AA degree or equiv; several yrs exp in microwave industry; ability to demonstrate good basic knowl of microwave theory & practice; some knowl of electronic analog & digital circuitry required; competent in use of genl electronic & microwave test instruments; have skills in use of hand tools; some drafting skills desirable.; A34; $1901. APPLY AT SLAC

94780-JM (JCC:6646) SR S&E TECH - ELECTRON: TMS Unit; fabricate & test various & specialized electrical & electronic chassis & impromptu circuits for stand-alone or detector & machinery monitoring & control or computer interfacing fr sketches & verbal instructions; integrate chassis'/circuits w/ other devices & computer sys; maintain & repair monitoring, control & safety sys; QUALIFICATIONS: AA degree in electronics or equiv; college tech course or equiv military serv sch'ls in electronics; specialized exp in cryogenics, photography & optics desired; genl shop skills; knowl of & exp w/ digital I.C.'s, transistors, relays, transformers, etc; good interactive skills.; A34; $1901. APPLY AT SLAC

94717-JM (JCC:6406) SCI & ENGR ASSOC I: Supv testing of klystrons & test stand operation; coord activities of test stand operators on three daily shifts; set up test programs & specify procedures to be followed by the various crews; develop acceptance & rejection criteria for new line of klystrons & revise methods used in testing existing types of klystrons; recruit & train new personnel; QUALIFICATIONS: AA degree or equiv required; familiarity w/ test methods commonly followed for high power microwave tubes; understand operation of high power modulators & associated electronics; exp w/ microwave measurement tech.; C99; $2500-3000. APPLY AT SLAC

95383-JM (JCC:8880) Mechanical Engr: Mechanical design & analysis of components & sys for the linear collider proj involving stress, heat transfer, vibrations, electro-magnets, vacuum & cryogenics; follow-up of fabrication, procurement, assembly & installation of components & sys; QUALIFICATIONS: BSME or equiv; knowl of mech design, stress analysis, heat transfer analysis & shop practice desirable; serveral yrs related exp.; C99; $2000-2700. APPLY AT SLAC

Rental housing

HOUSING AVAILABLE

□ **End of Sept. '84 to Apr. 1, '85 (flex):** Furn. 3 or 4BR/2 or 3BA campus hse. Nonsmokers, cat lovers (must care for res. cat) can be seen up to Aug. 20, '84. Call 326-3842. Thereafter write Prof. Tuttle, Mathematics Dept., Amherst College, Amherst, MA 01002.

□ **Beg. Sept. '83 for 1 yr:** Fully furn. 3BR/2BA Eichler w/frpl. 10 min. to Stanf., nr. schools, pet poss. $1200/mo. util. extra. 1st & last mo. dep. req. Call Susan, (415) 494-2196.

□ **NOW:** 3BR/2BA 2 story hse. in Palo Alto. Corner lot, AEK, microwave, DR, den, lrg. LR, 2 car garage, brick patio, yrd. w/grdn (grdnr paid). Xclnt sch. dist. Min. 1 yr. lease (pref. 2). Dep. req. Call (415) 324-9193.

□ **Aug. 27 to Oct. 16:** Short term, completely furn. 1BR and den/2BA Oak Creek apt. Ref. req. $1250/mo. Call (415) 328-6189.

□ **Sept. 27 to Nov. 20:** Fully furn. campus hse. Grdnr & cleaning woman provided. Reasonable rent in exchange for pet care. Pref. single or cpl. Call 494-3000 or 857-0674.

□ **Aug. 21 to Sept. 25:** 2BR/2BA Peter Coutts condo. Study, pool, jacuzzi, car, $900/mo. Call 497-0833 day; 493-6273 eve & wknd.

□ **Dec. '83 to Dec. '84:** Fully furn. 5BR/2½BA hse. in Stockholm, Sweden. EXCHANGE for similar in Stanf. area. Write Prof. L. Bergdahl, Thoracic Surgical Clinic, Karolinska Sjukhuset, S-10401, Stockholm, Sweden.

□ **Aug. 28 to Oct. 31:** Furn. 2BR, full study adult Atherton hse. $1500/mo. Call Dr. Arnold, 321-4121, ext. 387.

□ **Now:** S. Lake Tahoe Vacn/ski hse., furn. 2BR, frpl, color TV, phone. Adj. Nat'l Forest. Walk to lake, Tahoe Keys. $120/wknd, $200/wk (5 days). Call Janine 497-2501 day; (408) 739-3141 eve.

□ **Now:** Clean, unfurn. 3BR/2BA hse. AEK, frpl, lrg. enclosed patio, 2 car garage. Menlo Pk. Bus to Stanf., SRI, USGB. 1 yr. lease. $875/mo. incl. grdnr. Call (408) 484-9159.

□ **Beg. Sept. '83:** 2BR/2½BA twnhse. W/D, lrg. ktchn, sep. DR, sunken LR, wet bar, 2 car garage, priv. patio, pool and jacuzzi. 15 min. to Stanf. Perfect for cpl./cpl. & child. $1100/mo. Call 961-8364.

Ride sharing between Santa Cruz and Stanford Tues. and Wed. 9-5 (flexible), call Andy Carman at 497-6341.

How To College providing big payoff for three fun-lovers

Three Stanford liberal arts graduates have struck paydirt by poking fun at the preppies.

Their self-published book, *How to College: A Humorous Guide to the Four Years* has gone into a third edition after selling 50,000 copies.

Bill Jeakle, Eugene Reardon, and Ed Wyatt spent thousands of tuition dollars researching this subject. Trying to make "all those all-nighters and frat parties pay off," they carefully compiled results on a campus computer.

Disaster loomed when administrators discovered 30 accounts had been created for a petroleum engineering class in which only a handful of students were actually enrolled. The computer files included depth reports on beer drinking, dating, and similar collegiate subjects.

Before the accounts were frozen and the files erased, editorial colleagues "put on trench coats and sunglasses" and using what Jeakle describes only as "student know-how" obtained copies of their creation suitable for a print shop.

After raising money from friends and family, the students launched The Primer Press to produce and market their college guide.

Parents and high schoolers were duly warned that the college choice "will affect your every resume, date, and cocktail party for the rest of your life.

"Be careful. There's nothing worse than a boring cocktail party."

When choosing a college, they advised, "You must take all the factors into account: reputation, number of the opposite sex, libraries, number of the opposite sex, post-graduate placement record, and number of the opposite sex."

To ease the pressure a bit, they added, "if you picked at random, you'd probably

be happy, so don't take the decision too seriously."

So far, their advice has stood the test of both the marketplace and a cross-country tour of more than 50 campuses.

"A lot of people are more vocationally oriented and concerned about getting jobs after college, than when we were at Stanford," says Jeakle, a 1982 graduate.

"It's funny. Because of that, they party a lot harder. They seem to have more to forget.

"We used to sit around with beer and pizza, and call it a meaningful philosophical discussion." Travelling from one fraternity house to another, the Stanford entrepreneurs often had to sleep through parties or found their brethren still celebrating as they went out the door to promote their books early in the morning.

"Being new publishers is both a boon and a bane," Jeakle says. "People don't know if you're really serious. They put you on hold.

"But when you're persistent, they give you a break. When that happens, the book usually sells." Hundreds of copies were snapped up at both the Stanford and Harvard Bookstores, the focal points of several new student entrepreneurs.

"We learned the hard way you don't get paid for books until 90 days after they're sold," Jeakle says. We had practically no money when we started, so we had to keep the rent low." The total after several months on the road was only $9.40 for a single night when the entrepreneurs realized they simply wouldn't be able to sleep through a fraternity luau at the University of Minnesota. They moved to a commercial camp instead.

"It's been a real business course for us," Jeakle says. The students are getting into distribution with Waldenbooks and into publicity with Glamour and Playboy.

Things are looking up. "We're not driving a Rolls yet, but we're turning a profit and can drink beer and eat popcorn for the rest of our lives," says Jeakle.

"We enjoy doing this. We're kind of astounded at the results so far. We were asked to New York by a publisher early this year, but there was so much time and red tape involved we decided to continue on our own." Another humorous "how to" book is now in the planning stage.

The advice offered in jest to worried parents and prospective collegians works out well in practice, he adds. "No matter what college you pick, you get a lot out of it. Everyone thinks their college is best.

"Parents shouldn't prejudice the choice. They put a lot of pressure on kids to pick certain schools. But students usually end up liking wherever they are."

For those who can't find or won't wait to discover *How to College*, copies may be ordered at $5.95 each, plus $1 postage, from The Primer Press, 12 Sherman Bridge Rd., Wayland Mass. 01778.

31194-PM (JCC:1755) LIBRARY SPEC II: 50%; fixed term 9/1/83-8/31/84; performs duties in Genl Reference Dept; searching & verification duties; prov clerical support in completing forms such as transfer, cancel conservation forms; retrieves & charges mat'ls, both fr the STK & other campus libs; typ & photocopies bibliographic instruction mat'ls; compiles statistics; typ corresp, etc; QUALIFICATIONS: typ 40; ability to learn a variety of sys & procedures; prev public serv exp; prev lib exp; bkground in Social Sci & exp in a univ or res lib desirable; contact Bob Johnson, Green Lib, Rm 223, (497-3152).; B12; $655-687.

31195-PM (JCC:1755) LIBRARY SPEC II: 50%; performs duties in the Music Cataloging Unit of the Catalog Dept; searching, distribution & maintenance of manual sys for matching cataloging copy w/ music scores & sound recordings for which no copy was found upon receipt, incl main entry & form of music uniform titles for each title so as to match acquisitions slips w/ incoming LC cards; alphabetized & files LC cards by main entry for scores & sound recordings; prep mat'ls for bindery; inputs printed copy or original cataloging worksheets for books, scores, sound recordings in 3 different MARC formats & RLIN files; QUALIFICATIONS: typ 40; prev lib exp; knowl of music as a scholarly discipline & a performing art; ability to learn AACR2 rules of entry & construction of uniform titles for music; ability to learn MARC tagging for music in 3 formats; ability to learn RLIN; reading knowl of 1 non-English Western European lang; contact Bob Johnson, Green Lib, Rm 223, (497-3152).; B12; $655-687.

35883-BP (JCC:2454) OFFICE ASST II: 9/1/83-5/31/84; 10-4; Receptionist in 12-person office; handle busy 5-line phone system; receive visitors; convery Univ & Dean of Student Affairs info; schedule meetings; advise students on procedures for filing leaves of absence & provisional registration; daily mail distribution; key operator for XEROX; prepare monthly report for Xerox billing; perform various clerical duties; QUALIFICATIONS: Type 50; able to win cooperation from faculty, staff, students; excellent phone & interpersonal skills; perform basic arithmetical calculations; knowledge of variety of standard office procedures; previous office exp; Apply to N. O'Leary, 323 Old Union, Stanford, CA 94305.; B09; $712-749.

27502-PM (JCC:2454) OFFICE ASST II: 50%; maintain Financial Aid Offc filing sys; serv as bkup reception/phones; photocopy, collate & distribute mat'ls; typ forms fr budget sheets; hand-carry forms to campus; collect data for reports; distribute forms in student mailboxes; QUALIFICATIONS: typ 50+; meticulous atten to detail; ability to deal w/ pressure; ability to relate effectively w/ students & staff in person & on phone; ability to perform many diverse tasks punctuated w/ interruptions; send appl/resume to Nancy Smith, M127, School of Medicine.; B09; $565-595.

21757-BP (JCC:2454) OFFICE ASST II: Prov support to Administration & Records unit of CPPC; facilitating student registration process & providing assistance by answering questions relating to employment & Grad Sch'l application process; prov bkup support for daily operations; collecting registration fees, maintenance of fee log & budget expense log; typing routine forms & itrs, photocopying, filing & order confirmation & spec projs as assigned by supvr; QUALIFICATIONS: typ 50; good organization & recordkeeping skills; ability to win coop fr diverse group of students, alumni, staff & faculty; send appl/resume to Valarie Thomas, CPPC.; B09; $1130-1189.

42779-PM (JCC:2462) OFFICE ASST III: Answer phones; take messages & sort & distribute mail to res lab; prov sec'l serv for res lab; operate Xerox Word Processor for reports, corresp, grant proposals, mailing lists, etc; act as a resource person in ordering supplies, training others to use the word processor; order lab, offc & any other supplies nec; organize & update res accts for ordering, grant awards, travel, budget statements; keep time sheets for hrly employees; typ grants, annual reports, manuscripts, & learn how to use IBM memory typewriter; act as key operator for dept copy machine; QUALIFICATIONS: typ 60; good typing & offc skills; learn or use of Xerox Word processor; aptitude for figures; ability to work w/ both Stanford & VA accts, personnel, work orders & req; send appl/resume to Dr. Ferid Murad, VAH A610 (111) Dept. of Medicine, VA Hospital, Palo Alto, CA 94304.; B11; $1246-1310.

27296-PM (JCC:2562) SECRETARY III: Prov sec'l support to Asst to President; distribute large volume of daily mail; handle & refer phone calls fr Trustees, faculty, admin staff & students; maintain files & distribute info concerning Board of Trustees; plan & schedule meetings; handle heavy calendar scheduling for Trustees & other mtgs; use NBI word processor for corresp & retrieval of info; typ corresp fr drafts; compose routine corresp; take minutes & prov staff support for various mtgs; monitor & reconcile budget acct; prep Univ acctg forms; proofread Board of Trustee minutes, agenda & documts; QUALIFICATIONS: typ 60; excel sec'l skills; good judgmt in handling confidential & sensitive mat'l; good organizational skills; knowl of word processing desirable; send appl/resume to Elaine Gloystein, Bldg 10, President's Offc; B14; $1440-1514.

30457-PM (JCC:2596) SECY II-SPEC: 50%; 11-4pm; sec'l duties for res group of approx 20 people incl faculty, staff & grad students; typ corresp (tech & non-tech); tech typing of manuscripts for publication; thesis & classroom typing; tech reports; prep of Univ forms; handle budget statements & check for correctness; answer phone; open mail; filing, etc; QUALIFICATIONS: typ 65; sec'l exp required, w/ tech typing exp preferred; knowl of Univ procedures helpful; send appl/resume to Dena Polyhronakis, Varian Bldg., Room 108.; B12; $655-687.

42503-PM (JCC:2596) SECY II-SPEC: Full sec'l serv for one Doctor & his research staff; receptionist & telephone answering; open, sort & organize mail; answer routine corresp, memos; make appts & keep calendar for supvr; travel arrangements; typing of corresp, protocols, manuscripts, grants/contracts; knowl & advise on Univ policy w/ regard to budget statements, financing; order & authorize requisitioning of lab supplies, offc supplies, subscriptions & publications; asst in prep of preliminary budget info for grant & contract proposals; use Lanier transcriber, Xerox Memorywriter, Xerox 860 word processor; QUALIFICATIONS: typ 60; excel verbal & written skills; knowl of genl offc procedures; exp at Stanford desired; med & scientific terminology desired; knowl of WYLBUR; good typing skills; contact: Shirley Coles, 497-7423.; B12; $1310-1373.

Krasnyansky, Cherkas, show work at union

Works by former Soviet painters Anatol Krasnyansky and Constantine Cherkas will be shown in Tresidder Union through the month of August.

A reception for the artists will be held from 3 to 5 p.m. Sunday, August 7, at the Union.

Cherkas, born in Moscow in 1919, has been called a Russian Rouault. Indians often appear in his American western scenes because they blend so well into the American landscape.

Krasnyansky, born in Kiev in 1930, works primarily in watercolor, with excursions into oil painting. His work is a return to a more romantic era, echoing childhood dreams and fairytales.

Both artists have exhibited in the U.S.S.R. and other European and Asian countries as well as in the U.S.

Right: 'Sunset on roofs in Tallin' by Anatol Krasnyansky, part of the exhibition at Tresidder.

S.U. Press publishes letters of Trollope

The Letters of Anthony Trollope (1815-1882), one of the great writers of the manners and morals of Victorian England, has just been published by the Stanford University Press (cloth: $87.50).

Edited by N. John Hall, professor of English at Bronx Community College and the Graduate Center, City University of New York, the two volumes contain almost 2,000 annotated letters that show Trollope in all of his diversity: as the enormously prolific writer of *Barchester Towers* and many other works, as friend of some of the era's most famous writers, as government official (he worked for the British Post Office), and as traveler to the U.S.

The letters, many of them previously unpublished, chronicle his daily life and show him commenting upon his own work.

In an exchange with a publisher he writes, "It is hardly possible for a novelist who depends more on character than on incident for his interest always to make the chief personages of his stories pleasant acquaintances. His object is to show what is the effect of such and such qualities on the happiness of those on whom they act; and in doing this he can hardly contrive that a nice young man should always be there to be married to the nice young woman."

To an unidentified correspondent who pointed out certain errors in *The Last Chronicle of Barset*, he wrote, after acknowledging his errors:

"But I console myself with thinking that a novelist, in dealing as he must do, almost necessarily, with many affairs of life, with many professions and with various trades may be excused, perhaps, the blunders if his pictures are generally true.

"Not to be false in sentiment, not to be untrue to nature, not to be dull, not to be grandiloquent, not to be injurious in his teaching, not to be immoral in his pictures—these I think should be his attempts. Do not suppose that I think myself to have been successful in all, or always in any."

Create your own image at Tresidder!

Art and fashion expert Shelley Komarov will present a "Create Your Own Image" seminar from 7 to 10 p.m. Monday, Aug. 15, at Tresidder Union.

"My seminar approaches today's fashions from conceptual, historical, and practical directions," she says.

"I won't tell people what to wear. Instead I will show how individuals can link their own personality to a style—how they can pick, then project, a specific dramatic image through fashion."

Drama is an important aspect of Komarov's seminar. She earned master's degrees in fine arts and economics in Leningrad, U.S.S.R., and became an award-winning fashion and costume designer in her native country.

As a costume designer, she created for the Leningrad Ballet, stage and motion picture productions. At the same time, she taught fashion design and history at the Leningrad Design College.

Komarov left the U.S.S.R. in 1978 and has been successful as a designer and partner in an art gallery in Los Angeles.

Shelley Komarov

To enroll in the seminar, send a check for $30 to Tresidder Union, Room 270. For more information, call ext. 7-9671.

Stanford Tennis School begins Aug. 15

The famous annual Stanford Tennis School, with Coach Dick Gould, will offer two sessions this summer, August 15-19 and August 22-26.

Classes will be three hours daily: mornings 9 a.m. to noon for adults, afternoons 1-4 p.m. for youths or adults, and evenings 5-8 p.m. for adults.

The registration fee is $125. For more information or to register contact Gould at 497-1160.

Buhler's art at H&S till Oct. 15

Paintings and prints by Walter Buhler of Palo Alto will be exhibited in the School of Humanities and Sciences, Building 1, from August 15 until October 15.

Buhler's works often reflect summer travels in the Bay Area, Oregon, the Midwest, and Switzerland, where members of Buhler's family still live.

The artist travels with sketchbook in hand and works from these sketches when he returns to Palo Alto where, for the remainder of the year, he is the chairman of the art department at Palo Alto High School.

Buhler describes his work as "somewhat realistic," but is not aiming for photorealism. He paints things he wants to "hold on to."

His early interest in architecture is expressed in paintings of buildings and places—some from the small Midwestern towns where he spent his childhood, others of Oregon seaside communities and still others of buildings closer to home in Palo Alto where the Buhlers have lived for 20 years.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the two weeks in which the events occur. The next deadline is Wed., Aug. 17 to cover the week of Mon., Aug. 29 through Sun., Sept. 12. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

LATE ANNOUNCEMENTS

Sunday, August 14: Evensong service. A Jacobean choral evening service presented by Cantabile. Music and liturgy of the period will be used. 6:30 p.m. Memorial Church.

SUNDAY, AUGUST 21

University Public Worship: Preacher: R.G.Hamerton-Kelly, Dean of the Chapel. 11:00 a.m. Memorial Church.

WEDNESDAY, AUGUST 24

Stanford Physicians for Social Responsibility: "TheLast Epidemic". This film will be shown several times before the PSR-sponsored symposium in October. 8 pm. Common Rm, 3rd floor, Women'sClubhouse. Free.

SUNDAY, AUGUST 28

University Public Worship: Preacher: Ernle W.D.Young, Associate Dean of the Chapel. 11:00 a.m. Memorial Church.

EXHIBITS

"Propaganda Posters of Two Revolutions". Featuresover 40 posters from the Russian Revolutions and Civil War,1917-1922, as well as the German Revolution of of 1918-1919 and theGerman elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover MemorialExhibit Pavilion. June 8—Jan. 31.

The Art of Literature: California Authors and TheirPrinters. A retrospective look at California literature andfine printing, 1860 to present. On the occasion of the firstAmerican conference of Assn Typographique Internationale. Rotundaand Gallery: Green Library. Aug. 1—Oct. 5.

Photographs by Ann Sconberg. Coffee House Gallery,1st. Floor of Tresidder Union. Aug. 1—Aug. 31.

Show and sale of paintings and lithographs by variousartists from the Komarov Gallery. Upper lobby, Tresidder Union.Aug. 1—Aug. 31.

CAMPUS REPORT

Volume XV, Number 43 | A publication for Stanford University faculty & staff | August 24, 1983

'A' parking permit fees to rise $25

Stanford University faculty and staff will have to pay $25 more this year for "A" and "E" parking permits, according to new rules issued by the Stanford Committee on Parking and Transportation.

Effective Sept. 1, fees to park in convenient "A" spaces will rise from $75 to $100. Less convenient "C" parking, Escondido Village, and student housing parking will remain $20, while service vehicle permits will rise to $120. All current stickers are due to expire Sept. 15.

Parking fines have also been raised from $7 to $10, according to a new Santa Clara County ordinance.

Mason Yearian, professor of physics and chairman of the Committee on Parking and Transportation, attributes the price hikes to inflation and increased expenditures for an improved Marguerite Shuttle serivce which will begin operation this fall.

"The increase really should come as no surprise," Yearian notes. "It is the first permit price increase since 1980-81.

"The committee took great care to keep the cost of 'C' stickers down," he adds.

Those who pay for "A" stickers this year will find it easier to get spaces,

Representatives of the Shanghai Museum spent a day touring the Stanford Museum recently with Patrick J. Maveety, curator of Asian Art at Stanford. From left to right are Li Junjie; Zhu Mon'ling; Gail Inlander (Asian Art Museum, San Francisco); Zheng Wei, curator of the exhibition Treasures from the Shanghai Museum—6,000 Years of Chinese Art; and Zhou Xiuqin with Maveety. The visitors were impressed by the generosity of the Stanford family's gift to the good of humanity.

Six university presidents call for public school support

Six presidents of the nation's leading research universities, describing themselves as "partners and advocates" for the public schools, have suggested 10 ways academic institutions can forge stronger school ties.

The first concerted university response to the flood of reports critical of the schools followed a three-day conference organized by Presidents Derek Bok of Harvard and Donald Kennedy of Stanford with leading education school deans and other experts at Pajaro Dunes Aug. 14-16. The top-level meeting was believed to be the first of its kind in about 80 years.

The presidents, who included Hanna H. Gray of Chicago, Robert McNeil of Wisconsin, Harold Shapiro of Michigan, and Michael Sovern of Columbia, sounded more supportive of the schools and more concerned with their financial support than several of the recent reports.

In a joint statement the group said:

"Over the past two decades, substantial progress has been made in improving access to our system of public education and in improving the academic achievement of younger children. Our next task is to press for continuing gains in achievement, without sacrificing our accomplishments in educating all of our young people. . . .

"Federal support, as well as assistance from state and local government, will be essential for real improvement."

They added "the American public has, as it should have, high expectations of the schools. Recent reports, including that of the National Commission on Excellence in Education, have crystallized a general conviction that the schools are not doing as well as they might, and that they need improvement.

"We agree; but we also emphasize that as a nation we ask a great many different things of our schools, and often fail to provide them with the resources to fulfill our expectations.

"Responsibility for the well-being of the schools is not localized in society, but widely distributed. Government at all levels must assert a responsibility."

Because of the diversity among universities, "it is impossible to write a prescription for our institutions' commitment to the schools. But each university should look to activities such as the following, and choose those appropriate to its capabilities:

- "Strengthening existing affiliations with elementary and secondary schools, or initiating new ones;
- "Making improvements in educational practice through collaboration of university faculties with the schools;
- "Improving teacher education programs, including opportunities for helping classroom teachers;
- "Providing opportunities for the continued professional development of superintendents, principals, and other school leaders;
- "Sponsoring special programs on campus for enriching the experience of students and of school personnel;
- "Emphasizing research programs that are aimed at deepening understanding of education and at the improvement of teaching and learning;
- "Encouraging institutional and faculty participation in collaborative curriculum development projects;
- "Encouraging our own students to consider devoting part or all of their lives to teaching;
- "Emphasizing the importance of teaching in the schools by recognizing

People

Pacific Basin discussed

National Security experts gather at Hoover conference

Sixty national security experts, high Navy officers and ambassadors met Aug. 15-17 at the Hoover Institution for a conference on the security concerns in the Pacific Basin.

The objective of the conference, according to the Hoover Institution Director W. Glenn Campbell, was to bring together the best of scholarship and statesmenship to address those problems. Campbell noted that the conference represents one of many events of the Institution's program on National Security Affairs.

Conference organizer Claude Buss said that among the participants Admiral Bobby R. Inman, former Deputy Director of Central Intelligence; Admirals Lloyd Vasey and Thomas Hayward; former American ambassadors James Hodgson and U. Alexis Johnson, the ambassadors from Thailand and South Korea to the United Nations; and the Head of the Strategic and Defense Studies Center at Australia National University as well as a number of Hoover scholars.

The participants shaped their remarks with a view to suggesting policies that will contribute to the maintenance of peace and stability while providing the maximum opportunity for growth and economic development in the Pacific region.

Keynote speakers included Dr. Paul Wolfowitz, Assistant Secretary of State for East Asia and the Pacific, and Admiral R.L.J. Long, who retired in July as U.S. Commander in Chief, Pacific. Admiral Long, whose recent former command encompassed over three hundred thousand personnel and an area of half the earth's surface, stressed in his opening address to the conference what became a recurrent theme among the experts.

They pointed to the increasing importance of the Pacific Basin to vital security and economic interests of the United States, which is a major member of the Pacific community. The United States trades more with the Asia-Pacific region than with any other region on earth.

Another of the main themes dealt with the expanding military and naval presence of the Soviet Union in the Pacific Basin. The Soviet's Pacific fleet is now the largest of the USSR's navy, and along with Moscow's land-based military build up and missile deployment in Asia, constitutes a growing security threat to the region. Many of the prominent scholars, naval officers, an diplomats addressed the issue of how the United States and its Pacific allies can effectively ensure a balance of power in the area. They presented assessments of the current situation in Pacific countries and set forth recommendations on political and military policies for such pivotal countries in the region as Japan, Australia, New Zealand, the Philippines, and the Republic of Korea as well as the United States.

Frans Alkemade

Alkemade wins Kodak's Kinsley trophy

A Stanford optomechanical specialist has been awarded the Eastman Kodak Company's Charles A. Kinsley Memorial Trophy for the best three nature prints entered in the 1983 Photographic Society of America Intenational Photography Competition.

Frans P. Alkemade received the trophy for his color photographs "Sunset in Yellowstone," "Geyser Country," and "Spring in the Redwoods." Last week at the PSA's annual convention in San Francisco.

The trophy is given in recognition of the three best photographic entries in each of 10 categories, including color slides, nature slides, and nature prints, pictorial slides, pictorial prints, photojournalism slides, photojournalism prints, photo travel slides, stereo slides, and motion pictures. The exhibition, considered the biggest international competition of its kind in the world, featured entries from 50 countries.

"A winning photograph has to have impact—it could be striking colors, a moody scene, something unusual. It must do something emotionally to you one way or the other," Alkemade explains. "It also must be technically perfect."

Alkamade has been interested in photography for the past 20 years, first photographing people in his native Holland and later in Paris. He became interested in nature photography after immigrating to the United States in 1964. Since then he has won numerous awards at various local and international exhibitions, including Best of Show and Best Composition at the Santa Clara Valley International Exhibition.

Alkemade has been a science and engineering associate in the Department of Physics at Stanford since 1966. A number of his photographs are on display on the second floor of the Varian Physics Building.

Aerospace R.A. applications sought

RESEARCH ASSOCIATE: A position is open for a research associate to continue research on propulsive flows and on thrust augmentos in particular. Applicants should be of at least Ph.D. standard with postdoctoral experience in aerodynamic analysis of high lift systems and viscous-inviscid interactions in thrust-augmenting devices. Solid background in the area of theoretical fluid mechanics is essential. Experience in the application of nonlinear optimization to aerodynamics is also required. Applicants should be capable of formulating and organizing a long-term research program. Salary will be in the range $31,000—$33,000 per annum depending on applicants' qualifications and experience. Please send resume and names of at least two references to Mary C. Clark, P.O. Box 5816, Stanford, Calif. 94305.

Stanford University is committed to equal opportunity through affirmative action and we are especially eager to identify qualified women and minority candidates.

Wayne Ross

Wayne Ross, property administrator for the Controller's Office, will retire August 31 after 21 years at Stanford.

Ross came to Stanford in 1962 after 20 years in the U.S. navy. Starting as assistant supervisor in Accounts Payable, he soon became supervisor and later took over responsibility for the Travel Section.

In 1979 Ross spent seven months as acting business manager in Athletics, then became Stanford's property administrator, with responsibility for all the capital equipment on campus

John B. Dunlop

John B. Dunlop, professor and chairman of the Department of Germanic and Slavic Studies at Oberlin College, has been appointed senior fellow and associate director for library and archival operations at Stanford Hoover Institution, effective August 1. He was a national fellow at the Institution in 1978-79.

As one of three associate directors, Dunlop will oversee the operations, maintenance and development of the Institution's world-renowned library, which contains more than 1,500,000 volumes documenting political, economic, and social change in the 20th-century.

He will be responsible for the Institution's Archives, which houses one of the largest private collections of historical materials in the U.S. The Archives contain 4,475 separate collections.

Dunlop has an extensive background in the history and literature of Russia as well as in Slavic languages. He received his B.A. degree from Harvard University and his M.A. and Ph.D. degrees from Yale University.

Prof. Jean Mayers in his office, with mementoes of his long career in astronautics.

'Mother' space platform designed by Stanford grad students

Aerospace organizations are studying with interest a projected flotilla of spacecraft for the 1990s, designed by 40 graduate students at Stanford in the School of Engineering's space engineering course.

The conceptual plans call for a "mother" platform, with perhaps as many as eight to ten co-orbiting satellite spacecraft, all unmanned, and a "space tug" to maintain support among the group pending shuttle visits.

First publicly displayed at a June unveiling on campus, when it was watched over closed-circuit TV by representatives of NASA and several leading space organizations, the project, called Pleiades, has since received growing interest.

"No negative comments have been received," said Jean Mayers, professor of aeronautics and astronautics at Stanford, in a campus interview. "No one has questioned the feasibility of the concept."

Mayers has been the driving force behind the project, together with Profs. Peter Banks and John Breakwell and Assoc. Prof. Bruce Lusignan.

Mayers has spent 35 years studying the problems of flight systems in the atmosphere and outer space. he was a principal figure at Sperry Rand in developing and producing the U.S. Army's Sergeant missile, and he played a key role in providing technical guidance to the U.S. Army from 1963 to 1971 in connection with the overall design and testing of the structural aspects of the high-performance, high-reliability Spring ABM system.

Among those represented at the public showing and critique in June were NASA, Lockheed, Hughes, Rockwell International, and TRW. Among those who had lent support during the period of creation were NASA, Astro Research, General Dynamics, Ford Aerospace, Jet Propulsion Laboratory, Lockheed, and TRW.

"This space flotilla was not created to meet any specific requirements suggested by outside organizations," said Mayers. "It was the group's response to what it thinks scientists will want as a base for their future experiments in space, eommencing in the 1990s."

Mayers agreed that several other organizations had published plans for space platforms, but pointed out the unique features of the Stanford project's design. "It is neither a single space platform, nor a manned platform—it is a platform system consisting of a central or coordinating platform with dependent co-orbiting free flyers.

"Our Pleiades system answers the problem of how to conduct high-quality space experiments at lower cost, including those that must be isolated either due to size considerations or because of the requirement for a low-disturbance, contamination-free, and unobstructed-field-of-view environment. That is why certain experiments have been separated from the central platform and placed in co-orbit as free flyers.

"Our team claims that our system is unique, and that scientists will opt for this basing concept. The co-orbiting spacecraft will have separation distances of up to 100 kilometers, but will use the coordinating platform for data processing and communication through geosynchronous relay satellites with ground-based facilities.

"The co-orbiting 'daughter' platforms, which are structural replicas of the repeatable units forming the central platform, only have the ability to communicate with the 'mother' platform, which in turn sends the processed data to a geosynchronous satellite for transmittal to the ground facility.

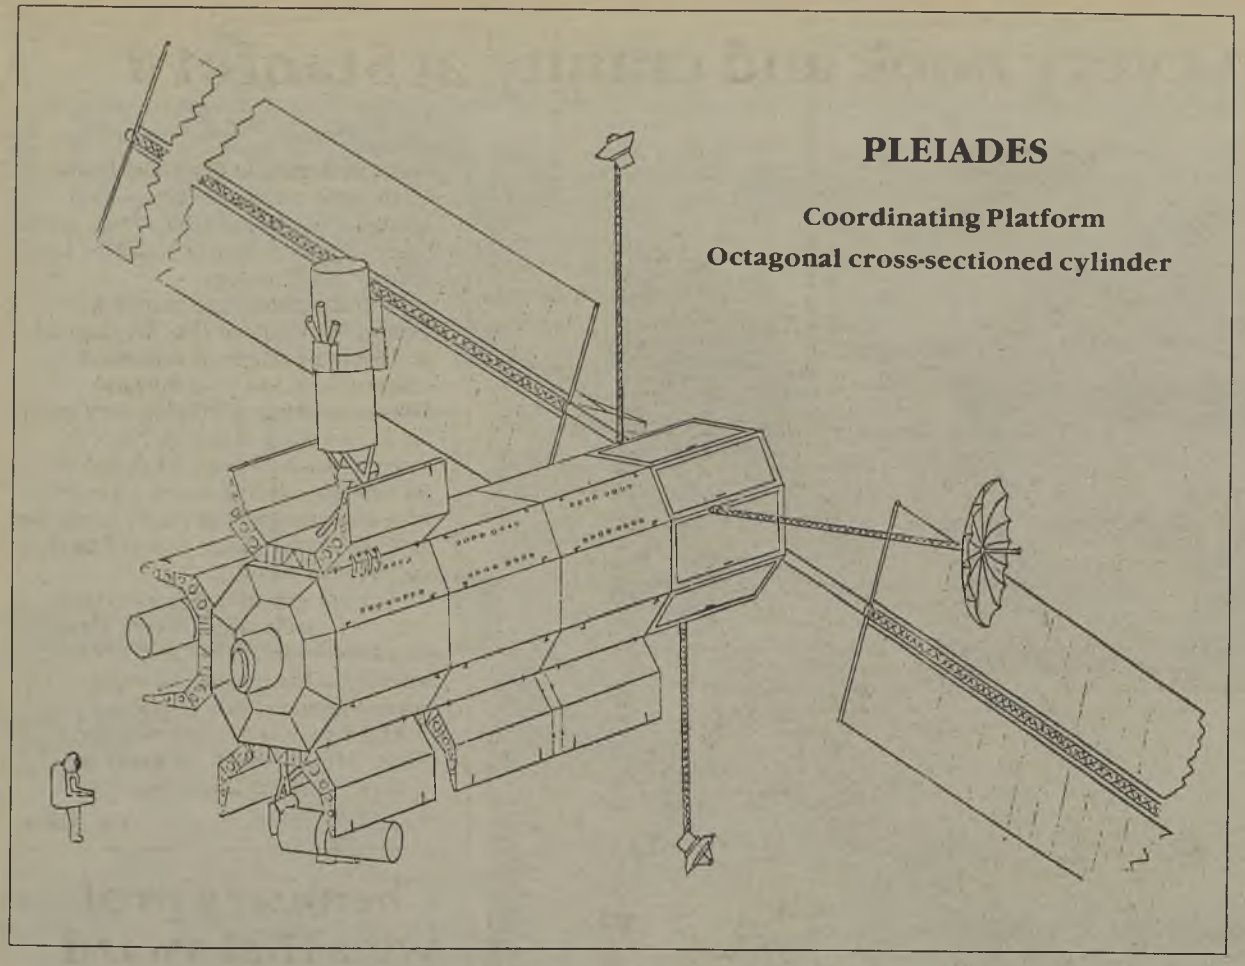
Our concept provides the inviting opportunity to increase experiment quality and decrease cost, which normally are conflicting requirements.

"By the 1990s, scientists will need to have a space platform system compatible with their demanding requirements. It would be accessible to scientists in universities, industry, and government there in the U.S., as well as to their counterparts in the international community."

Mayers says that Project Pleiades should prove to offer a more practical option to the experimenter. Also, the cost would be considerably less than basing on a manned platform that is only partly dedicated to accommodating the science mission.

The project would, of course, require stable funding, but in terms of the benefits it would bring, its probable development costs of a maximum of $200 million a year would be well worthwhile.

"It would provide an essentially unlimited facility in terms of lifetime and availability," said Mayers. "It could be the seed of a coherent plan for multidisciplined scientific investigation free of Earth's atmosphere."



The flotilla would be maintained in the same orbit, be compatible with shuttle service, and have limited repair facilities via the service vehicle, a free-flying teleoperator, which travels to and fro between the central platform and the co-orbiting spacecraft. Visits from Earth to the flotilla by the shuttle would be necessary only every six months, or longer periods up to two years. The centralized mission control center would be on Earth with a data distribution center and a constant monitoring system.

The capability for five major scientific experiments is envisaged on the central platform; these would be the ones that do not require isolation. Those experiments which require absolute isolation would be placed on the co-orbiting platforms.

Asked what would happen when the orbit pattern of the flotilla decays, Mayers replied: "There will be reboost capabilities so that all the components can be kept in position. Admittedly, this is a challenging system problem but hardly an insuperable one.

"All satellites have to be continually corrected in order to maintain correct orbit. When this is done with the flotilla, it should stay in orbit for at least 20 years, given shuttle transportation and changeout

continued on next page

Mayer/ continued from page 3

capability, as well as the ability to provide for refueling, refurbishing, and repairs."

Won't the free flyer experiments become contaminated by a visit from the "space tug" or the shuttle? "No, if necessary, the experiments would either be afforded protective devices in sensitive areas or be turned off temporarily."

Mayers is careful to say that Pleiades will probably not be the next step in man's exploration of outer space. "Logically, it should be, but the next step appears to be the manned station that is being planned by NASA.

"The difficulty with that will be that the presence of humans will inevitably introduce increased cost and complexity into the system design, and tend to compromise the many sensitive scientific experiments requiring a benign environment.

"My experience over a long period in association with complex flight vehicle systems is that one has to attack the design problem with a building-block approach, rather than pursue the high-risk path, particularly when funding, schedule, and performance requirements are all critical.

"An unmanned station is the most suitable next step for achieving high-quality space science experiments, not the least of which would be the use of the science platform as a test bed for ultimate design of the much larger space station.

Remember that there is no precedent for a large structure in space, and that such a structure would have to be successful on the initial mission. The Pleiades platform is constructed on the ground and is strong enough to accept both launch and aborted-mission loads, and stiff enough to meet dynamics requirements in space, both for the science experiments and the control system.

"A decision by NASA to go for a manned station raises enormous difficulties, including finding the huge funds required. It will need an effort on a national scale. Then, it becomes a political decision, with the guiding factor being the overt and deliberate efforts of the Russians for about two decades towards a space station.

"The manned station is expected to start off with a minimum budget of a billion dollars annually for about six years. Imagine what costs will mount to in the face of inevitable overruns and slipped schedules for the manned system, given the scope of other projects competing for funding, and the current and projected status of the required R and D base."

Mayers downplays his own part in Pleiades. "All I did was to organize and direct the course. The students did most of the work, and the quality of the final product is to their credit. I was one of only four professors, each of whom advised on a particular aspect of the work."

Prof. Peter Banks advised the Science group; Assoc. Prof. Bruce Lusignan the Communications-Power group; Prof. John Breakwell the Guidance-Control group. Mayers himself advised the Spacecraft group.

Out of the 40 graduate students taking part in the two-quarter project, 16 came from the Aeronautics and Astronautics Department; 10 from Electrical Engineering; two from Materials Science; four from Mechanical Engineering; and one each from several other departments, including Art.

Mayers speaks with affection and awe of Nicholas Hoff, emeritus professor of engineering at Stanford, whom he describes as the most important professional influence in his life. "A very great and brilliant man," says Mayers. "When I was a sophomore at the Polytechnic Institute of Brooklyn, Hoff became my first, last, and only major field adviser in both undergraduate and graduate studies. Ever since then he has been my mentor.

"Hoff's influence on me changed my whole career, first as an undergraduate student, then as a graduate student, and finally as an engineer, researcher, and teacher.

"His magnanimity must be mentioned, too. On three widely separated occasions, I have given him a negative decision in response to offers of research and teaching positions.

"In the last instance, he was chairman of the Aeronautical Engineering Department at Stanford when I wrote to him in 1961 inquiring about the advisability of moving from a technical management position in industry to a more scientific environment in a research and development laboratory. He replied by offering me an appointment as a visiting associate professor.

"After a year, a regular appointment was offered, but I demurred, unsure that teaching was my destiny. It was a foolish decision on my part. Anyway, we compromised on another year in visiting status, and when the regular appointment was offered again, reason held sway.

"Having been schooled by Hoff, I worked on research at Stanford in the same general area as he, which was examining the stability of the lightweight structural elements common to flight vehicles.

"The things we did have gradually found their way into textbooks and engineering practice. Specifically, in application to the semimonocoque construction found in aerospace vehicles, and in development of advanced theories for use in understanding the ofttimes anomolous behavior of realistic as opposed to overidealized conventional, sandwich, and other advanced composite structures.

"Most recently, we have developed an understanding of the failure mechanism causing crippling of composite plate structures, and have essentially closed the gap between theory and what has been observed in the laboratory."

Mayers showed to the interviewer different types of composite structures which have been developed for various purposes in space and aeronautics. "The goal is to distribute the combination of material and geometrical configuration to the point where you have the lightest structure to provide the greatest strength and stiffness for the static, dynamic, and thermal loadings expected.

"Naturally, factors such as cost, confidence, producibility, and maintainability limit the optimization process. Real-world linear behavior poses the greatest challenge.

"People are working on these problems all over the world, but we think our team is one of those at the forefront in attacking and solving problems in nonlinear structural mechanics, particularly those that would lead to realizing more efficient flight vehicle structures.

"Unfortunately, since the advent of advanced composites about 1960, research and development efforts have been rather piecemeal, and no concerted and organized effort has been undertaken in the U.S. to create a data base for composites comparable to the one that grew steadily and methodically for the aluminums, titaniums, and steels."

Mayers showed a specimen of the material chosen, after thorough tradeoff studies, to construct the major portions of the Pleiades system. It is a smooth, shiny, avocado-colored composite called graphite epoxy. It is made by putting together layers of bidirectionally woven graphite cloth impregnated with epoxy and bonding them together under pressure and temperature in an autoclave.

"It is extremely strong and stiff for its density," said Mayers. "It has the best combination of strength and stiffness per unit weight of any material currently available today at justifiable cost.

"For example, beryllium is stiffer but not as strong on a unit-weight basis. Some glass filament layups are often stronger, but not as stiff on a unit-weight basis."

Asked whether the Pleiades material was in advance of anything the Soviets had produced, Mayers said he thought this was probably so with respect to quality. "However, for a number of years now, this country has lagged behind in R and D. Not only Russia but Europe and Japan are pressing hard to forge ahead in R and D for aerospace systems.

"I hope the epitaph of the U.S. will not be 'We invented and others implemented.' Over the past two decades we have faltered in recognition of the critical importance of the R and D role and, of course, commensurate funding. Thus, other nations are either overtaking or surpassing us.

"We have no corner on intelligence or manufacturing ability. It all depends on who wants to compete. Certainly, there has been a huge transfer internationally of technology.

"As the records clearly show, we have educated in the U.S. a host of talented foreign graduate students in aerospace and related disciplines for some time now. A significant number of graduate engineering departments around this country would have vanished from the scene in the mid-70s had it

Carpenter has been in every nook and cranny at Stanford

Carpenter Dick Meyer has been practicing his craft on the Stanford campus for 32 years, and like other artists, he signs his work.

"There's nowhere on campus where I can't find a job I did," he muses. "My name and the year I did the work is hidden all over. I have my name in the steam tunnel under the President's Office, in the dome of Memorial Church, the attic of the Museum, behind office walls, and under cabinets."

In the process Meyer thinks he has met and worked with more campus people, both faculty and staff, than anyone else at Stanford. The numbers are augmented by weekend work he has done for them in their own homes.

The occasion for reminiscing is his forthcoming retirement at the end of September. As for many other Stanford staff members, retirement for Meyer is the beginning of a whole new career—he and his son, Chris, will form Meyer Construction Company in Chico.

The way it was

When Meyer came to Stanford in 1952, the conditions of his employment included using his own car to get around the campus, and supplying and maintaining his own tools and work clothes. He took the job, however, because construction work outside the university had slowed down considerably, and his wife, Jean, was pregnant with their first child.

Encina Hall was still a men's dorm then, and Meyer laughs when he remembers the repairs that were needed every year.

"The minute students left Encina for the summer, we came in with a thick pile of work orders," he recalls.

On the other hand, the old construction still impresses the carpenter—"I marvel when I go up in the attic in the Quad. You don't find construction like that any more. It was all the best materials and workmanship."

Since then, Meyer says, he's been in every nook and cranny at Stanford. "I've been in every attic, in every basement, and on every roof on campus."

He's come to work from his Cupertino home at 3 a.m. to patch roofs during the winter rains, and to board up windows during the 1970 window-breaking sprees. He's seen buildings that he worked on disappear to make room for new ones.

"Few people today remember Woodpecker Lodge, the Oaks, Madrona, Russell House, and the old Post Office," he says. "The change I've seen is tremendous.

"People were very appreciative of the work we did. Things were different back then—they were a lot more personal.

"I went over to the Sterlings' house one rainy day to patch one of their flat roofs, and the President himself came out with an umbrella to meet me.

"Mrs. Sterling didn't like to bother us too often, but this time the leak was right over her bed."

Dick Meyer (left) shows graduate student Drew Batavia the changes made in his Escondido Village apartment to make it as easy as possible for him to maneuver a wheelchair.

Meyer values highly the personal relationships he's developed with faculty and staff members he's worked with—"So many people over the years."

He's also been inspired and challenged by Stanford's growth, both personally and in his work.

"Serving an outstanding and dedicated faculty, staff, and the great students has made my work meaningful and spurred me to do a better job. I'm thankful that I was able to be part of the challenge to excellence at Stanford."

The University has been growing ever since Meyer came to the campus, and it hasn't always been easy.

"There were growing pains in trying to keep pace," he admits, "but we've done it."

He believes that Associate Vice-President of Business and Finance Jason Mavis has been instrumental in making Operations and Maintenance a real supporting arm to Stanford's main goals of teaching and research.

What were the most interesting jobs Meyer has done?

One was building the platform from which U.S. President Gerald Ford spoke at the Law School dedication in 1974.

The most recent has been the remodeling of three Escondido Village apartments for quadriplegics.

"Jerry Parks (manager of Escondido Village) is a great guy," says Meyer. "He gave me a free hand to do whatever had to be done. I was able to work closely with the students to make the apartments functional for them on their own."

Doorways were enlarged or replaced with folding doors. Structural changes made room to maneuver a wheelchair throughout the apartments. Meyer built special furniture at the proper level for people who cannot use their hands in the usual ways.

Meyer, who came to Stanford with less than one child, now has four grown children. Bill teaches in Tracy High School while studying for a master's degree at Hayward State. Chris, with whom he will go into business, teaches at Chico State while studying for his master's degree in industrial technology.

Both daughters are married. Nancy, who earned two AA degrees at de Anza College, is a medical assistant in a San Jose hospital. (Meyer anticipates missing very much his frequent contact with Nancy's three-and-a-half-year-old daughter, his only grandchild so far.) Trudy, who also attended de Anza, works for an Oldsmobile dealer in the East Bay and lives in Newark.

"I'm not going to run away and forget about Stanford," says Meyer. "It's hard to leave, because of the wonderful people and working environment here."

And how could Stanford ever forget Meyer, when his name is written in all the buildings?

Pat Black

Chemistry prof wins IBM award

Nathan S. Lewis, assistant professor of chemistry at Stanford, has received a $60,000 Faculty Development Award from the International Business Machines Corporation.

IBM gives the award "to support universities in their effort to recruit and retain oustanding young faculty in key scientific and engineering areas."

Lewis received his Ph.D. in inorganic chemistry from the Massachusetts Institute of Technology in 1981 and came to Stanford shortly thereafter. He has done significant research on photovoltaic cells and is the author of 25 articles.

Scott appointed assistant dean

Beverly Scott has been appointed assistant dean of Graduate Studies and Research. Her primary duties will be to recruit and provide academic support services for Black graduate students.

Scott received her B.A. and M.S. in psychology at San Jose State University and her Ph.D. in social psychology from Stanford in 1974. She later served as an instructor and assistant coordinator of the Multicultural Department at DeAnza Community College.

Since returning to Stanford in 1979 she has served as assistant dean for minority programs in the School of Engineering and as assistant dean for extra-departmental programs in the Office of the Dean of Undergraduate Studies.

Ph.D.orals

WEDNESDAY, AUGUST 31

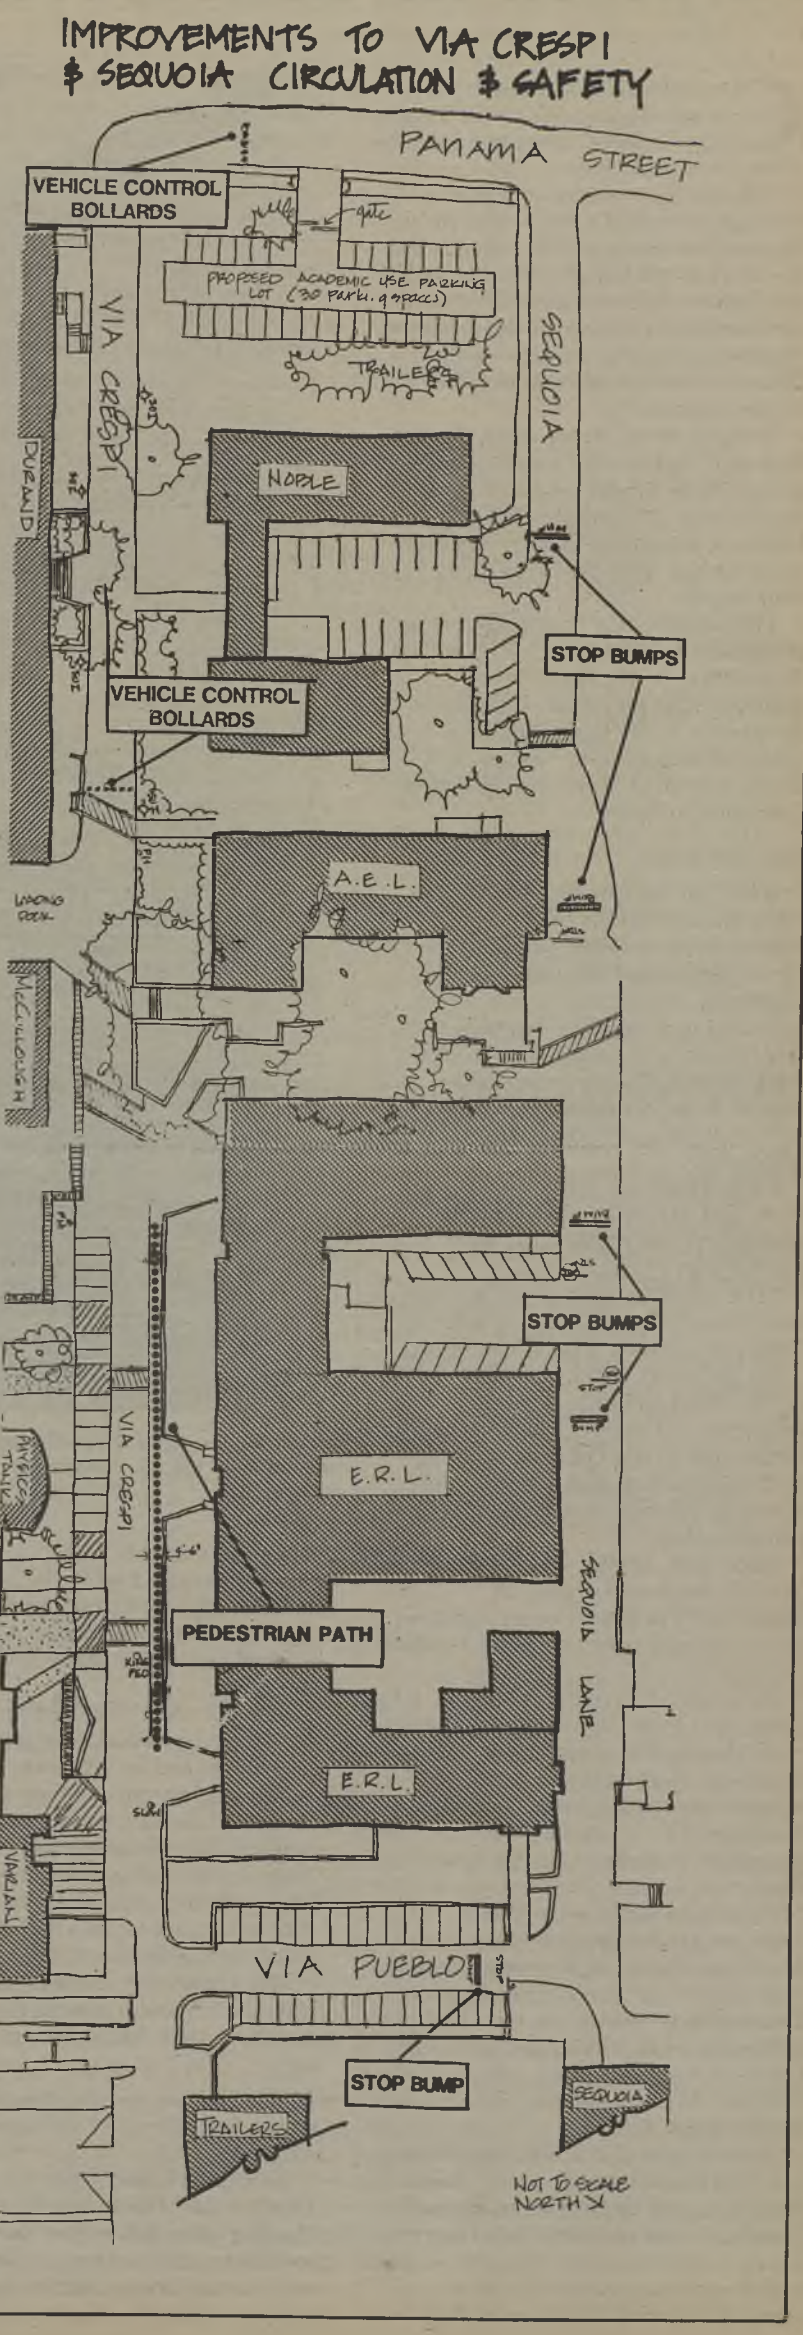
Bollards, traffic bumps to improve safety on Via Crespi, Sequoia Lane



Conflicting and hazardous circulation conditions voiced by occupants of the Sci Tec Quad along Via Crespi and Sequoia Lane have prompted the implementation of several traffic safety improvement measures for this area.

In order to achieve safer conditions along these heavily trafficked thoroughfares, a system of vehicle control barriers (bollards), stop signs, "stop" bumps, crosswalks, and pedestrian paths is planned for installation in the immediate future.

Currently used throughout the campus, new wood bollards will be installed at two locations. One set will be placed across Panama Street east of Samuel Morris Way (the street between Terman Engineering Center and Roble Gym) on the northwest side of Terman Center, closing off northbound through traffic down Via Crespi; the other set will be situated a third of the way down Via Crespi between the Noble and Applied Electronics Labs (AEL) buildings, preventing southbound Via Crespi traffic.

"Stop" bumps will appear at four locations along Sequoia Lane and will serve as a gentle reminder that stop signs are positioned just a few yards ahead. A three and a half to four-foot gap on either side of the "Stop" bumps will provide safe passage for bicyclists. However, they too, should take heed of the newly posted stop signs.

To define a safer travel zone for pedestrians, a pedestrian path will extend the length of the Electronics Research Lab (ERL) along the west side of Via Crespi. Existing crosswalks will be repainted and several new crosswalks will be added to further increase the overall level of pedestrian safety.

Employee flu shots to be offered

Stanford will provide influenza vaccinations at no charge to all employees who want them between 1:30 and 4 p.m. every Friday, Sept. 23 to Nov. 11.

This year the flu vaccine will include three types of influenza: A/Brazil, A/Philippines, and B/Singapore. It will not contain swine flu. Adults and children over 12 years old will require only one dose.

Immunization will not be given to people who have colds or other infections, or who are allergic to egg or chicken. Each person will be required to sign an informed consent form that outlines possible risks in taking the vaccine. Immunization completed by Nov. 11 will have full effectiveness during the flu season.

The flu vaccine is recommended only for the following high-risk groups: those with heart disease, chronic lung disease, chronic kidney disease, diabetes mellitus or other chronic metabolic disorder, chronic severe anemia, such as sickle cell diseases, and conditions which compromise the immute mechanism, including certain cancers and cancer therapy. Those over age 65 should receive immunization; pregnant women must have their doctors' permission.

Parking permit fees to rise, cont.

continued from page 1

Yearian says. More "A" spaces will be created, especially by Memorial Auditorium, and they will now be "overbooked" by only 150 percent instead of the usual 200 percent.

Another change this year will affect those who drive more than one vehicle to work. Effective Sept. 1, employees will be allowed to purchase either an additional permanent sticker at full price for each vehicle or a "floater" sticker which may be transferred from one car to another and hung on the inside rearview mirror. If the floating permit is lost, stolen, or destroyed, however, a new one must be purchased at full price.

Three-member carpools will receive an "A" floating permit free of charge; two-member pools will receive a complimentary "C" floating permit.

"Many other institutions have used this 'floater' method effectively," Yearian notes.

Computer printed applications are currently being sent by I.D. mail to all faculty and staff whose 1982-83 parking stickers are due to expire Sept. 15. Those who have current stickers are encouraged to wait until they receive their applications before attempting to buy new stickers from the Police Department.

Those who do not have current parking stickers will be able to purchase their new ones on or after Sept. 1 in Room JE015 of the Stanford Medical Center or at the Stanford Police Department.

For further information, all employees are urged to read the summary of parking regulations issued by the Stanford Police Department. All comments on the new rules should be sent to the Committee on Parking and Transportation in care of Police Services, 711 Serra St.

Chemistry pioneer awarded for 'leadership, dedication'

Stanford Prof. Henry Taube, one of the pioneers in modern inorganic chemistry, has been named winner of the 1983 Welch award in chemistry.

The award, $150,000 tax-free, will be given at a banquet on Nov. 7 in Houston.

Taube has already begun to spend the money. "My wife Mary now has a custom-made wooden screen door," he said.

In its citation the Robert A. Welch Foundation said the award was for Taube's "decades of leadership and dedication...."

"Taube's work in inorganic chemistry does not necessarily result in the direct development of consumer goods that are familiar to the general public, but his ideas and experimental methods are now the standard tools of many scientists in the field. He has changed inorganic chemistry to a degree that has been matched by very few others," said Jack S. Josey, president of the foundation, which was created by Texas oil man Robert A. Welch.

A native of Saskatchewan, Taube received his PhD from UC-Berkeley, and taught at Cornell and Chicago before coming to Stanford as a full professor in 1961.

His first teaching experience at Chicago was responsible for his interest in the reaction of metal complexes.

"I was asked to give an advanced class in chemistry, and I'd never given an advanced class. . .before, so I chose the particular field of coordination chemistry. It really embraces most of inorganic chemistry," he said.

"The organic chemists had done a good job during the '30s and '40s measuring and trying to understand the rates for organic reactions; there was virtually nothing in the field of inorganic chemistry of this kind, so in a sense it was a subject waiting for investigation.

"In the course of developing my lectures, I saw that there were many opportunities for research. This is an instance where there was really an important connection between formal teaching and developing a program of research."

Taube said the reasons the field was left open to him was that organic chemistry seemed, on the surface, more exciting.

"If you take an ordinary citizen he's going to be more interested in organic compounds. After all, the miracle drugs are organic compounds, the things we eat are organic compounds...it's the stuff out of which living cells are made."

"Historically, I guess, inorganic chemistry developed before organic--people were interested in the mineral world, but as the connection between chemistry and living matter developed, I think that was when the emphasis shifted."

Taube noted that living cells can't live without inorganic elements, metals such as zinc and iron, so inorganic research is hardly irrelevant.

Much of his research has centered around understanding reactivity, an important aspect of catalysis, vital to life processes and to industrial chemistry.

Henry Taube

"Most industrial catalysts are solids and the reactants are in a fluid state--it would be a gas or a liquid. The chemical reaction takes place on the surface of the solid, that's the place where all the business occurs," he said.

"It's very difficult to find out the nature of the catalytic site on the surface because they represent such a small amount of the total solid. Not every sites on a surface has catalytic action."

"There's another approach to the problem, and that's by studying catalysts in solution...because now the ordinary machinery of preparative chemistry is available. You can fashion a particular compound according to known procedures, find out if it's catalytically active, and you can begin to develop a relationship between catalytic activity and molecular structure.

"That's the direction that much current research is going.

"I think that the directions I took in 1950 are relevant to this kind of effort."

The Welch award was established in 1972 "to foster and encourage basic chemical research and recognize research which will contribute to the betterment of mankind. The winner is nominated by the foundation's scientific advisory board, comprised of leading scientists from throughout the nation."

The foundation was founded in 1954, and has provided more than $130 million in research grants to scientists in 49 Texas colleges and universities. "It sponsors chairs in chemistry, a lectureship program of outstanding scientists, a high school chemistry scholarship program, and an annual chemistry conference which each year draws to Houston some of the world's leading chemical scientists.

Taube has won many other awards, including the National Medal of Science, the Willard Gibbs Medal, and the American Chemical Society's award for Distinguished Service in the Advancement of Inorganic Chemistry. He is the eighth scientist to win the Welch award.

200 plan experiments for double-ring research center

More than 200 potential users of the Stanford Synchrotron Radiation Laboratory (SSRL) met here early this month to plan possible experiments for a new, two-ring research center that SSRL is considering to be plugged into the main linear accelerator.

SSRL may request funding for research on the feasibility of the double-ring concept in fiscal 1985.

The new facility is being considered because of the increasing demand for experimental time at the radiation laboratory, and because the increased brightness of the vacuum ultraviolet and X-ray radiation will make entirely new experiments possible, according to SSRL director Arthur Bienenstock.

The idea for the new facility, conceived by an SSRL committee formed last October, was announced at a recent physics meeting in Santa Fe, N.M., by Herman Winick, the deputy director.

The cost would be between $100-150 million.

"Support for synchrotron radiation has blossomed," Bienenstock said. "There's a belief among many that it is one of the most exciting ways to study matter. Technically, we have advanced beyond anyone else in the world, and everyone knows that."

Bienenstock said the current facility is turning away experimenters.

Considerable applications

Synchrotron radiation is a by-product of high energy physics. SSRL, an independent laboratory based at the Stanford Linear Accelerator Center, makes use of this radiation for experiments. The radiation has considerable commercial and medical applications.

The new facility would be built at Station 10, about two-thirds of the way down the accelerator.

SSRL hopes to build two storage rings--rings of vacuum pipe in which high energy electrons or positrons circulate at almost the speed of light and produce radiation as they pass through magnets--one on top of the other. In one, the electron energy would be five to six billion electron volts (GeV) producing X-rays.

The electron energies in the other would be one to two GeV, yielding soft X-rays and vacuum ultraviolet radiation.

Radiation would be split into 58 beam lines.

Both rings would take advantage of the latest technologies of wigglers and undulators, magnetic devices that increase the intensity of the radiation. The technologies were pioneered at SSRL

Old intensities insufficient

"What we're finding is that as we mature, the intensities that seemed so immense to us 10 years ago, are just insufficient for some of the things we dream about going after," Bienenstock said.

"When SSRL was first being built, we recognized that one of the things we would be able to do is look at a 'messy' material and get the atomic arrangements around a particular type of atom, some specific species that we wanted to study.... Synchrotron radiation was beautiful for that.

"As we had more time and more intensity, that technique has developed so that we can now tell about the surroundings of an atom that's present in concentrations like one part in 100,000.

"Why is that important? That takes you to the level of metals present in metaloproteins and metaloenzymes in biological systems. You can tell how the atomic arrangements are changing in those (systems) as the material is undergoing biological processes."

"What is more, we can now tell about atomic arrangements on the surfaces of materials.... Suppose you want to study how a chemical reaction occurs on the surface of a material, or oxidation, rust. In the very early stages, you have a small number of oxygen atoms and a large number of metal atoms on a surface. We can now tell the surroundings of just those metal atoms that are next to oxygen."

The new, more powerful facility can also be used to further studies in how catalysts work, or in the study of protein crystals.

Bienenstock said the purpose of a two-ring facility is that the new ring must be very large. "In order to get a very bright beam you need a very large storage ring," he said. "Once you do that you've got a lot of space in between different beam lines because the ring has a very large circumference, and therefore you can put two rings on top of each other and alternate beam lines for each."

He added that having both rings in the same building is more efficient for the staff.

The location has been determined because SSRL wants to use positrons, antimatter electrons, to produce the beam. Each of the stations along the line would be able to provide space and radiation for several experiments.

Bienenstock said that the new federal budget contains $1.5 million as the first part of a $12.6 million expansion of SSRL. The new money would provide ultrabright X-rays from the 16 GeV storage ring, PEP, would provide more space, and would improve the ability of the laboratory to continue operations through a larger part of the year.

Additional funds would go toward adding a new beam line at SPEAR.

The university administration said it had not made a decision on whether the university would make the appropriate investment on the project. **—Joel Shurkin**

Hennessy receives Villanova award

John L. Hennessy, assistant professor of electrical engineering and computer science at Stanford, has been presented with the Gallen Award from Villanova University, Pennsylvania, "for technical efforts which have yielded advancement in the engineering profession."

Hennessy received his undergraduate degree from Villanova in 1973. He later received his Ph.D. in computer science and taught at the State University of New York at Stony Brook and at Villanova.

An authority on VLSI design systems and architectures and programming design and implementation, Hennessy has published numerous articles and has worked as a consultant for a number of major corporations. He has been at Stanford since 1977.

Villanova presents the Gallen Award "to recognize oustanding contributions to the field of engineering, as an incentive to students to emulate excellence, and to personify the achievements of the college and its alumni." The recipient must also have maintained a strong interest in the promotion of Villanova's College of Engineering.

Nigerian students may face hardships if currency restrictions continue

Nigerian students at Stanford may face economic hardships if their country's new restrictions on currency export continue, say University officials.

A *New York Times* story last week reported that at least 10,000 Nigerian students—or half the Nigerian students in the United States— are not getting financial support from their homeland and may be forced to leave school because of that country's shortage of foreign currency.

Currently there are 12 Nigerian graduate students and one post doctoral student at Stanford. They receive funding from a variety of sources, including grants from the Nigerian Ministry of Education, several Nigerian Universities, private sponsors, and the Nigerian federal and state governments.

"So far there have been no real payment problems" says Ann Fletcher, assistant to the graduate dean for international admissions. A survey of Nigerian students taken last May showed no outstanding bills from Nigeria since 1975, she says.

The *Times* reported that the United States Agency for International Development is currently encouraging universities to require payment of Nigerian expenses a year in advance.

Although Stanford is not going that far, "We are watching the new students extremely carefully," Fletcher notes. Confirmation papers for Nigerian government scholarships must be in perfect order, she says.

Those students supported by personal funds coming from Nigeria may have the most difficulty, she adds. "We're asking those on personal funds to be sure that they have money with them when they arrive and to obtain official clearance for the transfer of funds by the Nigerian Central Bank.

"We're being very cautious and have even written extra letters to the students asking them to be sure that their finances are in order," she says.

Nigeria obtains most of its foreign currency from oil revenue. Current economic problems have been attributed to the recent oil glut and resulting lower prices.

Stanford Nigerian students study in a variety of fields, including history and business; electrical, mechanical, petroleum, and civil engineering; medical microbiology and materials science.

Humboldt Award winners meet Aug. 29

About 200 scientists from Germany and the western United States will gather to discuss current problems in the natural sciences at the Second Bi-National Colloquium for Humboldt Award winners, to be held Aug. 29-Sept. 1 at Stanford.

Among the speakers will be Stanford Linear Accelerator Center Director Wolfgang Panofsky, who will discuss "Current Topics in Arms Control," and Stanley Cohen, professor of genetics, who will comment on "The New Genetics: Opportunities and Problems."

Other topics will include "Free Trade: Crucial for the Prosperity of Western Enterprise?," "In Search of the Big Bang," "Accelerators and Physics," "Conserved and Variable Elements of the Genomes of Higher Organisms," "The Ebb and Flow of Atomic Chaos," and "Atom Probe Analysis of Alloys." A final round-table discussion will focus on "Transatlantic Scientific Cooperation."

Wolfgang Paul, president of the Alexander von Humboldt Foundation; J. E. Wallace Sterling, Stanford chancellor; and Donald Kennedy, Stanford president, will make opening remarks.

Hans Leeusink, former German federal minister; Heinrich Pfeiffer, secretary-general of the Humboldt Foundation; and Peter Hermes, the German ambassador to the United States, will also attend.

All sessions will be held in Bishop Auditorium, Stanford Graduate School of Business.

The Humboldt Award was established in 1972 by the Federal Republic of Germany to commemorate the 25th anniversary of the Marshall Plan. It is given annually to internationally recognized American scientists, enabling them to carry out research in the Federal Republic of Germany.

Since its modern establishment in 1953, the Humboldt Foundation has supported some 1,800 American scientists and scholars for one or two-year research stays in Germany.

The Stanford colloquium represents the foundation's continuing effort to maintain close contact with its former research fellows and award winners.

Art history graduate student Gerard Koskovich represented Stanford's GLAS (Gay and Lesbian Alliance at Stanford) at the Troisieme March Nationale Homosexuelle et Lesbienne June 18 in Paris. The March proceeded from the Place 18 Juin to the Palais Royale.

Installations, repairs delayed

AT&T dispute will affect campus

The labor dispute between AT & T and several labor unions will affect the telephone service provided Stanford University and Medical Center, as described below:

New installations, moves, and changes of lines, circuits, and station equipment have ceased as of midnight Saturday, August 6. Pending service orders process by Stanford Telecommunications and delivered to PT & and T on or before August 5 will be held by PT & T for post-strike rescheduling.

Any request for service received by Stanford Telecommunications between August 8 and August 12 will be processed and delibered to PT & T for inclusion in post-strike scheduling. Service requests received after August 12 will be date stamped, reviewed, and filed chronologically by Telecommunications for release in conjunction with strike settlement.

Any *urgent or life support* related service requirements should be communicated directly to Telecommunications, 7-1845, for special handling.

Repairs and system maintenance will be handled by PT & T management personnel. Any malfunction of station equipment should be reported to PT & T by calling (800) 242-2121. "Out of service" conditions will be given priority over lesser forms of equipment failure. Any *major* system failures, especially transmission facilities (tie-lines, foreign exchange, WATS) should be communicated directly to Telecommunications, 7-1845.

Telecommunications will keep the campus posted on the situation.

Letters to the editor

Kirkpatrick story needs correction

Editor, *Campus Report:*

I read with great interest the story on Emeritus Professor Paul Kirkpatrick, particularly the reminiscences of my father, Russell Varian. My knowledge of my father is dependent on others' memories as he died when I was 7.

I would like to make a couple of corrections, however. My uncle's name was Sigurd and he was a few years younger than my father. When Sig's plane crashed off the coast of Mexico his body was washed up on shore a day or two later.

Susan Varian Hammond, Director
Post Adoption Center for Education and Research
Palo Alto

'Wife and mother' isn't newsworthy

Editor, *Campus Report:*

If Catherine Milton's status as wife and mother is truly newsworthy, is it not equally appropriate to inform readers that Thomas McBride is also married and the parent of two children?

Or, to avoid redundancy, perhaps we should have been informed that the two of them have engaged in their joint family effort in addition to their many successes as individuals. As written, your "People" section of Aug. 10 is a depressing example of well-intended but not even very subtle journalistic sexism.

Wendy Gibson
Development Office

McBride's status as a husband and father was included in the story announcing his appointment as the Law School's associate dean in Sept. 1982.

Cohn: what feminism is all about

Editor, *Campus Report:*

I read Prof. Cohn's letter on feminism with interest and some understanding.

My thoughts, of course, immediately flew to the veiled Moslem women living under house arrest, the African women upon whom infibulation is practised, to the Indian women who are burned alive: a while ago it was witch burning and footbinding. . . .

This is what feminism is about. The enormous outrages and tragedies that are still *practiced* on human beings (women) in the names of religion and social custom are the greatest of all the stains on mankind.

It is sad that Prof. Cohn thinks that American society is falling apart because women are stepping outside their traditional role of slave lynch-pin to the family and seeking personal fulfillment and financial independence.

But imagine the converse, if men stepped outside their traditional roles of hunters, aggressors, and power-seekers we might have:

Peace on Earth.

Helen Kendrick
Los Altos

Fred Hechinger, president of the New York Times Company Foundation (in striped shirt), sneaks a glance at the *Chronicle* while (left to right) Michael Sovern, Donald Kennedy, Patricia Graham, Lawrence Cremin, and Robert Rosenzweig confer.

A reporter's notebook on the Pajaro Dunes conference Aug. 14-16, 1983

Universities respond to school plight

On Aug. 14-16, Presidents Derek Bok of Harvard and Donald Kennedy of Stanford convened an unusual meeting of research university presidents and deans of education at Pajaro Dunes, California.

Other participants included J. Myron Atkin, dean of the Stanford School of Education; Ernest Boyer, president of the Carnegie Foundation for the Advancement of Teaching; Lawrence A. Cremin, president, Teachers College, Columbia; Bernard R. Gifford, dean of the School of Education, UC-Berkeley; Patricia Albjerg Graham, dean of Education, Harvard.

Also: Hanna H. Gray, president, University of Chicago; Fred M. Hechinger, president, New York Times Company Foundation; Robert O'Neil, president, University of Wisconsin system; Robert Rosenzweig, president, Association of American Universities; Harold Shapiro, president, University of Michigan; Michael Sovern, president, Columbia University.

Michael Heyman, chancellor of UC-Berkeley, was represented by Doris Howes Calloway, provost for professional schools and colleges.

Muriel Cohen of the *Boston Globe* attended on the invitation of President Bok; Bob Beyers, director of Stanford News and Publications Service, attended on invitation of President Kennedy, compiling the following set of notes.

After dinner discussion Sunday, Aug. 14

Kennedy: This is a conversation among friends. It is not hyper-organized.

Since the initial plans for this meeting, there has been substantially greater momentum associated with public school policy. This is welcome, but it presents a problem: is the momentum derived from accurate feelings about public

Presidents offer ten education guidelines

Following is the text of the Pajaro Dunes conference statement on research universities and the public schools Aug. 16, 1983:

We believe that the nation's schools are critical to the vitality of our society. Over the past two decades, substantial progress has been made in improving access to our system of public education, and in improving the academic achievement of younger children. Our next task is to press for continuing gains in achievement, without sacrificing our accomplishments in educating all of our young people.

The American public has, as it should have, high expectations of the schools. Recent reports, including that of the National Commission on Excellence in Education, have crystallized a general conviction that the schools are not doing as well as they might, and that they need improvement. We agree; but we also emphasize that as a nation we ask a great many different things of our schools, and often fail to provide them with the resources to fulfill our expectations.

Responsibility for the well being of the schools is not localized in society, but widely distributed. Government at all levels must assert a responsibility; Federal support, as well as assistance from state and local government, will be essential for real improvement.

Similarly, universities must play an active role if we are to insure excellence in a full-access system of primary and secondary schools. As university educators, we have a special concern for the centrality of *academic* objectives in the schools, and for the importance of teaching as an activity. We therefore welcome a role as partners and advocates for our colleagues in the public schools.

Help from the universities must derive from their institutional strengths and from their diversity. That help needs, furthermore, to be consistent over time: episodic interventions, like volatile government support, will merely raise expectations and then leave them unfulfilled. The way in which each university can help will depend upon its character and circumstances. Like schools, universities differ widely. Some have schools of education, others do not. Some have long histories of interaction with local schools, whereas others have little or no experience. For that reason, it is impossible to write a prescription for our institutions' commitment to the schools. But each university should look to activities such as the following, and choose those appropriate to its capabilities:

- Stre .gthening existing affiliations with elementary and secondary schools, or initiating new ones;
- Making improvements in educational practice through collaboration of university faculties with the schools;
- Improving teacher education programs, including opportunities for helping classroom teachers;
- Providing opportunities for the continued professional development of superintendents, principals, and other school leaders;
- Sponsoring special programs on campus for enriching the experience of students and of school personnel;
- Emphasizing research programs that are aimed at deepening understanding of education and at the improvement of teaching and learning;
- Encouraging institutional and faculty participation in collaborative curriculum development projects;
- Encouraging our own students to consider devoting part or all of their lives to teaching;
- Emphasizing the importance of teaching in the schools by recognizing especially successful teachers, or in othe ways;
- Serving, where needed, as sources of advice in the shaping of public policies affecting education.

Although the responses of our institutions will vary according to their situation, our intention is firm that they will respond positively. Recognizing the central importance of the nation's schools, we further commit ourselves to assist, by personal advocacy, the cause of public education.

Pajaro Dunes Conference

continued from page 9

education or are there misconceptions which should be dealt with when the train goes down the track?

Rosenzweig: Should we focus on public or institutional policy?

Kennedy: Both, but public policy probably is more important.

Bok: The focus should be on what the universities can do to help the schools including educating the public about the situation. We need some clarification about the true state of public education. The weakest part (of most recent public reports on the schools) comes in trying to figure out what should be done. There's a real paucity of concrete remedies.

Graham: Besides the material you have been sent in advance, there are reports forthcoming from the National Science Board on precollegiate math-science education, Ernest Boyer, and Ted Sizer, books by Diane Ravich on *The Troubled Crusade*, by Sara Lawrence Lightfoot on *Portraiture* and John Goodlad's study. These may prove more substantive and thoughtful than any committee documents. "What we have is a call to arms; what we don't have is a solution."

Kennedy: The politics of the present situation is interesting. The "Nation at Risk" report is a "kind of keynote," providing a large part of the political momentum, but very few specific cures or sources of funds for remedies.

The political momentum has been obtained at the expense of public regard for what we have (in the schools). To use a Vietnam analogy, some may feel "we have to bomb the village in order to save it."

Universities ought to try to channel the political momentum, try to repair damage to public confidence in the schools, to build public support for change.

Cremin: (After extensive discussions with Prof. Michael Kirst of the Stanford School of Education, past president of the California Board of Education) Legislative changes like those which have occurred recently in California and are under consideration in New York have been several years in the making.

(It is important for universities to correct some elements in the debate). "It simply is not true that this is the first generation that will have a poorer education than its parents." Universities need to carry forward the argument in the interest of truth. (He cited Barbara Lerner's recent Public Interest magazine article on How America's Schools Are Doing as more influential than warranted on policy).

Atkin: "Universities have been largely silent as institutions with regard to reform (of the public schools) especially since the late 1950s." The impetus now is from politicians, combined with extraordinary corporate interest.

Bok: There are four kinds of tasks the times call for:

1) To clarify what the situation in the schools really is: the data are inherently controversial, hard to figure out. The public view that everything's deteriorating is not true. There have been some striking successes—with younger children, for example. The greatest problems are in the high school, especially on middle class white students.

It's incredible how little we know about our average students. About 25 percent need remedial education . . .

—Robert O'Neil

2) To help the public to recognize that many groups and institutions share in the responsibility for the state of public education. Concern over the deteriorating student performance, the reduction in homework, the declining quality of textbooks, shorter school days, etc. is framed in a way that makes it look like the schools' fault. "Initially everyone . . .has some role to play in improving" the schools, "not blame excessively" those in the schools.

3) To overcome the "deplorable lack" of specific, instructive remedies by suggesting practical policy measures.

4) To work directly with the schools in preparing teachers, discussing curricula, etc.

Shapiro: It's right not to blame the schools. . . . The fact that there are some good schools doesn't solve the deep concerns for the system as a whole. There are lots of recommendations for more order, more homework, classwork, etc. but no operative plans.

Graham: There's lots of talk, not much concrete advice. "The 'how' part is in short supply."

Shapiro: Even though the schools may be better, the gap between where we are and where we need to be is greater than before.

Kennedy: It's a very delicate question: how to (improve the schools) without blaming the victim. (The poor academic standing of high school graduates considering teaching reflects the fact that) "for 10 years or more, society has been implicitly, explicitly discouraging teachers." Not explaining the complex array of social problems (affecting the schools) adds to the discouragement (of finding solutions). As a tactic, we might be more encouraging than we feel about exogenous problems so we can tackle them better.

Sovern: (Don't minimize the problems).

Hechinger: Public education is overadministered, largely by people who are less capable than teachers and principals. Most reports increase the power of educational administrators, mainly through the state, thereby further discouraging (those in the front lines).

Most proposals give additional orders to school boards and administrators—very little to improve the quality of the people and locate more power where the action is.

Past reforms often failed because they didn't deal with the problems of teachers, and didn't make them part of the process (of solutions). Universities can help try to reverse this process 1) by improving the quality of the teachers and principals, 2) by improving training, and 3) by working for improvements at the grass roots—not have outsiders tell teachers to do more of the same.

To improve education on the firing line, universities may run around legislative proposals, state commissions, etc.

Gifford: It's no accident this window of opportunity for education is not the result of university presidents or campus-based educational reform.

Over the past decade, major research universities were not only negligent but in many ways aided and abetted conditions we now find deplorable.

High schools and schools are very much governed by the universities, at least as seen by one from the belly of the largest school system in the country. Universities are intensively, positively ignorant of the impact of their policies on students. When UC or Columbia change admissions or requirements, students in high school feel the impact. My personal impression is that students who choose to study education are systematically discouraged on college campuses).

Major research universities have had nothing to say to the people who govern schools, and it shows. High school teachers find no sympathetic community of scholars. Research universities are part of the problem, but we haven't realized the connection between our behavior and the decline in the schools. Many have given up on schools of education. They have written off the enterprise only to reap the results of neglect. Major research universities are not in the forefront of reform.

Graham: A hundred years ago, faced with similar problems, Princeton and Wisconsin went down to very different tracks: Princeton resuscitated Lawrenceville, while Wisconsin started to work very closely with the high schools in the state.

O'Neil: One of the consequences is that we know much less about our entering freshmen. The cozy relationship may have led to a very deficient data base. It's incredible how little we know about our average students. About 25 percent need remedial education, chiefly white students from urban and suburban high schools.

Boyer: This is an important meeting. It could help give direction (to change in the future). I'm not sure what's going on today: not sure it's a great reform, a political aberration or a media blitz. I hope we are in a period of great reform. "Current interest in reform may be a mile wide and an inch deep."

Corporate America became interested in the schools several years ago. The interest of educators themselves in reform was not strong and went "relatively unnoticed."

Demands for minimum competency spread rapidly across the country.

A look at demography—the aging population, growth of minority enrollment, etc. (including decline in families with children in school)—you could argue that public schools are more vulnerable, and that this period of transition if not constantively sustained could leave us worse off than before.

It's not like the late 1950s, when the issue touched every family.

I'm suggesting that this is not necessarily an authentic reform movement. We may simply have a series of reports, with the President riding in on a white horse. We need more responsible voices. Corporate America helped somewhat out of enlightened self-interest.

University leaders are still voices of stature, credibility. (University presidents, corporate leaders, and maybe a clergyman or two can get the White House to return their calls.) When people in these institutions (universities speak), others listen. (laughter)

Current headlines have so highlighted internal failings (of the schools) they could (make solution of problem more difficult). Older people may simply set back and say they'll do nothing until "those school people fix it."

"If (reform) is not well directed (school support) could evaporate as quickly as it exploded." Consensus (for change) is shaped by responsible media. (People need to) hear about the practical steps they can take.

Kennedy: I agree universities are not active enough. It could be very useful to combine a statement to the public with what (our) institutions should do. Too many people in research universities have lost interest in schools. The wan-

Robert Rosenzweig and Patricia Alberg Graham

Pajaro Dunes Conference

continued from page 10

ing started when the bubble of science curriculum reform started collapsing in the 1960s.

Graham: Within universities, schools of education remain relatively poor in resources.

Cremin: Universities train people and illuminate public discourse. The next phase of curriculum development is not updating (what we already have). Universities and the schools haven't wrestled seriously with the problem of teaching math, algebra, and other subjects to the last third of those enrolled in the schools.

Universities need to work with teachers on curricula for those who are more difficult to teach than they do for those who are easy to teach (so students will not opt out in favor of films or less substantive academic material) I hope for collaborative efforts to produce new curricula.

Atkin: To even begin, universities have to convey understanding and even sympathy for what the schools are trying to do. The rhetoric of reform has been harsh, suggesting willful misbehavior. We can use a softer language, with honesty.

Teachers are no more stupid—or less stupid—than politicians, businessmen, and others. They are dealing with a complex situation, often very intelligently.

Public schools are very responsive institutions. If we see their adaptive quality, then we may make suggestions that have possibility of success. Collaboration doesn't come simply. It often requires a different attitude than one finds among professors.

Bok: As a rather sober prelude, what have universities done that has been of lasting, constructive value for the schools? A great deal of the history of reform resembles a pendulum. A lot hasn't stood the test of time. (Conant urged school consolidation in the 1950s, now Goodland favors smaller schools, for example). What's made a constructive difference, a real difference?

Graham: We need to distinguish between what universities have done regarding public policy and what they've learned through research. Universities as a matter of policy and self—interest created a network of relatively easy access: this filled the freshman class as well as a public commitment to educational opportunity.

Cooperation (between the universities and the schools) existed concerning curriculum and progressive education (in the Eliot era at Harvard, for example). There have been relatively few of these kinds of meetings (i.e., like Pajaro Dunes) in the last 30 years or more.

In research, there are several good things to say: we know more about teaching kids to read, for example, even though the findings have been "sold" with difficulty to the publishing industry.

Universities are at their best in training teachers who go into schools. (Referring to major research universities) "we've largely gotten out of the business of teacher training in the last two decades. Years ago, I fought a long and largely unsuccessful effort to get Columbia undergraduates recognized for teaching in the schools. That's still a very important issue. As long as we regard high school teaching as laughable (not much good will happen)."

Bok: What about the impact of curricular reform?

Graham: I have a rather iconoclastic view: What youngsters need from schools is minimal mastery of the basic tools of writing, speaking, math, etc. coupled with unbridled enthusiasm for science, history, etc. University-based reforms have not sought to instill enthusiasm but to master the subject material.

Atkin: 20 or 25 years ago, university reforms enhanced high school teaching. High school teachers, for example, would identify themselves as "physicists," where now they would call themselves "teachers."

Kennedy: The significant work product wasn't books.

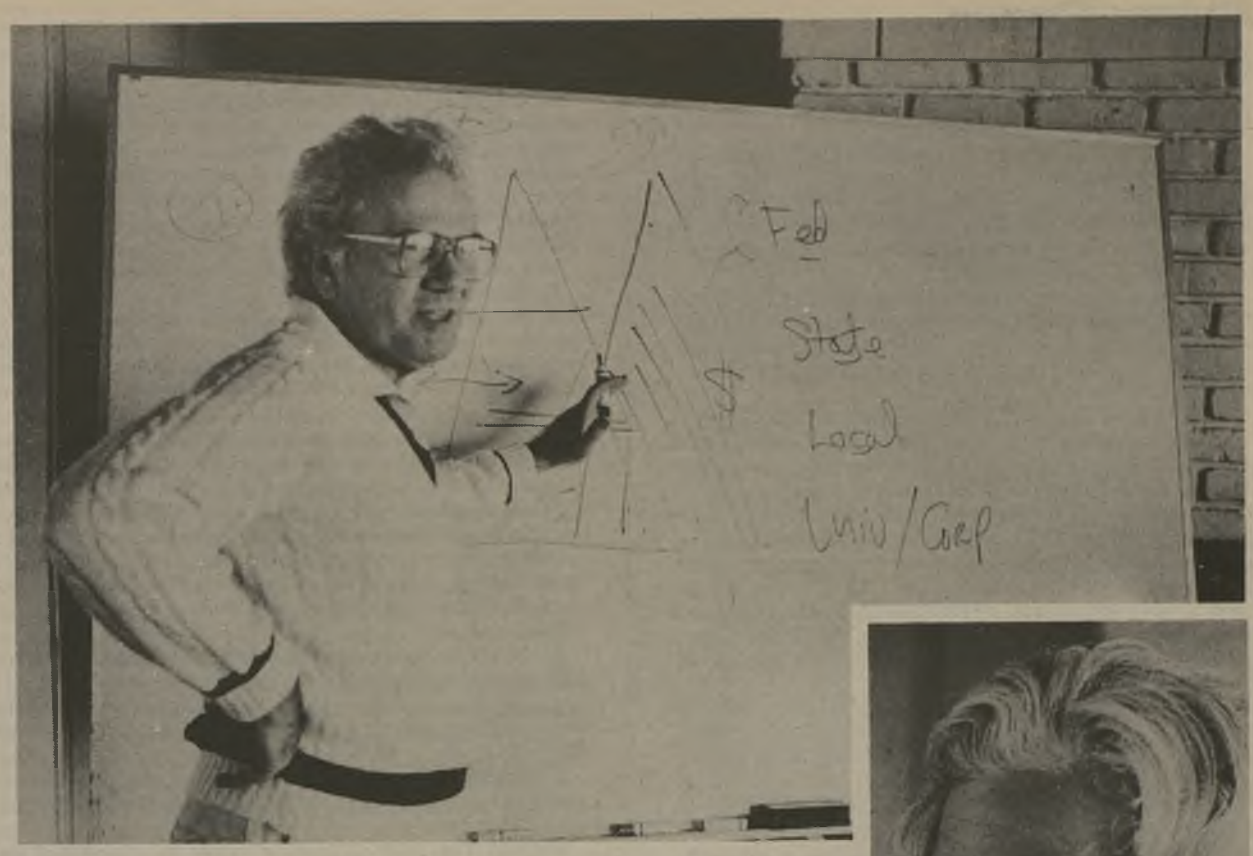
Sovern: During the Vietnam War, a great number of very talented youths became teachers to avoid the draft. They took this work very seriously. (That's an impression, not highly documented by research.)

Graham : The first year, they were likely to be pretty bad teachers, but in the second or third year they could become pretty good.

Bok: What was the effect of the MAT (Master of Arts in Teaching) at Harvard and elsewhere?

Graham: Men were more likely to stay in the system, while women stayed three or four years, then got out for other options opened by the women's movement or simply for "domestic bliss." The women tended to come from higher social class backgrounds and were more intellectually gifted than men in the MAT program.

Boyer: What about the universities' influence on standards in the high school curriculum? Schools tend to gobble up and duplicate these with "an absolutely stunning influence" from the top down.



Cremin: From roughly the 1880s to the 1920s, universities, education schools, and high school teachers were one profession. The College Board and the Committee of Ten came into being. But the profession was dominated by the universities.

There was a progressive separation during the 1920s, '30s, and '40s. In the 1950s, a rapprochement began, with the universities no longer so powerful. In some cases, the universities abandoned their standards.

Now we're trying to define rapprochement on a new basis. The U.S. Office of Education, under Francis Keppel and Harold Howe in the 1960s, had funding for a tremendous variety of cooperative activities between universities and the schools. But later the universities fled from the schools: cooperative programs with individual schools didn't work because of the arrogance of the faculty, the intractability of the problems, and the desire for greater autonomy among the people who were being "done to."

Graham: Isn't that a good cautionary tale?

Cremin: Yes.

There's a sense among teachers especially—and also among principals—that they're trapped, unrecognized . . .

—Ernest Boyer

Hanna H. Grey

Monday, Aug. 15

Bok: The way reports on the schools are understood by the public "the picture is painted in too uniformly gloomy terms" and significant achievements are overlooked. The country is wakened to a problem by being "hit over the head," not by an even-handed approach. This tactic may attract the public's attention but only by weakening the morale of those who work in the schools.

A large part of the public's confusion comes from scholars in the universities trying to attract attention to themselves with "very strong criticism." "We in the academy should recognize our rule in creating confusion and our responsibility to try to reduce it.

There appears to be a "heartening" consensus on the factors responsible for our problems. But these are not put in a social context. As a result, the schools and people in them are blamed without recognizing the effects of family, community, and other social factors that limit what schools can accomplish.

Fred Mosteller "guesses" from exemplary schools that achievement could be improved by one-third to one half a standard deviation if schools adopted the best possible practices. That's worth doing, but it's not nirvana. There's a danger of overpromising what the schools can do by themselves to improve.

Suggested remedies are the "most deficient" part of the recent reports. Like the statements by political candidates concerning education "they don't strike me as hard hitting, effective, or well thought through.

Now that public concern has been pumped up, the concern could blow over with no lasting effect or hasty, impromptu reforms could be passed without adequate analysis. There's a very high stake in doing everything we can to achieve significant change.

Kennedy: The proposed remedial actions are "disappointingly vague." The "Nation at Risk" report was "outlandishly incongruent" in issuing "a clarion call for action" and then "exempting the Federal government from any responsibility,". . .there isn't any free lunch.

Shapiro: How confident are we that we can deliver if society decides to give the schools a greater share of the national wealth?

Bok: Is it possible to agree on a limited number of reforms?

Boyer: Money is clearly part of the response, but the nub of the problem is people. There's a sense among teachers especially—and also among principals—that they're trapped, unrecognized, not connected professional with colleagues who can give them status.

At the heart of the problem is how we can convince people in the schools that teaching is an important job. Only then can we draw more people into the schools as teachers.

Universities can play an important role, both symbolically and in fact. Teachers are asked to do a great deal with little support and very little recognition.

For the President to raise the problems of the schools as a natural crisis and then walk away is a bit like announcing World War III and then saying "tennis, anyone?"

The President should urge full funding of Title I and bring it up into the junior and senior high schools. The past record of Title I for compensatory education is encouraging.

Similarly, the NDEA teacher training program had important impact following sputnik. It was one of the key recovery mechanisms we had, a mixture of attitude and substance that renewed the profession. Universities and the schools were brought together.

In teacher recruitment, those in the schools need a sense of status. "You can't recruit good people into a bad profession."

Conditions in the schools are often "very grubby"; there is no time for professional development. Most school districts don't even have a dime for travel (by teachers to professional conferences).

Teaching has been in a downward spiral. We kid ourselves by proposing a longer school day or longer year while ignoring people.

continued on next page

Pajaro Dunes Conference

continued from page 11

Gifford: The dollar problem is large. To make change, we need to increase salaries 25 to 30 percent to attract good people. California has authorized $800 million more this year, $900 million next. The last $200 to $300 million is crucial. If the state falters and full funding doesn't materialize, it could all come to nothing.

Graham: The most fundamental problem is there's no unanimity among educators and the public about what the schools should do for children. Many school people believe a significant portion of the children simply can't be educated. Part of the public agrees.

Ambivalence, ambiguity over goals hurts recruitment.

Cremin: The Gallup polls in 1981, 1982 bear out this concern. They showed more consensus for tighter academic standards well before the recent flurry of reports.

My hunch is that the best reform effort won't see a basic difference in the kind of federal involvement in the schools. . . . The 1965-72 authorization packages provide a really feasible set of reforms. . . (In a 1972 article on the Great Society educational reforms, published in Public Interest, Ralph Tyler found the reforms worked extraordinarily well but to make the system truly universal would cost even more than we thought. . . .

If we're going to move ahead on the federal agenda broadly included under equity, we can't pass education for handicapped children without putting money in to enable teachers to deal with the mainstream kids. I'm for including it under equity, but (that act) created quite a degree of chaos in the schools by court mandates forcing teachers to deal with new clienteles without funding, training, or research.

The enactment of noble dreams, supported by the federal courts, contribute to the disspirited feeling of teachers and loss of achievement in the schools.

Bok: If there's agreement on goals, then progress is possible. But if there's disagreement on goals—excellence versus equity—then it will be very difficult to agree on a coherent program of reform.

Graham: This set of reform proposals caught the public mood of concern.

Boyer: Equity has been regarded as a federal obligation.

(Using charts he shows goals, attitudes, and programs are related) Conflicting goals reflect federal actions, court decrees, and changes in family life which have tended to make schools a social service center.

Sovern: Don't despair on dollars. Corporations recognize the country has been deficient in human capital investment. This may be the moment when it's possible to generate substantial additional support. It's obvious the Democratic candidates think so.

If one can articulate the importance of investment in human capital as well as physical capital, a national commitment of new funds may be possible.

With the right incentives, teaching could again become a popular way to spend all or part of one's life. **—Michael Sovern**

Rosenzweig: (From President Reagan's perspective, California's recent actions may illustrate the value of keeping the federal government commitment down and watching the state commitment to schools increase).

Hechinger: University role should include speaking out on federal policy, such as tuition tax credits. To gain credibility, universities should lay out their own program for involvement with schools.

There's never going to be consensus about what kids should learn. Universities schools together should arrive at basic curriculum acceptable to all students. Shouldn't be done the way the College Board did; that was totally irrational.

Universities should encourage faculties to work directly with schools, and enlist teachers from outset in reform. Nine out of 10 teachers are trained in small institutions, some of which are pitiful. If some research universities set up model teacher training programs, they could have an enormous impact. They might also help struggling institutions.

Atkin: There's a clear government roles in helping fund education for the handicapped. Universities should be much more central on curricular questions historically, universities have unique strength in teacher preparation and a strong influence on school curricula.

O'Neil: How important is it for research universities to acknowledge past errors, such as withdrawal from teacher training, laboratory schools, education school cutbacks. At Wisconsin, I found education enrollments dropped 25 percent since the mid-1970s, following a 20 percent decline in the early 1970s. Overall, about 20 percent of the faculty positions for education were eliminated.

Bok: *Nostra culpa* would increase our credibility.

Kennedy: That's right.

Some very modest federal expenditures could have highly leveraged effect on schools. Universities can encourage more people to enter teaching. Salaries are a state obligation.

Graham: Don't forget the federal role of support for research.

Gifford: For the past three years, UC-Berkeley Chancellor Michael Heyman has invited the principals of the 30 schools that provided the largest number of students to our campus. One result of these meetings is a marked improvement in the spirit and morale of these key actors in Berkeley's education interests. Also, we try to let high schools know how well their students have done at Berkeley. This feedback also helps to improve the university's relations with the high schools.

In the 1960s, American Physical Society had lectures by high school teachers and by professors concerned with science education in schools. Now professors have turned their backs on those who produce the apprentice scientists. Good teachers in the schools feel isolated, unappreciated, and unloved. Professional schools might encourage prospective students to consider teaching for a few years before enrolling for full time study.

Sovern: The same suggestion might be considered for Ph.D. candidates in science. It's interesting to note that the professions of law, medicine, and dentisty—even some fields of engineering—appear overpopulated. With the right incentives, teaching could again become a popular way to spend all or part of one's life.

Boyer: These are very exciting suggestions. They sound almost embarrassingly simple. Still, you can't overstate their value. Recognition which may look marginal inside the university but it can carry real clout outside.

Graham: My sense is there's going to be a teacher shortage. Universities aren't noted for their lightning speed in responding to such changes. We need to rethink teaching careers. Teaching isn't bad for 21-year-olds. It offers a lot more autonomy than most fields.

Nontraditional sources of teachers can include older women, engineers trained in the 1940s and 1950s, and graduate students, especially in the humanities, if there's a way to get them certified.

Sovern: Many first class writers (free lancers average about $5,000 annually at present) could welcome income from teaching English.

Graham: Schools have to be flexible enough to use people. Often nontraditional teachers don't fit into the school culture easily.

Monday afternoon, Aug. 15, review of education school programs

Atkin: Stanford has built on its strength in applied special science while emphasizing its role as a professional school encouraging the faculty to rediscover its professional roots. A three year, $1.5 million study of Stanford and the schools involves six districts from San Francisco to San Jose. We have worked intensively with school people to define areas for study, try to make sense of findings, develop recommendations. Social scientists from outside the Education School have been working closely with us. There haven't been as many faculty from other areas, particularly subject fields of high school curriculum. We've identified 12 to 20 people, but don't have a significant share of their time.

Shapiro: Yale's New Haven project has the same problem, especially in science.

Atkin: Long term hope is for a permeable boundary between schools, university. Prof. Larry Cuban now holds seminars for Santa Clara, San Mateo county superintendents. I hope some of these superintendents will contribute to the analytical literature. They have much to say.

We need to inject greater stability into the (national school) system. Periodic overcorrections are a problem. First there's too little joy, then too much.

Stanford is serious about teacher education. We have a four quarter program, whose enrollment has increased to 48. We get extraordinary students, about half from Stanford. GRE scores are exceptionally high. There is a cadre of students interested in teaching, even at research universities.

Professors Gage and Shulman are running a seminar for teacher educators from SF State, San Jose State, Hayward, UC, and other institutions.

Stanford Teacher Education Program is heavily internship based. It had been a STEP-child, but now haas a regularly assigned faculty billet.

I'm concerned about overcorrection, especially large reforms such as tuition tax credits or vouchers. "If your goals are not great, you're not paralyzed" and can make meaningful changes.

Bernard Gifford and

We need to inject greate (national school) system. P are a problem. First there's too
—J. Myron

The effect of principals has been mainly shown at the elementary school level. There's reason to think elementary principals are more like high school department heads than high school principals.

Atkin: Politicians deal with issues very rapidly. James Guthrie of UCB and Michael Kirst of Stanford have a proposal on policy analysis for California education, geared to political timetable (a professorial night shift) for short-term analysis. This would be for very short term analysis. The Institute for Educational Finance and Governance provides long-term work. We enjoy close relations with Sacramento.

Shapiro: Universities may be fundamentally unsuited for that kind of activity.

Cremin: They also can become political scapegoats.

Graham: At Harvard, over the past 20-30 years the issue of mission has been a central concern, we're also highly tuition dependent. Teachers have great difficulty coming up with $8,320 a year. Increasingly we are a professional school.

In 1979, the faculty voted unanimously to reengage with the schools. Now about half to two-thirds of our faculty are so involved. The extraordinary interest in public policy has receded.

We are taking a different approach from Stanford. For school leadership, here's a Principal Center which enrolls 500, including 70 Boston area principals (about one-third are actually not principals but other school leaders). The curriculum is heavily driven by the principals. Summer institute drew 100 this year.

All summer superintendents seminars included dinner with Bok, which was profoundly important symbolically, plus a series of philosophical talks by Harvard faculty on science, demography, etc.—NOT how to finance schools, etc.

Graham: Harvard voted to get out of teacher training in 1972, voted to go back in this spring. Our reading laboratory was almost closed several years ago, but now is active. Research done years ago is now beginning to pay off in improved reading. Research interest is now shifting to writing and comprehension; results will take a decade to see.

In public policy analysis, I'm terrified of overpromising. Frank Keppel is working with graduate students, who have professional experience in the schools.

Our problems include student interest; money, we may be pricing ourselves out of the market for education professionals; interest in the schools—about 40 percent of our total faculty effort now is directed in this area; and overpromising.

Cremin: You'll lose to the divinity school; they'll promise anything. (Laughter)

Kennedy: The conventional wisdom is that schools of education are poor development prospects. Our development staff is surprised at how much support has become

and J. Myron Atkin

eater stability into the . Periodic overcorrections too little joy, then too much...
yron Atkin

available for the Stanford and the schools project.

Shapiro: It's not as hard as people say. It may be much easier when a proposal is related to something outside the Education School—having the English Department involved in a writing project, for example.

Hechinger: (on school involvement). The University of Pennsylvania helped sponsor professional meetings for teachers from the high schools. The program has now spread to 15 states.

Gifford: The Bay Area Writing Project, now gone national, has helped to spawn a new profession; teachers of writing. The Bay Area Math Project has found that math teachers often don't know each other, even in the same district. It's not difficult to arrange: in Oakland 50 to 70 teachers got together for the first time in 30 years.

Boyer: Harvard's priorities are very much in keeping with the ideas of our study: leadership from the great centers of learning can revitalize school leadership. The Harvard institute for principals is a good example.

Here's another suggestion: corporations that have their own campuses could open them to principals for one or two weeks, with the companies providing scholarships and the universities providing professors for the program.

In teacher training, educating those already in the clasroom may be a better short-term good than making changes for newcomers. For the immediate future, excellence lies with those now in the schools.

Shapiro: Should resources be reallocated to inservice training?

Atkin: Stanford is likely to put more resources into inservice education. The average age of teachers on the Peninsula now is 52.5.

Gifford: List of expectations and hopes at Berkeley:

Teacher education programs now almost the same as those as state colleges. Entire school ought to be experimental.

We need to increase understanding, support of education as a field of study. Heyman swam against the tide in keeping the School.

We need to reinvent, rationalize the professional degree Ed.D. regarded as second rate.

We need to define the mission of the school. We have a natural advantage in math, science, technology education.

Need to upgrade concern for gifted. We have 320 students age 10-14 who score above national norm in SATS. The gifted are uniformly neglected, sometimes even punished in the schools.

Next year plan a microcomputer institute similar to Stanford's.

Hope to give Stanford, Harvard a run for their money, especially in language, literacy, math, science, and technology.

Bok: To paraphrase the women's movement, you have to be twice as good as Harvard and Stanford to receive recognition. But fortunately that's not too hard. (Laughter)

Gifford: That's the same as what my family used to say. My grandmother fed me a steady diet of black biographies—Jackie Robinson, Ralph Bunche, etc.

Cremin: Teacher's College is much larger, more autonomous than the schools of education at Harvard, Stanford, or Berkeley. (It has its own board of trustees, for example). We're probably closer to Columbia academically and intellectually than we've been in a long time.

Our effort during the past decade has been to broaden teaching from a school of schooling into a school of education. By that I mean we've given more and more attention to the education that goes on in families and day care centers and nurseries and workplaces and over television. But we've also continued to be deeply interested in the work of schools, especially in the context of the education carried on by these "other educators."

We have a new pre-service Ed.D. program that prepares people for entry into a variety of educational roles, including school teaching but also leaders in museums, daycare centers, and telecommunications agencies.

We have a new program for preparing professional, in day care, and a new Infants and Parents Center that's been widely used as a model, including at Middlebury College.

We have a new research center on education and the American economy, a master's program for education leaders in business organizations, a new dept of communications and telecommunications.

Our Horace Mann—Lincoln Institute has a network of 50 schools involved in defining is research. Unlike others, we did not close out our teacher education programs. When enrollments declined, we completely redesigned our initial teacher training program. We have our own subject matter specialists—in English, history, biology, and music and art—on the faculty as well as our own specialists in teaching and learning.

There's been a tremendous development of continuing education. This year we cut our summer courses drastically, put money into 80 workshops and a mob of people came in for periods ranging from a weekend to three weeks. We designed programs with people in the field, particularly alumni.

Our formerly separate departments of administration and curriculum are now collaborating , we're moving toward a more generic program.

Columbia has started its own relationships with local schools above and beyond the above of Teachers College, involving faculty members in the liberal arts from Columbia College and the Graduate School of Arts and Sciences.

Gray: The University of Chicago abolished its School of Education in 1974 but continued a graduate department in education with faculty from many social sciences disciplines, often in joint opportunities. It has been very intensively engaged with its neighborhood for 30 years. It also operates a private school and a school for special children (established by Bruno Bettehheim). MAT is not heavily subscribed, but remains quite vital.

The University runs a summer seminar with Chicago school superintendents and has a large investment in a program for inner city youth aged 10-12 to 16-18.

Scientists generally are interested especially in talented students and faculty in those who are college-bound. Faculty can be "terribly conflicted" and have "especially strong, unrealistic views" of what education can do. They may have in mind only one kind of student. But they also have broader concerns as citizens about secondary education more generally.

The internal culture of research universities often looks down on educlation social work, library science. There's a pecking order of professional education. Some make a desperate attempt to become "pure" researchers for status involved.

Kennedy: The dynamics of getting faculty involved in the schools may be both hurt and helped by the presence of a school of education.

Bok: Hunch that Yale, Chicago "probably have a distinct edge" in getting faculty involved because of the vacuum left without an education school. Elsewhere faculty may simply "leave it to the education school." (Graham later questioned this.)

Cremin: Princeton has only a very small teaching program and practically no faculty involvement in schools. It depends on tradition, the president, and other local factors.

Kennedy: We may need to find the moral equivalent of the curricular reform movement of the late 1950s to give high school teachers the same access to professionals in the colleges.

Graham: That could be a two-edge sword. . .we need to find ways to inspire teachers to reach the bottom half of the student body.

Hechinger: The overwhelming majority of science and math teachers start growing more professional once they start teaching.

Bok: Community colleges, state colleges may be better to do updating of teachers. To bring science teachers into Harvard Physics Department for this purpose is "not sensible."

Shapiro: Agree. I'm very skeptical of making teachers colleagues. Having people come in from the universities to the schools won't do.

Atkin: You have to capture the university professor's interest intellectually.

Boyers: Case studies suggest that course success (for teachers brought to universities) depends 1) on faculty quality and 2) teacher involvement in shaping curriculum for the course. They want to feel part of the action, get the best of what's offered.

Rosenzweig: (Questions pessimism. Notes that NDEA programs for teachers worked well, and that NEH is successful now.)

Bok: Suggests faculty interest diverted by summer stipends for research.

Kennedy: Disagrees. Peak of summer institutes and research support coincided.

Graham: Typically strongest members of university departments are apt to be interested in working with high school teachers. Toughest problem is to match what professor wants to teach with what teachers want to learn.

Atkin: Faculty interested in undergraduate education also are often willing to work with high school teachers. Quite senior people may become involved in revamping curriculum—they want to discover new ways of presenting material.

High school teachers may fear the uncertainty that professors like in presenting material.

Bok: Perhaps there should be more work with videotapes to help people become better teachers (cites tennis instruction as example). Notes Harvard has set up branch in Medical School for this purpose. "Soon the main office will be there," Kennedy quips.

There's been considerable success with microteaching.

Graham: notes AFT is doing teacher training in Toledo.

Atkin: Teachers rarely have opportunity to see how other teachers handle problems. A videotape library could help.

Long, sustained relationships with state agencies can make a difference . . .

—Harold Shapiro

Bok: Very few people have any idea how they look in the act of teaching. I'm surprised how many young teachers are willing to expose themsevles and how much they get out of seeing themselves (on TV).

Calloway: Berkeley established the Lawrence Hall of Science as a public teaching museum. Some faculty have participated in its programs but it is staffed principally by nonfaculty professionals. Some Berkeley faculty not from the School of Education also volunteer time to the public schools. (At Berkeley, Marian Diamond goes out into the schools with a model of the brain. A neurophysiologist, she believes young students will be more interested in studying humans first, rather than animals).

Kennedy: Lawrence Hall of Science, and the Exploratorium, as "swing institutions" have a significant impact on science education in the Bay Area.

Boyer: Some irreverent thoughts: "perhaps universities should more systematically encourage student interest in teaching even at the high school level through Future Teacher Clubs or summer institutes for future teachers. Why not invest in future teachers like we do in athletics.

Universities might ask incoming freshmen to name their outstanding teachers in high school, then letters of recognition could be sent to these great teachers or they might receive summer fellowships. We need to remind faculty they're dependent on high school teachers. (Stanford School of Engineering brings the most influential teachers of its top graduating senior students to campus at university expense, Kennedy noted later).

A lot more could be done to accelerate gifted students. The University and schools program at Syracuse offers adjunct positions to gifted high school teachers, who then lead advanced placement classes in the schools.

One other point: science equipment in high school labs is "absolutely appalling." Some "can't even find funds for test tubes," others "draw diagrams of lab" for students. "No faculty member would spend an hour"; maybe faculty should go to school boards and argue the case for equipment. Faculty could provide consultation on how to equip labs at reasonable cost.

Kennedy: Terrific idea. There's a lot universities could do to design a minimal lab.

Bok: In California, Florida, Utah, public universities have

continued on next page

Pajaro Dunes Conference

continued from page 13

taken the lead in curricular standards. Many school principals, superintendents welcome higher admissions standards.

Boyer: Thinking about curriculum ranks above all others in effectiveness. Universities have enormous leverage, which they underestimate. Trashing the schools about the curricular smorgasboard is a bum rap; they took seriously what universities did 15 years ago.

Done unilaterally, however, such changes may lose some of their educational value. Also, they can miss half the population in schools (who don't go to college).

Bok: (After noting influence of Fred Hargadon's letter to high school counselors from Stanford in 1978) suppose a half dozen well-known private university admission officers and high school principals outlined what college bound students should consider taking in order to prepare themselves well.

Boyer: The right 10 people at this time could have a stunning influence (harks back 80 years to the Committee of Ten).

The time has come to think about assessing student achievement in ways that break out of the SAT stranglehold. We need to assess progress in terms of curriculum (i.e., what's being taught). Hope the time may come in the next decade when universities help the schools break out; the SAT has outlived its usefulness, both in screening students for college and in measuring achievement.

We need to update curriculum and its assessment. SAT is 60 years old, an essentially obsolete instrument. We need to relate assessment to content.

Cremin: The original Committee of Ten said, in effect, this is the education everybody needs. The communion on the reorganization of secondary education made the same argument in 1916, but with a program that led us a stray for 40 years.

O'Neil: University of Wisconsin, State Superintendent of Instruction jointly developed recommendations almost identical with those presented later by Commission on Excellence, and close to those of College Board, then mailed to every parent of eight graders in the state. The impact was initially uncertain, with few districts so far carefully analising its requirements.

Hechinger: (Puzzled by lack of university response to reports)

Sovern: Without a plan for increased support, proposals for a longer school year probably are not taken seriously.

Kennedy: (surveying national issues) National Commission on Excellence deficient with respect to remedies; should have expansion of federal programs for research on schools professional improvement for teachers (NDEA), foregiveable loans to encourage students to become teachers.

If nothing else, the job of the universities is to articulate academic goals . . .

—Lawrence Cremin

Cremin: Some reports still aren't in. Predict reactions in middle 1983-84. People are getting revued up. Many were quite surprised at reception given President's report.

Hechinger: "Extraordinary public interest" in schools will last only year or two at most. . .then probably no other opportunity for a decade or more.

Bok: (Suggests lower priority on responding to reports). If universities enter public debate should be concerned about what they can contribute. The batting averages on faculty picked as political advisors not high. There clearly are some useful things to discuss.

Shapiro: Michigan economic policy studies show that long, sustained relationships with state agencies can make a difference.

Atkin: Focused conferences of experts on a particular topic may be helpful. Stanford plans one in October or November on teacher preparation, involving state officials.

Boyer: I strongly favor universities taking serious responsibility for helping shape the public debate and giving guidance. University interests are inordinately involved. "New laws are made by half-informed people running around, grabbing slips of paper" I don't see how universities can justify detachment (on school policy questions.)

Atkin: Note growing move to push teaching toward apprenticeship model with master teachers. If universities are now going along with dramatic changes. . .eventually, wehther or not university education required to become a teacher could be an issue.

Graham: Some states want the universities to get out of the business of preparing teachers.

Kennedy: When university presidents converge on an issue, they often express concerns through associations like the AAU or the NAS. There's no natural vehicle apparent for this when it comes to policies involving the schools.

Boyer: There's widespread belief that prestigious universities have withdrawn from the schools. Almost anything you do will send an important message—to the general public, legislators, teachers.

Kennedy: There is a lot of consensus on usefulness, need to reaffirm commitment to public schools.

Hechinger: There isn't any doubt about the state commitment. The federal government is bowing out but making new demands on the schools.

Cremin: The principal news is the universities commitment to the schools. This implies a readiness to follow up on a number of things at each institution.

Public has variety of goals for the schools. If nothing else, the job of the universities is to articulate academic goals. Presidents are uniquely appropriate group to articulate academic goals. (Parents might articulate goals for character development, etc.) . . .Public wants kids to achieve more.

Gifford: Remarkable increase in access of schools to all society should be celebrated. We're trying to complete reforms started in 1960s and partially consolidated in the 1970s. Once doors are open, challenge is to narrow disparities in performance.

Atkin: Consistent, long-term institutional involvement is needed.

Bok: Every university ought to recognize responsibility (toward schools). A number of actions are possible, with or without schools of education. An illustrative list might help.

Boyer: Research, clarifying elements of a good education, investing in people, more flexible arrangements for students. . . .

Bok: Big commitment is schools of education moving heavily back into schools.

Public schools...

continued from page 1

especially successful teachers, or in othe ways;

- "Serving, where needed, as sources of advice in the shaping of public policies affecting education."

University help to the schools "needs to be consistent over time," the presidents added. "Episodic interventions, like volatile government support, will merely raise expectations and then leave them unfulfilled."

The presidents' declaration followed extensive discussion with four prominent education school leaders: Lawrence A. Cremin, president of Teachers College, Columbia, and Deans J. Myron Atkin, Stanford; Bernard R. Gifford, UC-Berkeley; and Patricia Albjerg Graham, Harvard.

Other participants included Ernest Boyer, president of the Carnegie Foundation for the Advancement of Teaching; Fred M. Hechinger, president, New York Times Company Foundation; Robert M. Rosenzweig, president, Association of American Universities; and Doris Howes Calloway, provost for professional schools and colleges, representing Chancellor Michael Heyman of UC-Berkeley.

"It may not be a first, but it's damn rare" for major research university presidents and education school leaders to meet so extensively, said Cremin, a noted educational historian.

In individual comments during the conference, Cremin said "it simply is not true that this is the first generation that will have a poorer education than its parents," flatly contradicting one of the highly publicized quotes from the National Commission on Excellence in Education.

Kennedy said the same report was "outlandishly incongruent" in issuing "a clarion call for action" and then "exempting the federal government from any responsibility...there isn't any free lunch."

Boyer said that for President Reagan to raise the problems of the schools to a national crisis and then walk away is "a bit like announcing World War III and then saying, 'tennis, anyone?' "

Bok observed that the way the reports on the schools are understood by the public "the picture is painted in too uniformly gloomy terms" and significant achievements are overlooked.

A large part of the public's confusion comes from university scholars trying to attract attention to themselves with very strong criticism of the school, he added.

Boyer, whose own report on the schools is due out this fall, said he still is not sure whether the nation is seeing "a great reform, a political aberration, or a media blitz.

"Current interest in reform is a mile wide and an inch deep." If reform is not well directed, school support "could evaporate as quickly as it exploded," he added.

Atkin noted that "universities have been largely silent as institutions with regard to school reform, especially since the late 1950s.

"Universities have to convey understanding and even sympathy for what the schools are trying to do. The rhetoric of reform has been harsh, suggesting willful misbehavior. We can use a softer language, with honesty."

Gifford said that over the past decade major research universities were not only negligent but in many ways aided and abetted conditions they now finbd deplorable.

The dollar problem is large, Gifford added. To make change, schools need to increase salaries 25 to 30 percent to attract good people. While California has authorized $800 million additional this year and $900 million next year, the last $200 to $300 million is crucial. If the state falters and full funding doesn't materialize, it could all come to nothing.

Don't despair on dollars, Sovern advised. Corporations recognize that the country has been deficient in human capital investment. This may be the moment when it's possible to generate substantial additional support. It's obvious the Democratic candidates think so.

Bok said he personally is "not very optimistic that very good proposals (for reform) will emerge. I'm not heartened by what I hear on the campaign trail."

Boyer suggested that full Title I funding should bring compensatory education up into the junior and senior high schools. The past record of this program is encouraging.

Teacher training programs similar to those in the National Defense Education Act were "a mixture of attitude and substance which renewed the teaching profession," Boyer said. This could bring universities and schools together again.

Graham noted that Harvard voted to get out of teacher training in 1972 but decided to return this spring. "My sense is there's going to be a teacher shortage," she observed.

Research done years ago has begun to pay off in improved reading, she added. Research interests are now shifting to writing and comprehension, but results may take a decade or two to become apparent in most classrooms.

Two years ago, Kennedy and Bok convened a Pajaro Dunes conference of university an undustry leaders on biotechnology which set the tone for much subsequent discussion of this controversial, newly emerging field.

After what several participants conceded was decades of neglect of the schools, the university presidents appeared moving to exert leadership in a field already marked by highly publicized corporate, legislative, gubernatorial presidential and public concern.

About 80 years ago, meetings of The Committee of Ten, a university-led group, played a central role in setting goals and standards for the nation's secondary schools.

Pajaro Dunes is a Pacific Coast resort west of Watsonville and south of Santa Cruz in Northern California.

Medical Center MEMO

OK'd: kidney transplants

The Medical Center has been given state approval to resume a renal (kidney) transplant program.

Dr. Rex Jamison, professor of medicine and chief of the division of nephrology, said kidney transplants—initially about 25 to 30 annually—could begin here in about a year. A renal surgeon and transplant nephrologist will be recruited and hopefully hired within coming months.

SUMC was notified earlier this month by the Office of Statewide Health Planning and Development that a Certificate of Need (CON) had been granted for the project.

To receive a CON to begin or resume certain medical services, institutions must prove that they are medically and financially sound, and fundamentally, that the project fulfills an area need.

Patricia Stone, a Stanford health care planner, noted last week that the Santa Clara County Health Systems Agency had waived its review of the application, filed March 30, enabling the state to reach a decision quickly and without public hearings.

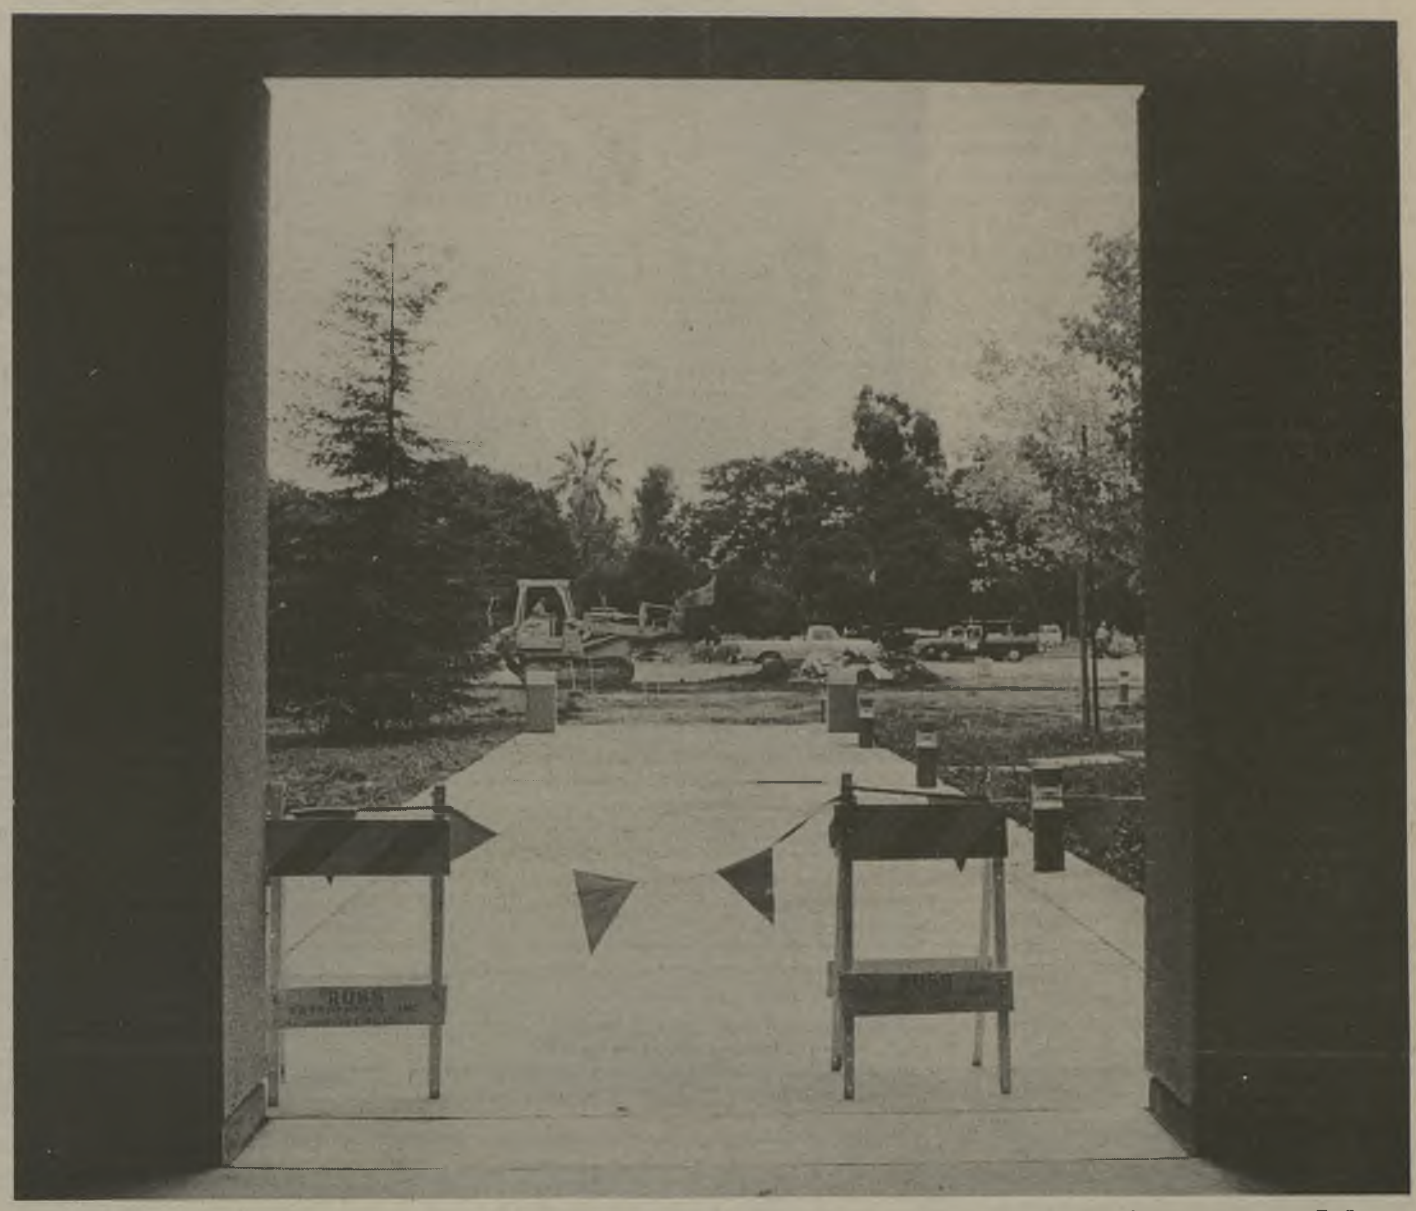
Cost of the project is about $18,000 for therapeutic equipment, and no construction is planned, Stone said.

SUH had a renal transplant program between 1965 and 1971, and then the specialized program became inactive.

Jamison noted that recent developments in immunosuppresive drugs—needed to prevent the body from rejecting the foreign organ—have increased survival of transplanted kidneys.

In its CON application, Stanford noted that currently no renal transplant program exists in Santa Clara County, where more than 80 persons under age 50 were waiting for new kidneys. Currently these persons must seek transplantation at centers outside the area, Jamison said.

In northern California, the only existing renal transplant facilities are at the University of California at San Francisco and Pacific Medical Center, San Francisco. Both of these institutions are experiencing long waiting lists, Stanford said in its CON application.



The transplant program will be a joint venture between the University's department of surgery and the department of medicine's nephrology division.

Stanford's existing nephrology program includes a hemodialysis unit, where about 40 patients undergo regular maintenance dialysis.

Other Stanford transplant programs include hearts, heart/lungs, corneas, and within a few years, bone marrow.

Whitlock uses genetic tricks to demystify dioxin

While U.S. lawmakers and physicians debate the human health risks of dioxin, Dr. James Whitlock Jr., a pharmacologist at Stanford University Medical Center, is using the chemical to explore, on a genetic level, how some people are able to disarm the same toxic compounds that cause cancer in others.

Dioxin, also called TCDD, has been controversial around the world, as a contaminant in "Agent Orange," an herbicide used as a defoliant during the Vietnam war. Industrial accidents and improper disposal of the compound in communities in Missouri and Italy have frightened citizens into fleeing their homes.

Whitlock

The chemical can be potently lethal, but there is great variation among animal species in their susceptibility to toxicity. Despite recent public concern about possible long-term effects of exposure, the only consistent and well-documented symptom in humans accidentally exposed to dioxin has been a temporary, severe form of acne. Scientists still have only a murky understanding of how the chemical causes changes inside humans and animals.

At a recent meeting of the International Union of Biochemistry held at Stanford, Whitlock, an associate professor of pharmacology, described the ways dioxin affects an enzyme system commonly used by most animals and man to process large molecules that might otherwise get caught and cause harm within the body.

Usually, such enzymes are useful in helping the cell eliminate potentially harmful compounds. But occasionally the enzymes are more hindrance than help.

Whitlock studies "benzopyrene," a common environmental carcinogen found in auto exhaust, industrial emissions and cigarette smoke, as it moves into cells and is broken apart and recombined into cancer-causing components.

"Many compounds, like benzopyrene, aren't themselves carcinogenic," Whitlock said, "but during their metabolism within the cell they may be activated to metabolites that are active carcinogens. We're interested in those enzymes and in how the cell deals with foreign compounds."

Whitlock and his colleagues have used biochemical tools and genetic tricks to track the chemical's movement inside the cell. Chief among their tools is dioxin, which induces an increased production of the enzymes that process benzopyrene into both harmless metabolites and harmful cancer causing compounds.

By isolating several mutant strains of cells that don't respond to dioxin and comparing them with cells that do, Whitlock has begun to understand how genes regulate the production of the enzymes. His studies have revealed a nuclear protein which "recognizes" dioxin and acts as a "switch" to turn the enzyme gene on and speed production of both beneficial and harmful enzymes. Currently Whitlock is trying to pin down exactly how this "dioxin receptor" controls production of each type of enzyme.

Although Whitlock's studies have been conducted with liver cells from mice, the enzyme systems also play an active role in humans and may serve as a good model for the way chemicals may act in concert to cause human cancers, he said.

"It's not at all clear what the effects of dioxin are on humans," he said. "There has been a lot of hysteria, but what we need to do is to find out exactly what's going on inside the cell."

—Deborah Franklin

Levy's work proceeds. . .

Hammer's gift funds expanded lab for cancer research

A $500,000 gift from industrialist Armand Hammer will help expand and finetune the promising new use of specialized protein "bullets" in battling several types of cancer, said Dr. Ronald Levy, Stanford cancer researcher, at a dedication ceremony at Stanford Medical Center Thursday, Aug. 18.

Hammer joined Levy, Vincent DeVita Jr., director of the National Cancer Institute, and other dignitaries at the christening of an expanded laboratory funded by the Hammer gift.

"We've had some preliminary results that are very promising, and Dr. Hammer's gift will help us expand our laboratory facilities and move a lot faster to test the possibility of making this into a therapy that we hope eventually can be made available to large numbers of patients," Levy said.

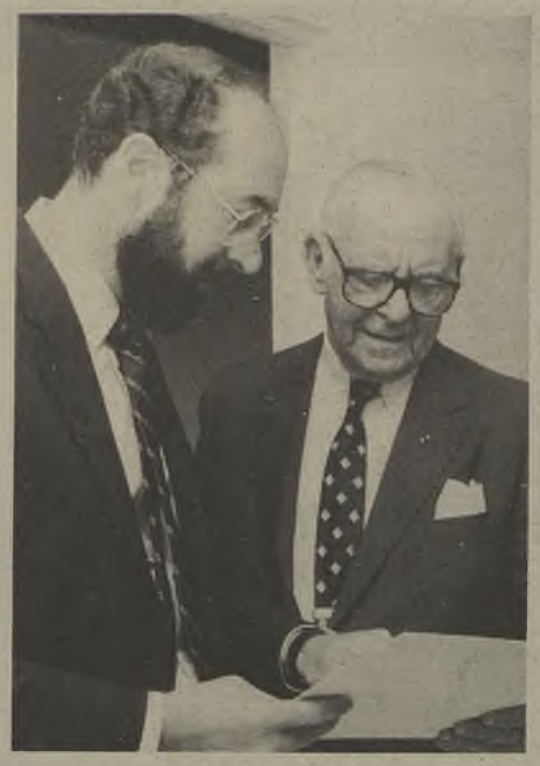
Hammer, chairman and chief executive officer of Occidental Petroleum Corporation, and chairman of the President's Commission on Cancer, said DeVita had recommended Levy's work to him as one of the most exciting areas of cancer resarch.

In 1981, Levy, an associate professor of medicine/oncology, used the special proteins, called "monoclonal antibodies," to treat a 67-year-old man dying from a rare form of lymphatic cancer.

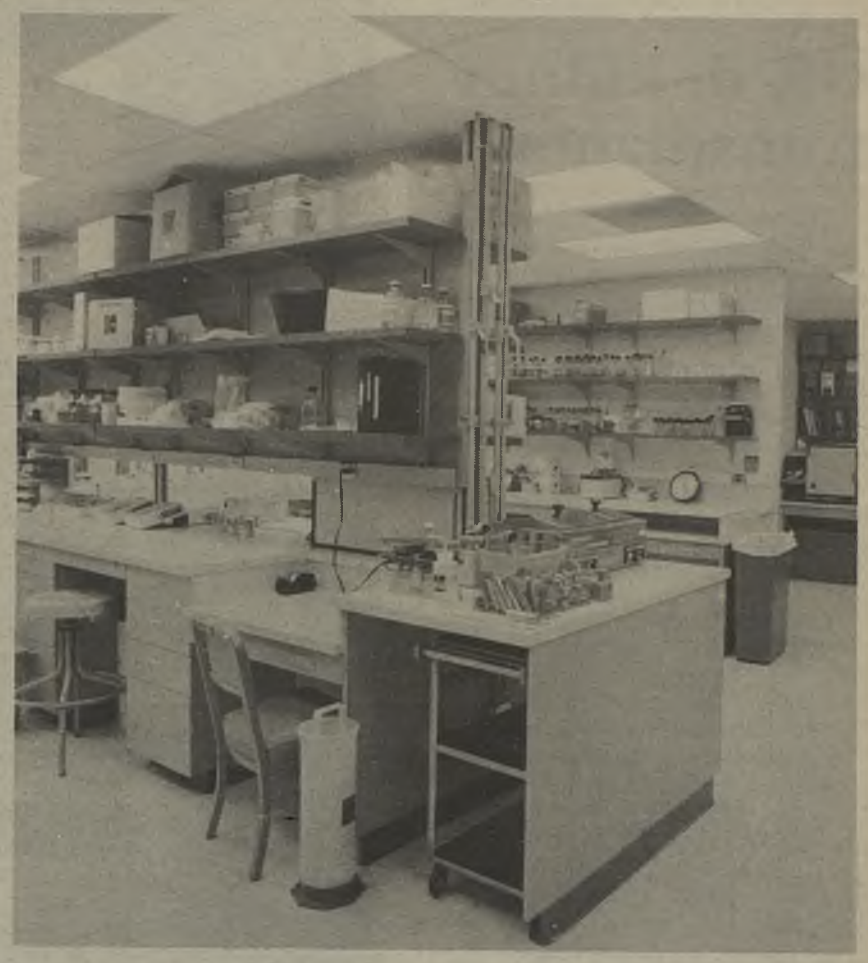
Previous treatments with conventional and experimental drug therapy couldn't halt the disease that was slowly ravaging his liver, spleen and lymph nodes. But after a four-week regimen of custom-tailored antibodies, the cancer began to recede.

Today, more than two years after treatment, the man remains completely free of disease.

The early success triggered hope in scientific circles and in the general public that monoclonal antibodies, already valuable as tools to diagnose disease and detect cell differences too tiny to be seen any other way, might have a new use in eradicating cancer.



Five patients have completed the treatment, and the scientists have begun the six-month-long process of manufacturing the custom-tailored antibodies for eight more patients. The results have been "encouraging," Levy told reporters at a press conference preceding the ceremony, though it is still too soon to tell exactly how successful and how generalizable the results will be.



Monoclonal antibodies were first developed by researchers George Kohler and Cesar Milstein in Cambridge, England, in 1975, as a variation of the normal antibodies that every mammal produces to attack any foreign substance—virus, bacteria, or cell—that invades the body.

Each antibody is designed to precisely match a specific site on the invader's surface and to latch onto it like a key in a lock. Once the antibody and foreign substance are joined together, other cells of the immune system are alerted to join the battle and destoy the invader.

A wide variety of slightly different antibodies may be produced in response to a typical infection, but Kohler and Milstein developed a method of screening the mixture to select and harvest only the specific type of antibody they desired and to produce it in large amounts.

Levy and other researchers have capitalized on the specificity of the monoclonals to develop a potentially powerful treatment for some types of cancer.

Above, Levy (left) and Hammer, at last week's ceremony to dedicate the lab (right) where, with the help of Hammer's gift, Levy will continue and refine his studies on the therapeutic value of monoclonal antibodies in cancer treatment.

"We're finding that the more sharply the antibody can distinguish between normal cells and tumor cells, the better effect we can get," Levy said. "And the best distinction between tumor cells and normal cells is attained by making a different antibody for each patient. That's a long and laborious process."

To produce the antibodies they use in treatment, Levy and his colleagues first inject mice with cancer cells filtered from a blood sample of the patient to be treated. A few days later, they remove the mouse's spleen, which now contains large numbers of white cells, the blood-borne factories where infection fighting antibodies are produced.

Some of these white cells have become sensitized to the injected cancer cells, and will produce antibodies that can specifically seek out and destroy cancerous cells in the patient's body without harming healthy tissue.

The scientists then fuse the white cells in a laboratory dish with cells from a mouse tumor, creating a new, immortal cell line or "factory" that can produce large quantities of the desired antibodies.

Currently it takes Levy's team an average of six months to produce enough antibody to treat a single patient, at a cost of approximately $50,000. If and when the experimental procedure is proven effective within the next couple of years, private companies could take over the production of the proteins on a large scale, and greatly reduce the treatment cost, Levy said.

All the patients he has treated thus far have suffered from one of several types of lymphoma and leukemia. The scientist said he has limited the treatment for primarily two reasons: as cancers that float through the bloodstream, lymphomas and leukemias are relatively easy targets for the special treatment, in comparison to solid tumors.

Also, even more importantly, leukemic cells have well defined "targets" on their surface that antibodies can easily identify and lock onto. Currently, such targets have been identified for only a few specific types of lymphomas and leukemias, but researchers around the country are seeking such targets for "virtually every type of cancer," he said. "When people understand what those targets are, then we'll know how to make antibodies against them."

"We really don't know what the final role of monoclonal antibodies will be in the total treatment of a person with cancer," Levy said. "I don't think that they will ever replace the current therapies that really do work, but I do think that they will be useful, probably in an adjunctive role."

While Levy has used the antibodies alone in treatment, other researchers are investigating the possibility of tagging the proteins with a radioactive isotope or chemical poison which they could aim exclusively at the cancer cells, sparing the healthy tissue that is inadvertantly killed through conventional cancer treatments.

"Eventually we hope to add monoclonal antibodies to the other modalities of treatment we have," Levy said, "to be used in different combinations, depending on the needs of each individual patient."

"This is only one step in the work that has to be done in the path to finding a cure for all cancers," said Hammer, who recently established a $2 million fund to support research towards a cancer cure. "But I think it is an important step."

—Deborah Franklin

Artificial heart: panel formed

Lois Christopherson, manager of patient relations for the Faculty Practice Program, has been appointed to a national advisory committee on the artificial heart.

She is the only Stanford representative on the 12-member panel formed by the National Heart, Lung and Blood Institute of the National Institutes of Health.

Claude Lenfant, director of the NHLBI, said the group is expected to study the artificial heart and other mechanical circulatory support systems, and then advise the institute on issues, actions and policies relevant to the research and potential therapeutic use of such devices.

Christopherson and her colleagues are scheduled to meet for the first time Sept. 13 in Bethesda, Md., and are expected to complete a report on "the broad medical, societal, ethical and economic aspects" of mechanical circulation by the end of 1984.

Called the Working Group on Mechanical Circulatory Support, the panel is chaired by Dr. Robert Van Citters, professor at the School of Medicine of the University of Washington.

Christopherson served for many years as clinical social worker for Stanford's cardiac transplantation program. In 1981, she left SUH to attend the Graduate School of Business' Sloan program, graduating with an M.S. in business before joining the FPP in her current position.

Volunteer finds hospital duties varied, but always uplifting

Joyce Vincenti has traded in the contrasts of tone on an oil painting canvas for the sometimes wider contrasts of joy and stress encountered at Stanford University Hospital.

And like in the paintings she once sold to galleries, the emotional contrasts often blend together in a volunteer work schedule that might find her reassuring the anxious family of a surgery patient, cuddling a premature infant, or sharing the joy of a couple going home with a healthy newborn.

Vincenti even found time to update the *Visitor Information Book* recently, as part of her responsibility on the SUH Auxiliary Board. The book contains a guide to local hotels, restaurants, entertainment and important phone numbers, as well as SUH information, parking rules, and campus maps.

And as if all these duties weren't enough, Vincenti spreads herself thinner by serving on the planning committee for the Auxiliary's annual educational seminar, and by volunteering time each week on various nursing units.

"I enjoy it," she said, "and besides, we don't have enough volunteers to be able to take it easy."

A Los Altos Hills artist, Vincenti has a studio in her home. "But I decided a few years ago I wanted to get out and interact with people," she said, adding that she's made a group of new friends through the Auxiliary—"some fine men and women."

In earlier days Vincenti taught elementary school in Rosemead, Calif., before meeting her husband Walter, an aeronautical engineering professor at Stanford who just won this year's Dinkelspiel Award for outstanding contributions to undergraduate education.

Walter and Joyce have been married for 35 years and have two children. She likes to tell the story of how they met:

"I had been visiting my cousin at a naval base in Cuba, to rest after an illness. I ended up teaching fourth graders there for a year. With all those officers, it was a nice place for a young single woman—I was 28 at the time.

"Anyway, I finally took the ship back to New York. On the last leg of the trip, the train ride from New York home, I met my husband."

Later Joyce Vincenti did volunteer work at the Children's Health Council in Palo Alto. She's always found hospitals fascinating, so when she was looking for such work again it seemed natural to join the Stanford Auxiliary. She recalls it wasn't hard for her neighbor Helen Brown, a now retired member, to convince her of that one day when they met in the market.

Today Vincenti insists that her duties as an Auxiliary member are always uplifting. "I constantly met people who have been through so much and are still so spirited," she said.

But part of her job, Vincenti explained, is to "sense when people want to be left alone" as well as when they might like to chat. This holds especially true with families at the surgery reception area, or waiting room.

"It always seems a long time that they have to wait," Vincenti explained. "Some are eager to talk and confide; others really want to keep to themselves.

PHOTO BY ED SOUZA

"I constantly meet people who have been through so much and are still so spirited."

—Joyce Vincenti

"But most look up from time to time, at whoever's on duty, for some sort of reassurance"—provided, perhaps, by the sight of uniforms and unworried expressions.

Thus, while her job may appear to consist of making coffee and pointing out the direction of the cafeteria, it is really much more than that, and the appreciation of those served is obvious. Not long ago, Vincenti said, a grateful gentleman simply took out his checkbook and gave the Auxiliary $100!

Once visitors sign in at the desk, she explained, they are sure to be looked after by the Auxiliary member on duty. "We check with the O.R. We're told when the patient is transferred to the recovery room, and then tranferred to another unit. We relay this information to the family."

Finally, they remind the doctors to come out and talk to the family.

Recently, Vincenti recalls, a family had waited nearly the entire day when the patient's heart stopped just as surgery ended.

In cases like this, there is usually a friend around to offer comfort, and the Auxiliary staffer can help most by providing information about the hospital's chaplaincy service, social services, and other practical matters.

(A special green phone, courtesy of Community Relations, is available for families, to communicate directly with the O.R. at night when the reception desk is not staffed.)

On another day of the week, Vincenti shifts gears to help provide direct patient services on the well baby and surgical nursing units. This, she explained, involves running errands, getting patients the newspaper or something from the gift shop, and wheeling them out upon dismissal from the hospital.

The happy sight of newborns going home for the first time contrasts, Vincenti admits, to the premature and critically ill babies she has attended to as a sort of "visiting grandma" when needed.

This contribution began when the Intensive Care Nursery's social worker, Charlene Canger, put in a special request for a baby whose mother was unable, because of personal problems, to visit her regularly. Most parents do come, and there's a special rocking chair in the ICN for their use. Canger asked whether an Auxiliary member might be able to fill in the gap (as one had some years before) for this particular infant, and Vincenti jumped at the chance.

"I visited with that baby for about three months, until one of the unit nurses adopted her.

"At first she was in an isolette, and I couldn't really touch her," Vincenti recalls. "So I'd talk to her, and play her a nursery rhyme tune—I don't even know if she heard it.

"Then, gradually they let me hold her and give her a bottle." Vincenti did become somewhat attached to that little girl.

Canger emphasizes that the role Vincenti played with this and other ICN babies served as a "real impetus for us to expand our parent support activities," and she has since received Auxiliary funding to do just that.

A new ICN reception desk, plans for the first ICN graduate reunion party, and newly formed ICN parent support groups are just a few examples of the kinds of activities taking place on the unit these days.

"The volunteers now," said Canger, "play a more indirect role with families than Joyce did."

Once, Canger recalls, "I felt very nervous because a mother came to visit her baby when Joyce was there too. It was a complicated case because she was a high risk, single mother who lived far away. When she first met Joyce she was a bit bristly.

"But Joyce quickly established herself as a loving aunt rather than a substitute mother. She said, 'I thank you for letting me share your son,' and then talked about the baby's long eye lashes and sociability. Soon she and the mother were friends.

Joyce was always sensitive to the baby's and the family's needs, and that with no special training," Canger remarked. "What's more, she always checked with the nurses and listened to what they said about the differences between preemies and other newborns."

Sometimes, Canger explained, it is unwise for a critically ill infant on a ventilator, for example, to be stimulated by touching or cuddling. ICN infants do or do not require social contact, depending on their medical progress.

"It's an individual clinical decision and a balance," said Canger. "It's a matter of looking at that little person's psychological and emotional development, in light of overall medical requirements."

Vincenti claims that personality traits are discernible even in these very young, often very sick, infants. "Some babies you'll just never forget. I remember one who was so alert and friendly, everyone was crazy about him."

As for the nurses, she said, "Besides the human caring, there's so much advanced technology they have to be familiar with in the ICN—I really admire that staff."

Vincenti considers herself lucky in terms of the variety of tasks she's had on the Auxiliary. "I just sort of fell into it all," she said.

But after almost 2,000 hours of volunteer time ("not much compared with other members") since she joined the group in 1977, Vincenti is still content with the services she's on. "There are a lot of areas one could switch to in the hospital, and maybe someday I will—but not now," she smiled.

—Lisa Ames

Satir to speak at Social Work's anniversary party

The 70th Anniversary Celebration Banquet for the Department of Clinical Social Work at SUH will feature Virginia Satir, internationally renowned therapist and author, speaking on "Families in the'80s."

The banquet will be held Thursday, Sept. 15, at the Faculty Club. A fee of $18 per person will be charged, with no host cocktails to begin 5:30 p.m. and dinner at 6:30.

Satir, who has shared her work and beliefs all over the world, was named the most influential therapist for other practitioners in the field by the Group for the Advancement of Psychiatry, in the early 1970s.

She is frequently thought of as *the* innovator of the approach that brings the entire family into the therapist's office. Considered unorthodox 30 years ago, her approach has now been adopted throughout the world.

Recognizing that the foundation for personal growth is primarily developed in the family, Satir applies this learning to business, institutional practices, and other human systems.

She was one of the founders of California's Mental Research Institute. In 1976, she created the AVANTA Network, a teaching network of people who have studied with her and who now give workshops around the world. She was a director, and the first director of residential training, at the Esalen Institute in California.

The awards and recognition banquet is the culmination of a year-long celebration as social services at Stanford attains its 70th year of existence and evolution.

Stanford's was one of the first departments of clinical social work to be established in a hospital in this country, said Wilbur Wright, director. "It was certainly the first on the west coast, started about two years after the first one began at Massachusetts General Hospital in Boston."

The Hospital Auxiliary was responsible for the department's funding support through 1940, Wright said.

The banquet will include, besides Satir's talk, an awards ceremony and a presentation of the department history to both the University and Hospital archives.

Those wishing to attend should respond by Sept. 2 to the department office, C136, at 497-5615. Further information can also be obtained at this number.

Cellar hosts benefit

The Cellar Restaurant in Los Altos is sponsoring a wine tasting Sunday, Aug. 28, to benefit the Intensive Care Nursery at Stanford University Hospital.

Larry Hancock, owner of the restaurant, organized the benefit to show appreciation to the ICN since his son, Joshua, was a patient there for six weeks in 1971.

The event is scheduled for 2 to 6 p.m. Tickets are $12.50 per person ($15 at the door), and all proceeds will be donated to the ICN.

The Cellar is located at 4926 El Camino Real in Los Altos. For further information, call Jeff Barile at 964-0220.

Participants in Back-Evac two years ago practiced the swing carry, a method of supporting a patient for evacuation in an emergency.

Back-Evac is back, for another series of training workshops

Hospital department representatives will be taught proper back care and patient evacuation techniques at the fourth annual series of Back-Evac training workshops to begin Sept. 6.

Terry Nordstrom of the physical therapy department is coordinating the classes. Each hospital department is asked to designate a "trainer" to attend the workshop. These people will then instruct all employees in their department on proper back care as well as in safe, effective patient evacuation techniques, should an emergency ever occur at SUH.

The yearly refresher program was initiated at the request of the Disaster Planning Committee, the Health and Safety Department, and Hospital Administration.

Various times are available for new and returning trainers, but class sizes are limited, so call 497-7225 soon to reserve a place.

Construction Corner

CVRB—parking disruptions:

The Cardiovascular Research Building project has advanced to the point that landscaping is planned to begin Sept. 6.

This work will result in a temporary loss of about 80 parking spaces in the area, but plans have been made to compensate for the loss.

Spaces lost in the afternoon lot will be replaced by creating two new areas of reserved afternoon C parking, and some A spaces will be relocated to the A lot between the pay lot and the Administrative Annex.

Additional day C parking will continue to be available in lots F and Q.

Maps illustrating these changes are available from Safety/Security Services. These will also be mailed later this month with a memo to all departments and units to clarify the impending activities.

Upon completion of this phase of the project, the parking spaces will revert to their former usage. Everyone's continued cooperation and understanding will be appreciated during this period of inconvenience.

Med Center Calendar

WEDNESDAY, AUGUST 24

Div. of Hematology Wednesday noon conference: "Clinical Application of White Cell Scanning"—Dr. Ross McDougall. Noon, S102.

Hematology support group: Meeting for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

Depts. of Pathology and Structural Biology seminar: "pH Dependent Fusion Mediated by VSV G-protein Reconstituted in Phospholipid Vesicles"—Dr. Robert Blumenthal (National Cancer Institute). Noon, D102.

Physicians for Social Responsibility/Stanford and Mid-Peninsula Chapter film: "The Last Epidemic." 8 p.m., 3rd floor, Old Union Clubhouse, common room.

THURSDAY, AUGUST 25

Dept. of Medicine grand rounds: "Survival on a Mucosal Surface: Marvels of Neisseria Gonorrhoeae"—Dr. Gary Schoolnik. 8:30 a.m., Fairchild Auditorium.

FRIDAY, AUGUST 26

Dept. of Gynecology official monthly staff meeting—Dr. Jonathan Parmer. 8 a.m., A336.

MONDAY, AUGUST 29

Dept. of Gynecology Reproductive, Endocrinology and Infertility conference: "Adrenal Gland Function and Control"—Dr. Alan Shapiro. 8 a.m., A336.

TUESDAY, AUGUST 30

Dept. of Biochemistry seminar: "In vitro splicing of mRNA precursors"—Dr. Richard Padgett (MIT). Noon, M316.

WEDNESDAY, AUGUST 31

Div. of Hematology Wednesday noon conference: Pediatric Presentation. Noon, S102.

Hematology support group: meeting for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

Registration deadline for Nursing Educational Services "Basic EKG Interpretation Workshop": to be held Sept. 14, 21, 28 and Oct. 5. For further information or to register, call 497-6366.

THURSDAY, SEPTEMBER 1

Registration deadline for Nursing Educational Services "Sports Medicine: A Team Approach": to be held Friday, Sept. 9, 8 a.m. to 4:30 p.m., Sports Medicine Library, 3250 Alpine Road, Portola Valley. For further information or to register, call Carole Kidder at 497-6366.

Registration deadline for Nursing Educational Services "Pediatric Critical Care Course Level II—Congenital Heart Disease": to be held Wednesday, Sept. 21, M104. For further information or to register, call Carole Kidder at 497-6366.

Dept. of Medicine grand rounds. 8:30 a.m., Fairchild Auditorium.

SEPTEMBER 7 through 9

Nursing Educational Services: "Cardiovascular Nursing in the '80s: Third Annual Symposium." For further information or to register, call 497-6366.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear.

...News Notes...

Spotlight on. . .

Dr. Elizabeth Langston *has been awarded a grant of $3,000 by the Committee to Combat Huntington's Disease, for research into a means to detect that disorder earlier than is presently possible.*

Huntington's is a hereditary neurological disease which usually strikes people in middle age. It is characterized by uncontrollable, irregular muscle movements and progressive mental deterioration.

Langston, a part-time fellow in neurology, is currently completing her medical internship at Santa Clara Valley Medical Center. In collaboration with Dr. John Hotson, assistant professor of neurology at SUMC, she will investigate whether a certain type of subtle eye movement, characteristic of those with late-stage disease, is detectable in persons who have had Huntington's only a year or two.

If people in relatively early stages exhibit such eye movement, Langston suggests, possibly those carrying the disease but not yet showing obvious symptoms do as well. Combined with other evidence, this could make early detection easier and allow for better genetic counseling.

* * * *

Duane Walker, *director of Nursing Services, has been chosen to lead a U.S. delegation of nurse administrators in September to the People's Republic of China cities of Beijing, Shanghai, and Guangzhou, as well as Hong Kong.*

Topics he will discuss include "Research and Its Implication for Nursing Practice," "Nursing's Role in Health Care Delivery," and "Image Making—Nursing in Today's Society."

The delegation is sponsored by Professional Seminar Consultants, Inc.

* * * *

Marilyn Tucker *has been promoted to manager of Systems Services for SUH, announced Ron Kreutner, assistant director of Finance/Controller.*

With SUH for over 20 years, Tucker has worked since 1974 primarily on computer systems involving Patient Accounting, most recently in the Patient Accounting Conversion.

She was recently honored at the 25th annual Thomas A. Gonda hospital employee awards ceremony for her special contributions both in the conversion project and in solving information needs and systems problems for many hospital departments.

* * * *

Eddie Ferraz and **Romulo Alvarez**, *both of Operations and Maintenance, were honored Aug. 15 at a ceremony in recognition of their completion of a four-year crafts apprenticeship program.*

The two men are the first SUH employees to complete this innovative program, which was begun here in 1980, to teach employees specialized crafts. Ferraz' apprenticeship was in

Ferraz (left) and Alvarez

carpentry; Alvarez' was in maintenance mechanics. Both finished their training early, said Bill Gilmore of SUH Employee Relations.

The program offers the opportunity for Hospital employees to become qualified for internal promotion and to receive a State Certificate of Apprenticeship relative to their craft, according to Ron Just, director of Operations and Maintenance.

Just hosted last week's ceremony. Also present were Sheldon King, director of SUH, and Mary Catherine Krawec, associate director, both of whom expressed their appreciation of the two men's achievements.

You should know. . .

The **Palo Alto Fire Prevention Bureau** *will inspect the Medical Center early next month to reaffirm that corridors are not blocked and that no combustible materials are stored in exit ways, said Ruben Perez, assistant director of safety/security services.*

The inspection is necessitated by recent problems in these areas. Safety/Security Services has arranged with Operations and Maintenance to clear such items from inappropriate areas prior to the Fire Prevention Bureau inspection. All improperly stored materials will be given a Fire Safety "warning tag," and then removed Sept. 1 and 2.

Meanwhile, Perez reminds personnel to remove inappropriately placed materials immediately. Questions may be directed to him at 497-7225.

* * * *

Hospital escalators *are now operating until 8:30 p.m. every evening, instead of the usual 5 p.m., to accommodate both patient and visitor needs, according to Ron Just, director of operations and maintenance.*

He said the extra hours are expected to have minimal impact on energy use.

Just also confirmed that periodic stoppage of the escalators is not due to problems, but is for normal maintenance and cleaning to keep them operating smoothly. They are closed two days each month for this service.

New **parking permits** *for 1983-84 go on sale Sept. 1, from 7:30 a.m. till noon and 1 to 3:30 p.m., Monday through Friday.*

Fees are $100 for A and E permits; $20 for C and Designated Student Housing; and $120 for Service Vehicle Permits. The Vehicle Registration Office for the Medical Center moved Aug. 17 from the Personnel Department to Room E015 in the hospital basement, across from the Credit Union.

The Department of Public Safety has sent out computerized, individual packets of information to all Stanford faculty and staff who had vehicles registered here before Aug. 5, 1983. Departments are encouraged to designate one person to gather applications together for processing.

Parking applications may be mailed in or dropped off at the Vehicle Registration Office. They will be ready for pick-up within three working days in E015. Permits will not be delivered or mailed.

* * * *

Discounted tickets *are available to employees for a soccer game featuring the Earthquakes versus the Seattle Sounders, 8 p.m. Sept. 3, at Spartan Stadium in San Jose.*

Tickets are on sale through Aug. 29 for this event, which is Tailgate and Fan Appreciation Night. For information on where to mail payments, call Susan Cabral, at 497-6251.

* * * *

The Hospital's **linen amnesty drive** *has already resulted in the return of items which, to replace, would have cost the institution about $450, said Joyce Miller, associate director of Nursing.*

As of August 14, items returned include: 30 doctors' shirts, 17 pairs of scrub pants, 23 scrub dresses, nine bath towels, four isolation gowns, three bib aprons, one surgical towel, and one X-ray gown.

Miller announced that the red and white linen return bins, placed at various locations around the parking lots, will remain up for about another month. Encouraged by success so far, efforts to get lost linen back will continue. All employees are asked to check for items they may have inadvertently taken home—and to return them to the bins.

* * * *

New guards *will provide security service beginning Sept. 1, said Hilary Ryniewicz, director of safety/security services.*

Security officers from Guardsmark, Inc. will cover the entire Medical Center area, wearing dark gray uniforms, white shirts, and ties.

Ryniewicz noted the selection of Guardsmark was the result of a normal bid request process occurring every few years.

Dietetics offers weight loss class

A 10-week weight control program, to be conducted by registered dietitians from the department of dietetics at SUH, will be held Sept. 27 through Nov. 29.

The course is open to the public and will be held Tuesday evenings at the Hoover Nursing Cottage.

Highlights of the program include a personalized weight loss plan, low calorie cooking demonstrations and snacks, menu planning, behavior modification techniques, and a dining out experience.

Kristine Birge and Patricia Kearney, registered dietitians at the Hospital, will conduct the classes. Stanford guest speakers will include Dr. Mary Southam of the Behavioral Medicine Program, and Elad Levinson of Human Resources Development.

"We want to show that there are safe and healthy ways to achieve weight control," said Birge, "while making the experience an enjoyable one with group discussions and active participation."

Many of the instructional materials developed for use in the course will be used by the dietitians in patient care programs as well, she said.

Enrollment in the "Enlightening Experience" program is limited to 20 participants. Early registration is advised. For more information, call Birge at 497-5440.

Medical faculty opening

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

The Department of Surgery seeks an assistant professor for a full-time position in the Medical Center's division of pediatric surgery.

The applicant must have completed an approved pediatric surgical training program and be eligible for the Certificate of Special Competence in Pediatric Surgery. Strong clinical skills and training, strong interest in clinical and/or laboratory investigation, and excellence in teaching will all count substantially in evaluating candidates.

Letters of inquiry and curricula vitae should be sent no later than December 1, 1983, to: John A. Collins, M.D., Chairman, Dept. of Surgery, Stanford University School of Medicine, Stanford, CA 94305.

Applications are being accepted for a senior faculty position (full or associate professor) as chief of the section of cardiology at the Palo Alto Veterans Administration Hospital.

Qualifications include proven academic accomplishments in cardiovascular disease, and clinical and administrative experience.

Send applications to Dr. John Schroeder, Cardiology Division, Stanford University School of Medicine, Stanford, CA 94305.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

31937-VW (JCC:3150) DEVELOPMENT OFFICER III: Assoc Area Dir respon for an assigned geographic region to prov staff support of gift procurement activities designed to produce gifts of $25,000 & above fr indivds, certain private foundations & closely held corporations; duties cover a full range of activities related to major gift development incl specialized analytical res, donor relations, dir contact w/ volunteers, donors, & prospective donors, & other tasks related to the gift procurement process; initial assignment will be in S.F. & the Bay area, although assignment is subj to change; QUALIFICATIONS: knowl of tech aspects of gift procurement, Univ admin, marketing & finance preferred; good commu skills; good judgment; familiarity w/ Stanford & the Development Offc desirable; ability to travel & work on wkends & evenings required; arithmetical & statistical skills essential.; C08; $2590-3313.

41626-DS (JCC:4084/4092) Programmer/Analyst III/IV: SU seeks to develop a comprehensive student info sys that will meet the operating & analytical requirements of the offcs charged w/ processing & maintaining student records & info; P/A must possess a high degree of expertise/exp in sys design, coding, testing & implementation; ability to analyze into cohesive sys design, 2 or more Univ functions, interface w/ other complex sys & programs & be able to consider decisions regarding relationships among admin subsys; prov technical direction & leadership; QUALIFICATIONS: thorough knowl of sys environments & capabilities of such eqpt as IBM 3081/370; Offc info sys; WP; PC's; knowl of financial acctg; expertise in software such as COBOL; expertise in DBMS; 2 yrs exp in SPIRES preferred; familiarity w/ standard batch sys approaches, w/ on-line tp sys required, w/ structured analysis/design tech & prototyping tools helpful, & w/ Univ subsys; exp in financial acctg practices/procedures & payroll sys.; C07/C08; $2221-3545/2590-4079.

40527-VW (JCC:5116) PROGR SCIENTIFIC III: Involves applications programming for an oncology protocol mgmt sys; requires significant exp w/ artificial intelligence techniques & the LISP or Interlisp langs; learn an already existing, large expert sys; QUALIFICATIONS: Masters level training in computer sci & prev exp w/ personal workstations highly desirable.; C07; $2221-3545.

897-DS (JCC:5166) COMPUTER SYSTEMS SPEC: Sr. Computing Offcr; Dir of computing sys for lang res institute; participate in design, then manage installation & development of multi-sight computing network of over 100 LISP-based computers, w/ laser printers, commu links, file serv, etc; supv engrs, sys programmers, admin personnel; develop integrated hardware & software environ based on new res in programming langs & linguistic sys; QUALIFICATIONS: exp managing large complex res computer installation & supvg personnel; strong computer sci bkground; interest in design & creation of state-of-the-art computer environments.; C09; $3122-4653.

36187-TC (JCC:5588) LIFE SCI RES ASST I: Major activities relate to the mechanism of action of catecholamine receptors; experiments will be conducted independently & w/ postdoctoral fellows; cell culture, protein purification, radioimmunoassay & measurement of receptors using radioligands; some handling or rats as well as genl lab duties such as ordering supplies; QUALIFICATIONS: Bachelor of Sci degree or equiv required; genl exp w/ techniques such as radioimmunoassay, chromatography (incl HPLC) & radioimmunoassay, would be helpful; extensive exp w/ cell culture methods highly desirable.; C05; $1756-2202.

36627-LL (JCC:5588) LIFE SCI RES ASST I: Utilize biochemical & chemical analytical tech in neurochemical & psychiatric res; perform biochemical assays for neurotransmitter enzymes, assays for neurotransmitters & their metabolites, receptor assays, & protein purification; establishing procedures for maintaining primary adrenal medullary cell cultures & adrenal medullary explant cultures for biogenic amine enzyme regulation studies; QUALIFICATIONS: BS or MS in chemistry or biochemistry or equiv edu & exp required; familiar w/ & can perform basic lab skills absolutely essential; use of serological & micropipettes, balances, pH meter, liquid scintillation counter, ultraviolet & visible spectrophotometers, high pressure liquid chromatography instrumentation, high speed & ultracentrifuges, polyacrylamide & agarose gel electrophoresis apparatus; sufficiently versed in theory to recognize problems, adapt & modify methods.; C05; $1756-2202.

20739-LL (JCC:5596) LIFE SCI RES ASST II: Set up, maintain, & keep accurate records of sterile in vitro cell culture sys using animal & human tumor cells & various hybridomas, maintain hybridoma cultures in vitro or in vivo (ascites), & purify monoclonal antibodies; prep assay & dilute radiolabeled mat'ls for in vitro & in vivo experiments; perform in vitro experiments using whole blood, blood cells, tumor cells, tissue culture cells, etc to study cell uptake, receptor binding kinetics, competitive inhibition of binding, transport mechanisms, etc, of various radio-labeled compounds incl monoclonal antibodies; process & count human blood & urine samples; QUALIFICATIONS: knowl of scientific theory assoc'd w/ a Master of Sci degree or equiv edu & exp in an applicable sci; knowl of nec lab skills.; C06; $1948-2441.

16484-JB (JCC:6826) SOC SCI RES ASST III: Fixed term, 10/15/83-10/14/85; asst Dir & Assoc Dir to conceptualize types of analyses to be performed on specific data sets; coord the DAP; identify & make recommendations of data sets to acquire for SCCR archive on Chicano machine-readable data files; develop process for validating study design, data collection procedures & resultant data of acquire data sets; designate approp forms of graphic representations of results; prep reports & proj summaries; train & supv grad & undergrad res assistants in secondary data analysis, etc; QUALIFICATIONS: doctorate or advanced grad training in population social demography, or related social sci field; exp in social res & data analysis; knowl of special design, sampling & analysis issues in performing secondary analyses of existing data sets for cultural & linguistic minority populations, particularly Chicano & Spanish-origin groups.; C05; $1756-2202.

21698-DS (JCC:7566) FACIL ENGINEER/COORD III: Facility Engr in charge of C.I.S. bldg operations & maintenance is a line mgmt position reporting to Mgr of Craft Shops in O&M; supv a staff of 2 technicians, also craftsmen or contractors performing work inside the bldg; respon for implementing a complete maintenance program associated w/ a highly technical semiconductor facility; prov CIS faculty w/ the internal capability of monitoring, adapting, controlling & consistently managing facility related issues 24 hrs/day, etc; QUALIFICATIONS: Bachelor's degree in mechanical engrg or equiv related engrg field; 5 yrs applicable exp; able to oversee 24 hr operation; proven tech exp in bldg maintenance; in supvn, & in dealing w/ a technically oriented group of clients; thorough understanding of health & safety hazards of semiconductor industry.; C08; $2590-3313.

42451-JB (JCC:8706) HEALTH & SAFETY SPEC II: 50%; makes fire & life safety inspections of Univ facilities incl bldgs under construction or renovation in orde: to ascertain compliance w/ applicable codes, ordinances & fire protection standards; writes reports of hazards or deficiences noted & suggests corrective measures; reviews plans of renovations to existing bldgs or construction of new bldgs incl fire protection suppression & alarm sys; conducts selected fire safety training & edu programs for Univ community; QUALIFICATIONS: ability to read & interpret bldg construction & fire proteciton sys plans; commu effectively both verbally & in writing; deal effectively w/ Univ officials, reps, & public in genl; knowl of principles, procedures & methods of modern fire protection eqpt & sys; knowl of state & local laws & ordinances & recognized fire protection standards; AS or AA degree or equiv major course work in fire science; significant exp as a fire inspector in a fire dept, fire prevention bureau or equiv organization.; C07; $1111-1438.

26733-PM (JCC:2094) ADMIN ASST II: Prov admin support for SUMEX Computer Proj, a dynamic national resource for res in artificial intelligence in med; serv as offc mgr & user community liaison w/ respon incl budget prep/mgmt, expenditure control, personnel admin, property/space admin, representing SUMEX in admin/public relations matters, supv of offc staff in clerical duties & computer sys file mgmt admin, & provision of basic computer sys usage instruction to users; design effective sys to administer the above, & know/interpret/apply Univ & NIH policies & procedures; QUALIFICATIONS: Admin Asst I or equiv exp, w/ working knowl of sponsored res admin incl Univ & NIH policies/procedures; excel skills in oral/written commu; effective supvry skills; exp w/ computer-assisted text-processing & admin tools, or ability to learn; send appl/resume to Ed. Pattermann, Med Ctr, TB105 or call 497-5569.; C05; $1756-2202.

36403-JB (JCC:2160) ACCOUNTANT II: Identification, acctg & distribution of all payments to SU; interview, hire & train staff incl part-time employees for registration peaks; respon for safety & accuracy & timely depositing of funds, maintenance of audit trails, & processing of student registrations; QUALIFICATIONS: Bachelor's degree or equiv exp in Acctg or a related field; familiarity w/ banking procedures & exp w/ foreign collection items, UNESCO coupons, bank transfers, etc; knowl of computer applications; banking exp nec; supvry skills; demonstrated commu & organizational abilities a must.; C06; $1948-2441.

43757-DS (JCC:2254) FIN/MGMT ANALYST I: Prov analytical & admin support for CIT's Operations Div; collection & analysis of financial data for the budgeting & planning processes of Operations' 12 cost ctrs; asst cost ctr mgrs in developing financial procedures & sys for budgeting, costing, & reporting; prep monthly financial status rpts on the Div's cost ctrs; asst CIT Finance in the costing of services provided by Operations; required to serv as support staff for periodic mtgs; required to act as bkup for any of the Div's admin staff during their absence, etc; QUALIFICATIONS: Bachelor's Degree in acctg, economics, business admin or a related field, & a knowl of financial analysis, acctg & computing; exp in researching complex tech & admin issues & making recommendations related to these issues; outstanding written & oral commu skills; ability to commu effectively w/ sr. staff members on sensitive issues; knowl of technology & terminology of computer operations.; C05; $1756-2202.

SLAC jobs

94621-JM (JCC:6646) SR S&E TECH - ELECTRON: TMS Unit; rotating shift; installation, modification, checkout, operation & maintenance of precisely regulated SCR power supplies, computer peripherals & other associated eqpt; asst in breadboarding & testing of new designs & construction of eqpt & prototypes; QUALIFICATIONS: electronics training to senior level; several yrs related exp; must be able to troubleshoot electronic control circuits.; A34; $11.52. APPLY AT SLAC

95704-JM (JCC:2546) SECRETARY I: Prov sec'l support to professional staff; primary respon incl, but not limited to performing accurate finished-form typing of corresp, memos, rpts, studies, etc. using correct grammar & spelling; establish & maintain files; route & screen mail; asst w/ overload as assigned; answer phones; take messages; serv heavy walk-in traffic; operate Telex; use independent judgment, knowl & tact to solve problems; QUALIFICATIONS: requires sec'l skills at level assoc'd w/ several yrs exp or equiv edu & exp; accurate typing of 50; good commu/interactive skills; bkground in serv-oriented environ.; B09; $1187-1248. APPLY AT SLAC

95547-JM (JCC:6484) LAB MECHANICIAN II: TMS Unit; fr drawings, sketches & verbal descriptions, perform machine work on diverse types of eqpt & produce components or parts; QUALIFICATIONS: requires full journeyman level skills; operate all machine shop & hand tools; use all types of precision measuring devices; familiar w/ rigging methods & operation of various types of hoists; familiar w/ standard shop practices; knowl of welding, brazing & sheet metal.; A37; $12.39. APPLY AT SLAC

95021-JM (JCC:2454/2504) Offc Asst II/II-S: Maintain document collections; typ fr drafts; make travel arrangements; do misc offc duties; make visitor arrangements & committee work; typ manuscripts into text editor; QUALIFICATIONS: good typing & spelling skills; ability to carry out a wide range of duties under minimal supvn; some knowl of computer terminals desirable; candidates w/ computer data entry/retrieval skills in addition to above will be considered at OA II-S.; B09/B10; $1187-1248/1248-1308. filing, coord of mat'ls for each applicant, & assembling the file into a finished product for committee review; typing of letters; answering of phones & questions on application procedures & Law Sch'l programs; serv as admissions reference source in absence of Admission Offc Mgr; codes admissions data for pre-programmed computer retrievals & uses in-house CRT for data input; assts Mgr in retrieving nec reports on a wkly basis; QUALIFICATIONS: typ 50+; college bkground helpful in reading grad/college transcipts, & in checking applicant credentials; good typing & genl offc skills; assumes heavy workload during peak periods fr both admissions & for financial aids; quality work required; accuracy extremely important; able to learn computer input & retrieval procedures; send appl/resume to Erika Kaltenbach, Room 112, Law School.; B11; $1308-1376.

41576-BP (JCC:2470) OFFICE ASST IV: 75%; fixed term 9/22/83-9/30/84; sec'l, clerical support for COFHE Grad Res Proj; info dissemination; maintain personnel records for employees; typ corresp; typ proposals & reports; supv production, printing & dissemination of reports; supv, hire & train clerical assistants; complete proper univ forms; make arrangements for proj mtgs; organize mailing lists & coord mass mailings; asst in compilation & production of complex tables of results, code questionnaires, asst w/ data cleaning; QUALIFICATIONS: typ 65; some exp in soc sci res desirable; accurate typing; knowl of offc machinery (xerox, calculator); knowl or willingness to learn word processing; knowl of Wylbur desirable; send appl/resum to Karlene Dickey, Bldg 1, 2nd Fl., Rm 2R.; B14; $1512-1590.

27072-PM (JCC:1747) LIBRARY SPEC I: Performs duties in Acquisitions Dept of Hoover Institution Lib; ordering books published in Western Langs, mostly in Spanish & German langs; receiving & processing shipments of such mat'ls & handling the corresponding invoices; searching public catalog & acquisition files to avoid duplicates; preparing wkly book truck; maintaining accurate records & compiling statistics; QUALIFICATIONS: typ 45; working knowl of Spanish & German; accurate typing ability; prev lib exp & familiarity w/ RLIN or other lib automated sys desirable; send appl/resume to Joseph Kladko, Hoover Tower, Rm 114 or call 497-2054.; B10; $1248-1308.

31199-PM (JCC:1763) LIBRARY SPEC III: Sun-Thur, 2-11pm; hrs vary during Dead Week, Final Exam Week & Intersession; some holiday work required; performs duties in Circulation Services Div of Meyer Lib; manages all circulation operations during evening hrs, incl supvg 1 full-time Lib Spec II & 2.5 FTE portal monitors; training & evaluation of student assistants; prepares schedule for opening & closing the bldg; schedules Loan Desk & compiles statistics; serv as a member of the divisional planning team; QUALIFICATIONS: typ 40; prev lib exp; prev supvry exp; prev public serv exp; demonstrated oral & written commu skills; ability to learn RLIN & SOCRATES searching tech; prev circulation exp & SU supvry exp desirable; contact: Bob Johnson, Green Lib, Rm 223 (497-3152).; B14; $1512-1590.

33346-PM (JCC:2058) ADMIN ASST I (N): Administer the Stanford Rock Physics Proj & the Integrated Reservoir Studies Proj established to conduct res under contracts fr industrial & govt sponsors; projs involves 6 faculty members & up to 20 grad students, as well as 2-4 other scientists, 1-2 part-time secs, & 1-2 techs; represent the Principal Investigators w/ sponsors, Stanford's Sponsored Projs Offc, subcontractors & outside vendors on most matter of a business/admin nature & attend mtgs; prep monthly & qrtly tech rpts; coord proposal prep & submission, reporting to funding agencies & publications; edit & establish format for proposals & manuscripts using word processing & computers; respon for financial planning, fiscal control, & budget prep, etc; QUALIFICATIONS: exp in managing an offc of 10-15 people; knowl of offc eqpt, word processing, use of computerized spread sheets & data bases; independence & decisiveness in planning & execution of admin tasks, etc; send appl/resume to Carol Vonder Linden, Room 365 Mitchell Bldg.; B16; $1673-1755.

42680-PM (JCC:2202) ACCOUNTING ASST II: Process invoices; prep check requests & transfer of expense forms; keep records of charges to various accts & be able to use computer to convert offc ledgers to machine managed data sys; monitor budget & fund statements; prev acct status info for approp depts in the lib; record daily lib cash receipts & arrange for depostis of money; process time sheets for payroll; maintain leave records; collect money fr copying machines; coord activities & work schedules w/ Dir's sec during regular offc hrs; QUALIFICATIONS: acctg procedures exp & excel arithmetic skills needed; outstanding organizational ability & sound independent judgment required; lib sci knowl & exp are important advantage; familiarity w/ some European Langs to process foreign payment documents helpful; accuracy, neatness, & ability to work w/ details are mandatory; contact: B. Gallo, Jackson Lib, Grad Sch'l of Business, 497-2161, M-F, 10-12 & 3-5.; B12; $1376-1442.

41671-BP (JCC:2454) OFFICE ASST II: Fixed term; 6 mos fr date of hire; 9-6 or 8-5; receive customer serv calls, record accurate info to be referred to NCC staff; execute specific follow-up serv procedures; prep, ship & verify the operation of various data commu eqpt, incl modems, cables, switching devices & MSDs; operate online data base entry sys to code, transfer, reconcile & document files on NCC statistics, inventory, order processing & various other activities; QUALIFICATIONS: prev exp receiving customer serv calls; take accurate info fr users, vendors, & central staff; aptitude for touch typing on both a typewriter & a CRT w/ good accuracy; possess basic skills w/ WYLBUR text editing or other similar data entry methods; able to prep & pack for shipment electronic hardware send appl/resume to Wes Ramirez, Laurel 111.; B09; $1187-1248.

31514-PM (JCC:2554) SECRETARY II: Prov full-range of sec'l support to Dir of Med Fund & Assoc Dir of No. Cal; receive & screen calls/visitors; schedule appts; open/sort mail; draft ltrs/rpts independently or fr oral/written instructions; maintain calendar; make travel arrangements; prep exp rpts & take respon prep volunteer mat'ls & progress rpts; coord several annual mailings; bkup receptionist for Offc of Development; QUALIFICATIONS: typ 55; knowl of offc procedures; ability to take initiative to see that work flows smoothly are essential; ability to handle heavy workloads at peak program periods; commu effectively; good writing skills; exp w/ computers/-word processors helpful; send appl/resume to Liz Trujillo, 301 Encina Hall, Stanford, CA 94305.; B11; $1308-1376.

40337-PM (JCC:2554) SECRETARY II: 50%; between 9-4; prov sec'l support for Health Improvement Program for faculty & staff; answer phone & greet visitors; answer questions regarding program & classes; perform telephone interviews for periodic surveys, keep community & Stanford referral list current & make referrals; typ corresp, reports, minutes, memos, forms, manuals; maintain supplies; establish & manage offc procedures; use WYLBUR computer program for mailing lists & record keeping; prep deposits of checks, etc; QUALIFICATIONS: typ 60; prior offc exp; excel interpersonal & commu skills incl effective telephone manner; good vocabulary & knowl of grammar; knowl of or willingness to learn WYLBUR or other text editor; interest in fitness, nutrition or health desirable; knowl of SU policies & procedures preferred; typing test required; contact: Fran Carl, SHDPP, HRP Bldg. Room 114.; B11; $1308-1376.

30418-BP (JCC:2554) SECRETARY II: Prov full sec'l serv to Assoc Dean of Grad Studies & Research; use dictaphone; understand, apply & explain Grad Div policies on financial support & academic regulations to depts & students; screen calls & visitors; make appts; coord mtgs & collect approp bkground mat'l for such; prep travel reqs & expense rpts; maintain variety of files; ordering Univ Fellowships for grad students; use computer terminal; student spouse not acceptable due to confidential student financial records; may not smoke in offc; QUALIFICATIONS: typ 65; s/h desirable; ability to carry out wide range of assignments w/ min of instruction; deal w/ depts & other univ offcs, w/ students pleasantly & effectively; handle phone calls fr all over U.S. in regard to national committees; basic math skills; use dictaphone; contact: Mary Lou Scott, Bldg 590, Rm 209.; B11; $1308-1376. 1

29542-PM (JCC:2554) SECRETARY II: Prov sec'l serv for 2 staff members of Med Development Offc; respon for fund raising, donor relations, & events; typ corresp w/ high level of accuracy & appearance; draft routine corresp; arrange appts & group mtgs; maintain calendar & tickler file; prep various Univ forms; asst in plans for spec events; prep letters on word processing eqpt; code & retrieve computer info; check monthly budget statements; screen mail; res prospects bkgrounds; QUALIFICATIONS: typ 60; detail oriented; excel spelling, grammar, & punctuation skills; good typing; neat & legible handwriting; willingness to interchange job assignments; commu effectively by phone; take independent action when nec; send appl/resume to Liz Trujillo, 301 Encina, Stanford, CA 94305.; B11; $1308-1376.

29541-PM (JCC:2554) SECRETARY II: Prov full range of sec'l serv for 2 line fund raisers; typ corresp w/ a high level of accuracy & appearance; draft routine letters & reports; prep various Univ forms; prep letters on word processing eqpt; code & retrieve computer info; screen mail; maintain calendar; make travel & mtg arrangements; reconcile monthly budget statements; answer phones; QUALIFICATIONS: typ 60; excel typing, spelling, & grammatical skills; effective telephone commu skills; willingness to interchange job assignments; establish prior & work well under pressure of assignments fr 2 staff members; send appl/resume to Liz Trujillo, 301 Encina, Stanford, CA 94305.; B11; $1308-1376,

29965-PM (JCC:2570) SECRETARY III: Prov sec'l serv to 2 chemistry professors & their res groups; use of word processor to prep scientific manuscripts, proposals, reviews & corresp; respon for development of grant proposal budgets & monitoring of monthly res expenditures; process purchase of res supplies as requested; travel arrangements; prov monthly budget projections & establish expenditure control procedures; assure compliance w/ Univ, govt, & funding agency regulations; QUALIFICATIONS: typ 65; rapid & accurate typing; recent sec'l exp; knowl of word processing or willingness to learn; good English skills; acctg knowl & exp w/ SU forms & procedures helpful; send appl/resume to Robin J. Maslin, Dept of Chemistry.; B14; $1512-1590.

19061-BP (JCC:2596) SECY II-SPEC: Sec'l serv to 5 full-time faculty members; respon for class mat'l, corresp, tech manuscripts, journal articles, & rpts; filing; responds to phone inquiries; routes messages & mail; significant student contact; QUALIFICATIONS: typ 65; tech typing exp required; accurate proofreading; willingness to train on computer terminal text-editing NBI sys; knowl of Univ procedure helpful; send appl/resume to Robert J. Moffat, Bldg. 500, Rm 500K.; B12; $1376-1442.

28296-BP (JCC:2596) SECY II-SPEC: The Space Plasma Physics Group consists of 2 professors, 2 Sr. Res Assoc, & several other res personnel as well as grad student res assistants; work of the group is mainly res of the near earth environ, & is strongly oriented toward NASA Shuttle & Spacelab programs although not exclusively; filing, corresp, telephones & genl sec'l duties; use all standard offc machines; extensive use of computer based word processing & electronic mail; make travel arrangements; schedule & make mtg arrangements, etc; QUALIFICATIONS: typ 60; able to handle visitors, phone calls, & interactions w/ other staff in a courteous & efficient manner; able to adapt to flexible offc routine; tech typing, or word processor, or computer exp nec; send appl/resume to Beverly Yate; B12; $1376-1442.

42499-PM (JCC:5500) DATA AIDE IV: Respon for the day to day supvn of a complex data entry unit for SU Faculty Practice Program; assure the accurate posting of transactions, incl patient demographic & financial info, clinic charges & receipts; respon for FTEs, incl input into evaluations, training, interviewing & routine day to day operations; perform data entry functions; QUALIFICATIONS: 1-3 yrs computer data entry exp, preferably in health care setting; working knowl of health care billing; basic understanding of principles of mgmt & supvn as they relate to a prof'l practice offc setting helpful; good knowl of cash acctg controls & procedures; Analytical & problem solving skills; high sch'l edu or equiv work exp; typ 40; send appl/resume to Joe Bayus, 525 Univ Ave., Palo Alto.; B15; $1590-1673.

26608-TC (JCC:6810) SOC SCI RES ASST I: 50%; Res Asst for Prof Ellen Markman, Dept of Psychology; run subjs in studies of cognitive development; requires working w/ children ranging in age fr 1 to 18, as well as working w/ college students; requires working w/ children individually rather than in groups; having children solve problems, group objs, construct pictures, follow instructions, & answer questions about stories & essay they hear; compiling & coding data; helping to analyze the data; occasional lib res; QUALIFICATIONS: college degree desirable w/ strong bkground in experimental psychology; strong bkground in statistics desirable; exp working w/ children; transportation nec since much of the res is conducted in public schools.; B12; $1376-1442.

40530-PM (JCC:8940) MISC CLERICAL/ASST RES NURSE: Research Assistant for hypertension studies; contacting & interviewing patients to participate in study; recording of clinical data, blood pressure monitoring; perform venipuncture; dispense medication; monitor study subjs; asst nurse practitioner in organizing criteria of study protocol; perform appt scheduling & follow-up; filing; ordering supplies, etc; QUALIFICATIONS: knowl of principles of health sci res methodology; basic understanding & knowl of clinical aspects of hypertension; working knowl of med terminology; good verbal & written skills; LVN license preferred; contact: Valerie Vierra, 493-5000x5918 or Linda Deasy, 497-7404.; B14; $1512-1590.

New employee orientation

The next orientation sessions for new employees will be held at 9 a.m. Tuesday, Aug. 30 and Sept. 6, in Room 282, Tresidder Union.

The sessions are open to all new employees without preregistration.

Bargaining unit

36641-TC (JCC:5638) LIFE SCI TECH I: TMS Unit; maintaining (feeding, freezing, passaging) mammalian cells, incl human; prep of tissue media & other solutions, & sterilization; prep of gels; fluorescent labelling of cells w/ monoclonal antibody; mycoplasma screening; QUALIFICATIONS: familiarity w/ tissue culture of mammalian cells, incl media prep & sterilization; bacterial culture, incl agar prep, pouring of plates, screening colonies.; A18; $ 7.88.

22962-TC (JCC:5638) LIFE SCI TECH I: TMS Unit; ordering supplies, stock control, prep of stock solutions & media, fixing & embedding tissue, sectioning plastic-embedded & frozen tissue, microdissection, operation of light microscopes & darkroom printing; opportunities exist for training in use of electron microscope; QUALIFICATIONS: approx 1 yr's exp in a lab.; A18; $7.88.

42886-VW (JCC:5644) LIFE SCI TECH II: TMS Unit; fixed term 9/1/83-8/31/84; radiolabeling herpesvirus infected cell cultures; gel electrophoresis of extracted proteins & nucleic acids; immunoprecipitation & immunoadsorption of viral antigens w/ antiviral monoclonal antibodies; hybridization of radiolabeled DNA probes to immobilized viral RNA or DNA; QUALIFICATIONS: specific exp in herpesvirus growth, 1 titration, precautions, monoclonal antibody tech, polyacrylamide & agarose gel electrophoresis; tissue culture; isolation of virions, viral & plasmid DNA, & viral proteins; working knowl of all genl microbiological & biochemical lab eqpt as well as genl lab tech.; A24; $ 9.08.

31601-LL (JCC:5644) LIFE SCI TECH II: TMS Unit; animal surgery involving stereotaxic implantation of cannulae in brains of lab animals; removal & dissection of the brain; prep of brain tissue for high pressure liquid chromatographic analysis of neurotransmitters; requires delicate manipulations & fine observation on a routine basis; the use of high performance liquid chromatography for the analysis of neurotransmitters; QUALIFICATIONS: sufficient skills & bkground to be able to learn highly skilled procedures in training capacity; familiar w/ stereotaxic surgery on lab animals, microdissection of nervous sys tissue & chemical analysis of such tissue; bkground in analytical chemistry; exp in chemical analysis incl fluorescence & high performance liquid chromatography w/ electrochemical detection extremely helpful, as would exp in neurophysiological preps & learning preps.; A24; $9.08.

39408-TC (JCC:5652) LIFE SCI TECH III: TMS Unit; Life Sci Tech for basic cancer res; perform skilled & highly skilled procedures, incl protein isolation & prep, gel electrophoresis, column chromatography, & hybridoma production (tissue culture); keep accurate records & maintain a clean lab; QUALIFICATIONS: 3 yrs of lab exp; exp'd in tissue culture & able to do gel electrophoresis & column chromotography w/ minimal supvn; able to work w/ students.; A30; $10.47.

28298-DS (JCC:7132) rec/ship/furn assembler: TMS Unit; receive deliveries fr off campus vendors & SU Stores Dept; check deliveries for accuracy & damage; record & deliver mat'l to requestor; makes daily pick-up of merchandise by petty cash purchases or SU purchase orders in Palo Alto & other peninsula cities; makes various on campus pick-ups & deliveries daily; pick-up mail fr SU Post Offc; sort I.D. & U.S. mail; prep various types of mat'l for mailing & shipping; QUALIFICATIONS: clerical aptitude high school or equiv; valid Calif drivers license required.; A21; $ 8.48.

17471-DS (JCC:7324) FOOD SERVICE WORKER IV: TMS Unit; Mon-Wed, 6:15-3:15pm; Sat/Sun, 9:15-6:15pm; prep of entrees, soups, breakfast, lunch & dinner according to cooks daily work sheet; coord helpers in cooking methods; keep work areas neat & orderly; maintain highest quality of food prep & serv thru use of specified portion, temperature control, attractiveness of food & sanitation using specific guidlines; order fr storeroom when nec; report needed repairs & maintenance; QUALIFICATIONS: knowl of cooking terms, recipes, ingredients, & eqpt for institutional cooking; able to read, write, speak & understand English; able to follow recipes; able to meet Health & Safety Regulations for Food Serv workers.; A20; $ 8.31.

29761-JB (JCC:7654) CUSTODIAN: TMS Unit; 8-4:30; performs custodial duties; daily cleaning, mopping, waxing, vacuuming, cleaning restrooms, etc; washes walls & woodwork by hand or using industrial eqpt; spot cleans, shampoos, waxes, dusts, & oils furniture; QUALIFICATIONS: knowl of cleaning & waxing methods & mat'ls used in industrial cleaning; knowl of related safety procedures; ability to lift 25-75 lbs; ability to withstand extensive walking, pushing, stooping, & squatting.; A13; $7.01.

29763-JB (JCC:7654) CUSTODIAN TMS: Unit; 8-4:30; performs custodial duties; daily cleaning, mopping, waxing, vacuuming, cleaning restrooms, etc; washes walls & woodwork by hand or using industrial eqpt; spot cleans, shampoos, waxes, dusts, & oils furniture; QUALIFICATIONS: knowl of cleaning & waxing methods & mat'ls used in industrial cleaning; knowl of related safety procedures; ability to lift 25-75 lbs; ability to withstand extensive walking, pushing, stooping, & squatting.; A13; $7.01.

29762-JB (JCC:7654) CUSTODIAN: TMS Unit; 8-4:30; performs custodial duties; daily cleaning, mopping, waxing, vacuuming, cleaning restrooms, etc; washes walls & woodwork by hand or using industrial eqpt; spot cleans, shampoos, waxes, dusts, & oils furniture; QUALIFICATIONS: knowl of cleaning & waxing methods & mat'ls used in industrial cleaning; knowl of related safety procedures; ability to lift 25-75 lbs; ability to withstand extensive walking, pushing, stooping, & squatting.; A13; $7.01.

22961-VW (JCC:6484) LAB MECHANICIAN II: TMS Unit; fabrication, construction, maintenance & repair of instruments, tools, eqpt & apparatus used by depts of Neurobiology & Structural Biology; eqpt for optical sys, neurophysiology set-ups, Laser instruments, chemical & physical lab; all the above will be accomplished by working fr blueprints, sketches or verbal instruction; recognize simple mistakes or errors in drawings in advance; tolerances up to + or .0005 in;. QUALIFICATIONS: ability to use all standard machines, such as lathe, milling machine, drill press, toolroom grinder, hand & table saw as well as a wide selection of hand tools & precision measuring devices; work w/ a variety of ferrous & nonferrous mat'ls, a wide range of plastics, Teflon, Delrin, Nylon & PVC, rubber mat'ls, epoxies etc; knowl & skills in use of welding operations, soft & silver soldering.; A37; $12.39.

28295-DS (JCC:6638) S&E TECH - ELECTRON: TMS Unit; process wafers for manufacturing of integrated circuits; be trained on an Electron Beam Pattern Generator & mask steppers; proceed w/ the operation of semiconductor related process eqpt; perform some routine maintenance on related eqpt; prov support for sr. staff & grad students of I.C. Lab; QUALIFICATIONS: 1 or 2 yrs' exp in I.C. processing.; A28; $9.98.

The deadline is Wednesday for the following issue. Questions should be directed to Dorothy, 857-0414 or Araya, 329-8828.

HOUSING NEEDED

□ **Now to July '84:** Professional cpl. willing to HOUSESIT. Will care for plants and pets. Local refs. Call (408) 295-5460 day.

□ **Sept. thru Dec. (flex.):** Stanf. grad. student (P.A. native) seeks to HOUSESIT. Loves pets, nonsmoker. Refs. avail. Call Carolyn Kline, 858-2829 early morn. best.

□ **Beg. Sept. 20 (Sept. 1 poss.):** Resp. single prof. lady seeks to HOUSESIT or pay minimum rent. Presently housesitting on campus. Local refs avail. Call 857-0268 wknds.

□ **Oct. 1 for 6 mo. (flex):** French aristocratic cpl. seeks to take care of hse, grdn, pets. Absolutely reliable, nonsmokers, no child. Local refs. Call (415) 326-7053.

□ **Aug., Sept., Oct.:** Yale and NYU grad. on sabbat. avail. for HOUSESIT. Nonsmoker, local refs. Call 454-5002.

□ **Sept. 1 for 9 mos:** Resp. sabbatical M.D. & wife, 2 mature children, 12 & 15, seek 3BR furn. or unfurn. hse. on or nr. campus. Nonsmokers. Loving care of home. Local refs. Call COLLECT (503) 222-2464.

□ **Sept. '83 to Aug. '84:** Visit. scholars seeks furn. rm., studio, or 1BR apt. nr. campus. Nonsmoker, no pets. Will do chores, fix-up, etc. for reduced rent. Call John McAdams, COLLECT (414) 224-6842.

□ **Now:** Responsible, neat woman seeks to HOUSESIT. Great w/plants and pets. Xclnt refs. Call Karen, 324-1780 day; 484-1116, eve.

□ **Aug. '83 to Aug. '84:** Visit. prof. fr. Norway, wife, 2 children seek 3BR, furn. hse. on or nr. campus. Responsible, nonsmokers. Up to $1000/mo. Call 497-2040.

□ **Now:** $100 REWARD for info. leading to rental of cottage/small hse. for resp. prof. woman. Call 326-4695.

□ **Beg. Sept. 1:** Stanf. librarian and UCSC prof. husband seek apt. or cottage nr. Stanf. w/character & privacy. No children or pets. Local refs. Call (415) 848-2137.

□ **Beg. Oct. 1 to Apr. '84 (flex):** Visit. prof. fr. England & wife seek furn. studio or 1BR apt. nr. Stanf. Prefer walk/bike dist. to campus. No children or pets. Call Mrs. Sehgal, 493-5650.

□ **Now or Fall qtr. for 1 yr or more:** Married Stanf. cpl. wish to rent 1 or 2BR hse. Xclnt w/grdn and home maintenance. Xclnt refs. Call 497-0761, day; 494-1548, eve.

□ **NOW:** Artist recently returned frm. Europe seeks quiet cottage or studio. Willing to accept some responsibilities. Call 851-1282 day.

□ **Beg. Sept.:** Medical worker avail. for HOUSESIT. Good w/pets and plants. Good refs. Call 497-5597 day; 854-7824 eve.

□ **Academic yr. '83-'84:** Four v. resp. & academic, nonsmoking Stanf. seniors seek 3-4BR hse. Pref. in faculty ghetto or close to campus. Will housesit if for whole academic yr. Refs avail. Can move in as early as Sept. 15. Write Barbara Levenson, 251 Scripps Ct., Palo Alto, CA 94306 or Vance McMahan, 5706 Tecumseh Circle, Houston, TX 78751.

□ **Nov. 1 thru April 30, '84:** Prof. fr. Weizmann Inst. in Israel on sabbat. at nearby research inst. seeks 3BR furn. hse. for self, professional wife, & 3 teenage children. Call Barbara Harley, 856-8444.

□ **Academic yr. '83-'84:** Female grad. student, nonsmoker, avail. for HOUSESIT, short or long term, and/or exchange work for rent. Loves pet, good refs. Call Gillina, (212) 473-7967 COLLECT if necessary.

□ **Beg. Sept. 1:** Physician (single) joining Stanf. Med School seeks 1-2BR unfurn. hse. or cottage. Enjoys rural atmosphere. Resp., quiet, refs. Around $750/mo. Call Mike or Peggy, 349-2774 eve.

□ **Beg. Oct. '83 for academic yr:** Visit. prof. fr. England seeks 1BR furn. apt. Bike/bus distance fr. campus. Call 497-4377 day.

□ **Sept. 15 for 1 yr:** Finnish post-doc and family (wife, 2 children) seeks furn. 2-3BR hse. nr. Stanf. for rent/lease or EXCHANGE for furn. 2BR apt. in HELSINKI nr. universities. Call 858-2948 or write Martti Mantyla, Vattuniemenkatu 16 b A 9, 00210 Helsinki 21, Finland.

Stanford offers weight loss course

The Health Improvement Program (HIP) is offering a weight loss course by mail designed for those not wishing to participate in traditional weight-loss classes.

Research conducted by the Stanford Heart Disease Prevention Program and investigators at the University of Minnesota suggests that self-administered weight-loss formats which minimize contact between participants and program staff can be as effective as more intensive, face-to-face treatment approaches.

The Health Improvement Program self-help course has been tested by Stanford Heart Disease Prevention Program researchers in Monterey and Salinas as part of its Five City Project in an effort to improve the cardiovascular health of the general populations in the two areas.

The available evidence indicates that the program is as effective as those using group treatment formats.

Orientation meetings to describe the course will be held at the HIP office in the Stanford Heart Disease Prevention Program Trailer next to Cypress Hall.

Meetings are scheduled for the following times and dates: Tuesday, September 8, 5:15-6:15 p.m.; Friday, September 9, 12 noon-1 p.m.

Enrollment in the course is limited; to reserve a place at one of the meetings, telephone HIP at 497-9649 between 1 and 3 p.m.

Expert to discuss computers, nukes

"Computer Reliability and Nuclear War" will be discussed at Stanford by Alan Borning, professor of computer science at the University of Washington, at 7:30 p.m. Thursday, Aug. 25 in History Corner Room 2.

Borning will discuss the dependency of both the U.S. and U.S.S.R. nuclear weapons systems on computers, and the danger of a computer failure precipitating an accidental nuclear war.

The talk will also cover the implications of new weapons strategies, and computer reliability in command, control, and communication systems in case of an actual nuclear war.

The lecture is hosted by the Stanford Arms Control and Disarmament Forum.

Antiquarian book fair scheduled

The second Antiquarian Stanford Book Fair, sponsored by the Associates of the Stanford University Libraries, will be held Friday through Sunday, Sept. 9-11, at Roble Gym.

The preview, from 6 to 10 p.m. Friday, Sept. 9, will include wine and refreshments as well as first look at all the books for $6.

More than 60 dealers will display books, prints, ephemera, maps, Californiana, etc. Proceeds will benefit the Stanford Libraries.

The Fair will be open from 10 a.m. to 7 p.m. Saturday, Sept. 10, and from 10 a.m. to 5 p.m. Sunday, Sept. 11. The charge of $2 covers both days.

NASA talk slated

A group of 20 engineers will give the final report after 10 weeks of study of a manned American space station at 9 a.m. Friday, Aug. 26.

John Hoge of NASA, director of NASA's Space Station Task Force, will speak at 8:30. The proposed space station, which will carry seven to nine astronauts, would be placed into orbit 250 miles above the Earth.

All sessions are in the Physics Tank, Room 100, and are open to the public.

Bike tour Aug. 28

A bike tour and fitness festival will begin at 6 a.m. Sunday, Aug. 28 with registration in the Tresidder Union parking lot. The event is sponsored by the University and *City Sports* magazine.

The bike tour, starting from Tresidder at 8 a.m., will proceed up through Los Altos Hills and Portola Valley and back to the campus. It will cost $10 ($9 in groups of 10 or more), which includes a tee shirt, refreshments along the way, and drawings for prizes.

The free fitness fair will present celebrities, clinics, lectures, slide shows, exhibits of fitness equipment contests, and antique bikes. It is expected to last until about 4 p.m.

For more information on the tour or festival, call *City Sports* at 788-2611.

Step-parents aided

On July 15 Drs. Emily and John Visher, authors of *How to Win As A Stepfamily*, and *Stepfamilies: Myths and Realities*, addressed a group of employees from the Stanford community.

The lecture discussion, organized by Help Center staff member John Preston, was just one of many planned for the upcoming year by the Help Center, Stanford's Employee Assistance Program.
Participants discussed their concerns regarding such issues as:

- children and bonding to the new stepparent;
- the integration of two households;
- the role of the stepparent and disciplines;
- visitation and the impact on the "new family."

The Center is now in the process of establishing an ongoing stepparent support group to be facilitated by Preston, who also is a stepparent.
The group is scheduled to begin in early September. Interested persons can register by contacting the Help Center, Monday through Friday 9 a.m. to 5 p.m. at 497-4577.

Carpools

Carpool partner wanted; San Bruno to Stanford, 8-5, M-F; call Bella 7-6941.

Wanted, codriver to Pennsylvania, departing Aug. 26. Expenses paid. Hank Sims, 321-7604.

Ride needed from Stanford to Oakland (near airport) in exchange for gasoline costs. Would also consider a ride to a BART station, preferably Fremont or San Francisco. Please call Nalini at 493-0356 after 8 p.m.

Challis Gore's photo *Valley of Death* was taken from Zabriskie Point, Death Valley, in 1955.

California photographer honored by three daughters

Seventy prize-winning photographs by the late Challiss Gore, including several owned by the Stanford Museum of Art, have been collected and published for the first time.

Challiss Gore . . . The California I Saw (1983 Preservation Press, $25) was compiled by daughters Judith Gore Hogness, wife of Stanford biochemistry professor David Hogness; Mary Gore Shirey and Janet Gore Venolia as a memorial tribute to their father.

The black and white photographs depict California in the 1950s and '60s, including scenes of native trees, the Mother Lode region, Death Valley, San Francisco architecture, missions, and coastal areas. The book also features photographs from the Gore family album.

"Gore's insistence on perfection led him to produce the rich black colors so difficult to achieve in the darkroom, yet so satisfying in the finished print, to give that special intensity to a dramatic subject," the editors note.

Born in 1887, Gore didn't pursue photography seriously until he was 60 years old. He quickly progressed from novice to prize-winner, and was recognized in hundreds of exhibitions throughout the country, in London, Tokyo, and South America.

He remained quite active in his later years until glaucoma and cataracts took his sight. He died in 1979 at the age of 92.

Copies of the book may be obtained at the Stanford Bookstore, at Stacey's on University Ave., or by calling Judith Gore Hogness at (415) 857-9694.

Mayer...

continued from page 4

not been for enrollment of foreign students."

The Stanford course, Space Systems Engineering, that created Pleiades, reflects a growing interest by students in space problems, focussed mainly on the space shuttle, interplanetary probes, and the increasingly sophisticated use of satellites.

"The course gives the participants real-world experience, as close as we can simulate the way it is done professionally," said Mayers. "The students run their own course through organization into four main groups. Each has a leader, and there is a program manager bearing overall responsibility.

"Being a systems engineering effort, we stress compromise. Eventually, individuality diminishes, and the initial class of 40 program managers devolves into the desired organization capable of the monumental effort and accomplishment that Project Pleiades represents."

The group's effort will be documented in a comprehensive report. Each participant has submitted a coordinated contribution.

. . . .

When a youngster some 50 years ago, Mayers spent every available minute building and flying model planes. He has been absorbed by problems of flight ever since. He received his pilot's license before his driver's license.

He was a naval aviator in World War II, in Catalina amphibians, first in North Africa, then the Caribbean. On demobilization he returned immediately to Brooklyn Poly and the M.S. program in aeronautical engineering, with Prof. Hoff as his thesis adviser.

He became an aeronautical research scientist for the National Advisory Committee for Aeronautics (forerunner of NASA) at Langley Field, Va. Here he did research in structural mechanics and in 1952, using SEAC at the National Bureau of Standards, was among the first to use a digital computer for scientific programming.

After eight years he went to Sperry Rand where he became, first, chief of structures and then manager of the Systems Analysis and Evaluation Department. He remained till, in 1961, the Sergeant missile system reached operational readiness status, on schedule.

Mayers and his wife Reva Lee have been married for 38 years. Both of their children are Stanford graduates—Eileen in English and history in 1967, and Laurence in art design in 1972.

With his 40-plus years in the military, NACA, industry, and the university to reflect upon, Mayers will retire at the end of this year to professor emeritus status.

Shem-Tov Levy

Israeli musician to perform here

Shem-Tov Levy, a major force in Israel's developing musical culture, will perform his own jazz and popular compositions at 8 p.m. Wednesday, Aug. 31, in the Tresidder Union Large Lounge at Stanford.

Tickets are available from the Stanford Hillel office and at the door ($6 general, $5 for students and senior citizens.)

A flautist, pianist, singer and composer, Levy is a well-known figure in modern Israeli popular music. His songs, while heavily oriented toward Western styles in their inclusion of jazz and popular motifs, also draw from Oriental traditions for much of their inspiration.

Born in Rehovot in 1950, Levy served in the Central Command Troupe, an Israeli army entertainment group, and studied in the Academy of Music at Tel-Aviv University. He later worked with the popular Israeli singer Arik Einstein and in 1977 formed the group Sheshet, which gave Israeli singer Yehudit Ravitz her first exposure in Israel.

He has produced several albums, including solos *Matzav Ruach* ("In the Mood") and *Hit'orirut* ("Waking Up"). He was recently selected to be musical director and primary composer for the album *Eretz Shemesh*, produced by the Israel Broadcasting Authority around and theme of Eastern and Western influences in Israeli music.

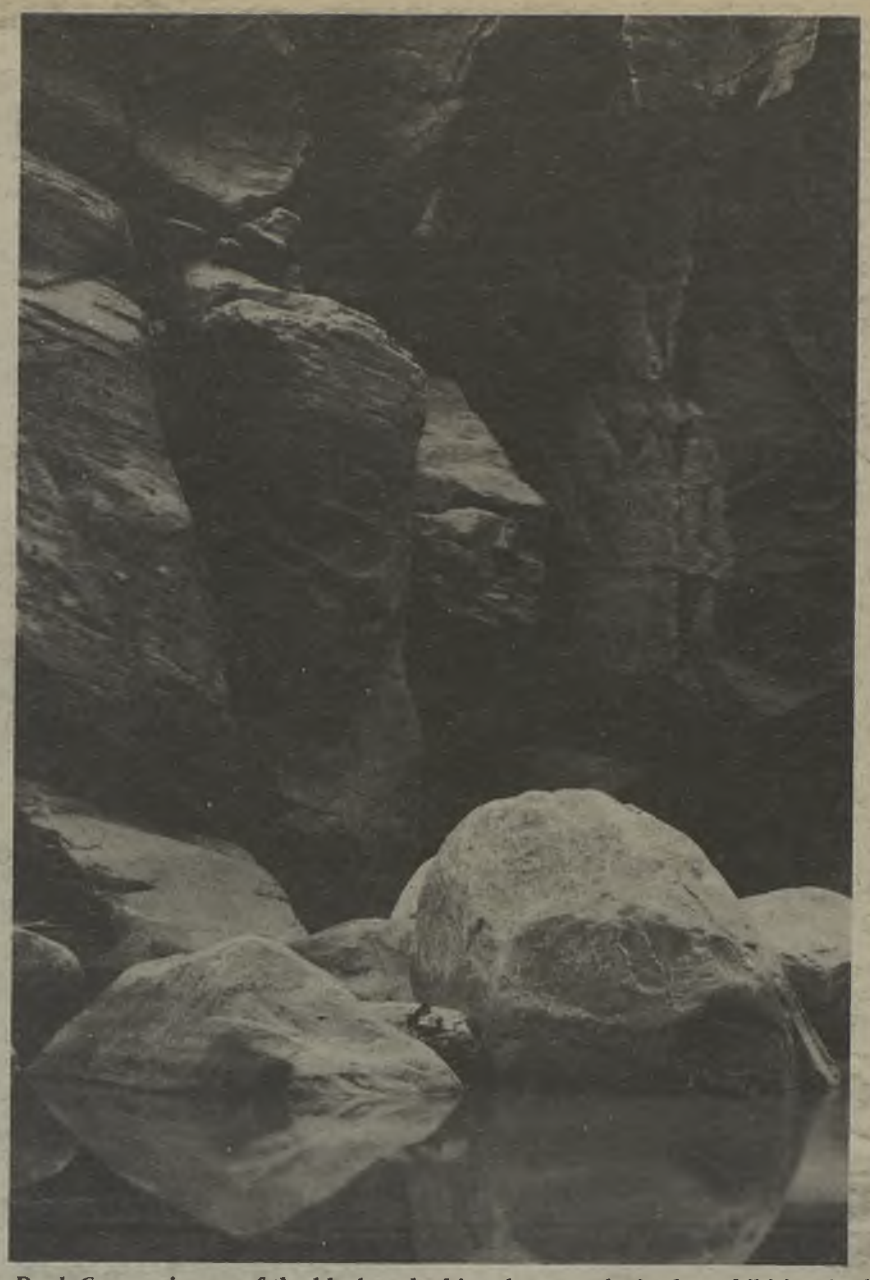
Levy's performance is sponsored by Stanford Hillel, the Palo Alto Orthodox Minyan, the Jewish Community Federal (South Peninsula Office), the Albert L. Schultz Jewish Community Center, and the Israel Students Organization.

For more information contact Neva Yarkin at (415) 497-4746.

Personal computer tapes available at Stanford's CIT

CIT has obtained copies of two interesting videotaped series called "Understanding Personal Computers" and "Bits, Bytes, and Buzzwords." These tapes are available to be seen at CIT, or you can arrange to see them elsewhere, for instance, in your own department or office.

The series "Understanding Personal Computers" consists of four tapes: "Introduction to Personal Computers," "Introduction to Personal Computer Hardware," "Introduction to Word Processing," and "All about Printers."



They are introductory tutorials that will teach concepts, computer jargon, advantages, and disadvantages of personal computers, and what to think about when deciding to buy one. Concepts discussed include word processing, financial analysis, data bases, project planning, graphics, accounting, electronic mail, teleconferencing, and hardware components.

The other series, "Bits, Bytes, and Buzzwords," is a five-part production of KQED, which TV-watchers may have seen earlier this year.

The series is for the person who is considering getting a microcomputer system for everything except games. It discusses many business applications for the microcomputer, and includes interviews with experts on various aspects of personal computing such as word processing or graphics, as well as a demonstration of a programming language called LOGO.

The single tapes in both series last about 30 minutes, so they are ideal for showing during lunch or within the context of a meeting.

Contact Jane Kingston at CIT (7-4807) for more information on arranging to see them.

Dark Canyon **is one of the black and white photographs in the exhibition Back Roads and Wilderness by James Loveless, at the International Center through the month of September.**

Wilderness photos to be exhibited at Bechtel I-Center

An exhibition of black and white photography by James Loveless titled "Back Roads and Wilderness" will be on view at Stanford's International Center from Sept. 2-30.

A reception for the artist will be held at the Center from 5-7 p.m. Friday, Sept. 9.

Loveless grew up in the mountains and deserts of the American West and spends most of his time outdoors in his native Utah. During the summer he is climbing instructor and leader of Primitive Land Survival courses. The winters find him leading cross-country skiing expeditions in the Rockies. He has been photographing in the wilderness and back roads of Utah and Wyoming for the past 10 years.

Loveless does his own darkroom work but, because of his busy outdoor schedule, seldom exhibits his photographs. He feels that photography is "the people's art, the special medium that allows anyone to develop the artistic self. The skill lies not in a steady brush or a clever hand, but in the ability to 'fall in love' again and again. It is all I ever hope to do to be aware and rejoice in those moments when my ability to perceive equals the sensory experience available."

The artist attended schools in Utah and is a graduate of Brigham Young University. He is currently in a master's program in recreation administration.

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Aug. 31 to cover the week of Mon., Sept. 12, through Sun., Sept. 25. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

Calendar

MONDAY, AUGUST 29

Biological Sciences Seminar: "Comparison of DNA Repair between Human and Mouse Cells," by Dr. Hiraku Takebe, Kyoto University, Japan. Noon. Rm T-175, Herrin Hall, Dept of Biological Sciences. No charge.

WEDNESDAY, AUGUST 31

Hillel concert: Shem-Tov Levy playing Israeli jazz and modern music. 8 pm. Tresidder large lounge. $6 general, $5 students and seniors.

SUNDAY, SEPTEMBER 4

University Public Worship and Communion: Preacher: Donald R. Caughey, Assistant Dean of the Chapel. 11:00 a.m. Memorial Church.

FRIDAY, SEPTEMBER 9

Library Associates: Second Antiquarian Stanford Book Fair. Exhibitors, 60 booksellers, maps, ephemera, etc. Opening. 6-10 pm. Roble Gym. Exhibitors, booksellers, prints, maps, ephemera. Opening night includes wine and refreshments. $6.

The Stanford University Museum of Art and the Stanford Art Gallery are closed for the summer.

The Museum will reopen on September 20, the Art Gallery on October 4.

SUNDAY, SEPTEMBER 11

University Public Worship: Preacher: Ernle W.D. Young, Associate Dean of the Chapel. 11:00 a.m. Memorial Church.

EXHIBITS

"Propaganda Posters of Two Revolutions". Features over 40 posters from the Russian Revolutions and Civil War, 1917-1922, as well as the German Revolution of of 1918-1919 and the German elections of 1920. M-F, 11 a.m. to 4 p.m. Hoover Memorial Exhibit Pavilion. June 8 - Jan. 31.

The Art of Literature: California Authors and Their Printers. A retrospective look at California literature and fine printing, 1860 to present. On the occasion of the first American conference of Assn Typographique Internationale. Rotunda and Gallery: Green Library. Aug. 1 - Oct. 5.

Photographs by Ann Sconberg. Coffee House Gallery, 1st. Floor of Tresidder Union. Aug. 1 - Aug. 31.

Show and sale of paintings and lithographs by various artists from the Komarov Gallery. Upper lobby, Tresidder Union. Aug. 1 - Aug. 31.

Sculpture and Paintings by Amelia Solomon. Upper Lobby of Tresidder Union. Sept. 1 - Oct. 1.

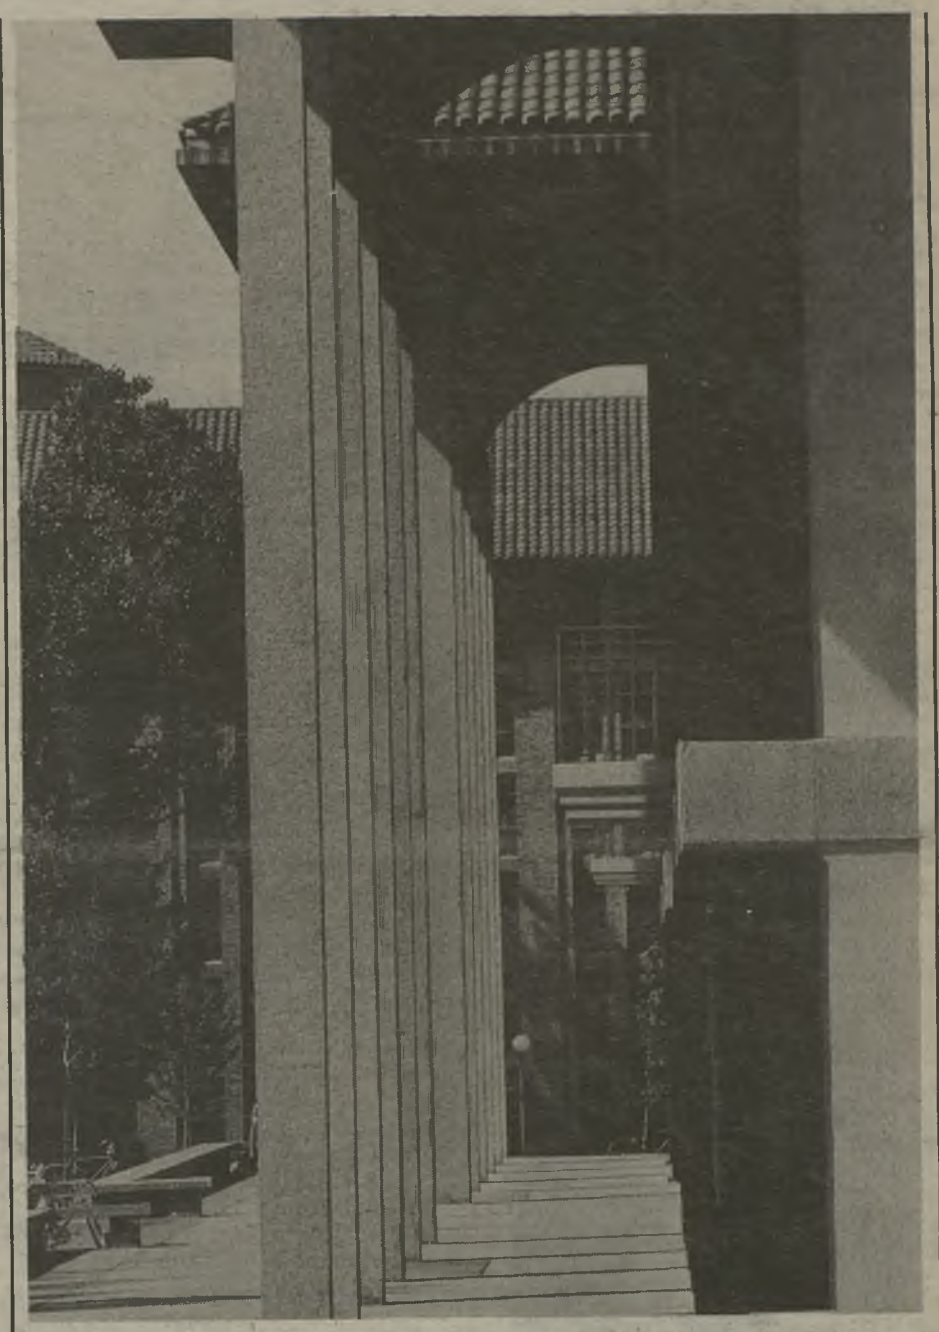
Kennedy urges tax exemption for tuition remission plans

Tuition scholarship programs benefitting the children of college employees should remain tax exempt, Stanford President Donald Kennedy believes.

His views are developed in an Aug. 23 letter to Representative Fortney Stark, a member of the Subcommittee on Select Revenue Measures. It currently is considering legislation (H.R. 3525) which would tax tuition scholarships used on a portable or exchange basis at other institutions.

"Unlike many of the fringe benefits that have been called into question within the past few years, the benefits received under all forms of tuition remission are unquestionably excluded from income and have been excluded since the beginning of the income tax," Kennedy noted.



While the proliferation of tax-free benefits has attracted Congressional concern, "the number of colleges and universities participating in both tuition exchange and off-campus grant programs has not grown in the past decade," he added. Continued budget pressures have forced some colleges to restrict portable tuition scholarships, either by date of employment or in dollar amount.

During 1982-83, 130 children of eligible Stanford employees were enrolled at the University, receiving one-half tuition as a scholarship. An additional 845 children were enrolled at other accredited American institutions, where they were eligible to receive actual tuition and required fees up to a maximum of one-half of Stanford's tuition.

"Many students choose not to enroll at their home institution as they may feel awkward taking courses from colleagues of their parents," Kennedy observed.

"Many believe that getting away from

'Fresh discussions' sought on Stanford West proposal

Stanford University Thursday, Sept. 1, proposed "fresh discussions" with Palo Alto on the 1,100-unit Stanford West housing project, saying it "cannot proceed under the conditions that have been proposed" by the city.

William F. Massy, vice-president for business and finance, described the University's position in a letter to Palo Alto Mayor Betsy Bechtel. *(See page 18.)*

"We stand ready to reexamine the design and configuration of Stanford West," Massy said, if the project "can be freed of the extrajurisdictional conditions and excessively high costs" imposed by the city.

In July, the city council voted to require that 85 acres of Stanford land outside the city be used only for academic purposes in the future. The land is located across Willow Road from the 46-acre Stanford West site.

The city also stipulated that there be no access from the 85-acre area to Willow Road and Pasteur Drive and that there be a 150-foot setback from the road.

Massy said these conditions remain "unacceptable" to the University.

The $12 to $15 million cost of below-market-rate units and mitigation requirements still give the University "great concern," he added.

"At the same time, we recognize the urgent need for housing at Stanford and in this area. We believe that the 46-acre site is well suited for this purpose, as evidenced by the fact that it is zoned for housing and designated as such in Palo Alto's comprehensive plan."

Massy noted that the Architectural Re-

Students criticize report on McCloskey class

Six Stanford student leaders have denied that former Congressman Pete McCloskey's academic freedom was abridged as a guest professor at the University last spring.

The Associated Students Council of Presidents and Guest Professorship Board "neither interfered with the contents of the course reading list" after it was approved in February "nor threatened to decrease Mr. McCloskey's salary," they declared in a 15-page reply to a faculty investigation of the incident.

Based on the faculty report, Provost Albert Hastorf said July 26 the University would not grant academic credit for any future course in the guest professorship program, until current student regulations are changed. The guest professorships are funded through student fee assessments.

The students said Hastorf's "ultimatum is not only disturbing by its demonstration of unwillingness to admit further dialog, but due to its imprecision is impossible to comply with."

Hastorf and other University officers have continued to discuss their concerns with students, and two Associated Student committees have been asked to work on issues highlighted by the controversy.

While the faculty recommendations "may eventually be adopted in whole or in part," the students urged that they "not be considered authoritative statements of University policy."

Under the students' constitution, the Associated Students "must retain responsibility for all funds spent," the students said. The faculty report and Hastorf said the funds for paying guest professors should be placed under University control.

The students said an offer by Cynthia Matthewson of the Associated Students Council of Presidents to recommend an increase in McCloskey's salary as guest professor "was not designed to affect his actions."

Cancellation of another guest professorship course had made more funds available. "It is extremely difficult to see how the promise of recommending an increase in McCloskey's compensation above a mutually agreed upon level could be construed as an abridgement of academic freedom," the students said.

In an April 28 letter to McCloskey, Matthewson said "any changes (in course

Academy of Sciences honors three profs

Three Stanford University faculty members have been elected members of the Institute of Medicine of the National Academcy of Sciences.

Dr. Robert Hofstadter, 1961 Nobel Prize-winning professor of physics, was one of five persons honored in August by direct election to senior membership.

Dr. Hugh McDevitt, professor of medicine and medical microbiology, and Dr. Robert Schimke, research professor of biology, were among 36 persons elected to regular membership.

Hofstadter received the 1961 Nobel Prize in physics for obtaining the first and most accurate measurement of the density distributions of electric charge in nuclei. More recently he was the recipient of an Alexander Von Humboldt Foundation award "in recognition of his accomplishments in research and teaching."

McDevitt has been credited with many of the crucial discoveries which appear to underlie the association between HLA (Human leukocyte antigens) and disease.

Shimke is internationally known for his work in the field of gene expression and protein synthesis, research which may influence treatment of malignant tumors. He has been chairman of Stanford's Department of Biological Sciences and Department of Pharmacology and editor of several major professional journals.

Following the recent elections of the new members who will take office Jan. 1, the institute now has 456 active members and 194 senior members.

The Institute of Medicine was chartered by the NAS in 1970 to enlist prominent physicians and others to examine policy matters pertaining to the public health.

New members are elected by present active members from among candidates chosen for major contributions to health, medicine or related fields. The institute's charter requires that at least 25 percent of the members be drawn from outside the health professions.

Artist's sketch shows Campbell Recital Hall extending west wing of Braun Music Center.

Trustees approve $2.3 million Braun Music Center addition for Summer '84

Stanford's Board of Trustees recently approved a $2.3 million addition to Braun Music Center: the Samuel J. and Ileen B. Campbell Recital Hall.

Braun Music Center is scheduled to open this January; Campbell Recital Hall next summer.

Major gifts from Mr. and Mrs. Campbell, plus a generous gift from the Hewlett Foundation, will fund the recital hall, which also will function as a choral rehearsal hall and large classroom. It is one of the four expansion phases originally designed for Braun Music Center by architects Marquis and Associates of San Francisco.

The Campbells met as students at Stanford, graduating and marrying in 1914. Mrs. Campbell died in 1978, Mr. Campbell in 1981.

Site preparation for Campbell Recital Hall already is underway, and most of the heavy work should be completed by November.

The hall will have 225 fixed seats with tabular arms in raised, semi-circular rows, providing sorely needed space for many Music Department concerts currently held in Tresidder Union and Dinkelspiel Auditorium.

The 9,500-square-foot addition will also include five teaching studios-faculty offices, a choral workroom, box office, computer room, and an enclosed courtyard for gathering during intermissions.

It will extend to the west of Braun, with a separate entrance on the south side facing Tresidder parking lot to make it immediately accessible to concert-goers.

The other three planned expansion phases for Braun Music Center are 1) library and archive expansion, 2) facilities for CCRMA (Center for Computer Research in Music and Acoustics, which will be housed in the Knoll), and 3) completion of interior spaces, including a production shop and stair tower-elevator to Dinkelspiel Auditorium.

Employee Day scheduled for Sept. 24

Invitations from President Donald Kennedy to Employee Appreciation Day will be in the Campus Mail this week to all faculty and regular staff on the Hospital, SLAC, and University payrolls who work 50 percent time or more.

The Day, Saturday, Sept. 24, will include a Stanford family "Tailgater" in Frost Amphitheater beginning at 11 a.m., followed by the Stanford-San Jose game in the Stadium at 1:30 p.m.

A special program featuring country and swing music by the "Good Ol' Persons Band" and the Leland Stanford Junior University Marching Band. Kennedy will be the host and M.C., assisted by an able crew of administrative keg tappers.

Football tickets will be distributed according to the three separate payrolls at specified locations and times. President Kennedy strongly urges departmental and work group participation. He suggests that friends plan to get together at the "Tailgater" in Frost and sit together at the game.

In order to accommodate that, employee I.D. cards, which must be presented in order to obtain tickets, may be taken by one person representing an employee group to that group's designated ticket office. Ticket distribution is not scheduled to begin until Tuesday, Sept. 13.

Reasonably priced lunches will be available at Frost for those who do not wish to prepare a picnic. Quarter-pound burgers with chips, condiments and a brownie, $3, or hot dog with the same for $2.50. Add 25 cents for cheese. The cold soft drinks and beer will be provided at no charge.

In order to plan for the "Tailgater" part of this Stanford Family day, its organizing crew needs to know how many intend to come and also how many intend to buy their lunch instead of bringing one. All employees are asked to indicate their plans when they pick up their football tickets.

Brian K. Reid
Werner Trattnig

Two members of the Electrical Engineering Department's Computer Systems Lab have received faculty development awards from the International Business Machines Corporation. Receiving the awards were Assistant Prof. Brian K. Reid and Acting Assistant Prof. Werner Trattnig.

Reid, who received a Ph.D. in computer science from Carnegie-Mellon, is working with Stanford University's fast Turnaround Laboratory. His group designed the initial version of a representational language called FABLE. His primary research interest is in the area of applied programming languages.

Trattnig received a Ph.D. in computer science from the Technical University of Vienna in 1980 and a Ph.D. in business administration from the University of Vienna in 1982. His research has focused on highly concurrent computer systems covering three principal areas: programming languages, computer architecture, and interactive software environments.

Ramon Myers

Ramon Myers, senior fellow and curator-scholar of the Hoover Institution's East Asian collection, has received a $10,000 postdoctoral grant for research on China from the American Council of Learned Societies.

Myers will use the grant to analyze Chinese crop surveys, which will lead to a better understanding of China's agricultural and economic history.

Myers received his Ph.D. in economics from the University of Washington in Seattle in 1960. A specialist in East Asian economic development and international relations, he has been at the Hoover Institution since 1975.

Funds for the grant were made possible by the Ford Foundation, the Andrew W. Mellon Foundation, and the National Endowment for the Humanities.

"It's time for me to repot!" smiles Dr. James McClenahan.

Cowell health director reflects on student lifestyle changes

BY DONALD STOKES

After 20 years of taking care of the health of Stanford students, Dr. James B. McClenahan, director of Cowell Health Center, has decided to 'repot' and work in another field.

After pondering several new careers, which included working on an Indian reservation, doing clinical research for a Silicon Valley firm, and serving the U.S. Army overseas, he has decided to become Public Health Officer for Amador County, in the Sierras. He takes up his new duties this month.

McClenahan has seen the campus population change considerably in style and outlook since he first arrived during the troubled 1960's.

Underneath the easier, open way of 1983, with its frankness about sexuality, its more conservative outlook in politics and work patterns, its emphasis on fitness, McClenahan thinks that basically students have not altered.

"We tend to think that students are more sophisticated than their parents used to be, and in a broad sense that is true, but there are still a number of areas where attitudes have not changed very much", said McClenahan in a campus interview. "I don't think, for example, that most students can talk to their parents about sexual problems much more easily than was the case 25 years ago.

"Neither have the pressures faced by students changed greatly over the years. For many students, coming to a university is a time for great readjustment and pressures, with all the effects of leaving home, finding self-identity, choosing a career, keeping up with the course demands, knowing one's sexuality, choosing a mate, and so on.

"A great many students come to us who are not sick emotionally, but they are distressed as part of the process of sorting out their development problems.

"Presently we have from 40 to 45 thousand calls on our services every year, counting all aspects of the Health Center services.

"By the time a student graduates from Stanford, the chances are from 80 to 90 per cent that he or she will have at some time come to Cowell for treatment or counseling. Of course, some students rarely come, while others come often. Each year about nine per cent of the student body come to us for some form of counseling.

The number of students who come to Cowell has gone down slightly during the last five years. We hope this has something to do with our health education program but we cannot tell for sure.

The biggest social change seen at Cowell in the last 20 years has been the turnabout in the attitudes toward sex. The new atmosphere of liberation has particularly affected the lives of women."

When McClenahan first became director the policy was that contraception aid could not be given unless the patient was to be married within the next three months. When the decision was made that contraception should be dealt with like any other health service, it had to go up for confirmation through all the channels of administration before it was finally adopted, and then it was featured in a national news magazine.

In a similar way, Stanford Hospital was among the first to provide abortions, but in those days the rule was that two psychiatrists had first to give their advice to the woman.

"One result of changing sexual attitudes is that unwanted pregnancies have increased significantly during the last five or six years",said McClenahan. "They still run at less than 100 a year.

"Functionally , the system is in place to help the women concerned—to help them decide whether to have the child, to abort, or to place the child for adoption. Most women elect to abort.

"Since I have been here we have offered a range of health services to women, including contraception classes. There is a more general openness about sexual problems, here as in the rest of the country. Naturally, the new atmosphere has sometimes brought with it new sorts of problems, both emotional and physical, and these we do our best to solve".

Today, more people are delaying marriage. Whereas in the previous generation the average age for marrying was 22, nowadays it is more usual for marriage to be delayed till the parties are 28 to 30.

Among the 5,000 or so women on campus the Pill is still the most favored method of birth control, but the diaphragm is coming back into more frequent use.

McClenahan is lean and fit, is 6'2" tall and weighs 135 pounds ("It is helpful to my job to be in good shape—then I can be preachy to the patients."). He does not jog, because of a leg problem, but he uses a stationary bicycle at home. He is a non-smoker and watches his diet carefully.

"Most Americans eat too much", he says, "and especially too much fat. I eat very few dairy products and drink only skim milk. Not that I am too holy about diet—every now and then I'll have a piece of pie or candy".

Because of more advanced medical therapies the Health Center now sees a number of students with significant medical diseases, such as cancer, and there are also those with psychological problems. The Center also sees a larger number of students who are disabled or handicapped. Some students are blind, others deaf or paraplegic; there are a number of quadraplegics.

The most visible sign of change in health attitudes is that smoking has almost disappeared among young people at Stanford. "We have a very low percentage of smokers among students, only from three to four percent. This is a big change from previous generations.

"Students take pride in keeping in shape. They run and swim and take much better care of themselves than the previous generation.

"There is also less difficulty with drugs. I am not sure there ever was widespread regular use of marijuana on campus, but undoubtedly there was a great deal of experimentation. Hard drugs? The few who used them regularly became addicted and simply had to drop out of school.

"Among the minority who use hard drugs today, the use of cocaine is the most typical.

"Throughout the 20 years I have been here the worst 'addiction' problem on campus has been with

continued on next page

McClenahan . . .

continued from page 3

alcohol. Though serious alcohol abuse is confined to a small number of people, it has resulted in some serious accidents and fatalities.

"Though there is widespread use of alcohol among students, a relatively small percentage are problem drinkers."

The Health Center has worked with the Dean of Student Affairs Committee on Alcohol to adopt a long-range strategy against alcohol abuse. Among the methods used is to urge all departments and students to deemphasize alcohol at public events. Individuals observed to be high-risk in their use of alcohol are identified and advised.

Asked whether homosexuality had increased on campus during his 20 years at Cowell, McClenahan said he doubted whether there were any more homosexuals of either sex than in previous years. "There is more openness today about all sexual matters, and probably we see more medical problems connected with homosexuality than used to be the case. This is partly because people are more willing to come forward and discuss them.

"There are a number of medical problems associated with gay males and those who live certain sexual lifestyles; these problems include herpes, some intestinal infections and hepatitis. Cowell is available to help".

The total staff at Cowell numbers about 70, including a wide range of professionals. The Infirmary (the inpatient facility) employs 25 people.

"There is a marvellous team here which covers nearly every aspect of medical care and education and counseling. They help students to take responsibility for their own health care. They are keys in the transition between home life to taking responsibility for their own health."

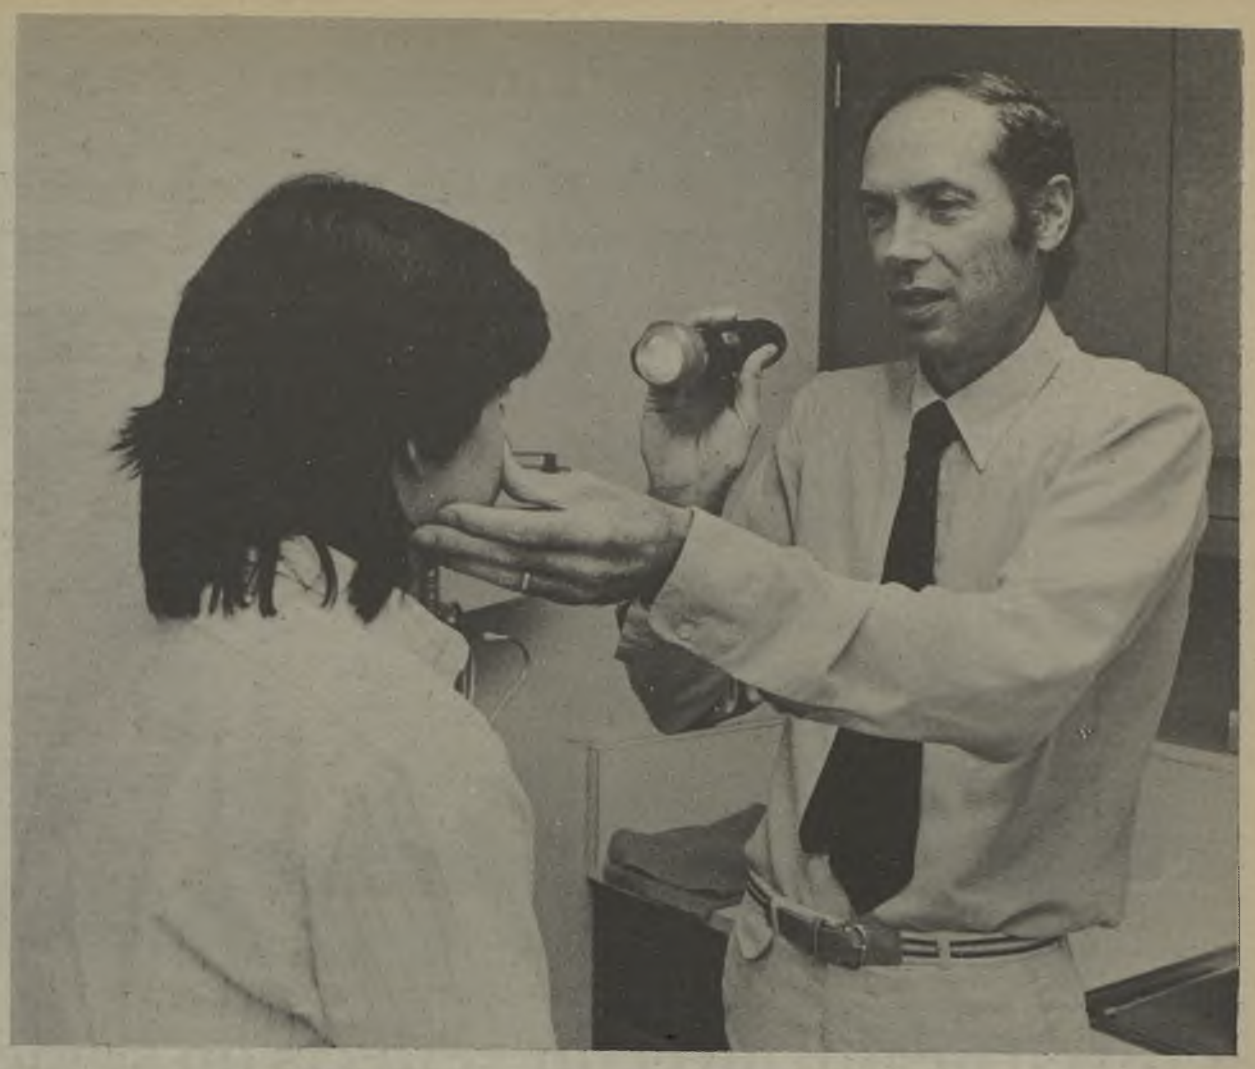
McClenahan pays tribute to Dr. Doryn Davis, who has been director of Cowell's Health Promotion Program for nearly four years: "She has succeeded in focussing health awareness widely on campus, and has secured the cooperation of many departments.

The program directs particular attention to cardiovascular disease, because nationwide half the population dies of heart disease or strokes.

"It would be pretty difficult to interest a 20-year-old in the possibility that he might have a heart attack at the age of 60, so we go about it another way"says McClenahan. "We try to get him to eat correctly and to exercise regularly." A popular innovation recently has been the Cowell Fitness Trailer. Designed to assess the physical fitness of students, it was received enthusiastically when it first began last fall. Student volunteers gave on-the-spot tests which could guide in weight control and general fitness.

In particular, students were intrigued by the on-site computer, which provided an individualized, computerized fitness profile for each participant.

There are now about 2,000 foreign students at Stanford, out of a student body of some 13,000. "We see unusual illnesses because of the influx from other lands. We see malaria, parasitic infections and an occasional case of TB. Many of the foreign students bring their wives and children, so we have to make provision for treating them also".



McClenahan thinks that the Health Center bears comparison with any similar organization. "I think we have built up a pretty good model. My task has been to see that Cowell meets the needs of all the students, and has the people to cope with the needs. I think we have done that, so that is one of the reasons I am looking for a new challenge.

"When minorities, primarily blacks and chicanos, began to be admitted to Stanford in larger numbers a decade ago, a number of problems arose because of the unfamiliarity of the newcomers with the patterns of Stanford life, and how they could relate to other students who had very different backgrounds.

"As the years have gone by these differences have tended to disappear, so that ethnic issues do not loom so large as they once did.

McClenahan has a personal interest in the Indian students at Stanford, and he tries to help with some of their special problems. "Many Indian tribes have beliefs and customs which are different from the typical white middle-class way of life.

"For instance, there have been Indian students here whose parents lived in hogans without running water or any modern facilities as we understand them. The transition of these students to Stanford can be very traumatic."

Dr. McClenahan examines a student in Cowell Health Center. He has supervised the health care of a quarter of a million young people.

It would be pretty difficult to interest a 20-year old in the possibility that he might have a heart attack, so we go about it another way . . . we try to get him to eat correctly and to exercise regularly.

Born in Des Moines, Iowa in 1931, son of a traveling salesman who dealt in flour, McClenahan graduated from De Pauw University, Indiana, in 1953. His inclination was to go into the ministry or to study medicine. He gained his M.D. at Washington University School of Medicine, St. Louis, in 1957.

He started his medical career at the University of California in San Francisco, and after that spent two years working in cardiology and pulmonary physiology at Hammersmith Hospital, London, England. While working as a cardiologist he became interested in the problems of open heart surgery.

He became a staff physician at Cowell Health Center in 1963 and served in that capacity for four years before being appointed acting director in 1967, and director a year later.

In his new post as Public Health Officer of Amador County, McClenahan will deal with the whole spectrum of health problems, including alcohol and drug abuse programs, immunization, well babies, family planning, sanitation and air pollution. "And of course there will be some politics" he smiles.

For the moment, McClenahan will live in Amador county and commute to his Palo Alto home weekends. Mrs. McClenahan is a travel agent.

The McClenahans have three children, all grown. Wynn, 24, graduated in human biology at Stanford and now works for a law firm in New York City. Kristine, 22, also graduated in human biology and is a research assistant in psychiatry at the Veterans Hospital, Palo Alto. Brian, 20, is a junior at Lewis and Clark, Portland.

McClenahan intends to maintain the lean hardness his health regime has given him.

Asked to name the golden rules to attain a long and happy life, he gave them as:

1. Eat right 2. Exercise correctly 3. Don't smoke 4. Avoid excess stress 5. Watch blood pressure.

"Most important of all" smiled McClenahan," choose your parents wisely".

Fine tuning Stanford's pianos was Robert Burton's task

He kept 75 instruments in best possible shape, earning Golden Hammer from piano technicians

Stanford owns about 75 pianos. The man responsible for keeping most of them tuned and repaired since 1961—Robert Burton—has just retired. Those who have depended on him all these years agree that his is a hard act to follow.

Burton started tuning pianos for pay 60 years ago at the age of 15. He learned from his father, who was also a professional clarinetist and teacher of all instruments. Until he moved to Palo Alto in 1959, Burton and his brother ran the largest piano tuning, rebuilding, and retail shop in the state of Washington.

Burton opened a piano service shop on Emerson Street and soon after signed contracts with Stanford's Music Department, Housing Office, Associated Students and what is now called Lively Arts to keep their pianos tuned and repaired. He has often been on stand-by during concerts in case a piano needed attention during intermission. For 15 years he tuned the piano in Frost Amphitheater for the Fiedler-Symphony concerts.

Burton was also a brass player, mainly tuba, and taught brass instruments in high school for six years during the Depression.

When asked recently if he had perfect pitch, Burton grimaced and called the question "a bugaboo for tuners. We're concerned not with absolute pitch, but with relationships of pitches, the intervals between notes.

"The note A hasn't always been the same. When I started to tune it was 435 vibrations per second. Now it's 440, and some orchestras want 442 or even 444. In the old days bands were tuned to 435 and opera orchestras to 452. My father always carried two sets of clarinets for the different pitches. The pitch for A was raised mainly to accommodate the oboe, which can't adjust its pitch very much.

"Pitch has also been raised for a more brilliant, penetrating sound. There's some evidence that people's acuity of hearing is diminishing due to the constant battering of noise around us."

Fifty years ago, 20 to 30 good makes of pianos were produced in this country. Today there are only about five.

"There used to be more brands of pianos made in Boston than there are now in the whole country," Burton recalls.

"Early pianos were built mainly in small shops by expert cabinet makers. The first American factories started up in the early 1800s, and by 1900 there were over 100 piano makers.

"From 1840 to 1860 there was a real exodus of European piano builders to the U.S., including Chickering, Kurtzman; Sohmer, Hardman, Steinway, Stieff, Knabe, Weber, Henry F. Miller, Mathushek, Kranich and Bach, Hallet and Davis, Haines, Fischer, Emerson and Decker—all major names in the development of the American piano.

"Some very good pianos were built in the U.S. between 1885 and World War I, and no major improvements have occurred since then. The war was the first big blow to piano production because all the spruce, which was used to make piano soundboards, was commandeered by the government to build aircraft. Many craftsmen were lost to the war. Then radio came in and that hurt the market badly.

"During World War II piano production stopped entirely except for the pianos Steinway and Weaver were commissioned to build for the armed forces. They came only in olive drab or battleship gray. Since there was no metal for the frames, they were built out of plywood and fell apart in a few years.

"The top American pianos today are Steinway, which has always been a leader; Baldwin, Sohmer, which was the last high quality American piano company to be owned and operated by members of the family which founded it; Mason and Hamlin; Chickering; and Knabe. The Aeolian Piano Corp., which manufactures the last three, recently closed down but is being reorganized and has actually begun production again.

Robert Burton shows the award given him by the Piano Technicians Guild.

Pitch has been raised for a more brilliant, penetrating sound. There's some evidence that people's accuity of hearing is diminishing due to the constant battering of noise around us.

—Robert Burton

"Yamaha is an excellent piano. In the past 50 years the Japanese have acquired the knowledge and skills that Europeans and Americans spent nearly 200 years developing. Kawai is also very good and there's an up-and-coming Korean piano—Young Chang.

"The European piano makers tend to prefer a more singing tone and slightly lighter touch, and the mechanical workmanship is usually excellent. The tensions on the strings are not as great. American pianos generally have 20-25 tons of pressure on them. The most expensive production piano in the world is the Boesendorfer, made in Vienna, and now owned by the Kimball Piano Co. of Jasper, Indiana.

"For purposes of testing someone for admittance to the Piano Technicians Guild, a good quality grand piano is tuned aurally by three or four experienced tuners and the resulting consensus of those tunings, in the form of numbers, is fed into a computer. The candidate's tuning of the same piano is then graded against the computer's scale."

At the Guild's recent 26th annual convention, Burton was awarded their highest honor, the Golden Hammer, "in recognition of exceptional personal service in and for the piano technological profession over a period of years."

Burton has been under contract to tune every Music Department piano (there are 50-55) every quarter and the four concert grands before concerts. Most visiting artists specify in their contracts that their pianos be tuned just before they perform. In the past few years Burton has had assistance from a few other technicians, especially Tom Gorley, Leonard Hanitchak, and Des Wilson.

"Actually, most pianists know very little about the mechanics of their instrument, unlike other instrumentalists, especially string players," he notes.

"The typical home piano goes out of tune mainly due to changes in humidity and temperature; moderate playing doesn't affect them as much. Certainly, many hours of playing, much of it very hard, such as most of the pianos at Stanford get, will knock a piano out of tune and regulation much faster."

Burton recommends home pianos be tuned four times the first year and twice a year thereafter, depending on the weather. "A piano in Half Moon Bay, for instance, goes out of tune quicker than one in Palo Alto."

Burton is retiring partly because he prefers to quit before losing hearing acuity at the extreme ranges of the piano. "It isn't unusual to find people who can't hear the top and bottom few notes on the piano at all. I've had my hearing tested every two or three years and it's still that of a 55-year-old. There are some tuners who don't have very good hearing and rely completely on electronic devices."

Twenty years ago, Burton thought there would be a great scarcity of piano tuners and rebuilders because young people did not find it an attractive field. But in the late 1960s and early 1970s, "young people by the dozens started to learn. They wanted to work with their hands and independently." Burton always had apprentices at his shop, which he moved from Palo Alto to a larger space in Redwood City in 1975 and sold in 1978.

"There are three or four charlatans in the area," says Burton. "We've kept them out of the Guild, but we can't stop them tuning. There's no real regulation of tuners and too many people can't tell if they've gotten their money's worth.

"There are some good piano tuners who do not belong to the PTG, but the Guild provides the only certification that a member has the basic qualifications to be a satisfactory piano technician."

Burton tunes only grand pianos now; "the uprights are too hard on my shoulders." Pretty soon he will stop altogether.

Music Department administrator John Planting says of Burton: "He has given us years and years of very dependable, helpful, friendly, courteous service, as well as good advice on maintenance and which pianos to acquire. And he's always been willing to come out at odd hours, fitting his work schedule to our needs. He'll be very hard to replace."

—Julia Sommer

Contoversial memo prompts committee

The chairman of the department of gynecology and obstetrics has agreed to participate in a faculty-resident-staff committee being formed to deal with internal difficulties highlighted by a controversial memo.

Dr. Toni McCain, a resident in the department, said Friday, Aug. 26, that she and two colleagues had agreed to help form the committee at the suggestion of university officials, including Dr. Dominick Purpura, dean of the medical school.

The three women physicians had sought support from the president and dean after one of them, chief resident Zena Levine, was the recipient of a July 21 memo—later rescinded—from department chairman LeRoy Heinrichs.

The memo, copies of which were sent to department faculty, chief residents and several administrators, noted that Levine was pregnant and requested that she postpone a planned vacation for scheduling reasons.

The memo contained material which Heinrichs in an Aug. 6 apology noted was "offensive to many."

The rescinded memo stated in part:

"Pregnancy can also ultimately affect patients who must bear the frustrations of your colleagues who must work with you or those who remain in your absence. Some faculty members express the modern view that responsible career women do not risk incurring the age-old criticism of women as unreliable professional colleagues, and some advise me, for that reason, to appoint no more women as residents in this program."

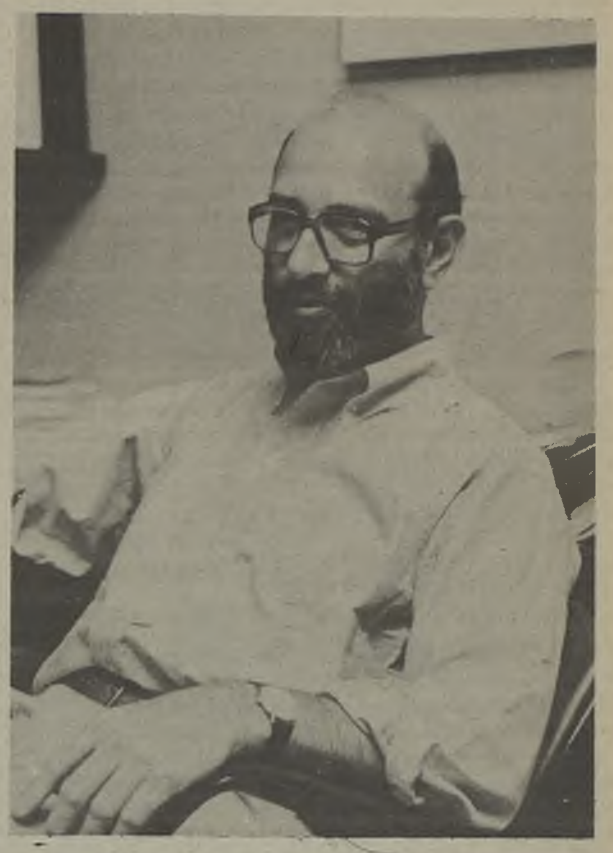
Purpura called the memo, which was released by an unidentified person to members of the news media, as "highly inappropriate, offensive, insensitive, and most importantly, unusable."

Heinrichs has apologized to the resident and her colleagues, and both he and Purpura have reaffirmed the school's desire to uphold Stanford's policy of affirmative action in the hiring of women.

Heinrichs noted that under his leadership, half of the department's 18 residents are women, consistent with current national trends.

He said the intent of requesting the change in vacation schedule was prompted by a desire to ensure that adequate medical staff was available and avoid placing a burden on residents already busy, a problem endemic to residency programs.

Dr. Allen Barbour, associate ombudsman for the medical center, said new approaches to relieve the problem of covering for absent residents are being explored.



McCain, Levine, and a former chief resident now in private practice, Barbara Peters, had asked both Purpura and university President Donald Kennedy to take action about the memo.

Purpura asked that the residents initiate a committee to help deal with departmental tensions.

A lysed (burst) *E. coli* cell with DNA running out of it.

Stanley N. Cohen

Transforming genetics. . .

Cohen describes progress, and future hopes

Research advances in the last 20 years have transformed the field of genetics from one of textbook descriptions to an experimental field where the only real obstacles seem to be the limits of scientific curiosity, geneticist Stanley N. Cohen told a meeting of American and German scientists at Stanford last week.

"Remarkable events have occurred in genetics in the last couple of decades," said Cohen, professor of genetics and medicine at Stanford, who highlighted geneticists' new ability to cut and paste the genes of bacterial and mammalian cells as they continue to unravel the mystery of the information bank that builds and regulates all living organisms.

Cohen, who pioneered techniques in the early 1970s for recombining genetic material in new ways, addressed more than 100 scientists at the second colloquium of the Alexander Von Humboldt Foundation, a German organization that, since 1972, has sponsored more than 800 American scientists for two-year research fellowships in Germany.

Alumni of the program and their German hosts in fields ranging from geochemistry to zoology and physics, gathered at Stanford for a three-day scientific smorgasbord presented by leaders of several fields.

"We've left the stage where genetics was a descriptive science, and instead it has become an experimental science in the manipulative sense," Cohen said.

One key event that gave rise to the transformation, he said, was the discovery in 1970 of "restriction endonucleases," chemical scissors that can cleave tiny chains of genetic material at precise points. Together with genetic glue called "ligases," the chemical cleavers permitted researchers to pry open loops of genetic material, insert a gene from a different organism, and splice the loop together again.

Armed with their splicing tools, scientists turned to the problem of reintroducing the altered genes into the living cell.

Nature's answer came through the discovery of relatively small loops of genes, called plasmids, that travel normally back and forth between cells, permitting bacteria to exchange genes such as those that control the organism's ability to cause an infection and its power to resist antibiotics.

Cohen, and researchers from other laboratories, found that by clipping off the bit of genetic material they were interested in, inserting it in the plasmid, and sneaking the plasmid into a bacterium, they could harness the organism's genetic machinery to produce virtually any protein they desired.

Already, biotechnology firms are using the techniques to produce relatively large quantities of human insulin, growth hormone, and virus-fighting interferon. These are medically valuable substances that, until recently, could only be gleaned through expensive processing of human and animal cadaver organs.

The early success prompted a new wave of research into identifying new cleaving compounds—there are now more than 200 compounds that each cut genetic strands in different places—and ways of splicing genes together.

While the common intestinal bacteria *Escherichia coli* has played the role of biological factory in the first experiments, scientists around the world are now testing other organisms which might be better suited to producing the new and

Clinics nurses to vote next week on union representation by CRONA

Sixty registered nurses at Stanford University Clinics and Medical School are eligible to vote in a Sept. 14 election to decide if they want to be represented by a labor union.

The National Labor Relations Board (NLRB) is conducting the balloting on whether the nurses wish to form their own unit of the Committee for the Recognition of Nursing Achievement (CRONA), which had requested that the NLRB conduct the elections.

CRONA, a non-affiliated labor organization, is the collective bargaining representative for registered nurses at Stanford University Hospital, a separate employer from the university-operated clinics and medical school.

Clinic nurses provide care to outpatients of the Faculty Practice Program. Nurses are also employed by the school in a variety of research and education projects.

Voting is scheduled from 8 a.m. to 6:30 p.m. in room M114.

News delivery change

Because of patient care concerns and mailroom considerations, the *Campus Report* will no longer be delivered to each nursing unit beginning with the issue of Sept. 21, 1983.

Instead, nursing staff are reminded to check the recently installed publications dispensers for the newspapers and other reading materials. The dispensers are located near the escalators on each floor of the hospital. There is also one in the Hoover Pavilion lobby.

This new policy is being implemented to meet various concerns. First, the mail service is centralizing its bulk-type distributions in order to better serve expanding center-wide activities and areas with their present staff and mail carts.

The mail service has increased its workload with central distribution services, and most importantly, patient care concerns must be given highest priority. The loss of important patient care or lab documents under a stack of newspapers could delay attention to an urgent matter.

Call Lisa Ames at the news bureau, 497-6911, or Ron Creamier at the mail service, 497-5130, with any special questions or concerns. All units and departments are asked to continue to keep these offices informed when distribution problems arise.

Communications move

Stanford University Medical Center's office of communications, which includes the news bureau, has moved to a new location effective Thursday, Sept. 1.

The new office is at 750 Welch Rd., Suite 301, Palo Alto, Calif. 94304. The phone number remains 497-6911.

The move was necessitated by the consolidation of the medical center's public events office with the office of communications, and the department of medicine's need for more academic space. The office of communications is adopting a typesetting computer system that will interface with the university's news and publications service, allowing a more efficient service, said Spyros Andreopoulos, director of communications.

The communications office prepares the *Medical Center Memo* section of the *Campus Report*, sends out news releases about the medical center to media, and provides a number of other communications services. It also publishes *Stanford Medicine*, the new medical center-wide magazine scheduled to debut this fall.

The magazine, to be of higher quality and more consumer-oriented than previous publications, will be distributed to faculty, staff, patients, referring physicians, donors, foundations and medical alumni, among others. It replaces *The Healing Arts* and *Stanford M.D.*.

Arthritis self-help group members discuss medications with their leader Ruth Erickson (left foreground).

Arthritis sufferers help themselves

The thumb-walk, the elbow chop and the heel-toe dance are just a few of the exercises taught in Stanford's arthritis self-help classes, a new series of which is scheduled to begin in October.

The classes, which have been cosponsored by Stanford and the Mid-Peninsula Health Service for the past four years, aim to drive home the fact that there are numerous things arthritis sufferers can do to help themselves.

And now, in addition to looking at the efficiency of patient education, researchers plan to expand the project to look at the psychological outcomes of teaching people to manage their own arthritic pain. "We'll conduct a two-year study to look at the effectiveness of long-term reinforcement as well," said research associate Dr. Kate Lorig.

The courses are open to anyone with arthritis. They provide information about arthritis, how best to use arthritis medication, how to design an appropriate exercise program, how to deal with emotional and physical problems created by the condition, and how to work more closely with one's physician.

Participants practice exercises and relaxation techniques and discuss nutritional concerns. They complete questionnaires at several intervals during the course and are continually compared to a control group of future participants.

The fall series will last six weeks. Each class is taught by two community leaders who have been trained by Lorig. Many leaders have arthritis themselves or in their families, some are retired health care professionals, and others are simply people interested in helping others.

Morning, afternoon and evening sessions will be held at 14 locations in the Bay Area including Palo Alto, Cupertino, Sunnyvale, Santa Clara, San Jose, Redwood City, San Mateo, San Francisco and South San Francisco. Classes meet for two hours weekly.

Pre-registration is necessary and enrollment is limited. A small fee will be charged, and scholarships are available. For information or applications to the arthritis self-management course, call 497-7935.

Diabetes study seeks volunteers

Do people with diabetes metabolize blood glucose inefficiently?

Diabetic volunteers are needed to help answer this question by participating in research conducted by Dr. Gerald Reaven and associates at the clinical research center at Stanford University Hospital.

To be eligible for this study, volunteers must have adult onset diabetes; be between 20 and 80 years of age, male or female; and be in good general health.

Part cipants will be offered the following free of charge: evaluation of blood sugar and insulin; routine health evaluation including liver and kidney function test, cardiogram, physical exam, and dietary evaluation.

Anyone interested or wishing further information should call Dr. Chris Donner or Dr. Clarie Hollenbeck, at 497-6973 between 9 a.m. and noon; or Ann Coulston, R.D., at 497-5430 between 1 and 5 p.m.

Campus Report goes weekly again

Please note that the next issue of *Campus Report* (Sept. 21) will mark the end of the summer schedule of publication for this year. During the summer the newspaper appears only every other week.

Starting with the Sept. 21 issue the newspaper, including the *Medical Center Memo* section, will again appear weekly throughout the academic year. Please plan publicity and announcements through the news bureau accordingly.

Last week's playoffs went to three games with the last one into an extra inning, when Psychiatry finally beat out X-ray Therapy (XRT) as this summer's coed softball champion team. Above are members from each team, up to bat: Rich King (left) of XRT; and Rick Ward, captain of Psychiatry. Behind Ward is XRT catcher Sue Lewis. This year's league was made up of 18 teams from throughout the medical center.

...News Notes...

Spotlight on. . .

Management changes have taken place in **Patient Accounting**, *said Suzanne Cameron, assistant director of the department. Former management positions have been reorganized based on functional responsibilities, and a new manager has been hired to fill a vacant position.*

Larry Dutch *has joined the staff to head the data control department (formerly patient accounting quality control). He came to Stanford from a position installing hospital financial systems for a computer software firm and was previously the director of data processing at Roseville Community Hospital near Sacramento. He is available at 497-6584.*

Yolanda Zesati *is the new manager of accounts receivable collections. Here at SUH, Zesati has extensive management experience in various accounts receivable departments, as well as in data control. She can be reached at 497-5560.*

Dan Thompson *is now manager of government program receivables, He joined the SUH staff in 1979 as assistant accounts receivable manager. In his new capacity, he will be involved in claims processing and preparation in patient accounts receivable. He is at 497-6022.*

* * * *

Warren Weeks *and* **Gary Rotzin** *of the facilities department have announced their intentions to resign from SUMC in the coming months.*

Weeks, whose resignation will be effective in November, plans to join Philip Rector, current director of SUMC facilities, at the University of Arizona. Weeks will serve as assistant director of physical resources at Arizona; Rector will be director.

Weeks has served at SUMC as associate director of facilities since 1979. Since coming to Stanford in 1970 he has also worked on central campus and at SLAC.

Rotzin, who resigns effective Sept. 16, plans to pursue other personal and professional goals. He has been associate director of facilities/projects at SUMC since 1979, and will continue on a consulting basis until January.

Since 1974 he had served as assistant manager of construction and engineering in the university's facilities planning and construction office.

With the departure of Rector, Weeks and Rotzin, a new structure for the facilities department will begin to be developed in the fall, said Sheldon King, director of the hospital.

* * * *

Dr. George Waltuch, *a hematologist at Menlo Medical Clinic and a clinical associate professor of medicine at Stanford, began a two-year term Aug. 23 as president of the SUH Medical Staff.*

Waltuch, who most recently served as vice president of the staff, succeeds Dr. Robert Hill, a cardiologist at Palo Alto Medical Clinic and a clinical assistant professor of medicine.

Dr. Melvin Britton, *a specialist in general internal medicine and a clinical associate professor of medicine, was unanimously elected vice president. Elected unanimously as members-at-large of the Medical Board were* **Dr. E.W. Fredell**, *an internal medicine specialist at Menlo Clinic and a clinical professor of medicine; and* **Dr. Robert Stebbins**, *an oncologist in Palo Alto who serves as clinical assistant professor of medicine and physician specialist at SUMC.*

Edwards and Kersten

The office of medical school development has appointed two new staff members, announced Sally Agle, deputy director of the department.

Carol Kersten, *a Stanford law school graduate, is now assistant director of medical development. Her duties will include working with several divisions of the department of medicine, and the departments of dermatology, neurology and nursing, as well as developing a solicitation program for medical school non-alumni parents.*

Paul Edwards, *who comes to the post of associate director of medical development from the university's office of development, will focus on major gifts programs for modernization of the hospital and construction of the new Children's Hospital at Stanford.*

You should know. . .

There's still time to register for the 10-week **weight control program** *offered by the department of dietetics at SUH.*

Classes will be held Tuesday evenings, Sept. 27 through Nov. 29, at the Hoover Nursing Cottage.

The "Enlightening Experience" program will emphasize safe and effective weight loss through group participation. It will be coordinated by registered dietitians Kristine Birge and Patricia Kearney. Guest speakers include Dr. Peter Wood of the SHDPP, Dr. Mary Southam of the Stanford behavioral medicine program, and Elad Levinson of the hospital's human resources department.

Cost of the program and materials is $300. A refund of $50 will be made if the participant's weight loss goal is achieved at the conclusion of the program.

To register, call Birge or Kearney at 497-5440.

* * * *

The Health Improvement Program (HIP) is sponsoring a **weight loss by mail program**, *developed by the Stanford Heart Disease Prevention Program (SHDPP). The course teaches participants to lose weight without attending classes.*

One-hour informational meetings are scheduled for Wednesday, Sept. 7 at 5:15 p.m.; Thursday, Sept. 8 at 5:15 p.m.; and Friday, Sept. 9 at noon. All will take place at the SHDPP trailer next to Cypress Hall.

A fee of $25 will be charged for the course. To reserve your place in the program, call HIP at 497-9649 between 1 and 3 p.m.

* * * *

Hospital employees are invited to attend the department of emergency services' **open house** *planned for later this month to celebrate the completion of redecorating in the ER lobby, said Barbara Behrens, assistant director of emergency services.*

Also attending will be members of community organizations who have contributed to emergency department programs.

New furniture for the waiting area was funded through employee purchases at the 1981 annual jewelry sale, sponsored by hospital employee relations.

* * * *

This year's hospital employee relations **jewelry sale**, *which took place Aug. 23, grossed $7,782. Employee Relations will receive 12 percent, or $933, of that total.*

The funds will be used for an employee relations project as yet undetermined. Past sales have helped fund, for example, the ER lobby refurbishing (see above) and the purchase of publications dispensers.

Winners of drawing prizes were employees Diane Madgic, dietetics; Candy Fisher, payroll; Anne Kinder, dean's office; Gail Nakayama, diagnostic microbiology; Vicki Hayden, financial data review center; and Stephanie Gray, radiology.

* * * *

A one-day **retreat** *for hospital department heads and cost center managers will be held Wednesday, Sept. 28, at Vallombrosa Center in Menlo Park.*

In small group sessions participants will discuss and help define the hospital culture and value systems. Department heads and managers will also participate in setting hospital goals for the future.

The retreat is being planned and coordinated by Sheldon King, director; Carole Price, associate director; Elad Levinson of Human Resources Development; and Jenny Steinmetz, MBO consultant.

Get your tickets!

Hospital and Medical School employees are once again included in President Donald Kennedy's invitation to a tailgater and football game for Stanford Employee Appreciation Day, Sept. 24, at Frost Amphitheater.

Two complimentary tickets are available for all regular full-time and part-time members of the hospital and medical school staff. Tickets may be picked up by categories of staff only at the times and locations listed below:

- **Hospital employees at the main center:** Room E009; Sept. 13, 14, 15, 16 and 19; 7:30 a.m. to 4:30 p.m.
- **Hospital employees at Hoover Pavilion:** Cafeteria (N126); Sept. 14 only; 2 to 3:30 p.m.
- **Medical School employees:** Human Resources (M118) or Maples Pavilion; Sept. 13, 14, 15, 16 and 19; 8 a.m. to 4:30 p.m.

People who wish to sit together must pick up their tickets together. Anyone with questions should call Susan Cabral, SUH employee relations, at 497-6251.

Cohen/ *continued from p. 6*

improved antibiotics, vaccines, and agricultural and industrial products biotechnology firms hope to produce with the new techniques.

"Using the full range of methodologies, it is now possible to express, in bacterial cells, genes from almost any source," Cohen said.

While the industrial applications of the new techniques are exciting, their value as tools to understand human genetics can't be emphasized enough, Cohen said. Although the relatively simple genetics of *E. coli* are fairly well understood, the meter-long string of genes packed tightly into every human cell remains comparatively mysterious.

Recombinant DNA techniques offer new ways, he said, to probe the complex genetic map that serves as a basis for life.

—Deborah Franklin

Heinrichs/ *continued from p. 6*

Departmental committees on well-being have become common at Stanford Medical School in recent years. McCain has prepared an invitation to residents, faculty and staff to participate in the proposed committee. Heinrichs has said he would sign and distribute the letter.

"This is an invitation to participate in a new approach to intradepartmental communication and problem-solving," says the proposal drafted by McCain.

Commmittees "are intended to be frank and open sessions where pertinent facts on particular issues are presented and suggestions are made which lead to real solutions."

"This (the committee) certainly has the potential to be useful," Levine said.

Peters, who has a clinical faculty appointment pending, said "open discussion through a committee is a powerful antidote to potential misunderstandings." **—Mike Goodkind**

Medical Center MEMO

Prepared as a section of the *Campus Report*, by members of the Medical Center News Bureau staff. Editor is Lisa Ames, who can be reached at 497-6911.

Dr. Philip Sunshine (right), director of the Intensive Care Nursery at SUH, tastes and talks with fellow wine lovers at a benefit held by The Cellar restaurant in Los Altos Aug. 28. The wine-tasting raised more than $3,000 for the ICN, where Joshua Hancock, son of the Cellar's owner Larry, spent six weeks as a patient in 1971.

Medical Calendar

To schedule Fairchild Auditorium and Lobby, Alumni Green, Grant Courtyard, and Dean's Courtyard, call 497-6389.

MEDICAL CENTER TOUR: Every Thursday, 1:30-2:30 p.m. Reservations required. Call 497-6389.

WEDNESDAY, SEPTEMBER 7

Hematology support group: meeting for patients with leukemia, myeloma, hemophilia, and other hematologic diseases. Family members and significant others welcome. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

THURSDAY, SEPTEMBER 8

Dept. of Medicine grand rounds has been **CANCELLED** due to Rosh Hashana.

FRIDAY, SEPTEMBER 9

Dept. of Gynecology and Obstetrics grand rounds: "Postmenopausal Sexuality"—Jean Dixon, Ph.D. 8 a.m., A336.

Dept. of Pediatrics grand rounds: "Sports Related Injuries in Childhood and Adolescence"—Dr. James Gamble. 8 a.m., M106.

Registration deadline for Nursing Educational Services "Pediatric Critical Care Course Level II": to be held Sept. 19 and 20, M104. Program coordinated by Kaaren Peterschmidt, R.N., M.S. For further information or to register, call Carole Kidder at 497-6366.

Nursing Educational Services: "Sports Medicine: the Team Approach." 8 a.m. to 4:30 p.m., Sports Medicine Library, 3250 Alpine Road, Portola Valley. For further information or to register, call 497-6366.

SEPTEMBER 7 through 9

Nursing Educational Services: "Cardiovascular Nursing in the 80s: Third Annual Symposium." For further information or to register, call 497-6366.

SATURDAY, SEPTEMBER 10

Div. of Cardiology: "Current Status of Anti-Arrhythmic Drugs." 8 a.m. to 5 p.m., Fairchild Auditorium. For further information, call 497-5635.

MONDAY, SEPTEMBER 12

Div. of Otolaryngology/Head and Neck Surgery Resident lecture series: "Physiological Acoustics—Operation of the Mechanical System"—Dr. F. Blair Simmons. 7:30 a.m., R117.

TUESDAY, SEPTEMBER 13

Registration deadline for Nursing Educational Services "Critical Care Course Level I": to take place Sept. 27, Oct. 4, 11, and 18, 900 Welch Road, Room 15. For further information or to register, call Carole Kidder at 497-6366.

WEDNESDAY, SEPTEMBER 14

Hematology support group: For patients and their families and significant others. 10:30 a.m. to noon, TF-122c. For further information, call 497-6961.

Nursing Educational Services: "Basic EKG Interpretation Workshop." 7 p.m. to 9 p.m., 900 Welch Road, room 15. Additional sessions to be held Sept. 21, 28 and Oct. 4. For further information or to register, call Carole Kidder at 497-6366.

THURSDAY, SEPTEMBER 15

70th Anniversary of Social Work at Stanford celebration banquet: Virginia Satir will speak on "Families in the '80s." 5:30 p.m., Faculty Club. For fee information or reservations, call Carol Piercy at 497-5615.

Dept. of Medicine grand rounds: "Clinical Aspects of Male Hypogonadism"—Dr. Carlos Carmargo. 8:30 a.m., Fairchild Auditorium.

Dermatology Special Guest Lecture: "The Conquest of Venereal Disease in The People's Republic of China"—Dr. George Hatem (Institute for Dermatologic Research, Peking). 5 p.m., M112.

FRIDAY, SEPTEMBER 16

Dept. of Gynecology and Obstetrics grand rounds: "Postcoital Testing"—Dr. Emmet Lamb. 8 a.m., A336.

Dept. of Pediatrics grand rounds: "Neonatal Polycythemia and Hyperviscosity Syndromes"—Dr. Herbert Schwartz. 8 a.m., M106.

MONDAY, SEPTEMBER 19

Discussion with patients' group by author of *Vital Signs: a Young Doctor's Struggle with Cancer*: Dr. Fitzhugh Mullan (NIH). 5 to 8 p.m., C122 Darwin Library. *(See article this issue.)* For further information, call 497-6171.

TUESDAY, SEPTEMBER 20

Fitzhugh Mullan will address faculty and staff. *(See Sept. 19 entry, and article this issue.)* 8 to 9 a.m., S092. For further information, call 497-6171.

SEPTEMBER 19 and 20

Nursing Educational Services Pediatric Critical Care Course, Level II. 7:30 a.m. to 4:15 p.m., M104. For further information or to register, call Carole Kidder at 497-6366.

WEDNESDAY, SEPTEMBER 21

Nursing Educational Services Pediatric Critical Care Course, Level II. 8 a.m. to 3:45 p.m., M104. For further information or to register, call Carole Kidder at 497-6366.

Human Resources Group—New Employee Orientation. 9 a.m. to 1 p.m., Fairchild Auditorium. To register, call Dorothy Thompson at 497-7541.

Calendar items must be received in the Office of Public Events, 750 Welch Road, Suite 300, by the Wednesday noon seven days prior to the issue in which the activity is first to appear. Contributions from the Hospital, Medical School, and Clinics are welcome. For further information call 497-6389.

Medical School faculty openings

Stanford University is an equal opportunity employer and welcomes nominations of women and minority group members and applications from them.

The Department of Medicine seeks a laboratory investigator-clinician for a tenure track position as an assistant or associate professor in the department. Candidates should have independent investigative capability and training in medical oncology.

Send resumes to Dr. Ronald Levy, Chairman, Search Committee, Div. of Oncology, Room S025, Stanford University School of Medicine, Stanford, CA 94305. Resumes will be treated confidentially.

Applications are invited from qualified pathologists/hematologists with strong academic orientation for the position of assistant professor or non-tenured associate professor in the Department of Pathology.

Applicants must be qualified to assume direction of the Coagulation Section of the Clinical Laboratories in the Hospital. Responsibilities will include supervision of laboratory personnel, test development, monitoring of quality assurance, and substantial teaching and consultative interactions with medical students, house officers and clinical colleagues.

Postgraduate training and certification in pathology are desirable, but regardless of area of primary specialization, an extensive laboratory background is essential.

Candidates must have demonstrated their capacity to conduct first-class research and will be expected to establish an independent and fundable research program in coagulation or cognate areas of laboratory medicine or pathology. A record of prior publications is essential.

Applications should be dated no later than Oct. 6, 1983, for an appointment to commence March 1, 1984. Send curriculum vitae and the names of at least three references to Dr. Howard H. Sussman, Director of Laboratories, Dept. of Pathology, Stanford University Medical School, Stanford, CA 94305.

Cancer surviving M.D. to speak

The author of *Vital Signs: a Young Doctor's Struggle with Cancer* will visit the Stanford community later this month to discuss the educational needs of the cancer survivor.

Dr. Fitzhugh Mullan is the chief medical officer in the Office of Medical Applications of Research, National Institutes of Health. A former cancer patient himself, he is concerned with educational and psychological strategies for re-entry—the challenges and problems of rejoining life as a cancer survivor.

Such challenges, often surfacing within the first five years after diagnosis, include fear of recurrence, living with compromise, health observation and maintenance, acceptance by society, and creating community among cancer survivors.

Mullan will address the need for future investigational activities in these areas. He'll also describe his own role changes as he went from doctor to patient, and then to doctor again.

Mullan will speak to a patients' group in the department of radiology from 5 to 8 p.m., Sept. 19, in the Darwin Library, C122. The following day he'll address faculty and staff, room S092, from 8 to 9 a.m., Sept. 20.

The talks are sponsored by the division of radiation therapy. They are open to all, as space permits. For further information call 497-6171.

Volunteers Needed. . .

How does diabetes affect sexuality?

Female volunteers are needed for a study investigating whether diabetes affects sexual response, said Dr. Diane Morrissette, a visiting scholar in Stanford's department of physiology.

The study will involve insulin-dependent diabetic women, between 21 and 43 years of age, in four one-hour sessions which can be arranged to fit the individual's schedule.

Volunteers will be provided with results of laboratory tests measuring hormonal levels in the blood.

For more information, contact Morrissette at 497-2432.

Student leaders chastise faculty report on McCloskey

Factual errors resulted from improper, unfair investigative procedures

Following is the response of the Associated Students of Stanford University to the Report of the Political Science Department Committee Investigating Possible Abridgement of Academic Freedom in Political Science 7, taught by P.N. McCloskey, Jr.:

INTRODUCTION

The report of the Political Science Department Committee formed to investigate possible abridgement of academic freedom in ASSU Guest Professor Paul N (Pete) McCloskey's course this past spring (Campus Report, July 27, 1983) was critical of a number of actions taken by last year's Guest Professorship Bureau (GPB) and Council of Presidents (COP). The present ASSU Senate established a committee to investigate these charges and to make any warranted response.

We have found significant and substantial inaccuracies in the Report relating both to the course of events and to their interpretation. These inaccuracies result in large measure from the following of investigative procedures which must be seen variously as improper, insufficient, or unfair.

Thus, in the following response to the Committee's Report, we will first examine some of its principal factual errors, and we will then address matters of procedure which distorted the investigation. A third section will consider the extent to which the Report's recommendations are founded upon its factual errors. A concluding section will present our recommendations for further action.

FACTUAL ERRORS IN THE REPORT

The Report of the Political Science Department Investigating Committee contains several factual errors. Some of the major errors examined in this section are those involving the selection of course readings, course administration, course finances, and the actions of the various parties towards resolving difficulties as they arose.

Informal Invitation to Mccloskey

The Report states that on July 1, 1982, a member of the GPB (David Marks) "informally invited Congressman McCloskey" to teach a course at Stanford in the winter quarter. In actuality, no member of the GPB has the authority to extend invitations to a prospective Guest Professor, informal or otherwise, and only the Director can authorize formal discussions. Mr. Marks therefore discussed the possibility of a Guest Professorship for Mr. McCloskey without proper authorization and this was made clear to all parties at that time.

Moreover, Mr. McCloskey had expressed interest in teaching at Stanford in a letter to President Kennedy before his discussions with Mr. Marks. It is clear that Mr. McCloskey was at least as eager to teach at Stanford as the GPB was in eventually inviting him.

Selection of Course Readings

The manner in which readings were selected for the course has received considerable attention. On January 19 the Political Science Department reviewed the proposed course and agreed to its accreditation. The proposed course outline stated merely that there would be a set of unspecified "selected readings" for each lecture. At least one member of the Department faculty, Professor Abernathy, protested both the lack of adequate review given to these "selected readings" and the hurried nature of the Department's accreditation of the course.

At the ASSU Senate meeting of January 25 two primary concerns regarding these readings were expressed: 1) did the readings have a direct bearing upon the topic of the course (Congressional Decision Making); and 2) in light of Mr. McCloskey's lack of previous experience, did they address the issues raised in the course in a sound academic manner as befitting a Stanford course.

At its meeting with Mr. McCloskey of February 17 the GPB made it clear that the Senate would not approve the proposed course unless these concerns were satisfactorily addressed. It was made clear to Mr. McCloskey that he would be asked to make commitments concerning the course readings, commitments which would be taken as binding. Mr. McCloskey voluntarily agreed to this understanding.

Based upon discussions between Mr. McCloskey and the GPB (the Political Science Department declined to be involved in this process), the Senate approved the course, including its readings. Director Linfield stated at that time that Mr. McCloskey and the GPB had agreed that all future modifications to this list of readings would be made in consultation between both parties, in a manner similar to that used in formulating the original list.

Final Senate approval of the course was given at its public meeting of February 22. Dozens of interested members of the community attended this meeting, several of them addressing the Senate in an open forum. The campus media (notably the *Stanford Daily* and the *Stanford Review* covered this meeting extensively.

From that date onward the precise procedure by which the selected readings had been compiled, and the procedure by which they would be modified, were known to the general public, including members of the Political Science Department, the Dean, and the Provost. These procedures were explicitly modelled upon those of comparable programs, such as SWOPSI, and no protests were heard at that time from any quarter. Indeed, the Report explicitly approved of the GPB reviewing proposed course readings before final approval had been given, reserving its condemnation for interference by the GPB in subsequent modifications of the original list of readings.

Modifications of the Course Readings

Throughout the Report the GPB is characterized as having "demanded" various "additions and deletions" to the reading list. This characterization of events seems particularly confusing. Given that the GPB extensively pre-screened and agreed with the original reading list, one wonders why it would subsequently "demand" various alterations.

Specifically, the Report cites assertions by various students taking the course that the GPB attempted to do the following:

- To "remove" from the required readings Si Kenan's book *Israel's Defense Line, Her Friends and Foes in Washington.*
- To "remove" from the required readings George Ball's article "The Coming Crisis in Israeli-American Relations."
- To "disallow" the reading chapter 4 of Crabb and Holt's book *Invitation to Struggle.*

Each of the instances cited above occurred on or before February 18, prior to the final approval of the course. Specifically, the GPB undertook the following actions:

- Suggested to Mr. McCloskey that Kenan's book not be used as a primary reference source due to its lack of a bibliography and footnotes. Mr. McCloskey agreed, and subsequently moved it to the list of recommended readings.
- Suggested that Ball's article be used in conjunction with lecture 18 (on Congressional approval of the AWACS sale) rather than with lecture 11 (Domestic Energy Policy). Mr. McCloskey agreed that the material should be covered in this latter lecture, and it was actually covered to some extent in both lectures.
- Suggested that Crabb and Holt's book not be used as a primary reference source due to the lack of a bibliography and footnotes. Mr. McCloskey expressed his desire to include chapter 4 of the book, and the GPB readily concurred.

Apparently the Committee (like some students in the course) was confused as to the precise chronology and nature of these events. These events were not examples of interference by the GPB in the selection of course readings by an instructor. Rather, they were instances of a review of readings conducted before the course (and instructor) received final approval. While the former action is condemned by the Committee, the latter is explicitly approved.

In actual fact the GPB never "demanded" various modifications to the original readings. Rather, Mr. McCloskey made various modifications without consulting the GPB. In some instances these modifications were simply such adjustments in a reading list as one expects from an instructor as shehe gains further experience and insight during the teaching of a course. In these instances there were no substantive disagreements between Mr. McCloskey and the GPB. In other instances it appeared that Mr. McCloskey either was reversing himself on previous agreements with the GPB, or was introducing material of insignificant academic interest or irrelevance to the stated topic of the course, Congressional Decision Making. In these instances (confined exclusively to the latter half of the course) the GPB displayed great reluctance to support his modifications.

In those instances where Mr. McCloskey and the GPB found themselves at odds there was real and genuine concern by the GPB that the course was veering away from the topic of Congressional Decision Making and becoming a course on American foreign policy, specifically American Middle East policy. The academic freedom of an instructor clearly and simply does not extend to converting an Economics 1 class into a Physics 53 class.

Specifically, the comments, cited in the Report, of the new co-directors of the GPB on May 24 regarding "difficulties they had had with Mr. McCloskey over the past week," can best be understood in light of the extensive changes in the selected readings which had just been made by Mr. McCloskey. In a lecture dedicated to the ratification of the Panama Canal treaty (definitely a matter of proper concern for the course) Mr. McCloskey wanted to devote the majority of the selected readings to the Suez Canal and Arab-Israeli relations. This was seen by the GPB as a clear deviation from the focus of the course, Congressional Decision Making, and an explicit and substantial departure from agreements and understandings they had with Mr. McCloskey before the course was approved.

Course Administration

The GPB did not suggest to Mr. McCloskey that a term paper be added to the course requirements in order to make it more "academically rigorous." Rather, Mr. McCloskey expressed interest in adding more course requirements, and specifically suggested the addition of weekly quizzes. The GPB advised him that a term paper might be more appropriate than weekly quizzes for a variety of reasons. Based upon these discussions the term paper requirement was freely adopted by Mr. McCloskey.

Only one instance of administrative laxity on the part of the GPB was found: although the copies of the selected readings for lessons 1 through 5 were made available in the Bookstore on time, the GPB mistakenly did not give the Bookstore appropriate pricing information, delaying their sale for several days.

The controversy during Spring quarter between the GPB and Mr. McCloskey did hinder the progress of the students in his course. However, the greatest hindrances to the course seems to have been Mr. McCloskey's use of class time to discuss his problems with the GPB. Indeed, delays in the distribution of the early readings can hardly compare to the distractions such a discussion generated.

Course Finances

The Senate approved the course budget on February 22, at the time at which it gave final approval to the course. The salary of Mr. McCloskey was set in the budget at $2000. No other figure had beendiscussed with him by Director Linfield either before or after the Senate's action.

This is part of the public record, and thus Mr. McCloskey's salary has been known since late February. Unfortunately, the Committee may not have received copies of the course budget. The lack of adequate communications between the ASSU and the Committee during its investigation is a result of the Committee reluctance to discuss these issues in an open forum, in which this major factual error would certainly have been detected and remedied. However, Cynthia Mathewson of the COP actually did state that the salary had been set at $2000 in her letter of April 28 to Mr. McCloskey, which the Committee did receive and and from which it quoted extensively.

In that letter Ms. Mathewson also suggested that the Senate be requested to authorize an additional $1000 for Mr. McCloskey once most of the concerns of all parties had been laid to rest. The Report states that "the meaning of the letter is obvious: if Mr. McCloskey did not agree to most of the ASSU demands, it was certain that he would receive $1000 less in compensation." This interpretation of the letter is difficult to understand. At *no* time was there threatened a decrease of the $2000 salary authorized by the Senate . Only the Senate has the power to modify budgets, and the Senate was never even consulted on this matter.

Ms. Mathewson's offer to recommend to the Senate an *increase* in compensation for Mr. McCloskey was *not* designed to affect his actions. Rather, the GPB had found after the cancellation of the Greenburg and Chambers course that its budget constraint was substantially relaxed, enabling it to recommend that Mr. McCloskey be granted additional compensation. The COP, concerned about the status of relations between the GPB and Mr. McCloskey, wished to delay actually recommending such an increase in compensation to the Senate until all parties could reach an understanding on other outstanding issues.

The report cites this episode as the "clearest evidence" of abridgment of Mr. McCloskey's academic freedom. It is extremely difficult to see how the promise of *recommending* an *increase* in Mr. McCloskey's compensation above a mutually agreed upon level could be construed as an abridgment of academic freedom. The reluctance of the COP to recommend to the Senate an increase in compensation can hardly be regarded as a restraint or pressure "designed to create in the minds of academic scholars. . .fears and anxieties that may inhibit them from freely. . .teaching." The Senate's approval of a $2000 salary should have been the final word on this issue. Finally, if Mr. McCloskey subsequently wished to request an increase in compensation, then he could have simply approached the Senate directly, as is the usual practice, bypassing the COP entirely.

The budget approved by the Senate also authorized various administrative expenditures. The normal procedure would be for Mr. McCloskey to present documentation to the Director of the GPB, who would then insure that the expenses were authorized by the budget and process a reimbursement request. Any disputes concerning the reimbursements would be presented directly to the Student Financial

Manager (the Controller of the ASSU) for disposition. As things stand, the Student Financial Manager issued a check to Mr. McCloskey 3 months ago, has notified him in writing twice of its availability, and is still waiting for him to pick it up. It is mystifying that Mr. McCloskey has not picked up his money and that the Committee did not inquire further into this matter before including it in their Report.

Finally, the Report recognized the legitimacy of the ASSU setting the course budget. The ASSU has always been very conscious of potential misuse of the budgetary process, and has adopted an elaborate series of controls designed to insure fiscal accountability without impeding operations. But to assume that depositing funds with the University Controller would prevent the ASSU from misusing its budgetary authority is unrealistic. Such action could only prevent the Student Financial Manager from defying the wishes of the Senate as expressed in the budget. Clearly that type of protection is not needed, for the Senate (which appoints and can remove the Student Financial Manager) will, as it always has, insure that its powers are not diluted.

Memorandum of Understanding

The proposed memorandum of understanding between the GPB and Mr. McCloskey, which was quoted in its entirety by the Report, was simply a concrete formulation of agreements which had already been made in the process of securing approval for the course. The provisions for removal were modeled upon those found in the *Academic Staff Handbook*, published by the Provost's Office; those concerning reading materials upon the current practices of comparable programs (such as SWOPSI); and the salary of Mr. McCloskey was simply the amount that had already been approved by the Senate.

None of the terms of this memorandum were novel inventions of the GPB or the COP. They were, as far as could be determined, established University policy as codified in such documents as the *Academic Staff Handbook*. or demonstrated in comparable programs (such as SWOPSI). If they are contrary to the Committee's interpretation of University policy, then either the GPB and COP were mislead by other agencies in formulating their guidelines, or their interpretation is not accepted in practice by all elements of the University. In either event further University action would seemed called for.

Political Science Department Actions

The Report cites numerous "misunderstandings" by the various students involved in this controversy. In many such junctures a minor effort by the Department might have satisfied the concerns of all parties. But in all these instances the Department displayed a lack of knowledge and of energy preventing it from exercising its rights and responsibilities as the accrediting agency.

On Jan. 19 the Department recommended Mr. McCloskey's appointment as a lecturer before the Senate had taken any action with respect to his nominations. Members of the Department were led to believe that the Senate had *already* approved the course in question. It is difficult to comprehend how such misinformation could have guided the Department's actions.

Moreover, within a week the *Stanford Daily* began a series of articles highlighting the Senate's decision to authorize the GPB to "conduct negotiations with" Mr. McCloskey. At that time all members of the Department should have been aware that the Senate had not yet approved the course, and that if the Senate did not do so, the Department would be left with a teacher but no salary to pay him.

The Senate was led to believe that the Department's decision was only designed to give the ASSU guidance as to the Department's eventual willingness to sponsor Mr. McCloskey if he had received Senate approval. While this was also apparently in error, the Department's decision was made in a closed faculty meeting, with no publicity attending it, making it impossible for Senators to easily discover that their belief was mistaken.

The Report, in its factual narrative, gives the misleading impression that Mr. McCloskey's appointment as a lecturer by the University was made quickly after the Department's decision. The actual appointment of Mr. McCloskey by the Board of Trustees was made on May 10, over three and a half months after the Department's decision.

Thus the Department had ample opportunity to correct the mistaken impression that the Senate was obviously working under, and even to reconsider its earlier decision. Its failure to do so was the first instance of a communications failure that plagued all parties for the next several months.

Professor Marshall's letter to the *Daily* on April 19 concerning the now public controversy between the GPB and Mr. McCloskey prompted immediate action by the GPB. Director Linfield on April 21 wrote to Chairman Eulau and offered to turn responsibility for the course over to the Department as soon as possible. His inability even to reply to Director Linfield's letter left the GPB totally in the dark with respect to the Department's intentions.

This point cannot be emphasized enough - if the Chairman had responded to Director Linfield, then *any* of the Department's wishes concerning the administration of the course, the content of readings, etc... would have been accepted by the GPB. If the violations of academic freedom which the Report discovered are as obvious as it concludes, then it is extremely difficult to believe that *some* statement by Chairman would not have been appropriate at this juncture. The Chairman's consistent refusal to address any of the issues raised was understood by the GPB to constitute tacit consent for it to continue its (hardly secret) actions. Indeed, while the Report concluded that course administration is an inappropriate area of student involvement, the Chairman's inaction forced the GPB to maintain completely unsupervised administration of the course against its expressed wishes.

Throughout Winter and Spring quarters the Department acted without sufficient information when it was readily available from the GPB, COP, Senate, or even the news media; it refused to advise the GPB when requested, indeed when practically begged to offer advice and assistance; and it consistently failed to communicate with ASSU officers (of the GPB, COP, and the Senate) when questions or difficulties arose. The Report correctly concludes that a program such as the Guest Professorship Program is very difficult to administer, but this difficulty is compounded out of all proportion when parties fail to participate in a meaningful way.

Handling of McCloskey's Grievances

As Spring quarter progressed Mr. McCloskey encountered what he interpreted as opposition to his handling of the course from the GPB. The Report relates how he then sought assistance from a variety of sources before making his complaints public in the *Stanford Daily* and other news media. An impression is given that only after all appropriate administrative avenues of redress were exhausted did Mr. McCloskey "go public."

Specifically, after he concluded that discussions with Director Linfield would be unfruitful, Mr. McCloskey requested the assistance of the Political Science Department. Chairman Eulau declined to aid him directly, referring him instead to Ms. Selznick of the Undergraduate Specials Program (which has no connection with either the ASSU or the GPB), who then referred him to the Ombudsman. At this juncture Mr. McCloskey decided to approach the press with his grievances.

Normally, according to the *American Association of University Professors* (AAUP) *Model Case Procedure*, "all parties to an academic controversy refrain from publicizing their differences in order to protect the investigative procedure from the impact of uninformed or uncritical reactions and in order that the door may be held open to mediation." It is not usually considered proper for an individual to appeal to a "trial by press" unless and until all administrative remedies had been exhausted.

Unfortunately, Mr. McCloskey came nowhere near exhausting proper administrative remedies. The Report relates his inability to obtain the names of the members of the GPB. Considering his close relationship with at least one member of the GPB (David Marks) and the fact that these names were in the public record (anyone in the ASSU Office, COP, or Senate could have made them available to him if the GPB Director had - wrongfully - refused), it is difficult to see how he could not have obtained them. On several occasions he was invited to attend meetings of the GPB to discuss his difficulties, invitations that he declined.

If after having met with the GPB Mr. McCloskey had found the GPB unresponsive to his concerns, then he could have approached the COP and have requested its assistance. Indeed, immediately upon reading in the press of Mr. McCloskey's grievances, of which until that time they had been unaware, the COP invited Mr. McCloskey to a meeting to discuss his difficulties. Finally, if all else had failed, he could have brought the matter to the attention of the Senate.

Although it is impossible to ascertain precisely Mr. McCloskey's state of knowledge throughout this affair, it is reasonable to conclude that an individual who had worked with the GPB intensively for months, and who had a close working relationship with at least one of its members, would have been able to follow simple grievance procedures. Thus it appears that he had no desire to seek appropriate administrative remedy for any just grievances. This lack of motivation, together with his actions, were in violation of both the letter and the spirit of the AAUP standards, and made a reasonable resolution of differences between the parties impossible.

New By-Laws

The new By-Laws for the GPB were enacted on May 17 (not May 24 as stated in the Report). It had been the sole object of discussion for two meetings of the Administration and Rules Committee. The Senate heard presentations by interested students (including those currently enrolled in Mr. McCloskey's class) and debated the bill at length. Contrary to the impression given by the report, none of the changes enacted affected Mr. McCloskey's class, since all agreements made with him were under the old By-Laws. The customary practice in these cases, and the one followed in this instance, is to "grandfather" current officers, practices, and agreements to protect them from the uncertainties of retroactive legislation.

Tone of the Report

On several occasions the Report asserts the intentions of the GPB. Given that no member of the GPB was allowed to make statements to the Committee, and given that the GPB's statements in the public record are extremely broad and general (as indeed they had to be), it is difficult to see how the Report could have repeatedly ascribed specific attitudes to the GPB concerning specific events.

Throughout the Report the actions of the GPB were characterized as "demanding," while those of Mr. McCloskey were frequently portrayed as "acquiescing." This gives rise to the Report's denunciation of a "master-slave" relationship between the GPB and Mr. McCloskey. In fact, the relationship between these parties was on the whole a cooperative one during Winter quarter, when almost all of the course decisions were actually made. In so far as it was not cooperative, most of that can be traced to misunderstandings which unfortunately were allowed to fester without quick resolution.

These characterizations in the Report, especially those in the "factual narrative" section, gravely distort the interpretation of events. Since the Committee's recommendations are stated without explicit justification, such distortions in interpretation carry a particular importance. The assigning of such intentions and the use of such loaded words almost guarantee an unfavorable finding towards the GPB no matter what the actual facts.

THE AFTERMATH OF THE COURSE

On 18 May 1983, Provost Hastorf, through Dean Wessels, charged a committee of the Political Science Department to investigate any possible violation of Mr McCloskey's Academic Freedom. The Committee produced a report in which it made recommendations with regard to the Guest Professorship program as a whole, and presented this to Dean Wessels on 30 June 1983. The report was released by the Provost and published in the Campus Report of July 27, 1983. The procedure followed in this process is analyzed below.

Choice of Investigating Agency

Given that the issue under investigation was the possible infringement of Mr McCloskey's academic freedom, and that there were only two parties involved in the supervision of the course - the Guest Professorship Bureau of the ASSU and the Political Science Department - neither should have been chosen as the investigative agency. In fact, as we have seen above, the chairman of the Committee, Prof. Eulau, was himself a major actor in the events that transpired with regard to the McCloskey course.

Investigatives Techniques Employed

The manner in which the Committee went about the business of collecting facts gives rise to questions about the impartiality of its inquiry. The Committee declined to take testimony from the people involved in the course because they "were not available on Stanford Campus". Whereas the Committee's statement is literally correct, it should be noted that Mr. Linfield had specifically said that he would be available to appear before the Committee, Mr McCloskey is working with a law firm in Palo Alto, and Ms Mathewson lives just off-campus.

Since testimony was not taken and specific questions not addressed, the Committee had to rely solely upon whatever information it obtained from the parties involved in response to a general request that the Committee made. In consequence, the Committee was unable to cross-check statements that it received. This resulted in its giving, at places, greater credence to hearsay, in the form of letters written by Mr. McCloskey, than to the written record of public meetings of bodies such as the ASSU Senate.

Scope of of the Committee's Recommendations

Whereas the Committee was constituted to investigate any possible abridgement of Mr. McCloskey's academic freedom, it made recommendations with regard to the Guest Professorship program as a whole. If the Guest Professorship program as a whole were to be reviewed it is undesirable that such a review be conducted without consultation with the ASSU or the Guest Professorship Bureau or with other academic departments at Stanford that have accredited Guest Professor courses in the past, or that the review be conducted with either the secrecy or the haste of the one conducted by the Committee. In fact, the Committee did not ask for, or receive from the ASSU, complete information with regard to the functioning of the GPB (or even details about the finances of the course), other than those relevant to the determination of the question with regard to academic freedom.

Moreover, it is strange that such a review of the Guest Professorship program be conducted by a single department when the recommendations are going to affect several academic departments at Stanford in addition to the ASSU. For example, the Guest Professorship Bureau has approached the English, History, and Religious Studies departments for possible courses in the coming year, and their views on the new by-laws or on the program as a whole were not, to our knowledge, even taken cognizance of.

The Release of the Report

The ASSU had been concerned about any possible viola-

continued on next page

ASSU/McCloskey...

continued from page 11

tion of Mr McCloskey's academic freedom, and on its behalf President Watson and Senator McGrath had, early in July, made an appointment for Friday, 29 July, with Dean Wessels to discuss the findings of the Political Science Department study. With full knowledge of this, Dean Wessels recommended and Provost Hastorf released the report to the Campus Report of July 27. Until the publication of the report in the newspaper, the ASSU and the Guest Professorship Bureau were kept completely in the dark about the contents of the report, and expected it to deal solely with the issue of Academic Freedom.

Considering that Dean Wessels was meeting with officers of the ASSU in the near future, and especially considering that the Political Science department had made recommendations far beyond its charge in castigating the entire Guest Professorship program at Stanford, he should have, by any norms of fairness and efficacy, if not by common courtesy, held up the release of the report until he had discussed its contents with officers of the ASSU. Likewise, Provost Hastorf should not have released the report before discussing it with the ASSU. Subsequently, the Provost apologized to officers of the ASSU for the manner of release of the report. But this was an oral apology made in private for a written indictment made in public.

STUDY OF THE RECOMMENDATIONS OF THE INVESTIGATING COMMITTEE

A clearer understanding of the facts gives cause for reconsideration of the recommendations presented in the Report.

The first recommendation of the Report was that the University not "grant credit for any course in the ASSU Guest Professorship Program" as long as "section 7 of the (ASSU By-Laws) (dealing with the GPB) remains in force." As has already been noted, this recommendation is outside the scope of the Committee's charge.

Furthermore, this recommendation, couched in terms of an ultimatum, does not specify what points in section 7 are of concern to the Committee. Extrapolating from arguments presented elsewhere in the Report, one can guess the extent of the Committee's concern, but since many of their specific concerns were based upon an improper understanding of the facts of this particular case and the operations of the GPB and the ASSU in general, it is difficult to see exactly what actions on behalf of the ASSU would satisfy the Committee. Such an ultimatum is not only disturbing by its demonstration of unwillingness to admit further dialogue, but due to its imprecision is impossible to comply with.

The second recommendation of the Report is actually a series of three recommendations. The first is that a "written contract between the GPB and the Guest Professor stating the amount of compensation to be paid and a statement of administrative costs for the course" be "filed with an appropriate administrative officer." The GPB is already directed by section 7 of the ASSU By-Laws to draw up such a contract, and filing a copy with an appropriate administrative officer should be a simple procedural matter.

The second of these is that the ASSU should deposit "in a University account the total amount of the Guest Professor's compensation and the total amount of administrative costs for the course." This recommendation is entirely unnecessary, being founded upon a misunderstanding of ASSU budgetary and controllership procedures and responsibilities. If the ASSU (through the GPB) and a Guest Professor enter into a written contract, then the salary and administrative costs cannot be altered without the consent of both parties. Thus this recommendation would only prevent the Student Financial Manager from refusing to implement the budget of the course as approved by the Senate. Such an unprecedented situation would, as mentioned earlier, probably result in the firing of the Student Financial Manager.

The third of these is that the accrediting departmentprogram should approve the course "for academic credit after the ASSU has agreed to invite the Guest Professor" and it then "agrees to assume all administrative responsibility for the course, including the provision of course materials, the payment of compensation to the Guest Professor, and all other administrative costs." The first part of this recommendation seems reasonable, provided that it does not preclude the accrediting agency from advising the ASSU on the academic soundness of a proposed course while the ASSU is making its decision. Indeed, it is the procedure the ASSU has always sought to follow. But the quick decision of the Political Science Department prior to Senate consideration of the proposed course prevented the ASSU from following it in the present instance. As far as the second part is concerned, the ASSU does welcome a greater and more defined role for the accrediting agencies in course administration. But in the past these agencies have been reluctant to assume any responsibility in this area. Thus it is unclear whether these agencies should be *forced* to assume *full* administrative responsibility. However, in the realm of financial administration the objections cited above apply, limiting the scope of this recommendation.

The final recommendation of the Report is that the University "pay Mr. McCloskey his unreimbursed, course-related expenses and increase his compensation for teaching his course." While one can hardly object to the University spending its funds as it deems appropriate, it is clear that this recommendation was founded upon an erroneous understanding of the facts, and thus should be considered with caution.

CONCLUSIONS

The COP and GPB neither interfered with the contents of the course reading list after the course had been given final approval in February nor threatened to decrease Mr. McCloskey's salary. The Committee Report's conclusions to the contrary can be traced to errors in fact which can in turn be traced primarily to faulty investigative procedures. Thus, while the ASSU should take into account the concerns raised in the Report when debating subsequent actions, and while the specific recommendations made in the Report may eventually be adopted in whole or in part, we must recommend that these recommendations not be considered authoritative statements of University policy.

The Report ignored some issues of primary concern to the ASSU in addressing the future of the GPB program. For one, the Senate must insure when spending student funds that these funds are being expended in the manner proscribed in an approved budget. In particular the ASSU must retain controllership responsibility for all funds spent. Indeed, this is actually required by the ASSU Constitution.

Even on the subject of academic freedom, which has been characterized as the primary issue, there appears to be a fundamental problem of interpretation of what it consists of. The *Academic Staff Handbook* states that the statement on Academic Freedom (which applies in full to all members of the faculty) "shall apply to members of the Academic Staff in a manner appropriate to their *role* and *responsibility* (emphasis added)". No guidelines as to what is an "appropriate" degree of coverage for a lecturer with a one quarter appointment is given.

There seems to be a fundamental confusion between preserving academic freedom and insuring academic integrity. The GPB and the COP were concerned that Mr. McCloskey was not acting in good faith or in a professional manner - possibly calling into question his academic integrity. The *Academic Staff Handbook* allows for the termination of a lecturer for "just cause, including substantial and manifest incompetence or professional misconduct." However, the procedures for termination outlined in the *Academic Staff Handbook* were not designed for short term (1 quarter) appointments. Moreover, the procedures do not seem easily applicable to situations where course expenses are not being borne by the University.

On these questions concerning academic integrity guidance is required from the faculty. Without such guidance the ASSU has been forced in the past to assume a responsibility it is perhaps not best suited to exercise directly. The Senate has instructed its Graduate Education and Research Committee to work in cooperation with the faculty in devising appropriate guidelines that can be used for all programs involving short term academic appointments (GPB, SWOPSI, etc...).

On matters regarding the actual administration of the GPB program, the Senate has instructed its Administration and Rules Committee to consult with appropriate academic officers in its examination of the By-Laws of the program.

In closing, a further examination of the facts of this case in an open and cooperative investigation is necessary before the future of the GPB can be decided. It is hoped that all parties will enter into these subsequent discussions with open minds and in full realization that more work must be done on this issue before a Guest Professorship Program operating under mutually acceptable guidelines can be established.

Six Stanford student leaders deny that McCloskey's freedom was abridged

continued from page 1

standings) made without the express consent of the (Student) Senate or its agent (the Guest Professorship Board) would be inappropriate and unacceptable. . . .

"The right to invite visiting professors (guest lecturer in McCloskey's course) resides exclusively with the GPB."

In their report, the students said McCloskey had been issued a $2,000 check three months ago, but still has not picked it up. They found this "mystifying."

The student report said "there was real and genuine concern" by the Guest Professorship Board that McCloskey's course "was veering away from the topic of Congressional decision-making and becoming a course on American foreign policy, specifically American Middle East policy.

"The academic freedom of an instructor clearly and simply does not extend to converting an Economics 1 class into a Physics 53 class."

"The greatest hindrance to the course seems to have been McCloskey's use of class time to discuss his problems with the Guest Professorship Board."

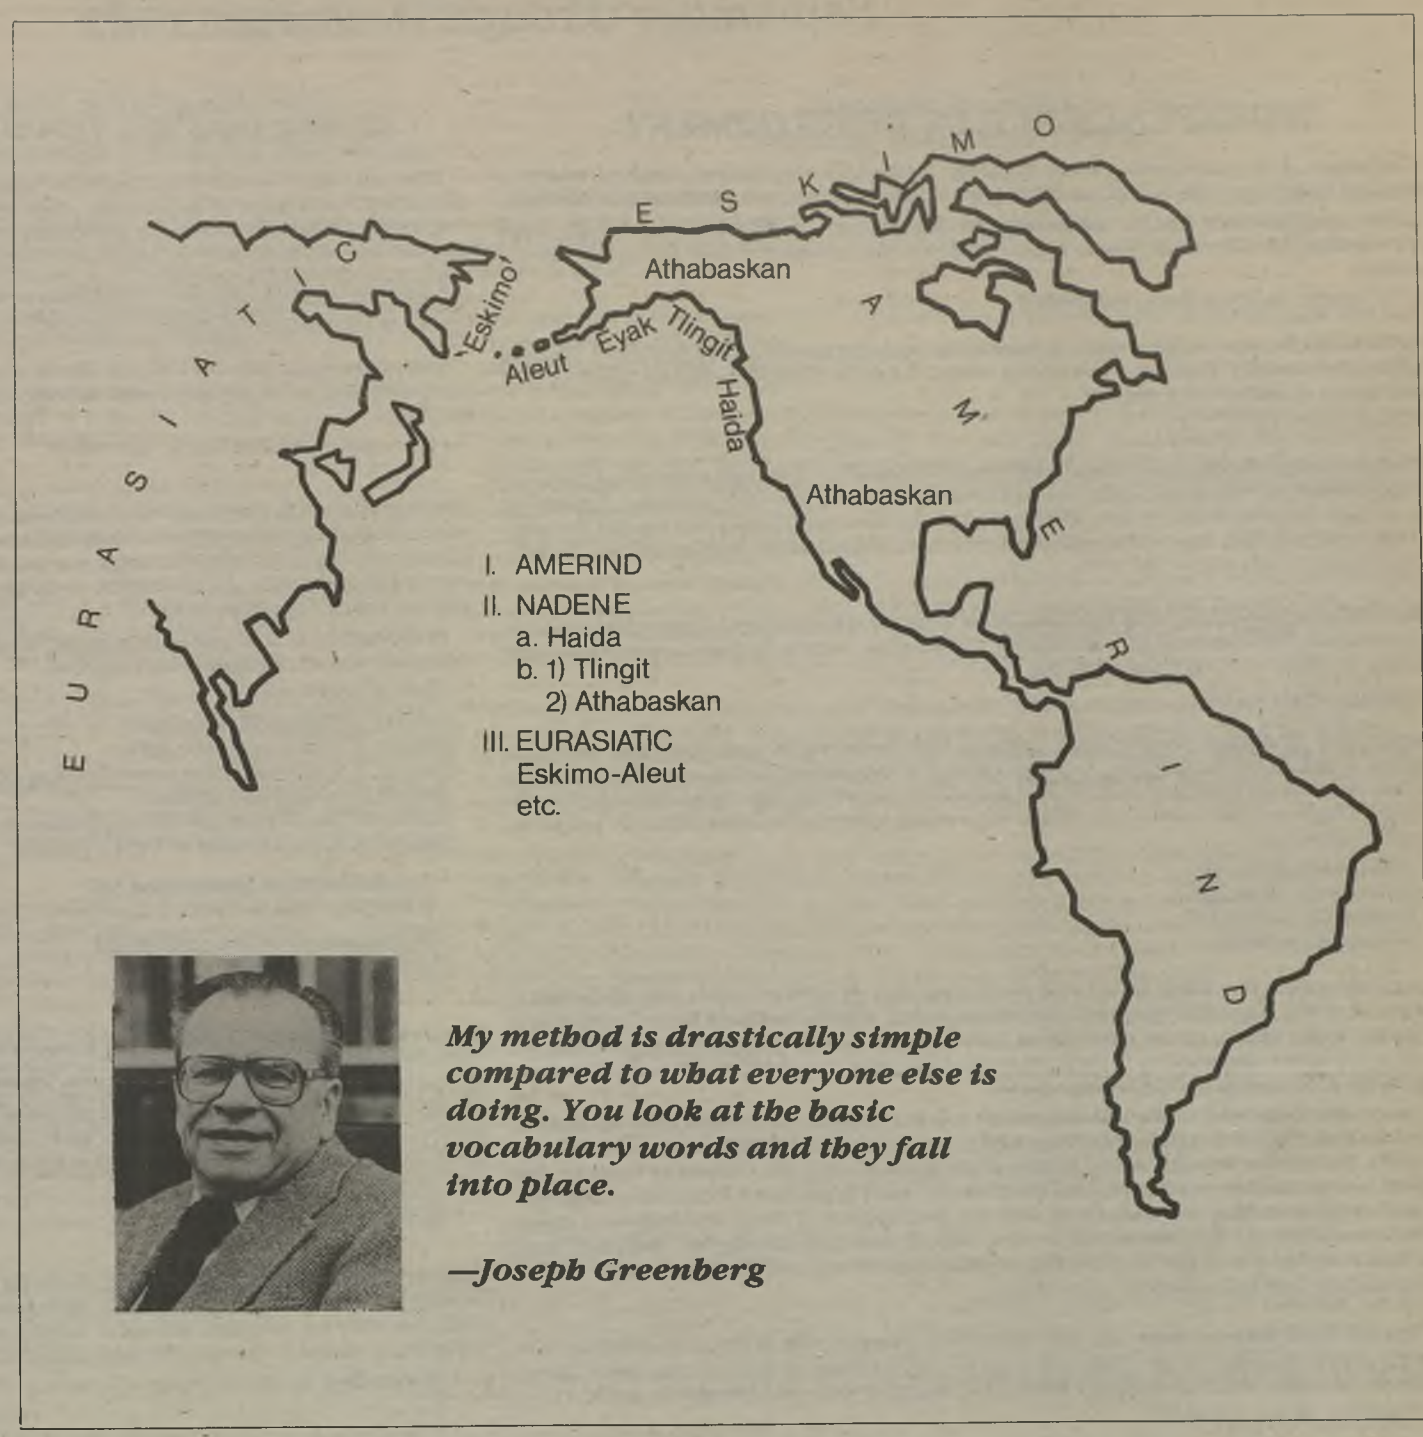
The faculty report, based entirely on written materials, noted that in one instance McCloskey and Guest Professorship Board Chairman Seth Linfield were debating the time to be given a guest lecturer in the course while the guest was on the platform.

The Guest Professorship Board and student Council of Presidents "were concerned that McCloskey was not acting in good faith or in a professional manner, possibly calling into question his academic integrity," the student report said.

"On these questions concerning academic integrity, guidance is required from the faculty. Without such guidance, the ASSU has been forced in the past to assume a responsibility it is perhaps not best suited to exercise directly.

"The Student Senate has instructed its Graduate Education and Research Committee to work in cooperation with the faculty in devising appropriate guidelines that can be used for all programs involving short-term academic appointments."

The Senate has instructed its Administration and Rules Committee to consult appropriate academic officers in examining by-laws governing the guest professorship program.



"More work must be done" before a guest professorship program "operating under mutually acceptable guidelines can be established," the students said.

Authors of the report included Student Senate Chair H.V. Jagadish, Senators Roc Blumenthal, James P. McGrath and Douglas J. Puffert, and Suzzanne S. Uhland and Karol E. Watson of the Council of Presidents.

Three anthropologists learn first hand about coincidence

Words, teeth, and blood types tell the story of three waves of migration

My method is drastically simple compared to what everyone else is doing. You look at the basic vocabulary words and they fall into place.

—Josepb Greenberg

Sometimes, if you're lucky, science works this way:

A Stanford anthropologist studying the native languages of the America's concludes that the presently-believed organization of those languages is wrong, and that there are really only three families of languages in the Hemisphere.

He goes to give a lecture at the University of Arizona and runs into a former student who has been studying blood types around the world. The former student has found there are apparently only three kinds of blood types in the Western Hemisphere, and they seem to exactly match the language map produced by the Stanford professor.

The Arizona researcher tells him about another scientist, at Arizona State University, who has studied teeth structures in the Americas, and has concluded that there are three types. They also match the language map.

Conclusion: it seems very likely there were three major waves of migrations from Asia to the Western Hemisphere, the oldest about 12,000 years ago, and all American Indian people derive from those three migrations.

Until now, anthropologists thought there were two.

The three anthropologists, Joseph Greenberg at Stanford, Steven Zegura at Arizona, and Christy Turner at Arizona State, are preparing a paper for Science Magazine describing their discovery.

"I'm basically an anthropological linguist," says Greenberg. He began preliminary work on Western Hemisphere languages in the 1960s, formulating the theory then that there were three language groups.

The conventional wisdom holds that there are as many as 200 different language families. "The trend had been to break them up into more and more separate groups."

If one assumes that each language group is indicative of a separate migration over the Bering Sea Bridge, the overcomplexity makes any interpretation impossible.

"It's hard to draw any historical implications if you've got 200 separate families; it seems utterly unlikely that you can draw from that that you had 200 separate migrations. It just wouldn't make sense," he says.

"My method is drastically simple compared to what everyone else is doing," Greenberg says. "You look at the basic vocabulary words and they fall into place.

"Eight words, basic words, like the numbers 1 and 2, and certain parts of the human body, like 'eye', 'nose', 'tooth,' words like that. I just wrote down 25 languages in Europe, standard languages, and the interesting deviant ones like Basque and so on.

"By the time you get to the third word you've got the correct classification, and in fact, you've got the correct sub-groupings of the Indo-European languages.

"People don't believe it's that simple."

Using library sources, Greenberg found there were only three families. Nine-tenths of the hemisphere can be lumped into one family, which he simply calls Amerind.

A second group includes the Athabascan. They are located mostly in the Canadian interior, although some Athabascan tribes still live in northern California. The Apaches and Navahos apparently share the same language tree. This group is collectively called the Na-dene.

"They would be quite different linguistically and not related at all to this big group," he says.

The third group are the Eskimos and the people of the Aleutian islands, called by linguists the Eskimo-Aleuts. Their language is related to Japanese, Inu and Korean.

The group comprising the Amerinds probably arrived in North American about 12,000 years ago, and spread out, reaching as far as the tip of South America. The Na-dene came about 6,000 years ago, the Eskimo-Aleuts about 4,000.

Greenberg is putting all this in a book for the Stanford University Press.

In the spring of this year, he travelled to Tuscon to give a lecture, and there ran into Zegura. Zegura had been a student of Greenberg's when he was an undergraduate at Stanford in the '60s.

Zegura had been studying the literature of blood groups. "What I was looking for was to see if any of the baseline data was coincident."

While preparing a lecture of his own he had discovered that he could lump American Indians into three blood group families. They matched what Greenberg had shown as a language map. He told Greenberg what he had found, and also told him about Turner in Tempe.

Turner has spent 20 years studying teeth, excellent tools for the anthropologist because they are very hard and tend to survive when other parts of the body fall to dust. He has identified 30 distinct features of teeth, including several characteristics indicative of certain people. For instance, the first bottom molar in Europeans have two roots, while the same tooth has three roots in Asians.

After looking at thousands of teeth from the Americas, he concluded that there were three groups. He could trace the first migration to people who lived in the Lena River Valley of northeast Asia.

The Eskimo-Aleuts can be traced to the Amur River area of China.

The Na-dene may be a combination of the two, coming to the Americas between the other migrations. Other anthropologists believe they were the result of mixed marriages between the other two peoples, but Turner does not agree.

Changes in teeth take too long for intermarriage to produce the Na-dene teeth, he says.

The three groups he found closely match Greenberg's language map and the blood groupings found by Zegura.

Both Greenberg and Turner are fairly sure of their conclusions, Zegura less so.

"I pointed out a probablistic thing," Greenberg says. It is not likely that the three men, working independently on entirely different data, could come up with the same results unless those results were true.

Correlation does not prove causality, Zegura warns. The people speaking the languages today, for instance, may not be descendants of the same people. Nonetheless, he adds, perhaps he, Turner and Greenberg really have something.

—Joel Shurkin

Stanford Staff Development Courses

September through December 1983

WORKPLACE SKILLS DEVELOPMENT

Challenges of the workplace will be explored in the following courses, each of which is structured to develop skills helpful to effective work performance in many different kinds of jobs.

Class size is generally limited and enrollments accepted in the order received. Classes often have a waiting list; therefore, please inform us if you cannot attend a class for which you are enrolled.

- To register, call Bea Tracy, ext. 7-0657.

Telephone Techniques—This workshop focuses on using the telephone and having an effective telephone personality. Topics include an overview of the skills required, tactful phraseology, and examination of issues and problems.

- Wednesday, 10-19; 1-3

Office Interaction: Getting and Giving Cooperation—Does your job include answering questions, giving information, assisting people who call or come to your office? This workshop focuses on how to make these interactions both efficient and productive. Participants will explore the ways that they and the people they work with experience the communication-problem solving process.

- Wednesday, 10-12; 9-11:30

Office Interaction: Working With Pressure—How to function at your best in spite of the pressure of continuous office interactions. Participants will examine ways to increase concentration and patience for effective workplace relations.

- Friday, 10-14; 9-11:30

Assertiveness Training—Assertiveness Training introduces verbal and nonverbal skills for handling uncomfortable situations. As a result of active involvement in this course, participants will be able to ask for what they want in clear statements, assertively deal with conflict on the job, maintain a feeling of self-worth while effectively dealing with manipulative demands, and make assertive decisions.

- Wednesday, 10-5; 1-5
- Wednesday, 10-12; 1-5
- Wednesday, 10-19; 1-5
  (Attend all sessions.)

Career Exploration Workshop assists staff members in making more effective career decisions. It consists of seven sequential one-hour workshops which provide methods for self-assessment (interests, skills, values, career motivations, interpersonal skills), information about Stanford career possibilities, and practice in decision making and development of action plans. Checking ideas against job market reality is emphasized.

Some of the tools used in the self-assessment process include the Strong-Campbell Interest Inventory Test, the Quick Job-Hunting Map, Firo-B, and problem-solving and values clarification exercises. Discussion includes reality testing of the kinds of skills the University looks for, the kinds of jobs on campus, and the personal qualities necessary to get ahead. Exercises on strategizing and decision making are used along with the development of short- and long-term career goals. Instruction and information on resume writing and interviewing are included, with information on the use of the Stanford Employment Department and its organization.

- To register, call Marilyn Gilla, ext. 7-0659.

On-The-Job Goal Setting—How can you focus your energies and skills more effectively to increase the satisfaction you get from your work, as well as the contributions you make? Susan Strong will provide practical steps for setting and reaching well-stated workable goals.

- Thursday, 10-13; 1:30-4:30

Skills Development Center—The clerical skills program upgrades skills of employees on their present jobs, helps them prepare for additional responsibilities, and provides clerical training specifically related to Stanford's policies and procedures.

For information about the clerical skills program, call Marilyn Gilla, clerical skills program coordinator, ext. 7-0659.

Is lack of typing skills getting in the way of effective use of your computer terminal? Marilyn Gilla teaches both beginning and intermediate keyboard skills for staff members starting to use a terminal. For information, call ext. 7-0659.

SPECIAL INTEREST COURSES

Employment Procedures and Record Keeping Made Easy

This workshop on employment procedures and record keeping, presents information about Stanford's employment process and an approach to record keeping and file management as it relates to the employment process for decentralized positions. Specific topics include an overview of the employment process, forms preparation, and setting up an effective record keeping system.

This workshop is for those who have administrative responsibilities in personnel matters (processing forms, record keeping) who want to streamline their personnel paperwork and record keeping, want pointers on how to fill out forms (Personnel Requisition-SU-9, Appointment Confirmation and Search Summary-SU-24), and want to get a quality job done in the least amount of time.

- Schedule to be arranged. Limited enrollment.
- To register, call Bea Tracy, 7-0657

SUPERVISORY DEVELOPMENT PROGRAM

The supervisory development program includes a two-session orientation to the personnel administration aspects of supervision, two intensive supervisory skills courses, and shorter workshops on specific aspects of supervision. All courses and workshops combine theory and practice and apply directly to participants' on-the-job experience.

Supervisory courses and workshops are given regularly through Staff Development. They may also be adapted to specific departmental needs and presented in departments. New workshops are developed to meet general and departmental needs.

Class size is generally limited and enrollments accepted in the order received. Classes often have a waiting list; therefore please inform us if you cannot attend a class for which you are enrolled.

- To register, call Bea Tracy, ext. 7-0657.

Fundamentals of Supervision—is a course in how to develop employee performance, establish effective supervisor-employee communication, and establish and maintain the supervisory role. Participants learn through discussion and practice of skills, incorporating new skills into their own supervisory style. An orientation meeting prior to the sessions introduces the basic principles on which the course is based.

Participation in the course requires at least three months of experience as a supervisor. Attendance at all sessions is also required.

Session topics are:

Session 1, Setting Job Standards
Session 2, Teaching a New Job
Session 3, Communicating about Performance
Session 4, Giving Recognition
Session 5, Identifying and Solving Performance Problems
Session 6, (Group Choice of Topic) Review

Fundamentals of Supervision (A)
- Tuesday, 10-4 to 11-15; 9-12

Fundamentals of Supervision (B)
- Thursday, 10-6 to 11-17; 9-12

Supervisory Problem-Solving—Five weekly three-hour sessions for supervisors who have completed Fundamentals of Supervision. You will increase your ability to handle the predictable and not-so-predictable problems involved in supervising others. Supervisory Problem-Solving emphasizes accurate identification of problems and approaches to solving them. The course focuses on joint problem-solving for such issues as conflicts and complaints and problem performance and behavior. Participants work to resolve on-the-job problems through discussion and practice.

- Monday, 10-21 to 11-21; 1-4

Effective Interviewing—introduces methods for making productive hiring decisions by getting sufficient appropriate information in interviews. The workshop is centered around practice exercises that are progressively more complex; participants will learn to plan and conduct interviews related to the specific responsibilities and duties of open positions.

- Wednesday, 11-16; 8:30-4:30

Managing Conflicts—which can and do occur in any work setting, and when well handled can renew motivation and be a catalyst for innovation. When ignored or mismanaged, however, conflicts can cause serious damage to morale, productivity, and well-being. Effective conflict management involves guiding the disputants to solve their own problems. In this workshop participants will learn how to find out the nature and scope of the conflict, how to elicit suggestions, and how to get agreement to an action plan while controlling bickering and outbursts without taking either disputant's side.

- Friday, 10-7; 8:30-4:30

Self-Control of Speaking Anxiety—If you are ready to break out of your scared-to-death frame of mind, Self-Control of Speaking Anxiety will help you develop qualities and techniques enabling you to speak with more ease. You will learn positive ways of controlling physical tension while you prepare and give presentations.

- Monday, 10-3; 8:30-4:30

Confident Speaking—This workshop is for staff members who regularly present talks as a routine part of their jobs. Special techniques to help you prepare, practice, and deliver your train of thought will be demonstrated and practiced in class.

- Monday, 10-10; 8:30-4
- Tuesday, 10-18; 1-5
- Tuesday, 10-25; 1-5
  (Attend all sessions.)

Giving Directives is a practical three-step procedure for giving directives of all kinds. Participants will also learn the specific effects of language on directives.

- Tuesday, 11-29; 8:30-4:30

Basic Attending Skills—Listening actively and intelligently is a major supervisory skill. In this workshop participants learn to follow what is being said, to ask open questions, and to paraphrase content, to reflect feeling, and to summarize. These skills, taught through demonstration, discussion, and practice, help supervisors and others to build relationships and bring about change.

- Friday, 10-21 to 11-18; 8:30-10:30

Stanford Staff Development Courses

September through December 1983

CONTROLLER'S OFFICE WORKSHOPS

The Controller's Office schedules these workshops throughout the year. For more information and-or the current schedule of workshops, call Alice Forbes, ext. 7-4531.

Course 1: Introduction to the Stanford Accounting System—(two two-and-a-half-hour sessions). For employees new to Stanford who monitor either departmental or auxiliary activity expenditure statements. The course includes the organization of the Controller's Office, discussion on account numbers, responsibility for the use of funds and record retention. Practical work includes practice in reading an expenditure statement and in forecasting for future results.

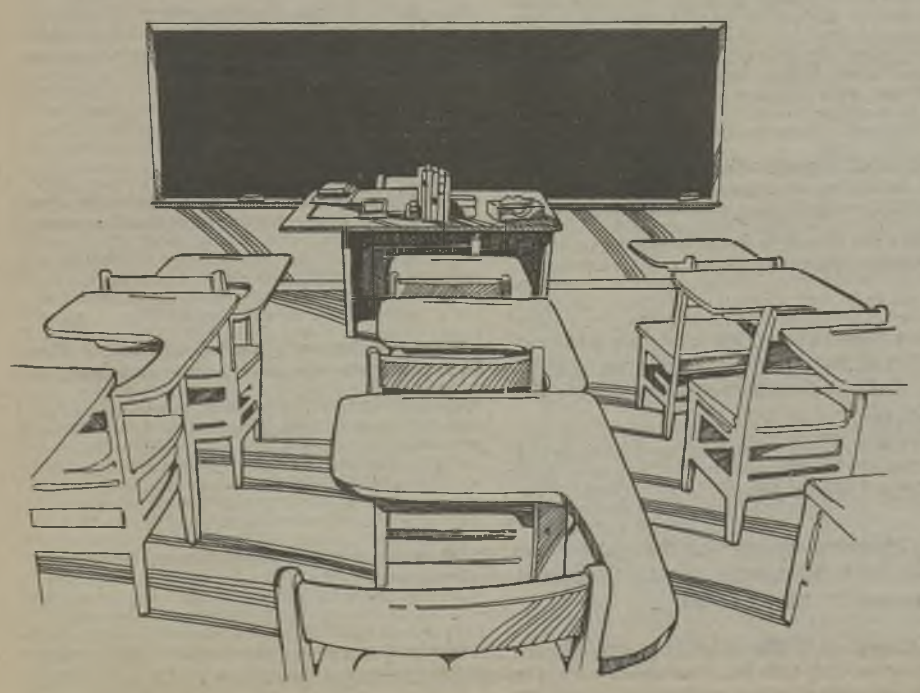
Course 2: Travel—(one two-and-a-half-hour session). For employees who need to understand the University's travel policy (Guide Memo 36.7) to complete travel and expense reports. The Travel Workshop summarizes travel policy, defines allowable travel costs, and provides practice in completing the necessary forms for Advances (SU-34A) and Expense Reports (SU-35).

Course 3: Equipment Administration—(one two-hour session). For employees who are new to the field of equipment administration as well as for those who want to "brush up" and-or need more information on the new computerized system. The emphasis of this workshop is on how to use the manual, forms and reports.

Course 4: Payroll-Personnel—(three two-hour sessions). For employees completing forms related to Payroll-Personnel actions and record keeping. This workshop includes a review of policies and procedures, and practice in completing all necessary forms.

Course 5: Payroll-Personnel Update—(one two-hour session). This workshop is planned for administrators and other interested employees to discuss specific topics involving the payroll-personnel system. Topics are announced each quarter.

Course 6: Fund Accounting at Stanford and How to Read Fund Statements—(two two-hour sessions). The purpose of this workshop is to teach interested employees the fundamentals of fund accounting as practiced at Stanford. The University's financial statements are discussed as well as fund statements and fund summary reports.



Course 7: Fundamentals of Grant and Contract Administration—(five two-hour sessions). This workshop is planned for administrators and others involved with the preparation of proposals as well as accounting procedures for expenditures, monitoring, and forecasting for sponsored research projects. Members of the Sponsored Projects Office will participate in the workshop. The sessions planned are:

1. Introduction and Overview of Definitions, Federal Regulations and the role of SPO.
2. Proposal Preparation.
3. Proposal Processing and Post-Award Administration.
4. Contract and Grant Rebudgeting, Forecasting, and Financial Management.
5. Grant and Contract Closeout, Updates, Issues, and Trends.

Course 8: Grant and Contract Administration Update—(one two-hour session). This workshop is planned for administrators and other interested employees to discuss current issues and problems in grant and contract administration. A specific topic will be chosen for each update session.

Course 9: Procurement—(two two-hour sessions). This workshop reviews the procurement process along with criteria for choosing the correct form amongst the SU-10, SU-11, SU-12, SU-13, SU-14, SU-15, SU-34A, SU-34B, SU-35, SU-40, SU-41, and SU-43.

Course 10: The Budget Process—(two two-hour sessions). Included in this workshop is the University's budget process, a discussion on how budget decisions are made, the budget calendar and production schedule, how to complete schedules A-E, their relationship to employee data sheets, and instructions on how to input data using the new on-line SPIRES budget system.

Courses from the Learning Assistance Center

The following courses have been developed by the LAC to respond to specific staff training requests. Each course combines classroom instruction and individual tutorials with the instructor. Class size is limited to provide for maximum participant involvement, and enrollments are accepted in the order received.

Writing II—For those who have taken Letters, Memos, and Minutes, and who wish to continue to develop their writing skills.

- Thursday, 10-6 to 12-1; 12:30-1:30

Effective Writing: Letters, Memos, Minutes—Is writing an increasingly important part of your work? In Effective Writing, participants review fundamentals of skillful writing, analyze and develop their writing style, and practice purposeful writing of letters, memos, and minutes. The class meets for one hour a week for eight weeks, and the instructor meets with each participant for five individual half-hour sessions.

- Monday, 10-3 to 11-28; 12-1

ESL I—Speaking and Understanding Conversational English—One hour per week of class, five 30-minute conferences, plus language lab. Practice in pronunciation and listening skills. Some work with English spelling as related to pronunciation of written words. Limited to 15.

- To arrange your first conference, call the Learning Assistance Center, ext. 7-2207.

Time Management—Is a day simply not long enough? This workshop helps participants discover where their time goes, set up a schedule and establish priorities, and become more effective at accomplishing what they decide to do. The class meets four times (one hour each time), and the instructor meets with each participant for three individual half-hour sessions.

- Wednesday, 11-2 to 11-30; 12-1

Principles of Copyediting—A practical workshop on copyediting will be offered on six consecutive Tuesday evenings. The course is designed for anyone wishing to gain expertise in the field. The instructor for the program is Karen Judd, production manager at Random House in San Francisco and author of *Copyediting: A Practical Guide*. Lectures will be complemented by copyediting exercises; participants will be expected to have a grasp of the fundamentals of copyediting. Sample copyediting tests will be given in the sixth session.

- Tuesday, 10-11 to 11-15. For more information, contact Bill Peabody at Bowman Alumni House, 497-2021.
- The registration deadline is September 23.

Courses from the Association for Continuing Education

The Association for Continuing Education delivers courses accredited by local colleges and universities. For more information call ext. 7-0657.

BUS 84S—Business English I—Instructor: Alice Stiebel. This is the first of a two-part, 4-unit course. Part II is offered Winter Quarter. A thorough review of the fundamentals of grammar and spelling needed to develop good English usage and writing skills. From the foundation of these basics, students will proceed to learn communication techniques appropriate for the specific needs of a business environment. *Prerequisite:* None. (2 Quarter Units)

- Tuition $96; book $20.84
- Monday and Wednesday, 9-26 to 11-30; 12-1

BUS 1AS—Principles of Accounting I—Instructor: Allen Lindsley. This is the first of a two-part, 4-unit course. Part II is offered Winter Quarter. An introduction to the theory and practice of accounting. Analysis of books of original entry and their relationship to the general ledger; accounting equation; classification of accounts; preparation of working papers; adjusting and closing entries; and financial statements as these relate to the service and business enterprise. *Prerequisite:* None. (2 Quarter Units)

- Tuition $96; book $34.72
- Tuesday and Thursday, 9-27 to 12-1; 12:20-1:10

MATH C103—Mathematics for Managers—Instructor: Frank Clauss. A basic course in the mathematics necessary for graduate study. Topics include algebra, graphing, functions, systems of equations, logarithmic and exponential functions, mathematics of finance, matrices, and introduction to differential calculus. *Required of all students without a similar college-level course in mathematics.* (2 Semester Units)

- Tuition $120; book $26.57
- Wednesday, 9-28 to 11-30; 5:30-8 p.m.

The Staff Training Assistance Program

The Staff Training Assistance Program provides reimbursement of tuition costs to $125 a quarter for courses and academic programs related to job performance. If tuition costs for a given quarter are less than $125, costs for textbooks and other required course materials can be partially or fully reinbursed. (If costs exceed $125 in a given quarter, departments may provide financial assistance beyond that available through STAP.)

Courses may be taken at Stanford or elsewhere. To receive STAP reimbursement a staff member completes a STAP form, available through Staff Development, ext. 7-0657. Supervisory approval is required.

- You must include a receipt and-or canceled check to be reimbursed.

Staff employment opportunities

Listed here are those job openings received by the Stanford and SLAC Employment sections last week before noon on Wednesday. This listing contains only the most recent listings. A complete listing of all employment opportunities may be viewed at Campus or SLAC (for listings coded JM) Personnel. The salary range information listed indicates starting salary. Some candidates (usually internal) may be made employment offers at higher salaries depending upon applicable experience.

To obtain an application or more information or to apply for positions not listing a contact person, call or visit Personnel at Old Pavilion, Serra and Galvez Streets, 497-1827, or SLAC Personnel, for jobs coded JM, 2575 Sand Hill Road, 854-3300, ext. 2353. *Stanford University is an equal opportunity employer through affirmative action.*

Exempt

44356-AW (JCC:1464) STU SERV OFFICER I: The Academic Standing Advisor respon for reviewing student records for deficiencies each quarter, advising students having academic difficulty, working w/ faculty, representatives fr Offc of Dean of Student Affairs,Financial Aids, Academic Info Ctr, Residential Edu, the Athletic Dept, & various other offcs; reviewing all petitions for late fee waivers, leaves of absence, overloads, 13th quarter, Pass/No Credit after deadline, etc; advising students about Univ academic & registration procedures; prov staff support for specified committees, arrange mtgs, taking minutes, etc; assisted by FTE & respon for supvsg 2 FTE; QUALIFICATIONS: excel commu skills; knowl of Univ academic regulations & procedures; ability to write minutes & reports of committee proceedings; good planning & organizational skills for managing heavy student traffic, committee activities & large volume of paperwork; exp w/ computer sys; supvry exp helpful.; C04; $1590-1983.

23725-AW (JCC:5192) COMPTG DOC WRITER II: Planning, outlining, writing, & preparing for pub. RLIN users' training mat'ls, references, manuals, eqpt manuals, explanatory papers; RLG program manuals; varied short info pieces; cover ltrs to pubs; copy ed or rewriting mat'ls fr/for other RLG staff; prep revs & update pkgs for current pubs; using computer word-processing sys to create pubs; coord w/ in-house style guidelines & procs; designing & overseeing creation of publications artwork; QUALIFICATIONS: skills in writing, rewriting, & copy editing, w/ emphasis on info gathering, source checking, awareness of audience & clear, simple expression; ability to produce clean drafts quickly; eye for formatting & attractive layout; consistence in style & usage; knowl of or willingness to learn computer word-processing sys to prep mat'ls; knowl of lib operations highly desirable; BA or comparable exp; approx 3 yrs' exp in prep printed descriptive or explanatory mat'ls; exp in DP environ desirable (programming not required).; C06; $1948-2441.

27180-LL (JCC:5596) LIFE SCI RES ASST II: Teaching, performance & preliminary interpretation of clinical echocardiography; teaching of these skills, as well as theory & physics underlying the method, to physicians in training is a significant part of the job; maintenance of smooth operation of the lab in all aspects & to deal effectively w/ diverse personalities; QUALIFICATIONS: undergrad univ degree; prior exp & a high level of skill in performance & interpretation of M-mode, two dimensional & Doppler echocardiography; completion of the exam as a Registered Diagnostic Med Sonographer expected; ability to teach physicians at various levels of med training required; organizational skills & ability to work smoothly under the daily stress of a busy time schedule is nec.; C06; $1948-2441.

14438-DS (JCC:8880) MISC PROFESSIONAL: Stanford Employment Experience Program Counselor; respon for facilitating the adaptation of minimally trained adults to Univ working environ; effectively utilizing counseling tech for the purpose of motivation, conflict resolution, transitional training & implementation of performance evaluation activities; develop & implement interview & screening procedures for all program applicants; coord all job training activities at specific job sites; identify training objectives for participants in conjunction w/ job site supvrs & prov liaison serv between Univ & community job training agencies; draft vacancy announcements in addition to developing mat'l for program newsletter; QUALIFICATIONS: exp developing & administering skill tests; exp working w/ the economically disadvantaged & handicapped; BA degree or equiv exp in counseling, psychology or related field desirable.; C04; $1590-1983.

31554-LL (JCC:5108) PROGR SCIENTIFIC II: Asst in applications programming tasks, the developmt & maintenance of software, & facilities support; aid the Mgr to establish & maintain the functionality of existing GSB software used in res, teaching, & various admin projs; consulting for users; computer instruction to user community; writing of sys documentation; prov programming support to other programmers; asst GSB sys programmer in maintenance & creation of high-level-lang sys software; prov some end-user consulting on microcomputer use, etc; QUALIFICATIONS: prev work under the TOPS-20/TOPS 10 operating enviorn w/ substantial exp in FORTRAN, Pascal, & BASIC programming in non-trivial applications, incl substantial exp w/ LINK, compiler obj-time sys, & run-time symbolic software debuggers (the various DDTs) essential; exp w/ DBMS essential; programming exp in high-level langs, incl C, SAIL, & LISP expected; knowl of MACRO assembler, database structures, & statistics is essential; non-smoking area.; C06; $1948-2441.

40396-JB (JCC:6406) SCI & ENGR ASSOC I: Work closely w/ scientists & engrs to develop precision optical/mechanical mechanisms & related components for use in ultra-high-vacuum beam lines; respon for design, engrg considerations, construction & installation phases of projs; producing the required working drawings per standard design/-drafting practices; distribute work & supv work of other designers & drafters; QUALIFICATIONS: AA degree min; completion of a 2 yr design/drafting curriculum; min 3 yrs practical exp in design & machine shop fabrication practices essential, w/ demonstrated ability to produce working hardware; exp in ultra-high-vacuum design & fabrication tech very helpful.; C99; $1948-OPEN.

31560-VW (JCC:1972) UNIV MANAGER II: Dir of Alumni Relations; reports to Assoc Dean for External Relations & is respon for all alumni activities of GSB; hosting spec events such as Alumni Wkend & class reunions, overseeing the activities of 23 alumni chapters, counseling alumni in career planning & placement areas, working closely w/ GSB faculty in developing advanced mgmt edu, & advising editor of qrterly alumni magazine to insures that it meets the alumni needs & interests; manage a budget of $450,000, etc; QUALIFICATIONS: demonstrated ability to conceptualize, develop & implement organizational strategies; strong ability to commu effectively w/ sr. mgrs, staff members, & peers; excel verbal & written skills; exp in program admin & budget mgmt; exposure to MBA program desirable.; C08; $2590-3313.

40398-JB (JCC:2028) ADMIN SERVICES MGR I: Affirmative Action Officer; resource for staff & supvrs; admin of staff appts, performance evaluations & salaries; salary equity studies; admin of personnel policy guidelines & funding agency contractual requirements; hands-on development of computerized listings; property control & mgmt; property retirement; property reporting; surplus property admin; maintenance of real property descriptions & costs; admin of commu sys, offc eqpt & furnishings; QUALIFICATIONS: 4-8 yrs dir & supvs'l exp w/ personnel sys, personal property sys & real property sys, preferably in a federally-funded environ; hands-on exp w/ microcomputer-based data & data-mgmt sys highly desirable.; C06; $1948-2441.

40399-JB (JCC:2120) ACCOUNTANT I: Versatile Accountant reporting to Budget Administrator; respons range fr basic bookkeeping functions to problem analysis: statement verification & resolution; maintenance of 100 accts which represent one major contract, a grant & an operating budget; prep of statements for lab staff responsible for budgeted monies; prep of annual close-out reconciliation & establishment of new fiscal yr accts; trouble shooting for staff-related acctg problems; using computerized acctg sys; QUALIFICATIONS: BA in acctg w/ related field exp or 5 yrs of exp resulting in acquired knowl of acctg theory & practices; computer sys exp as well as micro computer exp highly desirable; knowl of SU acctg sys helpful.; C05; $1756-2202.

40554-VW (JCC:2262) FIN/MGMT ANALYST II: 8:30-5:30; respon for all F.P.P. financial reporting functions; supv/coord consolidation of income, expense, activity, accts receivable & other info on FPP depts into a comprehensive financial report on a monthly basis; analysis of this data in written form to accompany monthly distribution of the report & follow-up analysis to highlight potential problems & solutions; reporting on indiv physician performance; participation in budget development, analysis of cost reimbursement alternatives, & expense analysis; QUALIFICATIONS: Bachelor's degree in business or economics w/ 5 yrs of work exp or equiv; MBA desirable; excel analytical skills; excel verbal & written commu skills; knowl of complex physician billing & acctg sys desirable; knowl of data processing concepts w/ some exp w/ spread-sheet software; some knowl of statistical analysis; open to change & willing to learn new skills.; C07; $2221-2875.

SLAC jobs

95668-JM (JCC:2262) FIN/MGMT ANALYST II: Asst in preparing annual budget documents for submittal to DOE; review & analyze cost performance against budget; participate in special analyses as required; asst in long range planning process; establish group/proj budgets; development & maintenance of computer models; QUALIFICATIONS: BS or equiv exp in Business Admin, Economics or technical discipline w/ some acctg bkground; MBA desirable; ability to commu both orally & in writing.; C07; $2221-2950. APPLY AT SLAC

94622-JM (JCC:8940) MISC CLERICAL: Electronic Production Controller; inventory & store electronic kits; pickup & deliver mat'ls; maintain accurate records & files using computer terminal; work w/ engrs, physicists, graphic & electronic techs & fabricators; prov assistance to outside vendors; QUALIFICATIONS: high sch'l or equiv coursework/exp in offc & genl sci related subjs; prev training and/or exp in component identification, recognition of basic electronic schematics, parts fabrication drawings, etc; computer terminal exp; able to qualify for govt driver's license.; B15; $1590-1673. APPLY AT SLAC

94779-JM (JCC:2058) ADMIN ASST I (N): Conduct manpower planning & scheduling; generate & authorize purchase & work orders; maintain personnel records; participate in salary reviews & performance evaluations; operate computer terminals in VM using XEDIT & SCRIPT; edit operational procedure manuals; initiate & compose corresp; prep & verify dept bi-monthly payroll; QUALIFICATIONS: several yrs sec'l exp & performing moderately complex admin functions; exp w/ computer terminals usage; ability to commu effectively both orally & in writing; typ 60; ability to assume respon & exercise good judgment.; B16; $1673-1755. APPLY AT SLAC

95640-JM (JCC:6646) SR S&E TECH - ELECTRON: TMS Unit; all shifts; operation & testing of high power klystrons; perform measurements of high power pulsed microwave signals utilizing direct & indirect monitoring & detecting methods; conduct performance tests & evaluate tube conformance to established standards; asst in training; QUALIFICATIONS: AA degree in electronics or equiv Electronic military training desirable; several yrs exp in troubleshooting, test & repair of eqpt; specialized training in microwave theory & pulse techniques acceptable for some required exp; good math skills essential; ability to commu effectively both orally & in writing.; A34; $11.52. APPLY AT SLAC

94324-JM (JCC:7082) STOREKEEPER II: TMS Unit; independently perform supply tasks incl stocking items, inspections, inventories incoming shipments, wait on customers, etc; QUALIFICATIONS: several yrs exp in storekeeping; mechanical aptitude & ability to organize records & mat'ls; able to qualify for govt driver's license; ability to meet physical requirements of job.; A22; $ 8.66. APPLY AT SLAC

Nonexempt

44357-BP (JCC:2058) ADMIN ASST I (N): Staff the Committee on Undergrad Studies & its Subcommittee on Distribution Requirements, as well as the Committee on Academic Appraisal & Achievement & its Subcommittee on the Evaluation & Improvement of Teaching; act as liaison to Registrar's Offc staff to inform them of committee issues which may affect offc policies & procedures; update computer file on certified distribution requirement courses; edit related sections of Univ info bulletins; serv as assistant to Univ Mgr III to be hired; prov bkup to central offc personnel as needed; QUALIFICATIONS: prior committee exp desirable; good commu skills, both verbal & written; text editing exp helpful; knowl of or desire to learn about student info sys; knowl of Stanford helpful; send appl/resume to Dana Curry, Old Union Rm. 133.; B16; $1673-1755.

42857-BP (JCC:2462) OFFICE ASST III: Fixed term, 9/1/83-9/1/84; schedule heavy calendars for Dir & Deputy Dir of AIS; open & screen mail; prov clerical support for various groups & committees w/in AIS; scheduling mtgs; prep & distribution of agenda mat'ls; providing monthly status reprots on inventory; asst w/ prep & planning of dept functions; prov bkup support to receptionist & other secs; typ orders, forms & memos; QUALIFICATIONS: high sch'l grad & equiv work exp; excel verbal & written commu skills; exp w/in a high-level organization; knowl of searching & updating in SPIRES for the yrly AIS sys plan; send appl/resume to L. Williams, Polya 163.; B11; $1308-1376.

29765-BP (JCC:2462) OFFICE ASST III: 50%, 1-5pm; prov sec'l & clerical support for Governor's Corner Housing Facilities offc; organize mat'ls & files; accurate record keeping & atten to detail; prep corresp; answer & screen telephone calls; prep & process personnel, payroll & other univ forms; input work orders via HP3000 computer terminal; relay info to Custodial Supvr & custodial staff; QUALIFICATIONS: typ 50; knowl of genl offc routine & use of offc machines; willingness to learn HP3000 (computer terminal); accurate typing skills; effective public relations; ability to file accurately, handle corresp & maintain various files/recordkeeping sys; send appl/resume to Glenn Carroll, 345 Lane L.; B11; $654-688.

36588-BP (JCC:2470) OFFICE ASST IV: Financial Aid Specialist; coord schedule for staffing reception window & phones; hire, train & supv student employees who perform these functions; screen mail for Advising & awarding section; asst in the review & awarding process of financial aid applications; coord grad work-study; bkup person for reception activities; QUALIFICATIONS: typ 45; proficiency in CSS Uniform Methodology help; excel oral & written commu skills; organizational skills & problem-solving abilities essential; high energy level & an ability to think well under pressure in an enviorn characterized by a continuous & high level of activity; send appl/resume to Roberta Johnson, 214 Old Union.; B14; $1512-1590. 1

11748-PM (JCC:2512) OFFICE ASST III-SPEC: Receptionist; takes messages; refers callers to approp resources; answers questions regarding Clinical Res Ctr policies & procedures; opens & sorts mail; drafts, types & proofreads corresp utilizing Wang word processor; maintains files; edits, proofreads & corrects manuscripts, drafts; orders & maintains offc supplies, etc; QUALIFICATIONS: typ 60-70 accurately; exp w/ or some knowl of word processing sys(training & further exp offered); familiarity w/ med terminology helpful; genl offc exp, editing & proofing; send appl/resume to Dr. Philip Berger/-Meredith Berger, PAVAMC, Bldg 4, Ward 4C2.; B12; $1376-1442.

40395-BP (JCC:2562) SECRETARY III: Sec in X-Ray Div of Stanford Synchrotron Radiation Lab; serv as Proj Sec for SEPFF construction program; prep bkground mat'l for periodic mtg, reports, & res proposals, incl some writing & editing; supvn of proj files; typing scientific manuscripts; answering corresp & composing memoranda for signature; receive calls & visitors; QUALIFICATIONS: typ 60; ability to compose ltrs, memo & reports independently or fr genl instruction; 2-4 yrs of sec'l exp; able to typ correctly & transcribe fr a machine; genl knowl of, & interest in sci or med res desirable; send appl/resume to G. S. Brown, SSRL Bldg 120.; B14; $1512-1590.

900-BP (JCC:2596) SECY II-SPEC: Sec to faculty members at new Ctr for the Study of Lang & Info; typ corresp, manuscripts, & reports; set up & manage files; prep Univ forms; answer phones; make appts; manage schedules; make travel arrangements; run errands; use computer sys for text-editing & message networking; QUALIFICATIONS: typ 60; good sec'l skills, well organized; physically able to run errands; exp w/ computers or word-processors highly desirable; send appl/resume to Joyce Firstenberger, Ventura 16.; B12; $1376-1442.

32612-PM (JCC:2672) MED SERV ASST III: 8:30-5pm; performs clerical duties nec for clinic; patient appts; requisitioning lab & radiology exams; heavy telephone commu w/ patients, physicians & other depts; works under the direction of Clerical Supvr in the Eye Clinic; interviews patients for financial & insurance info to properly register patients into Faculty Practice Program; QUALIFICATIONS: typ 30-35; 1 yr exp in a med setting; work in a fast pace, high pressure environ; able to interact w/ public, physicians & employees; biligual ability desirable; med terminology essential; computer knowl helpful; send appl/resume to Vicki Stewart, A367 Boswell Bldg.; B11; $1308-1376.

30906-PM (JCC:1747) LIBRARY SPEC I: 50%; performs duties in the Binding & Finishing Div of Acquisitions Dept; hand letters spine info on books & pamphlet covers; selects approp info regarding author, title, subtitle & call number; corrects old spine lettering info when nec, using an electric stylus & transfer foil; typ binding tickets; assigns bindery control numbers; maintains binding ticket file cards; sorts items for various binding styles; QUALIFICATIONS: typ 45; ability to print by hand clearly & evenly; ability to use electric stylus; commu well in English, both orally & in writing; knowl of one or more foreign langs, preferably French, German, Portugese or Slavic langs; send appl/resume to Bob Johnson, Green Lib, Room 223 (497-3152).; B10; $624-654.

33506-PM (JCC:1771) LIBRARY SPEC IV: Operational control of the Circulation/Stacks Maintenance dept during the 104 hrs/wk the lib is open; hire, train, supv, schedule & evaluate staff in dept; dir the work of the dept; emergency on-call; develop procedures for circulation, reserves & stacks maintenance; ensure staff development opportunities; coord support for Info Desk; maintain statistics & admin records of dept & coord data gathering surveys as required; QUALIFICATIONS: typ 45; strong leadership/supvry skills; strong commitment of public serv; supvry exp; lib exp; excel commu skills; problem solving skills; exp in Circulation/Stacks desired but not required; contact Valerie Su, 497-6831.; B16; $1673-1755.

36409-BP (JCC:2058) ADMIN ASST I (N): Able to quickly familiarize w/ all complex govtl regulations; donor/Univ restrictions pertaining to loans; possess sufficient acctg knowl to understand all acctg aspects of Univ loan sys; maintain all controls & trails; understand the functioning of Student Loan Computer Sys to control, maintain & develop sys; substitute for supvr in her absence; familiar w/ work of each member of the section (8 FTEs) to asst and/or substitute when other section members are out of the offc; asst in prep of reports, maintenance of manuals, monitoring changes in regulations & outside interest rates, balance & reconcile all controls to G/L & the compuer sys; conduct interviews w/ students, monitor 'holds' & their releases, etc; QUALIFICATIONS: typ 45-50; requires excel organizational skills & problem-solving abilities; working knowl of acctg & data sys; excel verbal & written commu skills; ability to work independently & to work effectively w/ people; send appl/resume to Jean Kitaji, 104 Old Union.; B16; $1673-1755.

36406-BP (JCC:2210) ACCOUNTING ASST III: Respon for assisting in the review & financial reconciliation of capital eqpt acquisitions on approx 250 contracts & 750 grants involving 5000+ active budget accts; asst dept mgrs to locate & resolve difference & recommends course of action that is consistent w/ Govt & Univ policy in order to bring accts into balance; reviews & approves SU-48 & SU-13s; interface w/ Surplus Property Sales on disposal problems; plans, organizes & schedules academic depts/non-academic depts for govt mandated biennial capital equip inventories; prov data entry sys support for 2 Acctants via IBM PC; prov support for month end & yr-end closing activities; QUALIFICATIONS: 3 yrs at lower level or equiv exp level in acctg; working knowl of SPIRES, WYLBUR, EASYMARK, VISICALC, use or ability to acquire this knowl quickly (daily use of

computer terminal required); excel commu skills & good, strong acctg bkground & knowl; send appl/resume to M. Willis, 200 Encina Hall.; B14; $1512-1590.
41771-PM (JCC:2454) OFFICE ASST II: 50%, 8-12; prov major staff support to Dir of Alumni Relations which requires exceptionally accurate clerical skills, knowl of basic offc procedures, strict attention to detail & highly developed interpersonal skills, all of which will be exercised in preparing various Univ forms, heavy telephone & personel contact w/ alumni, keeping track of details & reservations for several simultaneous alumni events & taking respon for & working indepednently on a given proj; QUALIFICATIONS: typ 60; good typing skills nec because of heavy work demands & pressures; strong telephone & commu skills; work well w/ other members in the team; send appl/resume to Erika Kaltenbach, Room 112 Crown Quad.; B09; $594-624.
33737-BP (JCC:2454) OFFICE ASST II: Answer phones; receive Ctr visitors; sort & deliver Ctr mail; organize bulletin board mat'l; operate the postage meter; order supplies; prep requests as needed for the Work Info Ctr & other plant services' attentn; update Newsletter mailing list & asst w/ large mailings; prov bkup support to the other offc secretaries; genl filing; respon for lib recordkeeping; QUALIFICATIONS: typ 40, excel telephone answering skills, as well as inter-personal skills; some academic bkground preferred; send appl/resume to Estela Estrada, CROW, Room 30, Chemistry Bldg. or call 497-1994.; B09; $1187-1248.
43601-PM (JCC:2462) OFFICE ASST III: Prov typing & genl clerical support for Pediatrics Dept incl housestaff affairs & clerkship program, Grand Rounds notices, transcription fr dictaphone & genl corresp; asst in coord of Pediatric Core Clerkship for approx 14 students every 8 wks; asst in arranging student orientation program; solicit & collect evaluations fr students & faculty; asst AA & Chief Resident in organization of housestaff training program; QUALIFICATIQNS: typ 55-60; genl offc skills; excel commu skills, both orally & written; med terminology or ability to learn; ability to transcribe fr dictated tapes; contact: Toni Whytoshek, Med Ctr S332, or call 497-5131.; B11; $1308-1376.
39297-BP (JCC:2462) OFFICE ASST III: 50%; serv as contact w/ residence staff on admin matters & refers students' quesitons about housing & other Univ matters, prepares newsletters; schedules facilities; order supplies; liaison w/ custodial staff; prep work orders, channels space requests for guest rooms, audiovisual eqpt; maintains rosters, keys, resident agreements, & offc files; asst residence staff in coordinating arrival arrangements; QUALIFICATIONS: typ 45; thorough knowl of, & ability to perform, offc procedures, practices, & methods; good commu skills; accuracy w/ numbers & details; a sensitivity to residence programming & ability to prov program support; send appl/resume to E. Hiyama, 311 Old Union.; B11; $654-688.
39296-BP (JCC:2462) OFFICE ASST III: Serv as receptionist; answer phones; open & sort mail; may be respon for scheduling appts w/in established guidelines; typ corresp, rpts, forms, etc; arrange layout of mat'l for printing; perform accurate finished typing of corresp, manuscripts, & forms; maintain offc inventory & order supplies; maintain a variety of files; compile & select data fr a variety of sources & organize data in specific rprts; QUALIFICATIONS: typ 45; knowl of & ability to perform offc procedures & methods; ability to coop fr students, staff & faculty of all ethnic bkgrounds; good oral & written commu skills; accuracy w/ numbers & detail; ability to evaluate admin procedures & prov useful feedback; send appl/resume to R. Whitney, 311 Old Union.; B11; $1308-1376.
30271-PM (JCC:2470) OFFICE ASST IV: Writes, edits & approves brochures for Program promotion; supv contract personnel doing typesetting, graphic design & printing of promotional & educational mat'ls for Program; coord edu'l mtgs & conferences; make application for CE & CME credit for upcoming conferences to approp agencies & maintain mandated files; typ, proof, edit & file corresp, projs & plans as requested; respon for Program mass mailings w/in region; respon for grant budget mgmt; QUALIFICATIONS: some travel required to assist w/ major edu'l Program presentations; flexibility essential; excel commu skills; frequent contact w/ public & multiple professionals; must be self-directed, self-starting, capable of setting own priorities & work schedule; send appl/resume to Cecele Quaintance/Trish Berlin, Boswell A346, 497-5763.,; B14; $1512-1590.
29341-BP (JCC:2470) OFFICE ASST IV: Coord all TV Network scheduling & facilities requests; dispatches student production assistants & tech directors as required by facilities requests; respon to find student replacements, often on short notice, to cover all production requests; schedules studios for Stanford & outside use & respon for seeing SITN meets all production needs; first line public phone interface, etc; QUALIFICATIONS: excel overall organizational skills; complete knowl of SITN organization & production serv or equiv; excel public relations/phone skills; send appl/resume to J. Lemon, 450 Durand Bldg.; B14; $1512-1590.
16027-PM (JCC:2478) OFFICE ASST IV: 50%, 8-12; respon to the co-directors of Program for full coord of interdisciplinary program w/ relevant Univ depts & offcs; prov specialized support to the participating faculty & teaching fellows; supv program's reading room; control admin of annual budgets; prep memo, reports, & all program info; coord & oversee the work of teaching fellows; hire & supv work study & other clerical personnel; QUALIFICATIONS: typ 50; bilingual skills (Spanish & English); ability to commu effectively in both verbal & written form w/ wide range of students, faculty & staff; exp and/or edu'l bkground that is conducive to working w/ faculty & program participants; knowl of Univ policies & procedure desired; send appl/resume to J.Porras/-J.Leckie, c/o Chicano Fellows Program,; B14; $756-795.
31555-PM (JCC:2562) SECRETARY III: Prov full range of admin & sec'l support for Assoc Dean for Academic Affairs; familiar w/ a variety of Univ procedures & policies; commit supvr's time; plan & organize calendar; block off prep time for mtgs & appts; make travel arrangements; draft letters/reports independently or fr oral/written instructions; coord & carry out all logistical activities related to Faculty Advisory Board, Dean's Advisory Group, & GSB Faculty Mtgs; organize & maintain filing & retrieval sys; QUALIFICATIONS: typ 65-70; sec'l exp w/ proven ability to handle respon independently, show judgment & discretion in dealing w/ sensitive situations; excel writing, editing, & typing skills; knowl of or willingness to learn word processing, text editing, printing; send appl/resume Norma Sandy, GSB Rm. 24, 497-3012.; B14; $1512-1590.
44411-PM (JCC:2596) SECY II-SPEC: Prov full range sec'l duties to 5 faculty members; typ course mat'l, genl corresp, heavy technical manuscripts (equations w/ Greek & Math symbols); handle mail & phones; primary emphasis of this position is typing of tech manuscripts, manuscripts, abstracts & other reports; QUALIFICATIONS: typ 70; excel grammar, spelling & proofreading skills; familiarity w/ text editing/word processing helpful; send appl/resume to Barbara Fairlie, Mathematics Dept., Bldg. 380.; B12; $1376-1442.
12781-PM (JCC:2596) SECY II-SPEC: 75%; 9-3:30; prepares tech Petroleum Engr reports for publication as well as for theses & dissertations; preparation incl initial entry into NBI wordprocessor; proper formatting of reports for publication medium essential; checks manuscript for proper grammar, punctuation, consistency as appropriate; typ class notes & exams; QUALIFICATIONS: typ 75; wordprocessing, typing multi-page reports, preferably scientific/-technical; send appl/resume to Ted Sumida, SUPRI, Noble 117.; B12; $1032-1082.
32637-PM (JCC:2738) MED SERV ASST IV-PREM: 7:45-4:30; respon for the day to day handling of patient inquiries either by phone, in person, or thru written corresp; requires intensive knowl of physician billing, Medicare, medical insurance billing as well as training in data retrieval for patient acctg & FPP policies & procedures; intensive patient contact; maintain accurate acctg & billing info or pàtient accts; QUALIFICATIONS: 1-2 yrs college edu w/ business & commu emphasis plus a min of 3 yrs exp in business offc dealing w/ public or equiv combination or both; knowl of commercial & govt insurance billing procedures, & understanding of FPP policies; knowl of med terminology & procedures; typ 35; contact:Lois Christopherson, 525 Univ. Ave. Suite 400, Palo Alto, CA 94301, or call 328-5461x18.; B15; $1590-1673.

New employee orientation

The next orientation sessions for new employees will be held at 9 a.m. Tuesday, Sept. 13, and Sept. 20 in Room 131, Tresidder Union.

The sessions are open to all new employees without preregistration.

Bargaining unit

5430-TC (JCC:5638) LIFE SCI TECH I: TMS Unit; 9-6; injects mice w/ tumor cells; monitors tumor sizes by serial caliper measurements; under supvn, treats mice w/ drugs, X-rays, & hyperthermia; maintains accurate records of treatment times, dosages, temperatures, etc; aids in analysis of data by using microprocessor; maintains tumor cell bank & routinely subcultures cells; maintains bibliography files & performes file searches; QUALIFICATIONS: 1 yr college biology & physics (or applicable exp); some knowl of BASIC & mathematical skills would be an asset; neatness & ability to maintain files essential.; A18; $ 7.88.
33250-VW (JCC:5638) LIFE SCI TECH I: TMS Unit; asst w/ res on infections in human subjs caused by herpes viruses, w/ emphasis on varicella-zoster virus infections; performance of radioimmunoassay FOR IgG, IgM & IgA antibodies to VZV in human serum; maintenance of tissue culture lines: melanoma cells, human fibroblasts; make media, buffers, other routine reagents according to standard protocols; help clean & maintain lab eqpt performance of routine cellular immunity assays unsign purified peripheral blood cells stimulated w/ viral antigen; keep routine records of patient samples; help to contact patients to be enrolled in clinical studies; QUALIFICATIONS: bkground in biological sci useful; prev lab work requiring sterile tech desirable; shares eqpt, mat'ls & work space w/ other workers; commu w/ a variety of people.; A18; $ 7.88.
29880-TC (JCC:5786) LAB ASST I: TMS Unit; 50%, 8:30-12:30; conduct genl lab work; make solutions; measure cellular dimensions; greenhouse maintenance, planting, & watering; simple clerical & recordkeeping in lab; xeroxing; logging of chemicals & use of instruments; QUALIFICATIONS: min exp in lab connected w/ biology desired; self discipline; capability to follow instructions w/ precision.; A13; $ 7.01.
29881-LL (JCC:5794) LAB ASST II: TMS Unit; asst in field & lab sampling programs; collect , sort , & analyze plan & soil samples; collect & summarize environ data; asst in greenhouse maintenance & field plots; asst in lab growth chamber experiments w/ SO2; QUALIFICATIONS: prev work w/ plant mat'l; must have flexible schedule & be able to work w/ little supvn.; A16; $ 7.52.
42615-TC (JCC:5835) ANIMAL CARE ASST I: TMS Unit; Fri-Tues, 7:30-4pm; basic husbandry & care of lab dogs & other species cleaning cages, watering, feeding, conducting daily observations for signs of illness or disease; work w/ a variety of animal species; report signs of animal illness/death to Supvr on prescribed forms; conduct assigned duties on wkends under a reduced level of supvn; QUALIFICATIONS: prefer extensive prior exp in care & maintenance of lab animals; requires manual dexterity, personal habits of cleanliness, neatness & organizational ability; ability & willingness to follow written & oral instructions; capable of handling & restraining most species of lab animals w/out undue fear; some mechanical ability; thorough knowl of lab animal care/husbandry tech at a level consistent w/ that required for AALAS certification at the Asst Lab Animal Tech level; a physical exam is required at the Div's expense, as are immunizations if required.; A12; $ 6.87.
18941-DS (JCC:7308) FOOD SERVICE WORKER II: TMS Unit; 6:30-3:30; sets up breakfast & sack lunch buffets; serv & supplies food during meal serv; cleans dining room after breakfast; gets utensils for serv & serves hot food during lunch; makes coffee; keeps dining room looking neat & attractive; freshens flowers; replaces ctr place mats & salts & peppers; washes tables & chairs; does heavy house cleaning at quarter breaks; QUALIFICATIONS: able to speak, read & understand English; able to stand for long periods; must wear a prescribed uniform incl closed in shoes; must work w/ student helpers.; **A10; $ 6.54.**
42881-TC (JCC:5644) LIFE SCI TECH II: To assist in the isolation & characterization of genes specific to B & T lymphocytes; to prep RNA & DNA fr tissues & cultured cells, recombinant phage & plasmids; in vitro labeling, DNA sequencing, Northern & Southern blotting; some lab organizational duties such as ordering & indexing; QUALIFICATIONS: exp in handling RNA & DNA preferred.; A24; $ 9.08.
29888-TC (JCC:5786) LAB ASST I: TMS Unit; 8:30-5:30; approx 80% time to be spent in maintenance of a colony of experimental insects; involve growing plants & feeding them to the immature growth stages of the insects; sorting & organizing insect pupae in prep for adult emergence, caring for adult insects, mating adult insects & collection of their eggs; cleaning of plant pots & cages for insects; 20% time to be devoted to learning & performance of various routine biochemical lab procedures: solution making, column chromatography, gel electrophoresis, etc; QUALIFICATIONS college level exp w/ biological sci; relevant tech employment exp helpful; capable & well-motivated.; A13; $ 7.01.

20 universities join SPIRES data base management system for administration

Soon after Stanford chose SPIRES as the data base management system for its administrative systems development, the Center for Information Technology undertook establishing a SPIRES Consortium of universities.

The 30 institutions that held licenses to use SPIRES were extended invitations. Twenty have joined, announced Jon Sandelin, CIT's general manager for the SPIRES Consortium—well above the number required for a viable consortium. Among the new member universities are UC-Berkeley, Princeton, the University of Illinois, the University of Michigan, and the University of Waterloo.

The purpose of the Consortium is to increase the sharing of applications developed with SPIRES and to provide better underlying support to installations using SPIRES. Such support includes installation, consulting, and documentation improvements. The support is funded by member institution annual fees.

Future plans include extending membership to universities not now holding SPIRES licenses. A brochure describing SPIRES and the Consortium has been prepared, and sessions on SPIRES are being held at various conferences. Further information about SPIRES is available from Sandelin.

Kennedy defends tuition scholarship benefits for children of employees

continued from page 1

home and being exposed to a new environment is integral to their educational experience. In addition, some students want . . . to attend a single sex college instead of a coeducational one, or a liberal arts college instead of a university, etc.

"Tuition scholarship benefits are not offered, and have never been offered, as compensation. No cash or other benefit is provided to other employees, their spouses, or children who do not participate in such programs.

"Furthermore, there is no benefit if the eligible person elects not to attend college. The beneficiary is not usually the employee but a child who has no obligation to the institution. In fact, some institutions offer such scholarships to the children of deceased or retired faculty."

Kennedy noted that "portable tuition has always been codified as a scholarship." With the enactment of the 1954 tax code, a portable tuition remission program was the only example used of a scholarship which was excluded from taxable income.

In testimony to the House Committee on Ways and Means Aug. 1, Vice Chancellor Jeff Carr of Vanderbilt University noted that 27,974 students received tuition remission benefits at 1,033 colleges and universities in 1981-82. While most programs are offered only at the home campus, approximately 4,300 students are eligible for portable tuition grants offered by 218 colleges and universities.

"This number has remained fairly stable over the last two decades," Carr said. "Under the terms of H.R. 3525, the financial assistance provided to this group of young Americans would be terminated at the end of the next academic year. . . .

"Estimates indicate that the revenue realized from the taxation of these scholarships will be small, perhaps less than $5 million. We suggest that the value to the nation, measured concretely by productivity and taxable income of the citizens educated under these plans, is many times greater. . . .

"In these days when many young scholars are drawn to other, more lucrative careers, tax-free tuition scholarships make it possible for those with children to remain in higher education without precluding basic educational opportunity for their children."

Carr testified on behalf of the American Association of University Professors, the American Council on Education, the Association of American Universities, the Association of Catholic Colleges and Universities, the Association of Jesuit Colleges and Universities, and the National Association of Independent Colleges and Universities.

Massy calls for Stanford West review

continued from page 1

view Board, the Planning Commission, and the City Council all questioned certain features of the project. The University is ready to reexamine the design and configuration of Stanford West, Massy said, but before doing so "we would first want to join in fresh discussions to establish a set of acceptable guidelines before adding to the considerable investment we have already made.

"Stanford and Palo Alto have devoted hundreds of hours to Stanford West. It seems entirely appropriate that we work further to create housing that fits within the policies of both parties.

"We appreciate your past consideration of this proposal and look forward to further discussions."

The University proposed to build 1,100 units on a site zoned for 1,600 units, providing three times the open space required and covering only half the area allowed for this purpose.

Oak Creek condos

Plans to convert the 759 unit Oak Creek apartment complex into condominiums have been called off.

Both Stanford University and Oak Creek associates, a partnership holding an option to acquire Oak Creek for conversion, have agreed that the conversion is no longer financially feasible, according to Frank Morrow, Stanford's director of real estate.

The conversion, first proposed in 1981 by Scott Carey, a partner in Oak Creek Associates, would have been the largest in Peninsula history. The complex is located on Stanford's land along Willow Road, not far from the University's Medical Center.

Massy: 'Stanford West can't proceed'

Following is a Sept. 1 letter to Mayor Betsy Bechtel of Palo Alto from Stanford Vice-President William F. Massy of Business and Finance.

During the past several weeks, we have been engaged in a careful review of the Stanford West housing proposal. President Kennedy, various vice-presidents, and staff members have been involved in that analysis.

We have regretfully concluded that Stanford West cannot proceed under the conditions that have been proposed. As I reported to you in July, the extra-jurisdictional conditions are unacceptable to the University, and the $12 to $15 million cost of the below-market-rate and mitigations requirements gave us great concern. That basic position, and those serious concerns, remain unchanged.

At the same time, we recognize the urgent need for housing at Stanford and in this area. We believe that the 46-acre site is well suited for this purpose, as evidenced by the fact that it is zoned for housing and designated as such in Palo Alto's Comprehensive Plan. We want to continue to work toward that end if Stanford West can be freed of the extra-jurisdictional conditions and excessively high costs. We are prepared to seek mutually-acceptable solutions to those issues.

The ARB, the Planning Commission, and the Council all questioned certain features of the project. We stand ready to re-examine the design and configuration of Stanford West in an effort to meet those concerns. Before undertaking such a study, however, we would first want to join in fresh discussions to establish a set of acceptable guidelines before adding to the considerable investment we have already made.

Stanford and Palo Alto have devoted hundreds of hours to Stanford West. It seems entirely appropriate that we work further to create housing that fits within the policies of both parties. We appreciate your past consideration of this proposal, and look forward to further discussions.

□ **Beg. Oct. '83 for academic yr:** Visit. prof. fr. England seeks 1BR furn. apt. Bike/bus distance fr. campus. Call 497-4377 day.

□ **Sept. 15 for 1 yr:** Finnish post-doc and family (wife, 2 children) seeks furn. 2-3BR hse. nr. Stanf. for rent/lease or EXCHANGE for furn. 2BR apt. in HELSINKI nr. universities. Call 858-2948 or write Martti Mantyla, Vattuniemenkatu 16 b A 9, 00210 Helsinki 21, Finland.

Carpools

Carpooler wanted, Dublin-San Ramon-Pleasanton area to Stanford (Medical Center), M-F, hours flexible. Also open to carpooling with Fremont-Milpitas residents convenient to I680 or 237. Call Ed at 7-5569.

Drivers needed for carpool from Noe Valley-Castro-Haight area to Stanford, M-F, 9-6. Call David Thompson, ext. 7-2454 (861-8149 after 7:30 p.m.).

Carpool partner wanted; San Bruno to Stanford, 8-5, M-F; call Bella 7-6941.

Personnel update

All regular faculty and exempt staff currently appointed 50 percent time or more should receive this week (mailed to the home) an information packet detailing recent revisions to the faculty and exempt staff base retirement plan, now called the Stanford Contributory Retirement Plan, according to Manager of Benefits and Records Jeannie Thomas.

Eligible employees who do not receive this packet by Friday, September 9 should contact the Office of Benefits and Records at 7-1778.

General information about the revised plan and more detailed information on the 46 investment options are available on request from the Office of Benefits and Records and SLAC, at the open meetings, and directly from the five investment companies. (Addresses and telephone numbers for these companies are listed in the information packet).

"Because the revised plan offers many more choices and much more flexibility than the current plan, and because the revised plan is very complex," says Thomas, "I recommend strongly that the following steps be taken before individuals make decisions about participation and selection of investment options":

1. Read carefully all materials which are being mailed to eligible faculty and staff members. These materials include: memo, summary plan description, brochure, and comparison chart;

2. Request additional literature from the Benefits Office about the investment companies (three families of mutual funds and two insurance companies) that the individual faculty and staff members determine are of interest. (The materials mailed to eligible faculty and staff this week contain a return request postcard for this purpose; additionally, this information will be available at the open meetings described below).

3. Attend one of the open meetings which will be held on campus, at SLAC, and at the Medical Center.

4. Request the prospectuses of the funds that are of interest by contacting the Benefits Office on campus (7-1778) and at SLAC (2357). (Receipt of a prospectus is a prerequisite for investing in a particular fund).

5. Consider scheduling an appointment with a representative from any of the companies available through this plan, (call 7-2241; see schedule below). Also, individuals having specific investment questions may call the companies by using the toll-free and collect telephone numbers which are published on the comparison chart included in the information packet.

6. After completing the above steps, contact the Benefits Office (campus employees, 7-2241 or 7-1778 and SLAC 2357) to schedule an appointment to execute the necessary paperwork for enrolling in SCRP or changing investment options.

Open meetings will be held to give more information about the revised plan and how to develop strategies for taking advantage of the new investment options it offers. The meetings are scheduled as follows:

Date	Time	Place
September 13, 1983	9 a.m. to 10:30 a.m.	SLAC Auditorium
September 20, 1983	10 a.m. to 11:30 a.m.	Annenburg Auditorium
September 21, 1983	5:15p.m. to 6:45 p.m.	Fairchild Auditorium
October 3, 1983	10 a.m. to 11:30 a.m.	CERAS 112
October 10, 1983	1 p.m. to 2:30 p.m.	CERAS 112

In addition to the open meetings on campus, representatives from the three families of mutual funds: (Fidelity, Scudder, and Vanguard) and the two insurance companies (Prudential and TIAA-CREF) will be available at the Office of Benefits and Records (Old Pavilion) for personal consultation. Company representatives will be available as follows:

Date	Time
September 22-23	8 a.m. to 5 p.m.
October 20-21	8 a.m. to 5 p.m.

Appointments will be made on an individual basis; please call 7-2241 to schedule an appointment with any representative(s).

Thomas says "I encourage all faculty and exempt staff members to attend the open meetings and to talk with representatives from the investment companies. The Office of Benefits and Records will make every reasonable effort to assist eligible participants to obtain sufficient information to make sound investment decisions. However, specific investment choices are individual decisions, requiring considerable attention and study and, in many cases, consultation with a financial advisor."

'83-'84 basketball tickets offered

Now, there is one more reason to buy a Stanford basketball season ticket.

The Golden Spike Restaurant in the Stanford barn will provide a coupon good for a complimentary dinner with each Stanford faculty-staff basketball season ticket purchased. The faculty-staff basketball season ticket has always been a good bargain, in that there is a special half-price offer for University employees and their families. And now there is a free dinner after the game.

"This is just one more way Stanford basketball wishes to make it easy for Stanford employees to enjoy Stanford basketball," Associate Head Coach Bruce Pearl said. "And it provides an excellent and inexpensive opportunity for some genuine family entertainment."

The 1983-84 schedule includes North Carolina (twice in the Stanford Invitational), UCLA, Oregon State, and the rest of the Pacific-10 slate. Tickets may be purchased at the Athletic Department Ticket Office.

Letters to the editor

Another view on feminism's 'failure'

Editor, *Campus Report*:

After reading Robert Greer Cohn's letter in the Aug. 10 issue, I would like to offer a different analysis of the "failure" of the feminist movement.

If there has been failure it is because, by and large, men have refused to change. One primary, even essential, presupposition of the feminist movement was and is that for there to be substantial equality and liberation, men will have to change. This was a misplaced trust. I will even grant that it was Utopian. Furthermore, since men control the institutions of our society, these, too, have not changed.

To blame the women's movement for "the drastic decline in the quality of public schools," for the lower scores on aptitude tests of "children of full-time working mothers," and for other shortcomings listed by Prof. Cohn, is patently unfair and misleading. Do not men have some impact on the lives of their children?

To portray women as the ones responsible for the "basic fabric of our culture" and the spiritual nurture of our children is a convenient way of setting them up for the blame when something goes wrong. Such a set-up fails to place any responsibility for culture and nurture with men. How so? Any analysis of a national dilemma which fails to take into account half of the population must be immediately suspect.

Recently I read *Moscow Women* by Carlen Hanssen and Karin Liden, in which the authors interviewed thirteen Russian women, revealing how jobs outside the home were simply added to traditional duties, child-care was inadequate, economic discrimination was rampant. The more I read the more I had a feeling of deja vu: how similar to America. I have no doubt that even Marxism can be foiled by intransigent male chauvinism. At least one thing is different: in Russia independent political groups are illegal: in America they are not, so there is some hope for American women.

Another hope is that slowly but surely men, like me, will change. Thanks to the feminist movement, I long ago gave up those sexist stereotypes and condescending beliefs so treasured by Prof. Cohn. I have also given up my need to dominate, to control, and to fear women in roles other than "traditional." As a result, I am convinced that I will be a better husband, a more caring parent, a more sensitive employer, and a more responsible citizen shouldering my share of the "home truths" in the future.

I think Prof. Cohn has greatly underestimated the tenacity and creativity of feminists, just as he has superficially analyzed the effects of the feminist movement on our culture.

Parking 'misdeeds' irritate commuter

Editor, *Campus Report*:

It is unconscionable for Stanford University to charge its employees for parking. Now Stanford is furthering this misdeed by raising said parking fees on the "A" lots. Then compounding this injustice—this time the committee on parking and transportation is now directing its misdeeds at the hapless "C" lot habitues—indeed a veritable punishment for not wishing to (or more than likely unable to afford) pay "A" lot fees.

The committee's plan is to turn Plum Tree Lane (a "C" lot) into an "A" lot, forcing the "C" people to move further away from their workplace to the next furthest "C" lot (Museum Way, which during the academic year is full to capacity). Plum Tree Lane is full all year round; Museum Lane will now have to carry the load of the displaced parkers.

Who really suffers here? Stanford? The committee on parking and transportation? No. Guess who? You and me . . . the workers; the staff; the backbone of the University; and quite a large number of students also.

Financial Aids seeks new campus jobs

Financial Aids has mailed information on employing students during the coming year to departments that have hired them in the past, according to Assistant Director Mary A. Roberts.

More than 60 percent of Stanford's undergraduates receive some combination of financial aid, so job opportunities on campus are very important to them.

Roberts asks that Student Employment Request forms be returned to Financial Aids by Sept. 1. Early listing will ensure a large pool of applicants from which to choose.

For more information or to get Employment Request forms, call Beverly Gibbs at the Financial Aids Student Employment section, 497-9765.

Two senior research positions in radiology

Two Senior Research Associate Positions in the X-Ray division of the Stanford Synchrotron Radiation Laboratory will be available starting after December 1, 1983.

The Research Associates will initiate programs in X-Ray research at SSRL, such as X-Ray scattering, X-Ray absorption spectroscopy, Mossbauer Spectroscopy, and X-Ray interferometry. The Research Associations will also initiate instrumentation development for the PEP undulator beam line and the SPEAR X-Ray scattering beam line, as well as for the existing experimental stations. The Research Associates will also consult with members of the user community to optimize usage of the X-Ray facilities of SSRL.

Candidates should have at least three years demonstrated research experience in X-Ray research and-or X-Ray instrumentation development, as well as experience in experimental data acquisition and control.

Interested candidates should submit a Curriculum Vitae and the names of three references to: Prof. George Brown, Stanford Synchrotron Radiation Laboratory, SLAC Bin 69, P.O. Box 4349, Stanford, Calif. 94305.

The closing date for applications will be Nov. 1, 1983.

Stanford University is committed to equal opportunity through affirmative action in employment and we are especially eager to identify minority persons and women with appropriate qualifications.

Alexander George, John Barton comment on Soviet action against airliner

The "uncivilized, barbaric" shooting down of a Korean commercial airliner by the Soviets probably will not develop into a major international confrontation, according to Stanford Prof. Alexander George, an expert on Soviet-American relations who studied Soviet response to perimeter reconnaissance flights in the 1950s.

While the incident should be condemned in the strongest possible terms, "I don't see this leading to a war-threatening crisis," he said in a campus interview Thursday, Sept. 1.

The "glimmering of some progress" in U.S.-Soviet relations, as marked by the recent grain deal, may be called into question, but "I don't see this becoming a spectacular confrontation," George said. U.S. Secretary of State George Shultz, on leave as a Stanford faculty member, has indicated he will proceed with previously planned meetings with Soviet officials.

While Soviet air defense policy "varies over time," George said, it is "very unusual and very severe" to shoot down an apparently innocent aircraft allegedly intruding national airspace.

Ordinarily, interceptors will signal that an intrusion has occured, then attempt to get the intruder to land, or even fire a warning shot before shooting down an unarmed aircraft.

"A critical question is whether or not they gave a clear, recognizable warning," George said. "Most likely, they will claim they gave warning, whether true or not." U.S. monitoring may disclose whether or not any voice warning was given. Tipping of wings or zooming toward the intruder would be more difficult to prove.

The response to such incidents reflects national policies of the countries involved, he said. The growing use of reconnaisance satellites and other forms of intelligence gathering has made the question of airspace intrusion less salient.

In April 1950, the Soviets shot down a Navy Privateer aircraft in the Baltic, George recalled. During the Cuban missile crisis, the inadvertent intrusion of a U.S. reconnaisance aircraft near Siberia caused a great deal of anxiety, he added. A U.S. reconnaisance plane was shot down over Cuba during the same crisis, contributing to President Kennedy's decision to issue an ultimatum to the Soviets.

"The context in which such an incident occurs is often an explanation for what happens later," he said. Recently named a MacArthur prize fellow, George is the author of a new book on *Managing U.S.-Soviet Rivalry: Problems of Crisis Prevention.*

Prof. John Barton, an expert on international law, said the shooting was "clearly wrong," even if the plane strayed into Soviet airspace.

But he noted that there had been similar incidents in the same region in previous years.

Strong protests may ultimately lead to an apology, but this is usually a long time coming and "conceivably may never happen," he said. Any compensation for the victims takes years and "usually is disguised, with no formal admission of responsibility," Barton said.

Dr. Hatem to speak on v.d. eradication

Dr. George Hatem, the physician credited with eradicating venereal disease in China, is to speak at the Medical School on his first trip back to the United States in 45 years.

"The Conquest of Venereal Disease in the People's Republic of China" is the subject of Hatem's lecture, Sept. 15 at 5 p.m. in room M112.

The lecture is free and open to the public.

Hatem went to China in 1933 to study tropical diseases but stayed on to provide medical care after joining the fledgling communist movement in 1936.

In 1954, Hatem began a venereal disease eradication program. No new cases of syphilis or gonorrhea were found in a followup survey conducted in 1964.

A graduate of the University of North Carolina, Hatem's specialized interests in dermatology and venerology had been put aside to cope with general urgent health problems during his early years in China.

Now a resident of Peking, Hatem has a Chinese family and is known in his adopted country as Ma Hai Teh, "Virtue from Overseas." He is visiting Stanford during a a six-month U.S. stay.

Staffers sponsor talk on wardrobe planning

Chris Conlan of Casual Corner (in the Stanford Shopping Center) will speak on "The Versatile and Inexpensive Wardrobe" from noon to 1:30 p.m. Tuesday, Sept. 13, in Tresidder's Room 282.

Her talk, sponsored by the Stanford Staffers, is free to all staff members.

Flu shots at Cowell

The flu shots to be provided free to all Stanford employees who want them, beginning Friday, Sept. 23, will be given at Cowell Health Center.

Employees who want vaccine for A-Brazil, A-Philippines, and B-Singapore types of influenza may come to Cowell between 1:30 and 4 p.m. each Friday, beginning Sept. 23. Pregnant women must have their doctor's permission.

Jewish services set this week

Jewish High Holyday services will be held in two places on the Stanford campus Wednesday, Thursday, and Friday, Sept. 7-9.

Liberal services under the leadership of Rabbi Ari Cartun will be held from 8 to 10 p.m. Wednesday, Sept. 7, and 10 a.m. to 1 p.m. Thursday, Sept. 8, in Memorial Auditorium.

Conservative services under the leadership of Jack Morganstein are scheduled for 8 to 10 p.m. Wednesday, Sept. 7; 8 a.m. to 1 p.m. and 8:30 to 10 p.m. Thursday, Sept. 8; and 8 a.m. to 1 p.m. Friday, Sept. 9.

Fall tennis lessons

Tennis lessons (six pupils per group) will again be offered to graduate students, staff, and-or their families on weekday mornings or Saturday mornings. Players are grouped by ability in these classes taught by Dick Gould's staff. Call 497-1160 on weekday mornings to receive detailed printed information and registration form. Lessons begin the week of Oct. 1.

Have a chat with FBI chief Friday

William Webster, director of the Federal Bureau of Investigation, will be available for informal discussion at 12:15 p.m. Friday, Sept. 9, in room 190 of the Stanford Law School.

All interested members of the Stanford community are invited to attend.

Webster was appointed director of the FBI by President Carter in 1978. Before that he served on the U.S. Court of Appeals Eighth Circuit and was a federal judge and attorney for Missouri's Eastern District.

His appearance is sponsored by the Stanford Law Forum and the Stanford Law School.

Reopening scheduled

The Stanford University Museum of Art and the Stanford Art Gallery are closed for the summer.

The Museum will reopen on September 20, the Art Gallery on October 4.

Mnookin receives APA commendation

Robert Mnookin, Stanford professor of law, received an award for distinguished contribution to child advocacy from the American Psychological Association Division of Child, Youth and Family Services Aug. 29 at the APA's annual convention in Anaheim.

Donald Routh, president-elect of the division, noted that Mnookin has substantially advanced our understanding of the enormously complex relationships among child, family, and state; in each instance, his analysis has been directed toward establishment of sensible and just policies designed to promote the welfare of children and families."

Mnookin received both undergraduate and law degrees from Harvard, and later held a clerkship under Justice Harland of the U.S. Supreme Court. After private practice in San Francisco, he joined U.C. Berkeley, where he was the first director of the Childhood and Government Project. He came to Stanford in 1980.

His articles on foster care, indeterminacy in child-custody adjudication, and bargaining in divorce are considered classics in family law.

1983 Clearinghouse open for business

Approximately 1,500 Stanford students, staff, and faculty will be looking for off-campus housing in September when the 1983-84 academic year opens.

The Clearinghouse, a nonprofit, student-run service to help new arrivals to find housing, is seeking rental houses, apartments, rooms in family homes, and houses to share.

There is a minimal fee for the first month's listing, with renewal free of charge. Call 497-3906 to list a rental at the Clearinghouse.

Besides listings of places to rent, the Clearinghouse will run the Clearinghouse Hotel, where students live while looking for permanent quarters. It also provides information on local community services and businesses for those who are new to the area.

The Clearinghouse opened for business Sept. 1 with a staff of student volunteers. Both homeowners and realtors are welcome to list rentals.

Information on local community services will be available as well as *Life off the Farm*, a complete guide to dining, shopping, transportation, recreation, entertainment, and housing in surrounding towns.

Calendar

Calendar items should be delivered in writing to Jean Miller, University Events and Services, Press Courtyard, Santa Teresa Street, by the Wednesday, 12 days before the beginning of the week in which the events occur. The next deadline is Wed., Sept. 14, to cover the week of Mon., Sept. 26, through Sun., Oct. 2. Calendar items are entered into CIT's IBM computer and may be examined by anyone. Type ADMIN INFO PUBLIC EVENTS.

TUESDAY, SEPTEMBER 13

Stanford Staffers Presentation: "The Versatile and Inexpensive Wardrobe" by Chris Conlan of Casual Corner. Noon-1:30 pm. Rm. 282, Tresidder Union. Free.

SUNDAY, SEPTEMBER 18

University Public Worship: Preacher: R.G. Hamerton-Kelly, Dean of the Chapel. 11:00 a.m. Memorial Church.

EXHIBITS
